E. Steel Prime Paint Finish: Clean, pretreat, and apply manufacturer's standard primer.

F. Baked-on Factory Finish: Clean, pretreat, and apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.

1. Color: **[Manufacturer's standard] [Match Project Director/COR's sample] <Insert color>**.
2. Toe Guards: Paint to comply with ANSI Z535.1.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for electrical systems for loading dock equipment to verify actual locations of connections before equipment installation.

C. Examine walls and floors of pits for suitable conditions where recessed loading dock equipment is to be installed. Pits shall be plumb and square and properly sloped for drainage from back to front of loading dock.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Set curb angles in concrete edges of dock-leveler recessed pits with tops flush with loading platform. Fit exposed connections together to form hairline joints.

B. Set curb angles in concrete edges of truck-leveler recessed pits with tops flush with driveway. Fit exposed connections together to form hairline joints.

C. Place self-forming pan system for **[recessed dock] [edge-of-dock]** levelers in proper relation to loading platform before pouring concrete.

D. Clean recessed pits of debris.

3.3 INSTALLATION, GENERAL

A. Install loading dock equipment as required for a complete installation.

1. Rough-in electrical connections.

3.4 INSTALLATION OF LOADING DOCK BUMPERS

A. Loading Dock Bumpers: Attach loading dock bumpers to face of loading dock in a manner that complies with requirements indicated for spacing, arrangement, and position relative to top of platform and anchorage.

1. Welded Attachment: Plug-weld anchor holes in contact with steel inserts and fillet weld at other locations.
2. Bolted Attachment: Attach dock bumpers to preset anchor bolts embedded in concrete or to cast-in-place inserts or threaded studs welded to embedded-steel plates or angles. If preset anchor bolts, cast-in-place inserts, or threaded studs welded to embedded-steel plates or angles are not provided, attach dock bumpers by drilling and anchoring with expansion anchors and bolts.
3. Screw Attachment: Attach dock bumpers to wood construction with lag bolts as indicated.

3.5 INSTALLATION OF RECESSED LOADING DOCK LEVELERS

A. Attach dock levelers securely to loading dock platform, flush with adjacent loading dock surfaces and square to recessed pit.

3.6 INSTALLATION OF STATIONARY LOADING DOCK LIFTS

A. Attach dock lifts securely to **[loading platform] [floor of recessed pit] [surface of driveway]**.

3.7 ADJUSTING

A. Adjust loading dock equipment to function smoothly and safely, and lubricate as recommended by manufacturer.

B. Test dock levelers for vertical travel and adjust to maintain operating range indicated.

C. After completing installation of exposed, factory-finished loading dock equipment, inspect exposed finishes and repair damaged finishes.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Project Director/COR's maintenance personnel to adjust, operate, and maintain loading dock equipment.

END OF SECTION 111305

SECTION 112173 - COMMERCIAL LAUNDRY EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the types of commercial laundry equipment identified below.

1. Washing machine.
2. Dryer.

B. Related Sections:

1. Section 113013 “Residential Appliances” for residential grade appliances.
2. Division 22 Sections for piping and other associated plumbing work.
3. Division 26 Sections for connections, receptacles, and other associated electrical work.

1.2 SUBMITTALS

A. Product Data: For each equipment type required indicating compliance with requirements.

1. Include installation details, material descriptions, dimensions of individual components, and finishes for each equipment.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.

B. Equipment Schedule: Submit schedule of equipment, using the same OBO Component Code and room designations shown on Drawings. Provide separate schedules for each building.

C. List of Equipment Service Agencies: Submit in writing a list of all manufacturers' representatives of the foodservice equipment, such as convection ovens, ranges, and their authorized service agencies' addresses and telephone numbers.

D. Operation and Maintenance Data: Operation, maintenance, and parts data for commercial-grade equipment to include in the maintenance manuals.

1. For each commercial-grade equipment item, include item number and description indicated in Contract Documents, manufacturer's name and model number, and authorized service agencies' addresses and telephone numbers. Provide divider for each commercial-grade equipment item. Organize manual name of the manufacturer. Provide cross-referenced index in the front of manual by (col.1) component code as shown on the plans, (col.2) component name, and (col.3) manufacturer and description. Include a removable reduced legible copy of the equipment plan with the item numbers.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: Engage experienced installer to perform work of this Section who has specialized in installing commercial-grade equipment, who has completed installations similar in design and extent to that indicated for this Project, and who has record of successful in-service performance.

B. Manufacturer Qualifications: Engage a firm experienced in manufacturing commercial-grade equipment similar to that indicated for this Project and with a record of successful in-service performance.

C. Product Options: Drawings indicate equipment size, profile, and dimensional requirements of equipment and are based on the salient characteristics indicated.

D. Electrical Appliances: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

E. ANSI Standards: Comply with applicable ANSI standards for electric-powered and gas-burning equipment; for piping to compressed-gas cylinders; and for plumbing fittings, including vacuum breakers and air gaps, to prevent siphonage in water piping.

F. Regulatory Requirements: Comply with the following National Fire Protection Association (NFPA) codes and standards:

1. The OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO).
2. NFPA 54, "National Fuel Gas Code."

G. AGA Certification: Provide gas-burning appliances certified by the American Gas Association (AGA).

H. Energy Ratings: Provide Energy Star or equivalent as required in this Section.

I. [Accessibility: Refer to accessibility requirements in Chapter 11 of the OBO Building Code (relative to the Architectural Barriers Act (ABA) "Accessibility Guidelines for Buildings and Facilities") regarding required features and installation of appliances.]

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver commercial-grade equipment as factory-assembled units with protective crating and covering.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary plastic protective covering before shipment. Store commercial-grade equipment in original protective crating and covering and in a dry location. Covering shall be easily removable, and shall be removed after equipment installation is complete, or when otherwise directed by Project Director/COR.

PART 2 - PRODUCTS

2.1 GENERAL

A. In cases where an item can be furnished with different fuel sources, Contractor shall determine which are readily available regionally at project site to facilitate operation, maintenance, and replacement.

B. Refer to Part 3 Article on COMMERCIAL LAUNDRY EQUIPMENT SCHEDULE for salient characteristics on equipment.

2.2 FINISHES

A. For clothes washer and dryer, provide factory-applied porcelain-enamel white.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, power connections, and other conditions affecting installation and performance of commercial equipment.

B. Examine roughing-in for plumbing, mechanical, and electrical services, with Installer present, to verify actual locations of services before commercial equipment installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate equipment work with the work of other Sections and provide items to be placed during the installation of other work at the proper time to avoid delays in the work. Furnish installation instructions to installers of related work as necessary for coordination of the installation. Place such items, including pipes, conduit, inserts and anchors, accurately in relation to the final location of equipment components.

B. Install all components of the equipment in accordance with the manufacturer's written instructions and recommendations.

C. Install equipment with access and maintenance clearances according to manufacturer's written instructions and requirements of local Authority Having Jurisdiction.

D. Verify plumbing, ventilation and electrical connection requirements for all equipment with manufacturer and coordinate connections with Division 22, 23 and 26.

E. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.

3.3 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Perform visual, mechanical, and electrical inspection and testing for each appliance according to manufacturers' written recommendations. Certify compliance with each manufacturer's appliance-performance parameters.
2. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
3. Operational Test: After installation, start units to confirm proper operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.

3.4 ADJUSTING AND CLEANING

A. Test each item of commercial equipment to verify proper operation. Make necessary adjustments.

B. Verify that accessories required have been furnished and installed.

C. Remove temporary protective coverings and packing material from commercial equipment and leave units in clean condition, ready for operation.

3.5 COMMERCIAL LAUNDRY EQUIPMENT SCHEDULE

A. General:

1. This Article may list descriptions for commercial equipment items that are not included for the project. Refer to the equipment schedule in the Drawings to identify applicable equipment items.

B. The following commercial equipment shall be provided by the Contractor in accordance with the Schedule on the Drawings.

WASHING MACHINE, COMMERCIAL

(OBO Component Code PL029)

- Commercial homestyle grade, non-vending
- Freestanding, front-loading with signal
- Stainless steel tub
- Energy Star
- 6 cycles minimum
- Features shall include multiple load size, water temperatures, and wash cycles including pre-wash or second rinse cycle

- Time-remaining display
- Capacity: 9.5 kg (21.5 lb)
- Cylinder Volume: 96.8 liters (3.42 cu. ft.)

DRYER, COMMERCIAL

(OBO Component Code PL030)

- Commercial homestyle grade, non-vending, **[Electric] [Natural Gas]**
- Freestanding, front-loading with front controls
- Energy Star
- 6 cycles minimum
- Features shall include multiple temperature settings, and timed-drying
- Capacity: 8.2 kg (18 lb)
- Cylinder Volume: 198 liters (7 cu. ft.)

END OF SECTION 112713

SECTION 113013 - RESIDENTIAL APPLIANCES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the types of residential appliances identified below.

1. Range hoods.
2. Refrigerator/freezers.
3. Dishwashers.
4. Clothes washers and dryers.
5. Microwaves.

B. Related Sections:

1. Division 06 Section on “Interior Architectural Woodwork” for cabinets and other architectural woodwork.
2. Division 11 Sections for commercial-grade equipment.
3. Division 22 Section on “Residential Plumbing Fixtures,” including garbage disposers.
4. Division 26 Sections for associated electrical work.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 SUBMITTALS

A. Product Data: For each appliance type required indicating compliance with requirements.

1. Include complete operating and maintenance instructions for each appliance.
2. Include installation details, material descriptions, dimensions of individual components, and finishes for each appliance.
3. Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.

B. Appliance Schedule: Submit schedule of appliances, using the same OBO Component Code and room designations shown on Drawings. Provide separate schedules for each building; appliances for townhouse-type staff housing may be included in a single schedule.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who is familiar with installation and maintenance of appliances required for this Project.

B. Product Options: Drawings indicate appliance size, profile, and dimensional requirements of residential appliances and are based on the salient characteristics indicated.

C. Electrical Appliances: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

D. **[High-Altitude [and] [Propane] Conversion: Where site is located above 600 m (2000 feet)[or where appliances use propane], provide gas-operated appliances with manufacturer's conversion kit installed by qualified service agency according to manufacturer's written instructions for Project location and type of fue**l.]

E. **[ANSI: Provide gas-burning appliances that comply with ANSI Z21 Series standards.]**

F. UL and NEMA Compliance: Provide electrical components required as part of residential appliances that are listed and labeled by UL and that comply with applicable NEMA standards.

G. AHAM Standards: Provide appliances that comply with the following AHAM standards:

1. Refrigerators and Freezers: Total volume and shelf area ratings certified according to ANSI/AHAM HRF-1.

H. Energy Ratings: Provide Energy Star or equivalent as required in this Section.

I. [Accessibility: Refer to accessibility requirements in Chapter 11 of the OBO Building Code (relative to the Architectural Barriers Act (ABA) "Accessibility Guidelines for Buildings and Facilities") regarding required features and installation of appliances.

1. [SDA: Those SDA dwelling units identified as accessible dwelling units shall comply with OBO Building Code accessibility requirements.]
2. [Representational Residences: Appliances in Family Zone shall comply with OBO Building Code accessibility requirements.]]

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Deliver appliances only after utility rough-in is complete and construction in the spaces to receive appliances is substantially complete and ready for installation.

1.6 **[WARRANTY**

A. Professional-Grade Appliances: For appliances identified as professional-grade in this section, provide limited warranty including parts and labor for first year and parts thereafter.

1. **Warranty Period: [Five] years from date of Substantial Completion.]**

PART 2 - PRODUCTS

2.1 RESIDENTIAL APPLIANCES

A. Range (OBO Component Code SQ124):

1. Freestanding **[electric] [natural gas]** range with four-burners and single oven with broiler, listed by UL.

B. Range Exhaust Hood (OBO Component Code SQ125):

1. Wall-mounted, undercabinet unit exhaust hood, listed by UL.
2. Connect to exterior with rigid metal duct in accordance with OBO Mechanical Code Section 505. Exhaust in accordance with OBO Mechanical Code Section 508.3.2, including requirement for 189L/s (400 cfm) max.
3. Quiet operation.

C. Microwave Oven, Countertop (OBO Component Code SQ076):

1. Listed by UL, 56 L (2 cf) capacity.

D. Microwave Oven, Undercabinet (OBO Component Code SQ126):

1. Listed by UL, 28 L (1 cf) capacity minimum.
2. Connect to exterior with rigid metal duct in accordance with OBO-ICS IMC Section 505. Exhaust in accordance with OBO-ICS IMC Section 508.3.2, including requirement for 200 L/s (450 cfm) min. exhaust.

E. Dishwasher (OBO Component Code PL032):

1. Undercounter, automatic dishwasher, sized to replace 610-mm (24-inch) base cabinet, listed by UL, Energy Star.

F. Mini Refrigerator (OBO Component Code SQ127)**:**

1. Freestanding, undercounter two-door refrigerator with top mounted freezer, listed by UL, 85 L (3 cf) capacity min., frost-free, Energy Star.

G. Full Size Refrigerator (OBO Component Code SQ058):

1. Freestanding, two-door refrigerator with top-mounted freezer, listed by UL, 550 L (20 cf) capacity min., frost-free, Energy Star. No through-door ice/water dispenser.

H. Full Size Freezer (OBO Component Code SQ142):

1. Freestanding, freezer, listed by UL, 550 L (20 cf) capacity min., Energy Star.

2.2 PROFESSIONAL-GRADE RESIDENTIAL APPLIANCES

A. Professional-Grade Range (OBO Component SQ280):

1. Slide-in **[natural gas] [dual fuel] [electric]** range.

   a. Professional grade, dual fuel range.
   b. Minimum six-burners and griddle plate.
   c. Minimum 15,000 BTU Sealed Burners
   d. Easy clean units, with at least one a convection oven. Minimum three rack positions for rack in each oven.
   e. Minimum 115 L (4.1 cu. ft.) oven cavity at convection oven
   f. Minimum 30,000 BTU oven burner / 18,000 BTU broil burner
   g. Halogen oven lights.
   h. Listed by UL or CE.
   i. Stainless steel construction.
   j. Stainless steel backguard.

B. Professional-Grade Range Exhaust Hood (OBO Component SQ281):

1. Wall-mounted exhaust hood(s); for range(s).

   a. Professional grade, multi-speed wall hood.
   b. Coordinate width with professional grade range unit.
   c. Suitable for 15.2 m (50 feet) of duct run.
   d. Listed by UL or CE.
   e. Stainless steel construction.
   f. Minimum 565 L/s (1,200 cfm) blower motor
   g. Stainless steel washable baffle type filter system and removable trough for removing liquefied grease.
   h. 250-watt heat lamp.
   i. LED lighting with dimmer control.
   j. Fan on-off switch with heat sensor for automatic fan start.
   k. Connect to exterior with rigid metal duct in accordance with OBO Mechanical Code Section 505.
   l. Quiet operation.
   m. Interconnect with make-up air ventilation in accordance with model International Mechanical Code Section 505.

2.3 LAUNDRY APPLIANCES

A. Clothes Washing Machine (OBO Component Code PL027):

1. Freestanding, front-loading, automatic clothes washer, listed by UL, Energy Star. Features shall include multiple load size, water temperature, and wash cycles.

B. Clothes Dryer (OBO Component Code PL028):

1. Freestanding, front-loading, **[electric] [gas]** clothes dryer, listed by UL, Energy Star. Features shall include multiple temperature settings and timed-drying.

2.4 FINISHES

A. Provide manufacturer's standard smooth stainless-steel finishes for all appliances unless otherwise approved by the Project Director/COR, based on input from the A/E of Record, prior to submission. For clothes washer and dryer, provide factory-applied porcelain-enamel white.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, power connections, and other conditions affecting installation and performance of residential appliances.

B. Examine roughing-in for plumbing, mechanical, and electrical services, with Installer present, to verify actual locations of services before residential appliance installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate equipment work with the work of other Sections and provide items to be placed during the installation of other work at the proper time to avoid delays in the work. Furnish installation templates, diagrams, and other data to fabricators and installers of related work as necessary for coordination of the installation. Place such items, including pipes, conduit, inserts and anchors, accurately in relation to the final location of equipment components.

B. Install all components of the equipment in accordance with the manufacturer's written instructions and recommendations.

C. Verify plumbing, ventilation and electrical connection requirements for all equipment with manufacturer and coordinate connections with Division 22, 23, and 26.

D. Built-in Equipment: Securely anchor units to supporting cabinets or countertops with concealed fasteners. Verify that clearances are adequate for proper functioning and rough openings are completely concealed.

E. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.

F. Clothes Dryer: Connect to exterior with sealed and insulated rigid metal duct with lint cleanout access.

G. Range Anti-Tip Device: Install at each range according to manufacturer's written instructions.

3.3 ADJUSTING AND CLEANING

A. Test each item of residential appliances to verify proper operation. Make necessary adjustments.

B. Verify that accessories required have been furnished and installed.

C. Remove temporary protective coverings and packing material from residential appliances and leave units in clean condition, ready for operation.

END OF SECTION 113013

SECTION 114000 – FOOD SERVICE EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Food Service equipment as indicated on the Drawings.

B. Project-Specific Design System Selection:

1. [Gas] [Electric]
2. [Air-Cooled] [Water-Cooled]

C. OFOI Equipment Types: Please refer to the SRP-Ms for coordination of food service equipment which will be furnished and installed by others in accordance with the SRP-M Schedules on the Project Documents.

D. Related Sections include the following:

1. Division 03 Section on “Cast-in-Place Concrete” for equipment bases, curbs, and recesses as indicated.
2. Division 05 Section on “Metal Fabrications” for equipment supports.
3. Division 06 Section on “Interior Architectural Woodwork” for millwork, wood casework, and plastic-laminate substrates.
4. Rough-in work will be done as work of other Sections.
5. Refer to Division 21 Sections for connections to space fire-extinguishing systems.
6. Refer to Division 23 Sections for supply and exhaust fans; exhaust ductwork upstream from exhaust hood or vent collar; connection of exhaust ductwork to exhaust hood or vent; make-up and ventilation system; HVAC controls, control wiring, switches, and interlocking devices; service roughing-ins; floor drains and traps; atmospheric vents; valves, pipes, and fittings; and other materials required to complete food service equipment installation.
7. Refer to Division 26 Sections for connections to wiring between starters, disconnects, wall receptacles, and other electrical materials required to complete food service equipment installation.
8. Division 28 Section on “Addressable Fire Alarm Systems” for connections to building fire alarm system required to complete food service equipment installation.

1.2 SUBMITTALS

A. Product Data: For each type of food service equipment indicated. Include manufacturer's model number and accessories and requirements for access and maintenance clearances, water and

drainage, power or fuel, and service-connections including roughing-in dimensions. Provide voltage, frequency and amperage for equipment without published export voltage documentation.

B. Shop Drawings: For food service equipment not manufactured as standard production and catalog items by manufacturers. Include plans, elevations, and sections at minimum 1:20 scale, roughing-in dimensions, fabrication details, service requirements, and attachments to other work.

1. Fabricated Equipment: Fully detailed and dimensioned at minimum scale of 1:20 for plan and elevation views, and 1:10 for sections.
2. Drawings showing location and size of all bases, depressions, special height walls, location of equipment requiring structural support in walls, openings in walls for equipment at minimum scale of 1:50.
3. Wiring Diagrams: Details of wiring for power, signal, and control systems for electrically operated systems. Differentiate between manufacturer-installed and field-installed wiring.
4. Piping Diagrams: Details of piping systems and differentiating between manufacturer-installed and field-installed piping.

C. Wet-Chemical Fire Suppression System: Prepare shop drawings according to NFPA 17A. Submit working plans and product data for fire suppression system to OBO OPS/FIRE/FPE for review and approval. Submittal shall include all necessary information for a complete and thorough review of proposed wet-chemical fire suppression system.

D. Coordination Drawings: For locations of food service equipment and service utilities. Key equipment with item numbers and descriptions indicated in Contract Documents. Include plans and elevations of equipment, access- and maintenance-clearance requirements, details of built-in equipment bases and floor depressions, and service-utility characteristics.

E. Equipment Schedule: For each food service equipment item, include item designator and description indicated on Contract Documents, manufacturer’s name and model number. For equipment items requiring operational servicing (e.g., convection ovens, refrigeration units), identify information for authorized service agencies; company name, agency address, and contact information.

F. Samples for Initial Selection:

1. Manufacturer's color charts showing the full range of colors available for exposed products with color finishes.
2. Plastic nameplate, including information on available colors and text style.

G. Samples for Verification: Of each type of exposed finish required, minimum 100-mm square or 150-mm long sections of linear shapes and of same thickness and material indicated for work. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.

H. Product Certificates: Signed by manufacturers of refrigeration systems or their authorized agents certifying that systems furnished comply with requirements and will maintain operating temperatures indicated in the areas or equipment that they will serve.

1. Certify that each refrigeration system is properly sized and meets operating requirements set forth for each system regarding maintaining specified operating temperature, hours of compressor running time, and system pressures and velocities as recommended by equipment manufacturer.

I. List of Equipment Service Agencies: Submit in writing a list of all manufacturers' representatives of the foodservice equipment, such as convection ovens, ranges, and their authorized service agencies' addresses and telephone numbers.

J. Maintenance Data: Operation, maintenance, and parts data for food service equipment to include in the maintenance manuals.

1. For each food service equipment item, include item number and description indicated in Contract Documents, manufacturer's name and model number, and authorized service agencies' addresses and telephone numbers. Provide divider for each food service equipment item. Organize manual name of the manufacturer. Provide cross-referenced index in the front of manual by (col.1) component code as shown on the plans, (col.2) component name, and (col.3) manufacturer and description. Include a removable reduced legible copy of the equipment plan with the item numbers.

K. Warranties: Special warranties specified in this Section.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer to perform work of this Section who has specialized in installing food service equipment, who has completed installations similar in design and extent to that indicated for this Project, and who has a record of successful in-service performance. Designers and installers of wet-chemical fire suppression systems shall be manufacturer certified.

B. Manufacturer Qualifications: Engage a firm experienced in manufacturing food service equipment similar to that indicated for this Project and with a record of successful in-service performance.

C. Product Options: Drawings indicate food service equipment based on the specific products indicated. Other manufacturers' equipment with equal size and performance characteristics may be considered.

D. Regulatory Requirements: Comply with the following National Fire Protection Association (NFPA) codes and standards:

1. The OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO).
2. NFPA 17A, "Standard for Wet Chemical Extinguishing Systems."
3. NFPA 54, "National Fuel Gas Code."
4. NFPA 96, " Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations."

E. Listing and Labeling: Provide electrically operated equipment or components specified in this Section that are listed and labeled.

1. The Terms "Listed" and "Labeled": As defined in the NFPA 70, Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

F. AGA Certification: Provide gas-burning appliances certified by the American Gas Association (AGA).

G. ASME Compliance: Fabricate and label steam-generating and closed steam-heating equipment to comply with ASME Boiler and Pressure Vessel Code.

H. ASHRAE Compliance: Provide mechanical refrigeration systems complying with the American Society of Heating, Refrigerating and Air-Conditioning Engineers' ASHRAE 15, "Safety Code for Mechanical Refrigeration."

I. NSF Standards: Comply with applicable NSF International (NSF) standards and criteria and provide NSF Certification Mark on each equipment item, unless otherwise indicated.

J. ANSI Standards: Comply with applicable ANSI standards for electric-powered and gas-burning appliances; for piping to compressed-gas cylinders; and for plumbing fittings, including vacuum breakers and air gaps, to prevent siphonage in water piping.

K. SMACNA Standard: Where applicable, fabricate food service equipment to comply with the Sheet Metal and Air Conditioning Contractors National Association's (SMACNA) "Kitchen Equipment Fabrication Guidelines," by the Sheet Metal and Air Conditioning Contractors National Association's (SMACNA), unless otherwise indicated.

1. Seismic Restraints: Provide OBO Building Code provisions require seismic restraints for food service equipment, provide restraints in accordance with SMACNA’s "Kitchen Equipment Fabrication Guidelines" unless otherwise indicated.

L. Preinstallation Conference: Conduct conference at Project site to comply with requirements to review methods and procedures related to food service equipment including, but not limited to, the following:

1. Review access requirements for equipment delivery.
2. Review equipment storage and security requirements.
3. Inspect and discuss condition of substrate and other preparatory work performed by other trades.
4. Review structural loading limitations.
5. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.

1.4 LABELING

A. Nameplates: Provide nameplates to identify controls and switches on fabricated equipment. Nameplates shall be two-ply 25 mm, rigid plastic material specifically manufactured for this purpose. Machine engrave nameplate with white letters on black background, with edges beveled at a 45 deg. angle. Attach nameplates using an adhesive recommended by manufacturer of engraving material.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver food service equipment as factory-assembled units with protective crating and covering.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary plastic protective covering before shipment. Coating shall be easily removable, and shall be removed after equipment installation is complete, or when otherwise directed by Project Director/COR.

C. Schedule delivery of equipment to prevent delays in Project, including delays in associated work.

D. Store food service equipment in original protective crating and covering and in a dry location.

E. Do not use walk-ins for construction storage.

F. Government-Furnished Government-Installed Equipment: As identified by the Government, the Government will furnish and install specific food service equipment items. Contractor shall coordinate space, cutouts, and utilities as applicable, and as defined by the Government.

G. **[Reused Equipment: As identified by the Government, coordinate and show sizes, utilities, and other requirements as determined by inspecting equipment as existing to be reused. Include costs for tagging, marking, removing, storing, cleaning, redelivering, and installing such equipment. Provide accessories identified as necessary for equipment to conform to new application.]**

1.6 PROJECT CONDITIONS

A. Do not begin installation of equipment until building is sufficiently clean, and until the operating temperatures and humidity in the spaces to receive the equipment conform to requirements of food service manufacturers.

1.7 COORDINATION

A. Coordinate size, location, and requirements of concrete bases, positive slopes to drains, floor depressions, and insulated floors. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section on "Cast-in-Place Concrete."

B. Coordinate timing of equipment access. If necessary, coordinate with Contractor regarding timing of construction of secondary walls, non-security doors, and similar construction to facilitate moving food service equipment to their proper location.

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section on roof accessories.

D. Coordinate installation of food service equipment with installation of flooring and wall tile.

E. Coordinate equipment layout and installation with other work, including light fixtures, HVAC equipment, and fire-suppression system components.

F. Coordinate connection location and requirements of service-utility connection installation with project fire protection, mechanical, and electrical subcontractors.

1.8 WARRANTY

A. General Warranty Provisions: The special warranty specified in this Article shall not deprive the Government of other rights the Government may have under other warranty provisions of the Contract, and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract.

B. Refrigeration Compressor Warranty: Submit a written warranty signed by manufacturer agreeing to repair or replace compressors that fail in materials or workmanship within the specified warranty period.

1. Failures include, but are not limited to, the following:

a. Breakage
b. Faulty operation, including inability to maintain set temperature.

2. Warranty Period: 5 years from date of Substantial Completion.

C. Wet-Chemical Fire Suppression System Warranty: The pre-engineered suppression system shall be warranted for five years from the date of delivery against defects in workmanship and material.

1.9 EXTRA MATERIALS

A. Extra materials shall match products installed. Package these materials with protective covering for storage, and include labels describing content. Provide the following:

1. Commercial Kitchen Hood: One (1) device for grease removal.

1.10 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date for a period of one calendar year with a renewable option for an additional year, provide proposal for system maintenance service based on manufacturer's recommended daily, weekly, quarterly, semi-annual, and annual maintenance activities. The proposal shall be submitted to the COR/Project Director at least 120 days prior to Substantial Completion.

B. The proposal shall be inclusive of controls set-up and programming, troubleshooting, and alarms based on manufacturer's recommendations and the operation and maintenance information, using factory-trained service personnel.

C. Maintenance service shall include preventive maintenance, repair or replacement of worn or defective components, required supply of cleaning solutions and specialty tools, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks shall also align with the manufacturer's recommended checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 GENERAL

A. In cases where an item can be furnished with different fuel sources or, in the case of refrigeration, various cooling methods, Contractor shall determine which are readily available regionally at project site to facilitate operation, maintenance, and replacement.

2.2 MATERIALS

A. Stainless-Steel Sheet, Strip, Plate, and Flat Bar: ASTM A 240, A 666, Type 304 Condition A, 18-8, stretcher leveled, No. 4 finish. At surfaces which are not exposed to view, No. 2B finish may be used. No lighter than 0.095 mm in thickness should be incorporated into the work.

B. Stainless-Steel Tube: ASTM A 554, Grade MT-304.

C. Stainless Steel Rolled Shapes: Cold-rolled type conforming to ASTM A 36.

D. Zinc-Coated Steel Sheet: ASTM A 653, G-115 coating designation. Commercial quality, cold rolled, stretcher leveled, and chemically treated.

E. Zinc-Coated Steel Shapes: ASTM A 36M, zinc-coated in accordance with ASTM A 123.

F. Plastic Laminate: Complying with NEMA LD 3 and NSF 35 requirements. NSF certified for end-use application indicated; 1.27 mm thick for horizontal and vertical surfaces, and 1.07 mm thick for post-formed surfaces; smooth texture; and easily cleanable.

1. Color: As indicated, or otherwise as selected by Project Director/COR based upon input from OBO/PDCS/DE from manufacturer's full range of colors.

G. Plywood and Lumber: Provide plywood and lumber as specified in Division 06 Section on "Interior Architectural Woodwork."

H. Sealant: ASTM C 920; Type S, Grade NS, Class 25, Use NT. Provide elastomeric sealant NSF certified for end-use application indicated. Provide sealant that, when cured and washed, complies with U.S. Food and Drug Administration (FDA) 21 CFR, Section 177.2600 for use in areas that come in contact with food. Provide at backsplashes to walls, cabinet bodies to concrete or tile bases, roll-in refrigerators to floor, and similar applications. Match surrounding surfaces and applied in accordance with manufacturer's recommendations for smooth, sealed finish.

1. Color: As indicated, or otherwise as selected by Project Director/COR based upon input from OBO/PDCS/DE from manufacturer's full range of colors.
2. Backer Rod: Closed-cell polyethylene, in diameter larger than joint width.

I. Tempered Glass: ASTM C 1048, Kind FT (fully tempered), Condition A (uncoated surfaces), Type I (transparent), Class 1 (clear), Quality q3 (glazing select). Provide products complying with ANSI Z97.1, manufactured by horizontal (roller-hearth) process, and 6 mm thick, unless otherwise thicker glazing indicated. Provide exposed safety edges, if any, seamed before tempering.

J. Plastic: Except for plastic laminate, provide plastic materials and components complying with NSF 51.

K. Sound Dampening: NSF-certified, 3-mm thick, tape type, sound-deadening material coating.

L. Gaskets: NSF certified for end-use application indicated; of resilient rubber, neoprene, or PVC that is nontoxic, stable, odorless, nonabsorbent, and unaffected by exposure to foods and cleaning compounds.

2.3 ACCESSORIES

A. Cabinet Hardware: Provide NSF-certified, stainless-steel hardware for equipment items as indicated.

2.4 FABRICATION, GENERAL

A. All fabricated equipment shall be fabricated in same factory, and shall be similar in construction details, materials, methods, and appearance to similar types of items fabricated under this contract.

B. Fabricate food service equipment in accordance with NSF 2. Factory assemble equipment to greatest extent possible.

C. Design of equipment shall be such as to provide for safe and convenient operation. Provide covers or other safety devices presenting safety hazards; such guards or safety devices shall not substantially interfere with operation of equipment. All guards shall provide easy access to guarded parts.

D. Each fabricated item of equipment shall include all necessary reinforcing, bracing, and welding with sufficient number and spacing of uprights and cross members for strength. Wherever standard sheet sizes permit, tops of tables, shelves, exterior panels of cabinet type fixtures, doors, and drain boards shall be constructed of single sheet of metal. Except where required to be removable, secure flat surfaces to vertical and horizontal bracing members by welding or other approved means to eliminate all buckle, warp, rattle, and wobble. Equipment which is not braced in a rigid manner, and which is subject to rattle and wobble is unacceptable; provide additional bracing in manner acceptable to Project Director/COR.

E. Plastic-Laminate and Wood Casework: Fabricate according to requirements specified in Division 06 Section on “Interior Architectural Woodwork.”

F. Welding: Use welding rod of same composition as metal being welded. Use methods that minimize distortion, and which develop strength and corrosion resistance of base metal. Provide welds free of mechanical imperfections such as gas holes, pits, or cracks.

1. Welded Butt Joints: Provide full-penetration welds for full-joint strength. Make joints flat, continuous, and homogenous with sheet metal without relying on straps under seams, filling in with solder, or spot welding.
2. Grind exposed welded joints flush with adjoining material, and polish to match adjoining surfaces.
3. Where fasteners are welded to underside of equipment, finish reverse side of weld smooth and underpressed.
4. Coat unexposed stainless-steel welded joints with suitable metallic-based paint to prevent corrosion.
5. After zinc-coated steel is welded, clean welds and abraded area, and apply SSPC-Paint20, high-zinc dust content galvanizing repair paint conforming with ASTM A 780.

G. Fixtures shall be shop fabricated of one piece and shipped to job completely assembled wherever possible. Equipment too large to transport or enter the building as one piece shall be constructed so that the field joints can be welded at the job site.

H. Fabricate field-assembled equipment prepared for field-joining methods indicated. For metal butt joints, conform to SMACNA "Kitchen Equipment Fabrication Guidelines,", unless otherwise indicated.

I. Where stainless steel is joined to dissimilar metal, use stainless-steel welding material or fastening device.

J. Form metal with break bends that are not flaky, scaly, or cracked in appearance. Where breaks mar uniform surface appearance of material, remove such marks by suitable grinding, polishing, and finishing.

K. Sheared Metal Edges: Finish free of burrs, fins, and irregular projections.

L. Provide surfaces in food zone, as defined in NSF 2, free from exposed fasteners.

M. Exposed surfaces shall be free from bolt and screw heads. When bolts are required, they shall be of concealed type and be of similar composition as metal to which they are applied. Where bolt or screw threads on interior of fixtures are visible or may come into contact with hands or wiping cloths. Cap exposed fastener threads, including those inside cabinets, with stainless steel cap (acorn) nut and stainless steel lock washers.

N. Provide pipe slots on equipment with turned-up edges. and size to accommodate service and utility lines and mechanical connections.

O. Provide enclosures, including panels, housings, and skirts, to conceal service lines, operating components, and mechanical and electrical devices, including those inside cabinets, unless otherwise indicated.

P. Seismic Restraints: Fabricate as applicable to comply with SMACNA as referenced in the Article on QUALITY ASSURANCE, unless otherwise indicated.

Q. Appliances shall be of rigid construction, free from objectionable vibration. Food service equipment shall operate quietly. Installed equipment producing objectionable noise or vibration shall be replaced as directed by Project Director/COR.

2.5 STAINLESS-STEEL EQUIPMENT

A. Edges and Backsplashes: Provide equipment edges and backsplashes indicated conforming to SMACNA "Kitchen Equipment Fabrication Guidelines," unless otherwise indicated.

B. Sound Dampening: Place between metal support structures and underside of metal work surfaces.

C. Tables: Fabricate with reinforced tops, legs, and reinforced undershelves or cross bracing to conform to SMACNA "Kitchen Equipment Fabrication Guidelines," unless otherwise indicated, and as follows:

1. Tops: Minimum 1.98-mm (0.0781-inch) (14-gauge) thick stainless steel, unless otherwise indicated.
2. Legs: 40-mm (1-5/8-inch) OD, minimum 1.59-mm (0.0625-inch) (16-gauge) thick stainless steel with stainless-steel gusset and adjustable insert bullet-type feet with minimum adjustment of 25 mm (1-inch) up or down without exposing threads, unless otherwise indicated.
3. Undershelves: Minimum 1.98-mm (0.0781-inch) thick stainless steel, unless otherwise indicated.
4. Top and Undershelf Reinforcement: Minimum 1.98-mm (0.078-inch) thick, stainless-steel reinforcing, unless otherwise indicated.
5. Cross Bracing: 32 mm 1-1/4-inch OD, minimum 1.59-mm (0.0625-inch) thick stainless steel, unless otherwise indicated.

D. Sinks: Fabricate of minimum 1.98-mm (0.078-inch) thick stainless steel with fully welded, one-piece construction. Construct two sides and bottom of sink compartment from one stainless-steel sheet, with ends welded integral and without overlapping joints or open spaces between compartments. Provide double-wall partitions between compartments with 13-mm (1/2-inch) radius rounded tops that are welded integral with sink body. Cove horizontal, vertical, and interior corners with 19-mm (3/4-inch) radius. Pitch and crease sinks to waste for drainage without pooling. Seat wastes in die-stamped depressions without solder, rivets, or welding.

1. Wastes: 50-mm (2-inch) nickel-plated bronze, rotary-handle waste assembly with stainless-steel strainer plate and nickel-plated brass, connected overflow.
2. Drainboards: Minimum 1.98-mm (0.078-inch) thick stainless steel, pitched to sink at 3mm/300 mm (1/8-inch/12 inches) of length. Reinforce drainboards with minimum 1.98-mm (0.078-inch) thick stainless steel 32-mm (1-1/4 inch) angle, unless otherwise indicated.
3. Legs: 40 mm (1-5/8-inch) OD, minimum 1.59-mm (0.0625-inch) thick stainless steel with stainless-steel gusset welded to 2.78-mm (0.11-inch) thick, stainless-steel support plate. Provide adjustable insert bullet-type feet with minimum adjustment of 25 mm (1-inch) up or down without exposing threads, unless otherwise indicated.
4. Drainboard Braces: 25-mm (1-inch) OD, minimum 1.59-mm (0.0625-inch) thick stainless steel, unless otherwise indicated.
5. Cross Bracing: 38 mm (1-1/2 inch) OD, minimum 1.59-mm (0.0625-inch) thick stainless steel, unless otherwise indicated.

E. Wall Shelves and Overshelves: Fabricate to conform to SMACNA "Kitchen Equipment Fabrication Guidelines," unless otherwise indicated, and with minimum 1.59-mm (0.0625-inch) thick, stainless-steel shelf tops.

F. Drawers: Provide lift-out type, one-piece, die-stamped drawer pan fabricated from 1.27-mm (0.05-inch) thick stainless steel with inside corners formed with proper radius. Support drawer pan with 1.59-mm (0.0625-inch) thick, stainless-steel channel frame welded to drawer front. Provide 25-mm (1-inch) thick, double-wall front fabricated from 1.59-mm (0.0625-inch) thick stainless steel and with integral recessed pull. Fill void in drawer front with semi-rigid fiberglass sound dampening. Mount drawers on NSF-certified, full-extension, stainless-steel drawer slides that have minimum 45-kg (100-lb) load capacity per pair, ball-bearing rollers, and positive stop. Mount drawer slides for self-closing on drawer housing as indicated.

2.6 STAINLESS STEEL FINISHES

A. General: Comply with NAAMM "Metal Finishes Manual for Architectural and Metal Products" for application and designation of finishes.

1. Remove or blend tool and die marks and stretch lines into finish.

B. Concealed Surfaces: No. 2B finish (bright, cold-rolled, unpolished finish).

C. Exposed Surfaces: No. 4 finish (bright, directional polish).

1. Grind and polish surfaces to produce uniform, directional textured, polished finish indicated, free of scratched. Run grain with long dimension of each piece.

2. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter, and leave surfaces chemically clean.

2.7 EXHAUST HOOD FABRICATION

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Aerolator Systems, Inc.
2. AHR Metals, Inc.; Air Saver Systems.
3. Air Tech; Delfield Company (The).
4. AyrKing Corporation.
5. Captive-Aire Systems.
6. Carroll Manufacturing International.
7. Duke Manufacturing Company.
8. Gaylord Industries, Inc.
9. Giles Enterprises, Inc.
10. Grease Master; a division of Custom Industries, Inc.
11. Greenheck.
12. Halton Company.
13. LCSystems, Inc.
14. Sturdi-Bilt Restaurant Equipment.
15. Vent Master; Div. of Garland Commercial Ranges, Ltd.

B. General: Type I exhaust hood. Comply with NSF 2 and NFPA 96.

1. Refer to Division 21 Sections for fire-extinguishing system requirements.
2. Refer to Division 23 Sections for duct, fan, and damper requirements.

C. Grease Removal: Provide removable, stainless-steel, baffle-type grease filters with spring-loaded fastening. Provide minimum 1.98-mm thick, stainless-steel filter frame and removable collection basins or troughs.

D. Light Fixtures: Provide NSF-certified fixtures with lamps, vapor-tight sealed lenses, and wiring in stainless-steel conduit on hood exterior.

E. Exhaust-Duct Collars: Minimum 1.59-mm thick stainless steel.

F. Below Hood Wall Cladding: Provide 18-gauge type 300 or equal quality polished stainless steel, with no pop riveting from finished floor to underside of exhaust hood. Wall cladding shall run the full width and depth of the exhaust hood dimensions.

2.8 ELECTRICAL FABRICATION

A. Provide commercial grade signals, "on-off" pushbuttons or switches, and other speed and temperature controls as required for operation of each item. Include the following:

1. Pilot lights.
2. Identification: Permanent engrave, or provide plastic laminate signs and graphics to identify each item.
3. Stainless steel cover plates at controls and signals.

B. Equip each item requiring electrical power with either terminal box for permanent connection, or with cord and plug for interruptible connection, as indicated. Grounding-type plugs shall be NEMA standard.

C. Fabricate foodservice equipment completely wired internally using wire and conduit suitable for wet locations, including separate grounding wire.

D. Provide electrical outlets and receptacles required to be mounted on or in fabricated equipment, and interconnect to suitable terminal box (subpanel, starter, or disconnect switch) with all wires neatly tagged showing item number, voltage characteristics, and load information.

E. Provide appropriate grounding-type connectors and neoprene cords installed on each item of plug-in equipment. Coordinate work with electrical work in project so that receptacles provided match specific plugs provided as part of plug-in equipment. Reduce length of cords furnished with specified equipment to suitable or appropriate length so they do not interfere with other equipment or operations.

F. Internally wire electrically-heated equipment to thermostatic control and to "on-off" red neon light indicator. Mount light indicator in terminal box on removable stainless steel access panel.

G. Use only rigid steel conduit where unexposed. Use chrome-plated conduit where exposed. Run wiring concealed wherever possible.

H. Provide on or for each motor-driven appliance or electrical heating or control unit a suitable control switch or starter of proper type and rating, and in accordance with Underwriters Code wherever such components are not built in. Other line switches, safety cut-outs, control panels, fuse boxes, other control fittings, and connections, when not integral part of unit or furnished

loose by equipment manufacturer, shall be furnished and installed by as part of the Division 26 electrical work. Electrical controls, switches, or devices furnished with food service equipment shall be delivered loose for field installation as part of Division 26 electrical work associated with each scheduled item of equipment.

I. Fabricated equipment shall be so wired, wound, or constructed to conform to the characteristics of electrical and other services at job site.

J. Fabricate appliances complete with motors, driving mechanism, starters, and controllers, including master switches, timers, cut-outs, reversing mechanism, and other electrical equipment.

K. Appliances shall be of rigid construction, free from objectionable vibration. Food service equipment shall operate quietly. Installed equipment producing objectionable noise or vibration shall be replaced as directed by Project Director/COR.

L. Motors:

1. Drip-proof, splash-proof, or totally enclosed type, having continuous duty cycle and ball bearings, except small timing motors may have sleeve bearings.
2. Windings shall be impregnated to resist moisture.
3. Motors, located where they are subject to deposits of dust, lint, or other similar matter from machine on which installed, shall be of totally enclosed type.
4. Motors shall have ample power to operate machines for which designated under full load operating conditions without exceeding their nameplate ratings.
5. Manufacturer, based on normal operation at maximum capacity, shall determine horsepower requirements on driven equipment.
6. Nominal rated motor horsepower shall be not less than horsepower required for normal operation of equipment at maximum capacity.
7. Insulation: NEMA Class B minimum.

M. Switches, controls, and similar electrical components shall be conspicuously labeled, with label secured to adjacent surface.

N. Where specified for custom fabricated equipment, provide compartment with electrical sub-panel that shall be pre-wired in conduit concealed in cabinet body construction and connected to electrical components built into or set upon the counter. Electrical sub-panel shall be as follows:

1. UL listed, 3-phase, 4-wire circuit breaker type with ground buss main breaker and individual breakers for each serviced load.
2. Buss shall be copper. Circuit breakers shall be molded case, bolt-on type with thermomagnetic quick-make, quick-break trip.
3. Multi-pole circuit breakers shall have internal trip bar.
4. Circuit breakers shall have interrupting capacity as indicated by short circuit and coordination study; while typical AICs for countries with 120 V, 60 Hz distribution is 10,000 amperes, the AIC may vary for countries with 220 V, 50 Hz distribution.
5. Provide separate breaker for each connected load.

6. Size each breaker for 125 percent of connected load. Provide single pole, 20 amp circuit breakers To accommodate each counter appliance and convenience receptacle.
7. Connect loads through breakers in phased sequence to balance load on each phase.

2.9 PLUMBING FABRICATION

A. Locate water inlets above positive water level wherever possible to prevent siphoning of liquids into water supply system.

1. Wherever conditions require submerged inlet, provide suitable type of check valve and vacuum breaker with fixture to prevent siphoning of liquids; adjust in locations where local Authorities Having Jurisdiction prohibit use of check valves.
2. Where exposed, piping and fittings shall be chrome-plated.
3. Where vacuum breaker piping is through equipment, provide chrome -plated escutcheon plates to cover holes.

B. Fabricate indirect waste lines from equipment to discharge into floor drains or safe wastes. Plates shall be chrome-plated where exposed. Extend line to point at least 25 mm (1 inch) above rim of floor drain, and higher if required by local Authority Having Jurisdiction; cut bottom on 45-degree angle, and secure in position.

C. Run horizontal piping lines at highest possible elevation, and at not less than 150 mm (6 inches) above floor, and through equipment where possible.

D. No exposed piping in or around fixtures or in other conspicuous places shall show tool marks or more than one thread at the fitting.

E. Provide suitable pressure-reducing valves for all equipment with such components that might be affected over time by adverse pressure conditions, including but not limited to dishwashers, booster heaters, coffee urns, and steam boilers.

2.10 REFRIGRATION SYSTEMS

A. Provide and install complete refrigeration systems, charged, started, and operating properly, including, but not limited to:

1. Compressors, condensers, racks, coils, vibration eliminators, sight glasses (moisture indicating type), expansion valves, filters, oil separators, thermostats, defrost time clocks, all controls and control wiring, liquid line driers, piping, and refrigeration grade copper tubing with all sweat joints using silver solder (with as few joints as possible)

B. Where specifications call for pre-piped lines (e.g., from fixture to valve compartment), provide such work in conformance with Board of Fire Underwriters or ASHRAE Standards, whichever is the greater.

C. Mechanically refrigerated cold pans shall have normally closed liquid line electric solenoid valve installed before expansion valve, and wired to silent- type toggle switch complete with "on-off" red neon light indicator, and both mounted in terminal box on removable access panel. This switch shall be fed by separate control circuit, and shall not to be wired into compressor circuit so that it shall stop the flow of refrigerant to cold pan and not turn off compressor. Compressor shall then pump down and turn off through action of pressure control.

D. Refrigeration equipment shall be designed and installed to maintain the following general temperatures unless otherwise specified:

1. Walk-in Refrigerator: 1.5 deg. C
2. Walk-in Freezer: -25 deg. C
3. Reach-in Refrigerators: 1.5 deg. C
4. Reach-in Freezers: -25 deg. C
5. Undercounter Refrigerators: 1.5 deg. C
6. Undercounter Freezers: -25 deg. C
7. Cold Pan: -20 deg. C
8. Work Rooms: 10 deg. C

E. Provide electrical and refrigeration components necessary for complete refrigeration systems.

F. Provide evaporator coil defrost system for walk-in refrigerator and freezer rooms where refrigeration systems is designed to operate at room temperature of less than 1.5 deg.C. Verify and provide additional refrigeration specialties and components required by manufacturer for proper operation under specific operating conditions and location of each system specified.

G. Install and wire refrigeration systems in conformance with manufacturer's instructions and recommendations. Ensure that condensing units are ventilated properly and are accessible for repair, maintenance, and inspection.

H. Furnish 2.66 mm (12 gauge) galvanized steel fish plates of suitable size and shape on exterior ceiling of the walk-in to spread weight of coils adequately.

I. Refrigeration tubing shall be the Type L, ACR hard drawn degreased, sealed copper.

J. Furnish minimum 12 mm armaflex or equal cellular type insulation for suction and refrigerant lines. Furnish metal pipe sleeves for building penetrations. Install permanent suction line filter in each compressor suction line with pressure fitting ahead of filter to facilitate checking of pressure drop through filter. Furnish escutcheon plate for sealing refrigeration and drain lines.

K. Provide thermostat to control refrigeration temperatures for each individual compartment.

L. Mount condensing units shall be mounted on welded steel rack. Rack shall contain all accessories and components necessary to form complete condensing unit package. Each condensing unit shall have factory mounted, prewired control panel/disconnect switch complete with circuit breakers, contactors, and time clocks. Fabricate systems with control and thermostat wiring installed.

M. Provide each walk-in refrigerator or freezer compartment with its own temperature indicator, located on exterior of walk-in complex. Minimum dial size shall 100 mm. Digital readouts shall be easily readable from 6 m away. Locate temperature sensing bulbs within inlet stream of blower coil, not on door panel, or other location.

N. Provide plexiglass framed holder for refrigeration system control wiring and piping diagrams. Mount at compressor location.

O. Provide thermometers for walk-in units with suitable length armored capillary tubes to allow sensing bulb to be installed in incoming air stream to blower coil with all runs fastened to walk-in walls to prevent it from damage. This identical requirement applies to alarm systems when specified.

2.11 WET-CHEMICAL FIRE SUPPRESSION SYSTEMS

A. Provide and install an automatic fire suppression system using a wet chemical agent for grease-related fires. Dual agent concept (wet chemical agent and water) is permitted. Wet chemical fire suppression system shall be designed and installed in accordance with the OBO Fire Code, NFPA 96, and NFPA 17A.

B. The system shall be capable of suppressing fires in the following areas associated with cooking equipment: ventilating equipment including hoods, ducts, plenums, and filters; fryers; griddles and range tops; upright, natural charcoal, or chain-type broilers; electric, lava rock, mesquite or gas-radiant char-broilers.

C. The system shall be the pre-engineered type having minimum and maximum guidelines established by the manufacturer and listed by Underwriters Laboratories, Inc. (UL).

D. The system shall be designed, installed, and serviced by personnel trained and certified by the manufacturer.

E. The system shall be designed to provide full hood continuous protection utilizing overlapping nozzle appliance protection that covers the complete appliance line under the total hood length. Cooking appliances with enclosed cooking hazards shall also be provided with nozzles dedicated to the appliance.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances, service-utility connections, and other conditions affecting installation and performance of food service equipment. Do not proceed with installation until unsatisfactory conditions have been corrected.

B. Examine roughing-in for piping, mechanical, and electrical systems to verify actual locations of connections before installation.

C. Equipment Access: Check all door openings, passageways, elevators, and any other site restrictions which may affect delivery and placement of equipment their proper location in the building.

D. Field Dimensions:

1. Verify field dimension at site of food service equipment installation areas by field measurement before equipment fabrication, and indicate measurements on Shop Drawings and Coordination Drawings. Coordination fabrication schedule with construction progress to avoid delay of the Work.
2. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish required dimensions, and proceed with fabricating equipment without field measurements. Coordinate construction to ensure actual dimensions correspond to established dimensions.

3.2 INSTALLATION, GENERAL

A. Install food service equipment level and plumb, according to manufacturer's written instructions, original design, and referenced standards.

B. Complete equipment field assembly, where required, using methods indicated.

1. Provide closed butt and contact joints that do not require a filler.
2. Grind field welds on stainless-steel equipment smooth, and polish to match adjacent finish. Comply with welding requirements in Article on FABRICATION, GENERAL.

C. Install equipment with access and maintenance clearances according to manufacturer's written instructions and requirements of local Authority Having Jurisdiction.

D. Provide cutouts in equipment, neatly formed, where required to run service lines through equipment to make final connections.

E. Except for mobile and adjustable-leg equipment, securely anchor and attach items and accessories to walls, floors, or bases with stainless-steel fasteners, unless otherwise indicated.

F. Install cabinets and similar equipment on concrete or masonry bases in a bed of sealant.

G. Install hoods to comply with NFPA 96 requirements and to remain free from vibration when operating.

H. Install seismic restraints according to SMACNA "Kitchen Equipment Fabrication Guidelines."

I. Install trim strips and similar items requiring fasteners in a bed of sealant. Fasten with stainless-steel fasteners at 1200 mm (48 inches) o.c. maximum.

J. Install sealant in joints between equipment and abutting surfaces with continuous joint backing, unless otherwise indicated. Provide airtight, watertight, vermin-proof, sanitary joints.

1. Install sealant at backsplashes to walls, cabinet bodies to concrete or tile bases, roll-in refrigerators to floor, and similar applications. Match surrounding surfaces, and apply in accordance with manufacturer's recommendations for smooth, sealed finish.

K. Seal equipment which butts to wall or against other equipment with silicone rubber sealant. Set trim strips or other items requiring fasteners in bed of silicone rubber sealant, and fasten with suitable stainless steel fasteners 1200mm or less on centers. Prior to application of sealant, thoroughly clean and degrease surfaces.

L. Install equipment, such as pass-through refrigerators and warmers, which pass through wall where one side is exposed to public view with operating controls located on kitchen or working side of wall. Install equipment, such as coffee urn, which is located on or in counter having pick-up side and working side, with operating controls facing working side of counter.

3.3 ELECTRICAL INSTALLATION

A. Line switches, safety cut-outs, control panels, fuse boxes, other control fittings, and connections associated with food service equipment, when not integral part of unit or furnished loose by equipment manufacturer, shall be furnished and installed by as part of the Division 26 electrical work.

1. Electrical controls, switches, and similar electrical devices are fabricated with food service equipment and delivered loose for field installation as a part of each scheduled item shall be installed as part of Division 26 electrical work.
2. Final electrical connections of food service to electrical panel shall be made by electrician as part of Division 26 electrical work after food service equipment is installed.

3.4 PLUMBING INSTALLATION

A. Install indirect waste lines from equipment which shall discharge into floor drains or safe wastes; install chrome-plated lines in portions that are exposed. Extend to point at least 25 mm above rim of floor drain, cut bottom on 45-degree angle, and secure in position.

B. Run horizontal piping lines at highest possible elevation, and not less than 150 mm above floor, through equipment where possible.

3.5 REFRIGERATION SYSTEMS INSTALLATION

A. Complete connections between electrical and refrigeration components with respective refrigeration systems.

B. Hang the evaporator coils per manufacturer's recommendation at locations as shown on Drawings. Units shall be mounted sloping such that drain pans are pitched to drain lines. Coils shall be hung using nylon or other approved non-conductive, non-corrosive fasteners. Unless specified otherwise, coils shall be installed 100mm from interior walk-in ceiling. Connect coils to condensing units to provide complete working system capable of maintaining interior temperatures specified regardless of heavy usage walk-in units may receive.

C. Provide copper or PVC drain line from each coil outlet to point 25mm above floor drain. Drain lines shall be trapped immediately above floor drain. Wrap freezer drain line with continuous electrified heater tape that shall be furnished as part of refrigeration system contract. Install drain lines in such a way that they do not interfere with placement of shelving inside walk-in. To extent possible, route drain lines outside walk-in refrigerator complex.

D. Install refrigeration tubing with horizontal runs sloped 25 mm per 6 m toward condensing units. Space and locate adjustable hangers to drop required to properly support refrigerant piping. Where vertical runs of more than 2 m occur in suction line, risers shall be trapped at bottom. Install piping so that refrigerant or oil cannot drain back into coils from suction line.

E. Install insulation on suction and refrigerant lines. Install pipe sleeves where piping passes through wall, ceiling, or floor. Fill space around the tubing with mastic insulating compound. Install a permanent suction line filter in each compressor suction line with pressure fitting ahead of the filter to facilitate checking of pressure drop through the filter. Insulate and seal penetrations through walk-in cooler or freezer structures to be vapor tight to prevent condensation within light fixtures, switch boxes, junction boxes, or other fittings. Install escutcheon plates at refrigeration and drain lines.

F. Interconnect blower coils with condensing unit.

G. As part of Division 26 electrical work, connect main power to each disconnect, and install interwire power from freezer’s condensing unit to freezer’s blower coil.

3.6 PROTECTING

A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure food service equipment is without damage or deterioration at the time of Substantial Completion.

3.7 START-UP

A. Startup Services: Engage factory-authorized service representatives to perform startup services and to demonstrate and train the Government's maintenance personnel as specified below.

1. Coordinate food service equipment startup with service-utility testing, balancing, and adjustments. Do not operate steam lines before they have been cleaned and sanitized.
2. Remove protective coverings and clean and sanitize equipment, both inside and out, and relamp equipment with integral lighting. Where applicable, comply with manufacturer's written cleaning instructions.
3. Test each equipment item for proper operation. Repair or replace equipment that is defective in operation, including units that operate below required capacity or that operate with excessive noise or vibration.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
5. Test motors and rotating equipment for proper rotation and lubricate moving parts according to manufacturer's written instructions.
6. Test water, drain, gas, steam, oil, refrigerant, and liquid-carrying components for leaks. Repair or replace leaking components.

    a. Coordinate calibration, air adjustments, and similar testing of gas-fired equipment with local gas company, if applicable.

7. Train the Government's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, and preventive maintenance for each food service equipment item.
8. Verify the following for refrigeration systems:

    a. Test refrigeration equipment's ability to maintain specified operating temperature under heavy-use conditions. Repair or replace equipment that does not maintain specified operating temperature.
    b. Adjust controls, including refrigeration circuits, and room air temperature controls.
    c. Verify that all condensers carry an overload protector
    d. Ensure that competent service mechanic is available during first 8 hours of operation.
    e. Verify that all switches, starters, and controls are identified as to function.

9. Review data in the operation and maintenance manuals.
10. Review data in the operation and maintenance manuals. Refer to Division 01 Section "Operation and Maintenance Data."
11. Schedule training with the Government, through Project Director/COR, with at least 7 days' advance notice.

3.8 CLEANING

A. At completion of installation, clean up items of equipment installed by Contractor.

1. Where stainless steel surfaces are disturbed by installation or fabricating process, finish such surface to match adjoining undisturbed surfaces.
2. At the completion of the installation work, run portable polishing machine over stainless steel and buff.
3. Touch-up painted equipment surfaces where as necessary.
4. Before final payment remove all surplus material, false work, temporary structures, including foundations thereof and debris of every nature resulting from his operations, and shall put the site in a neat, orderly, and broom-clean condition.

3.9 FOOD SERVICE EQUIPMENT SCHEDULE

A. General:

1. This Article may list descriptions for equipment items that are not included for the project-specific size of the food service area. Refer to the equipment schedule in the Drawings to identify applicable equipment items.

B. The following food service equipment shall be provided by the Contractor in accordance with the Schedule on the Drawings.

THREE-COMPARTMENT SINK

(OBO Component Code PL040)
(OBO Component Code PL074)
(OBO Component Code CM136)

- 14 gauge type 304 or equal quality stainless steel sink with three individual one piece stainless steel deep drawn bowls, two integral stainless steel drainboards, integral stainless steel backsplash, and integral stainless steel side splash as conditions necessitate, where end of sink meets wall or column
- Raised rolled edge at front and both sides
- Stainless steel tubular legs with front and rear crossbracing and adjustable stainless steel feet
- Grind and polish welds to blend with adjacent surfaces
- Fabricate drainboards to drain to sink compartment
- Splash mounted heavy duty chrome-plated swivel faucet with aerators
- Three leverwastes with overflow, one mounted in each sink compartment
- Sink to accommodate installation of Dishwasher, below
- Refer to elevations and details for additional requirements

THREE-COMPARTMENT SINK

(OBO Component Code PL057)

- 14 gauge type 304 or equal quality stainless steel sink with three individual one piece stainless steel deep drawn bowls, two integral stainless steel drainboards,

integral stainless steel backsplash, and integral stainless steel side splash as conditions necessitate, where end of sink meets wall or column
- Raised rolled edge at front and both sides
- Stainless steel tubular legs with front and rear cross bracing and adjustable stainless steel feet
- Grind and polish welds to blend with adjacent surfaces
- Fabricate drainboards to drain to sink compartment
- Two splash mounted chrome-plated swivel faucets with aerators
- Three lever wastes with overflow, one mounted in each sink compartment
- Punch holes in backsplash for vacuum breaker for Waste Disposer, Heavy Duty Faucet, and Rinse Overspray
- Supply and mount control bracket for Disposer controls
- Install Waste Disposer Cone, in drainboard as shown on Drawing
- Sink to accommodate installation of Dishwasher, below
- Refer to elevations and details for additional requirements

HAND SINK

(OBO Component Code PL046)

- 20 gauge type 304 or equal quality stainless steel sink with one piece stainless steel deep drawn bowl
- Folded paper towel dispenser and liquid soap dispenser factory installed
- Splash mounted chrome-plated gooseneck faucet with wrist handles and aerator
- Integral stainless steel skirt at front and sides of sink with tapered sides
- Chrome-plated P-Trap

SINK

(OBO Component Code PL079)

- 20 gauge type 304 or equal quality stainless steel sink with one piece stainless steel bowl
- Splash mounted chrome-plated gooseneck faucet with wrist handles and aerator

PREP SINK

(OBO Component Code PL047)
(OBO Component Code CM075)

- 14 gauge type 304 or equal quality stainless steel sink with two individual one piece deep drawn stainless steel bowls, two integral stainless steel drainboards, and integral stainless steel backsplash
- Raised rolled edge at front and both sides
- Stainless steel rear enclosure on backsplash as conditions necessitate
- Stainless steel tubular legs with front and rear cross bracing and adjustable stainless steel feet

- Grind and polish welds to blend with adjacent surfaces
- Fabricate drainboards to drain to sink compartment
- One splash-mounted chrome-plated swivel faucet with aerator
- Two lever wastes with overflow, one mounted in each sink compartment
- Refer to elevations and details for additional requirements

MOP SINK & FAUCET

(OBO Component Code PL009)
(OBO Component Code PL010)

- Type 304 or equal quality stainless steel sink with coved corner stainless steel bowl
- Sink size per Drawings, floor mounted to height nominal 250 mm
- Grind and polish welds to blend with adjacent surfaces
- Wall mounted chrome-plated faucet with support rod

RINSE OVERSPRAY

(OBO Component Code PL043)

- Install deck-mounted chrome-plated fixture on Three Compartment Sink
- Hot and cold water mixing faucet
- Wall bracket to support upright
- Pre-assembled flex hose, spring body, overhead spring and spray valve
- Refer to elevations and details for additional requirements

SINK

(OBO Component Code PL078)

- Water station with drip pan and push back glass filler
- Pedestal style glass filler with 1/2" NPT inlet and 1 1/4" drain
- 18 gauge stainless steel drip pan
- 8” nozzle clearance minimum to accommodate pitchers
- Self-closing lever
- Deck mounted installation type

WASTE DISPOSER

(OBO Component Code PL044)

- Stainless steel grind chamber
- Stainless steel and chrome-plated exterior finish
- Enclosed motor housing
- Rubber mounting above grinding chamber
- Support leg as necessary

- Auto-reversing control panel in NEMA 4 or equal stainless steel enclosure with push button controls
- Anti-siphon vacuum breaker mounted on backsplash of Three Compartment Sink
- Cone assembly with removable splash baffle, reversible bowl cover
- Install disposer, cone, and control panel in Three Compartment Sink
- Refer to elevations and details for additional requirements

DISHWASHER, COMMERCIAL

(OBO Component Code PL042)

- Type 304 or equal quality stainless steel top and front panel
- 16 gauge type 304 or equal quality stainless steel tank with electric tank heat
- Hot water or chemical sanitizing; hot water sanitizing preferred
- Internal hot water booster heater, sized to boost water to sanitizing temperature
- Removable stainless steel scrap screen
- Drain water tempering kit as required by code
- Single rack tank; capable of washing approximately 58 racks per hour
- Electric or gas-fired tank heat <electric heat is typically preferred>
- Pressure Regulator where conditions require
- Vent Fan Control interconnected with Condensate Hood
- Right to left operation
- Straight-thru operation, with side openings to accommodate clean / dirty dishtables
- Automatic fill, door-actuated start and automatic drain closure

UNDERCOUNTER DISHWASHER, COMMERCIAL

(OBO Component Code PL060)

- Type 304 or equal quality stainless steel top and front panel
- 16 gauge type 304 or equal quality stainless steel tank with electric tank heat
- Hot water or chemical sanitizing; hot water sanitizing preferred
- Internal hot water booster heater, sized to boost water to sanitizing temperature
- Removable stainless steel scrap screen
- Drain water tempering kit as required by code
- Single rack tank; capable of washing approximately 30 racks per hour
- Sized to fit under Three Compartment Sink drainboard
- Corrosion resistant pump and automatic pumped drain
- Provide two dishracks with machine

CLEAN DISHTABLE

(OBO Component Code CM004)
(OBO Component Code CM046)
(OBO Component Code CM057)

- 14 gauge type 304 or equal quality stainless steel dishtable with integral stainless steel backsplash
- Raised rolled edge at front and left side
- Angled return at right end of backsplash, modified table, and turned down right end on table, sized to fit into Dishwasher, without splashing or leaking
- Stainless steel tubular legs with front and rear cross bracing and adjustable stainless steel feet
- Grind and polish welds to blend with adjacent surfaces
- Fabricate table to drain to Dishmachine
- Refer to elevations and details for additional requirements

DISHTABLE, DIRTY WITH RINSE SINK

(OBO Component Code PL045)
(OBO Component Code PL058)

- Straight-Soil Dishtable, 10-1/2"H backsplash, with pre-rinse sink
- 16 gauge 304 series stainless steel legs with crossrails front to back
- 14 gauge 304 series stainless steel top, includes prerinse basket with slide bar (slide bar only when disposer adapter is specified).
- Accessories:
  Install collar, with 14" x 16" control bracket
  Anti-Siphon vacuum breaker holes

ADJUSTABLE DISH DOLLY

(OBO Component Code CM001)

- One piece, non-corrosive, hi-tensile, reinforced aluminum base
- Plastic-coated extruded aluminum channels
- Adjustable plate adapters appropriate to plate size and style
- Four heavy duty swivel casters, two with brakes
- Extra adjustable adapters
- Vertical corner bumpers

CUP/GLASS RACK DOLLY

(OBO Component Code CM002)

- Non-corrosive, hi-tensile aluminum construction
- Sized appropriately to accommodate glass storage racks
- Four heavy duty swivel casters, two with brakes
- Extra adjustable adapters
- Corner bumpers

CUP/GLASS RACK DOLLY WITH HANDLE

(OBO Component Code CM034)

- Non-corrosive, hi-tensile aluminum construction
- Sized appropriately to accommodate glass storage racks
- Four heavy duty swivel casters, two with brakes
- Chrome-plated spring back push handle
- Extra adjustable adapters
- Corner bumpers

TRAY CART

(OBO Component Code CM035)

- Stainless steel tubular frame
- Medium-duty nominal 230 kg load capacity
- Two 20 gauge type 304 or equal quality stainless steel shelves
- Four swivel casters, two with brakes
- Corner bumpers

SOILED TRAY RACK CARTS, SINGLE

(OBO Component Code CM036)

- Single wide non-corrosive, hi-tensile aluminum racks to fit two stacks of patron trays
- Four heavy duty swivel casters, two with brakes
- Side, rear, top and bottom enclosures in finish as selected by Project Director/COR
- Push handle
- Corner bumpers

SOILED TRAY RACK CARTS, DOUBLE

(OBO Component Code CM056)

- Double wide non-corrosive, hi-tensile aluminum racks to fit two stacks of patron trays
- Four heavy duty swivel casters, two with brakes
- Side, rear, top and bottom enclosures in finish as selected by Project Director/COR
- Push handle
- Corner bumpers

4 SHELF UNIT WITH CASTERS

(OBO Component Code CM003)
(OBO Component Code CM015)

(OBO Component Code CM043)
(OBO Component Code CM052)
(OBO Component Code CM093)

- Shelf unit to be made up of four adjustable stainless steel wire shelves, four stainless steel posts, two heavy duty swivel rubber casters, and two heavy duty swivel rubber casters with brakes
- Shelf size per Drawings
- Provide accessories necessary to assemble and adjust complete shelf unit

5 SHELF UNIT WITH CASTERS

(OBO Component Code CM014)
(OBO Component Code CM054)
(OBO Component Code CM055)
(OBO Component Code CM085)

- Shelving unit sizes per Drawings
- Each shelf unit to be made up of five adjustable chrome-plated wire shelves, four chrome plated posts, two heavy duty swivel rubber casters and two heavy duty swivel rubber casters with brakes
- Provide accessories necessary to assemble and adjust complete shelf unit

OVERSHELF RACK, SORTING

(OBO Component Code CM005)

- Sorting Shelf, wall mounted, traditional design, 42"W, accommodates (2) full size dish racks.
- Shelf, type 300 stainless steel, 16 gauge.
- Brackets, type 300 stainless steel, 16 gauge.

REACH-IN REFRIGERATOR/FREEZER, DOUBLE DOOR

(OBO Component Code CM016)

- Two section dual temp reach-in cabinet
- Half +2 degree C refrigerator
- Half -17 degree C freezer
- Stainless steel interior and exterior
- Exterior digital thermometer
- Provide adequate ventilation for condensing unit
- Half-height solid doors hinged per plan
- Four swivel polyethylene casters, two with brakes
- Six Chrome plated wire shelves behind each half door
- Stainless steel finished back as conditions necessitate
- Cord and plug]

REACH-IN REFRIGERATOR/FREEZER, SINGLE DOOR

(OBO Component Code CM017)

- One section dual temp reach-in cabinet
- Top half +2 degree C refrigerator
- Bottom half -17 degree C freezer
- Stainless steel interior and exterior
- Provide adequate ventilation for condensing unit
- Exterior digital thermometers
- Half-height solid doors hinged per plan
- Four swivel polyethylene casters, two with brakes
- Six chrome plated wire shelves behind each half door
- Stainless steel finished back as conditions necessitate
- Cord and plug

COUNTERTOP REFRIGERATOR, DOUBLE DOOR

(OBO Component Code CM048)

- Two section reach-in countertop +2 degree C cabinet
- Stainless Steel exterior
- White aluminum interior with type 300 or equal quality stainless steel floor
- Three PVC coated wire shelves
- Provide adequate ventilation for condensing unit
- Double pane glass hinged door with magnetic gasket
- Interior lighting
- Low-height legs
- Cord and plug

REFRIGERATION SYSTEM, REFRIGERATOR CONDENSING UNIT (REFRIG. SYSTEM, +2 C)

(OBO Component Code ME004)

- Completely wired, charged and tested, semi-hermetic condensing unit mounted in remote location and coupled with evaporator unit
- Air-cooled or water-cooled refrigeration; water-cooled preferred
- Provide adequate ventilation for condensing unit component of either type of refrigeration
- Conduit assembly between components
- Thermostatic expansion valve
- Solenoid valve
- Temperature control
- Sight glass, Drier
- Pressure Control

- If installed outdoors and if conditions necessitate, provide crankcase heater, low ambient controls, and weather-proof, painted metal housing with hinged, lockable cover

WALK-IN REFRIGERATOR (REFRIG. SYSTEM, +2 C)

(OBO Component Code CM125)
(OBO Component Code ME003)

- Pre-fabricated wall and ceiling panels of urethane foamed-in-place insulation, to be assembled on site
- Pre-fabricated floor panels of urethane foamed-in-place insulation if conditions necessitate
- Assemble panels with locking fit to ensure tight fit at seams
- Box of size and configuration as shown on Drawings
- Nominal 2750 mm high box
- Refrigeration System to serve walk-in
- Exposed Exterior Walls: 20 gauge or equal quality stainless steel
- Unexposed exterior walls finished with stucco-embossed galvanized steel
- Matching metal trim strips and closure panels to adjacent walls and ceiling
- Interior Walls and Ceiling: White Baked-on Enamel
- Interior Floor if conditions necessitate: 14 Gauge or equal quality galvanized steel, depressed into floor finished per foodservice equipment details in Drawings
- Door(s) located and hinged per Drawings, nominal 915 mm x 1980 mm door;
- Center light fixture over door panel
- Entrance Door: Heated window, self-closing hardware, and heavy duty hinges
- Additional framework at door panel to prevent warping
- Digital thermometer wired to exterior door panel
- Aluminum diamond kickplate on both sides of all doors
- Additional light fixtures as required to appropriately light storage space
- Refer to elevations and details for additional requirements

REFRIGERATION SYSTEM, REFRIGERATOR CONDENSING UNIT (REFRIG. SYSTEM, -25 C)

(OBO Component Code ME006)

- Completely wired, charged and tested, semi-hermetic condensing unit mounted in remote location and coupled with evaporator unit
- Air-cooled or water-cooled refrigeration; water-cooled preferred
- Provide adequate ventilation for condensing unit component of either type of refrigeration
- Conduit assembly between components
- Thermostatic expansion valve
- Solenoid valve
- Temperature control
- Sight glass, Drier

- Pressure Control
- Time Clock
- If installed outdoors and if conditions necessitate, provide crankcase heater, low ambient controls, and weather-proof, painted metal housing with hinged, lockable cover]

WALK-IN FREEZER (REFRIG. SYSTEM, -25 C)

(OBO Component Code CM126)
(OBO Component Code ME005)

- Pre-fabricated wall and ceiling panels of urethane foamed-in-place insulation, to be assembled on site
- Pre-fabricated floor panels of urethane foamed-in-place insulation if conditions necessitate
- Assemble panels with locking fit to ensure tight fit at seams
- Box of size and configuration as shown on Drawings
- Nominal 2750 mm high box
- Refrigeration System to serve walk-in
- Exposed Exterior Walls: 20 gauge or equal quality stainless steel
- Unexposed exterior walls finished with stucco-embossed galvanized steel
- Matching metal trim strips and closure panels to adjacent walls and ceiling
- Interior Walls and Ceiling: White Baked-on Enamel
- Interior Floor if conditions necessitate: 14 Gauge or equal quality galvanized steel, depressed into floor finished per foodservice equipment details in Drawings
- Door(s) located and hinged per Drawings, nominal 915 mm x 1980 mm door;
- Center light fixture over door panel
- Entrance Door: Heated window, self-closing hardware, and heavy duty hinges
- Additional framework at door panel to prevent warping
- Digital thermometer wired to exterior door panel
- Aluminum diamond kickplate on both sides of all doors
- Additional light fixtures as required to appropriately light storage space
- Refer to elevations and details for additional requirements

SALAD TOP REFRIGERATOR

(OBO Component Code CM110)

- Refrigerated Counter, Salad Top, two-section, (2) doors
- 16 gauge stainless steel top with (2) 1/6 size pan opening recessed 2" (pans not included)
- Cold pan to have 2BF stainless steel interior
- Plate shelf
- ABS interior sides, stainless steel floor, unfinished ends & back, side-mounted self-contained refrigeration
- Exterior drawer fronts, stainless steel with ABS plastic liner
- Adjustable height casters in lieu of standard legs

- Accessories:
  Stainless steel right end
  Stainless steel left end

REFRIGERATED BOTTLE CHEST

(OBO Component Code CM068)

- Bottle Cooler, slant top, self-contained refrigeration, heavy-duty construction
- (20) cases of 12oz long neck bottle capacity
- (2) sliding stainless steel doors, condensate evaporator
- Stainless steel top & interior, black exterior, 1/4 HP
- NSF, cULus
- All stainless steel exterior finish
- 2 Bin Divider with support brackets
- No Lock (Standard, nc)
- Accessories:
  Low Profile Rollers, 1-5/8", set of (4)

REFRIGERATOR, SNACK DISPLAY CASE

(OBO Component Code CM090)

- Glass door merchandiser refrigerator, 23 cu.ft.
- (1) hinged glass door with lock
- 36°F to 46°F temperature range
- Digital thermostat with LED display
- White aluminum interior with (3) adjustable shelves
- LED lighting
- Top lighted signage panel
- Black powder-coated exterior
- Bottom mount self-contained refrigeration
- (4) casters (2) braked
- 2/3 HP, 115v/60/1-ph, 2.8 amps, cord with NEMA 5-15P, cULus

REFRIGERATOR, DISPLAY, MOBILE

(OBO Component Code CM091)

- Refrigerated Merchandiser, one-section, (3) shelves
- Laminated vinyl exterior, permanent non-peel non-chip black vinyl
- Stainless steel interior
- Low-E thermal glass hinged door
- LED interior lights
- 1/6 HP, 115v/60/1, 2.0 amps, NEMA 5-15P
- Energy Star

- cULus, CSA, CE, UL EPH Classified
- Self-contained refrigeration standard
- Castors, 2-1/2", set of 4
- Five (5) bottle organizer, per shelf
- Two (2) Standard wire shelf

FREEZER, ICE CREAM CHEST

(OBO Component Code CM092)

- Display Freezer, 4.87 Cu. Ft., 3 Basket Capacity
- Clear, curved glass sliding lids
- -18°F to 10°F temperature range
- Easy grip sliding lid handle
- Lid lock and keys
- Lid frame heated to prevent frost or ice build-up
- White painted steel exterior and white powder-coated steel interior
- Internal condensate evaporator pan
- LED lighting
- Cold wall evaporator with adjustable thermostat
- Drain with plug to aid with cleaning
- Removable rubber bumper guards, side grill
- External temperature display
- Casters
- ETL-Sanitation and cETLus listed

REFRIGERATOR, DISPLAY, 2 DOOR MOBILE

(OBO Component Code CM094)

- Glass door merchandiser, swing door refrigerator
- Refrigeration system: self-contained, capillary tube system
- High capacity, factory balanced refrigeration system that maintains cabinet temperatures of 33°F to 38°F (-0.5°C to 3.3°C)
- Electronically commutated evaporator and condenser fan motors
- Bottom mounted condensing unit
- Cabinet construction: Stainless steel exterior
- Interior - Stainless interior liner with stainless steel floor
- Foamed-in-place high density, polyurethane insulation
- Welded, heavy duty steel frame rail, black powder coated
- Frame rail fitted with leg levelers
- Illuminated exterior sign panel
- Double pane thermal insulated glass door assemblies. White powder coated frames
- Self-closing doors. Positive seal, torsion type closure system
- Magnetic door gaskets of one-piece construction, removable without tools for ease of cleaning
- Eight (8) adjustable, heavy duty PVC coated wire shelves

- Four (4) chrome plated shelf clips included per shelf
- Shelf support pilasters made of same material as cabinet interior; shelves are adjustable on 1/2” (13 mm) increments
- LED interior lighting, safety shielded
- Listed under NSF/ANSI Standard 7
- Casters

FREEZER, DISPLAY, 3 DOOR MOBILE

(OBO Component Code CM095)

- Glass door merchandiser, swing door freezer
- Refrigeration system: self-contained, capillary tube system
- High capacity, factory balanced refrigeration system that maintains cabinet temperatures -10°F (-23.3°C)
- Electronically commutated evaporator and condenser fan motors
- Bottom mounted condensing unit
- Automatic defrost system time-initiated, temperature-terminated
- Cabinet construction: Stainless steel exterior
- Interior - Stainless interior liner with stainless steel floor
- Foamed-in-place high density, polyurethane insulation
- Welded, heavy duty steel frame rail, black powder coated
- Frame rail fitted with leg levelers
- Illuminated exterior sign panel
- Triple pane thermal insulated glass door assemblies. White powder coated frames
- Self-closing doors. Positive seal, torsion type closure system
- Magnetic door gaskets of one-piece construction, removable without tools for ease of cleaning
- Twelve (12) adjustable, heavy duty PVC coated wire shelves
- Four (4) chrome plated shelf clips included per shelf
- Shelf support pilasters made of same material as cabinet interior; shelves are adjustable on 1/2” (13 mm) increments
- LED interior lighting, safety shielded
- Listed under NSF/ANSI Standard 7
- Casters

REFRIGERATOR, UNDERCOUNTER, OUTDOOR

(OBO Component Code CM096)

- Deluxe outdoor rated refrigerator, undercounter, self-contained refrigeration
- 32°F to 50°F temperature range
- (5.3) cu. ft. interior volume
- 304 stainless steel construction
- Adjustable digital thermostat
- Heavy duty adjustable wire shelving
- Interior lighting

- Front venting and sealed back
- Factory installed security lock
- Adjustable legs for leveling
- UL certified for outdoor use

REACH-IN REFRIGERATOR, SINGLE DOOR

(OBO Component Code CM097)

- Solid Door Refrigerator, Reach-in, single-section, 24.96 cubic feet
- Self-contained refrigeration digital thermometer
- (3) chrome plated wire shelves, recessed metal door handle, built-in door locks
- Pressure relief valve, solid hinged half height doors
- ABS interior door liners, stainless steel exterior & interior, stainless steel breaker strips
- Top mounted compressor
- 6" polyurethane casters in lieu of standard legs
- cUL, UL, NSF, ENERGY STAR, 1/3 hp
- Self-contained refrigeration system, standard. All components are mounted to the exterior of the cabinet ceiling
- Accessories:
  Additional chrome plated shelf & clips, for refrigerator/freezer

REACH-IN FREEZER, SINGLE DOOR

(OBO Component Code CM098)

- Solid Door Freezer, Reach-in, single-section, 24.96 cubic feet
- Stainless steel interior and exterior
- Self-contained refrigeration digital thermometer
- (3) chrome plated wire shelves, recessed metal door handle, built-in door locks
- Pressure relief valve, solid hinged half height doors
- ABS interior door liners, stainless steel exterior & interior, stainless steel breaker strips
- Top mounted compressor
- 6" polyurethane casters in lieu of standard legs
- cUL, UL, NSF, ENERGY STAR, 1/2 hp
- Self-contained refrigeration system, standard. All components are mounted to the exterior of the cabinet ceiling
- Accessories:
  Additional chrome plated shelf & clips, for refrigerator/freezer

UNDERCOUNTER REFRIGERATOR

(OBO Component Code CM069)
(OBO Component Code CM109)

- Refrigerator, undercounter, self-contained refrigeration
- 33°F to 42°F temperature range
- (5.3) cu. ft. interior volume, electromechanical thermostat, (2) black vinyl-coated full extension shelves (adjustable) & (1) black-vinyl coated floor rack
- (1) hinged door, interior lighting, front vented, self-evaporating condensate pan
- galvanized back & base, stainless steel top, sides, & interior
- R1/6 HP, ETL-Sanitation, cULus
- Casters, 3-3/4", includes mounting platform (set of 4)
- Accessories:
  Door finish: solid stainless steel
  Right hinged

ICEMAKER, AIR COOLED

(OBO Component Code PL048)

- Capacity – 120 KG
- Stainless steel evaporator and exterior
- Air-cooled or water-cooled condensing unit; air-cooled preferred
- Adequate ventilation must be provided for the condensing unit
- Produces individual ice cubes automatically dispensed into Ice Bin
- Antimicrobial protection
- Mount icemaker on Ice Bin, providing accessories necessary for a seamless fit
- Water Filtration Kit

ICE BIN

- Stainless steel exterior with polyethylene bin liner
- Insulated construction
- Stainless steel legs
- Mount one Ice Maker, on ice bin

ICEMAKER, AIR COOLED, LARGE

(OBO Component Code PL059)

- Capacity – 230 KG
- Stainless steel evaporator and exterior
- Air-cooled or water-cooled condensing unit; air-cooled preferred
- Adequate ventilation must be provided for the condensing unit
- Produces individual ice cubes automatically dispensed into Ice Bin
- Antimicrobial protection
- Mount icemaker on Ice Bin, providing accessories necessary for a seamless fit
- Water Filtration Kit

ICE BIN

- Stainless steel exterior with polyethylene bin liner
- Insulated construction
- Stainless steel legs
- Mount one Ice Maker, on ice bin

ICE WELL

(OBO Component Code CM099)

- Stainless Steel Underbar Ice Bin with Bottle Holders
- Built-In backsplash and drain for easy clean-up
- Heavy commercial use
- 20 gauge, type 304 stainless steel insulated stainless steel construction
- 1" I.D. drain pipe with 1 1/4" connection and 3" tailpiece
- Galvanized legs with adjustable plastic bullet feet
- NSF Listed

ICE BIN, DROP-IN

(OBO Component Code CM115)

- 20 gauge, 304 stainless steel
- 1” NPT drain tubing
- Stainless steel sliding lid
- 23 lb. ice bin capacity

ICE BIN, MOBILE, WITH CASTERS

(OBO Component Code SQ158)

- Stainless Steel Ice Cart, 125 lb. ice capacity
- Insulated stainless steel ice compartment
- Built-in drain and faucet
- Hinged cover
- Extended push handle
- Corner and handle bumpers
- (2) 5" swivel casters and (2) 8" fixed casters

MULTI RANGE, GAS

(OBO Component Code CM018)

- Restaurant Range with open burners
- split cast iron top ring grates
- (6) 33,000 BTU two-piece cast iron open top Startfire burners at left
- 5/8” thick steel griddle plate
- (2) Thermostatically controlled griddle, add per thermostat, for each 12" section

- Grease trough
- (2) standard ovens with 3 position rack guides with oven rack
- 38,000 Btuh/ 11.13 kW cast iron “H” style oven burner
- Porcelain oven interior, fits standard sheet pans in both directions
- Stainless steel front & sides
- Stainless steel plate rail
- Stainless steel backguard, with removable stainless steel shelf
- Samped drip trays w/ dimpled bottom
- 6" adjustable stainless steel legs
- Gas regulator
- 310,000 BTU, CSA Flame, CSA Star, cCSAus, NSF.
- Accessories:
  3/4" Rear gas connection, including "Tee" in manifold, end cap & cover
  Natural Gas Regulator, 3/4" N.P.T.
  Gas Shut-Off Valve, 3/4" N.P.T.
  Gas Flex Hose with quick disconnect includes restraining device, 3/4" N.P.T. x 60" (verify gas connection)
  6” (152mm) levelling swivel casters (4), w/front locking
  Piezo spark ignition for pilots on griddles

LOW PROFILE BACKGUARD/FLUE RISER, STAINLESS STEELMULTI RANGE, ELECTRIC ALTERNATE

(OBO Component Code CM018)

- Restaurant Range with 10” high performance sealed element burners
- (2) standard ovens with 3 position rack guides with oven rack
- Porcelain oven interior, fits standard sheet pans in both directions
- 33 kW, CE, cCSAus, NSF
- Grease trough
- Stainless steel front & sides
- Stainless steel plate rail
- Stainless steel backguard, with removable stainless steel shelf
- Samped drip trays w/ dimpled bottom
- 6" adjustable stainless steel legs
- Accessories:
  6” (152mm) levelling swivel casters (4), w/front locking

FOUR BURNER RANGE, GAS

(OBO Component Code CM060)
(OBO Component Code SQ280)

- Heavy Duty Range with open burners
- (4) 35,000 BTU two-piece Startfire burners, removable heads
- Standard oven, piezo ignition, drip tray, porcelainized oven interior
- Stainless steel front & sides

- 6" chrome steel adjustable legs
- 180,000 BTU, CSA Flame, CSA Star, NSF.
- Accessories:
  3/4" Rear gas connection, including "Tee" in manifold, end cap & cover
  Natural Gas Regulator, 3/4" N.P.T.
  Gas Shut-Off Valve, 3/4" N.P.T.
  Gas Flex Hose with quick disconnect includes restraining device, 3/4" N.P.T. x 60" (verify gas connection)
  Swivel casters with Polyurethane wheels (non-marking)

LOW PROFILE BACKGUARD/FLUE RISER, STAINLESS STEELFOUR BURNER RANGE, ELECTRIC ALTERNATE

(OBO Component Code CM060)
(OBO Component Code SQ280)

- Heavy Duty Range with (2) 18” boiler elements
- 18.5 kW, cCSAus, NSF
- Standard oven, 4-position rack glides, (1) rack
- Stainless steel front & sides
- 6" chrome steel adjustable legs
- Thermostatic controls, 3” H vent riser
- Accessories:
  Swivel casters with Polyurethane wheels (non-marking)

GRIDDLE TOP RANGE, GAS

(OBO Component Code CM062)

- Heavy Duty Range, griddle, thermostatic controls
- 1" (25mm) thick, 99,000 BTU (29 kW) total griddle top
- Standard oven, piezo ignition, drip tray, porcelainized oven interior
- Stainless steel front & sides
- Swivel casters with Polyurethane wheels (non-marking)
- 139,000 BTU, CSA Flame, CSA Star, NSF.
- Accessories:
  3/4" Rear gas connection, including "Tee" in manifold, end cap & cover
  Gas Shut-Off Valve, 3/4" N.P.T.
  Gas Flex Hose with quick disconnect includes restraining device, 3/4" N.P.T. x 60" (verify gas connection)
  Low Profile Backguard/Flue Riser, stainless steel

GRIDDLE TOP RANGE, ELECTRIC ALTERNATE

(OBO Component Code CM062)

- (1) 36” electric griddle

- Thermostatic controls
- Standard oven, 4-position rack glides, (1) rack
- 3” H vent riser
- 21.5 kW, cCSAus, NSF
- Stainless steel front & sides
- Accessories:
  Swivel casters with Polyurethane wheels (non-marking)

FRYER WITH FILTER, GAS

(OBO Component Code CM019)

- One nominal 20 ltr high efficiency fryer, floor model with solid state controllers, melt cycle, stainless steel pot and door, enamel sides batteried together per Drawings with one matching spreader cabinet with stainless steel top and door
- Stainless steel exposed sides on battery
- Four casters for battery, two with brakes
- Self-contained filter system located below fryer for automatic, hands-off filtration
- Two twin size wire baskets for fryer
- Frypot cover
- Electric or gas-fired; gas-fired preferred
- Cord and plug for filter
- Flexible conduit for electric fryer

FOOD WARMER AND HOLDING STATION

(OBO Component Code CM050)

- Stainless steel exposed sides on battery
- Four casters for battery, two with brakes
- Integral fry dump station and rod-style food warmer heat lamp, cord & plug
- stainless steel scoop-type pan

COMMERCIAL MICROWAVE OVEN

(OBO Component Code CM045)

- Stainless Steel Cabinet and Cavity
- Nominal 1200 Watts
- Programmable memory
- Multiple Power Levels
- Interior Oven Light
- See-Through Oven Door
- Touch Control Keypad
- Cord and plug

80 LITER TILTING KETTLE, ELECTRIC

(OBO Component Code CM047)

- Type 304 or equal quality stainless steel construction with stainless steel tubular leg base and adjustable flanged feet
- 2/3 Steam Jacket, with jacket permanently filled with treated, distilled water
- Solid State Controls for Temperature and Low Water Safety
- Tilt Mechanism
- Type 316 or equal quality stainless steel kettle liner for high acid food products
- Spring-assisted, hinged stainless steel cover
- Hot and Cold Water Faucet with Swing Spout
- Electric or gas-fired; gas-fired preferred

DOUBLE CONVECTION OVEN, GAS

(OBO Component Code CM058)

- Convection Oven, gas, double-deck, standard depth
- 66 degree C (150 degree F) to 260 degree C (500 degree F) temperature range and electromechanical timer
- Direct spark ignition with 100% safety shutoff
- 2-speed fan control (high & low) w/3/4HP fan motor
- Total of 60,000 BTU (17.6 kW) loading per oven cavity
- Dependent 60/40 doors with double pane thermal windows in both doors
- Stainless steel front, sides & top, porcelain cavity
- 24" cooking cavity height, with (6) chrome plated oven racks on 13-position rack guides
- Low profile casters with front brakes (set of four)
- UL, cUL, NSF.
- Accessories:
  Direct Connect Vent
  Gas Flex Hose with quick disconnect includes restraining device, 3/4" N.P.T. x 60" (verify gas connection)

DOUBLE CONVECTION OVEN, ELECTRIC ALTERNATE

(OBO Component Code CM058)

- Convection Oven, electric, double-deck, standard depth
- 66 degrees C (150 degrees F) to 260 degrees C (500 degrees F) temperature range and
  electromechanical timer
- 2-speed fan control (high & low) w/3/4HP fan motor
- 20.8 kW UL, cUL, NSF
- Dependent 60/40 doors with double pane thermal windows in both doors
- Stainless steel front, sides & top, porcelain cavity

- 24" cooking cavity height, with (6) chrome plated oven racks on 13-position rack guides
- Low profile casters with front brakes (set of four)
- Accessories:
  Direct Connect Vent

SALAMANDER BROILER, GAS

(OBO Component Code CM067)

- Range mounted on flue riser with high shelf
- (2) 20,000 BTU infrared burners with Hi-Lo valve controls each
- (3) position spring balanced rack assembly
- Removable grease pan
- Stainless steel top, front, sides, backsplash & bottom with heat shields
- Electric or gas-fired; gas-fired preferred

WET-CHEMICALFIRE SUPPRESSION SYSTEM

(OBO Component Code CM037)

- Wet chemical system, actuated in the event of fire, supplied and installed according to codes
- Stainless steel enclosure with cover for agent tank, release and regulator mechanisms, mounted flush against finished ceiling
- Enclosure for system located per Drawings
- Pre-engineered system lines and nozzles to be factory installed by manufacturer of Exhaust Hood
- Piping to hoods shall be above finished ceiling down to hood
- Exposed piping and fittings over the cooking equipment shall be stainless steel or chrome-plated
- System designed for overlapping coverage of all appliances under the hood
- Remote manual actuation device located per Drawings and code
- Locate mechanical gas line shut-off valve beneath hood if gas-fired equipment,
- Pressure switch to shut-off electrical power to any electricity connected to equipment located beneath the hood

EXHAUST HOOD

(OBO Component Code CM038)

- Hood size per Drawings
- Number of hood sections: One
- System to serve equipment below, as indicated on drawings
- 1.27 mm (18 gauge) Type 300 or equal quality polished stainless steel, fully welded airtight construction, with no pop riveting
- Grind and polish welds to blend with adjacent surfaces

- Full access through front removable panels
- Balancing dampers
- Welded exhaust duct collar with connection flange
- Full length adjustable extraction baffles within exhaust plenum
- Light switch located on hood
- Four LED light fixtures wired in conduit to common junction box located on top of hood
- Stainless steel removable enclosure panels from top of hood to underside of ceiling.
- Integral piping for Surface Fire Suppression System
- Hanging brackets
- Refer to elevations and details for additional features and installation information

CONDENSATE HOOD

(OBO Component Code CM006)

- Hood size per Drawings
- Condensation extraction only through internal baffles
- 18 gauge or equal quality polished stainless steel fully welded airtight construction, with no pop riveting
- Grind and polish welds to blend with adjacent surfaces
- Welded exhaust duct collar with connection flange
- Full perimeter condensate channel with drain to Soiled Dishtable/Three Compartment Sink
- Hanging brackets
- Refer to elevations and details for additional requirements

WORKTABLE WITH SINK AND BACKSPLASH

(OBO Component Code CM086)

- 14 gauge type 304 or equal quality stainless steel top with sound deadening, integral stainless steel backsplash, and rolled rim on front and sides
- Table size per Drawings
- 18 gauge or equal quality stainless steel undershelf with turned down edges
- Integral stainless steel one piece deep drawn sink bowl, with swing spout, aerator, and lever waste with overflow
- Stainless steel tubular legs with full cross bracing and adjustable feet
- Grind and polish welds to blend with adjacent surfaces
- Refer to elevations and details for additional requirements]

CHEF'S COUNTER W/ SINK & OVERSHELF

(OBO Component Code CM051)
(OBO Component Code CM061)

- Custom counter per Drawings
- 16 gauge or equal quality stainless steel top
- 22 gauge or equal quality stainless steel back, left and right ends
- 22 gauge or equal quality stainless steel bottom and intermediate shelves with turned down edges
- Integral stainless steel one piece deep drawn sink bowl, with swing spout, aerator, and lever waste with overflow
- Round stainless steel adjustable legs
- Hot Food Wells to accommodate three standard rectangular pans
- Hot Food Well drains manifolded to gate valve
- Individual infinite temperature control for each Hot Food Well
- Integral section of counter shall have +2 degree C refrigerated base with one solid stainless steel door, hinged per Drawings, and raised rail with refrigerated opening sized for multiple ingredient pans
- Provide adequate ventilation for condensing unit
- Stainless steel removable lid over opening in raised rail
- Solid stainless steel access door in front of sink
- Single 18 gauge or equal quality stainless steel overshelf spanning counter, with enlarged section at Microwave Oven
- Rectangular Heat Lamp mounted under overshelf above Hot Food Wells
- Mount infinite control switch for heat lamp on chef's side of counter, with wiring from heat lamp run through overshelf upright
- One convenience tombstone with multiple receptacles mounted on countertop
- Delete backsplash, provide 900 turndown
- Grind and polish welds to blend with adjacent surfaces
- Refer to elevations and details for additional requirements

CHEF'S COUNTER W/ SINK & OVERSHELF, SMALL

(OBO Component Code CM107)

- Custom counter per Drawings
- 16 gauge or equal quality stainless steel top
- 22 gauge or equal quality stainless steel back, left and right ends
- 22 gauge or equal quality stainless steel bottom and intermediate shelves with turned down edges
- Integral stainless steel one piece deep drawn sink bowl, with swing spout, aerator, and lever waste with overflow
- Round stainless steel adjustable legs
- Integral section of counter shall have +2 degree C refrigerated base with one solid stainless steel door, hinged per Drawings, and raised rail with refrigerated opening sized for multiple ingredient pans
- Provide adequate ventilation for condensing unit
- Stainless steel removable lid over opening in raised rail
- Solid stainless steel access door in front of sink

- Single 18 gauge or equal quality stainless steel overshelf spanning counter, with enlarged section at Microwave Oven, Item B36
- One convenience tombstone with multiple receptacles mounted on countertop
- Delete backsplash, provide 900 turndown
- Grind and polish welds to blend with adjacent surfaces
- Refer to elevations and details for additional requirements

COUNTER WITH BACKSPLASH

(OBO Component Code CM074)

- Custom counter per Drawings
- 14 gauge type 304 or equal quality stainless steel top with 5"H backsplash and sound deadening and rolled rim on all edges
- 22 gauge or equal quality stainless steel bottom and intermediate shelves with turned down edges
- Round stainless steel adjustable legs
- Grind and polish welds to blend with adjacent surfaces
- Refer to elevations and details for additional requirement

CONVERTIBLE HOT/COLD PAN, 3 PAN

(OBO Component Code CM023)

- Stainless steel construction to accommodate three standard rectangular pans
- One-piece pan sloped or creased to drain
- Remote control panel with 3-way hot/cold/off power switch and thermostat for hot operation
- Provide adequate ventilation for condensing unit
- Mount in Service Counter, with controls mounted on counter face at chef’s side
- Coordinate installation with millwork
- Refer to elevations and details for additional requirements

CONVERTIBLE HOT/COLD PAN, 2 PAN

(OBO Component Code CM024)

- Stainless steel construction to accommodate two standard rectangular pans
- One-piece pan sloped or creased to drain
- Remote control panel with 3-way hot/cold/off power switch and thermostat for hot operation
- Provide adequate ventilation for condensing unit
- Mount in Service Counter, with controls mounted under island behind an access panel
- Coordinate installation with millwork

- Refer to elevations and details for additional requirements

ROUND HOT FOOD WELL

(OBO Component Code CM049)

- Food Warmer, top-mount, built-in, electric, for 11-quart round insert, drain, wet/dry operation, thermostatic control, fully insulated, stainless steel construction, UL, cULus, NSF
- Controls mounted under island behind an access panel
- Coordinate installation with millwork
- Refer to elevations and details for additional requirements

SLICER

(OBO Component Code CM007)

- Angle-feed 2-speed manual slicer with automatic carriage and adjustable low fence
- Stainless steel knife
- Top mounted stone sharpener
- Food Chute
- Cord and plug

MIXER

(OBO Component Code CM008)

- Tabletop planetary mixer
- Heavy duty motor
- Nominal 19 Ltr Capacity Bowl with appropriately sized beater and wire whip
- Three fixed speeds, plus stir speed
- 15-Minute Timer
- Automatic Time Recall
- Swing-Out Bowl
- Attachment Hub to accommodate future accessories
- Open Base
- Stainless Steel Bowl Guard
- Cord and plug

MOBILE EQUIPMENT STAND

(OBO Component Code CM009)

- Sized to accommodate both Slicer, and Mixer
- 14 gauge type 304 or equal quality stainless steel top with sound deadening
- 18 gauge or equal quality stainless steel undershelf
- Stainless steel tubular legs

- Four swivel rubber casters, two with brakes
- Grind and polish welds to blend with adjacent surfaces

MOBILE WORKTABLE WITH BACKSPLASH

(OBO Component Code CM010)
(OBO Component Code CM012)

- Sized per Drawings
- 14 gauge type 304 or equal quality stainless steel top with 5"H backsplash and sound deadening and rolled rim on all edges
- 18 gauge or equal quality stainless steel undershelf with turned down edges
- Stainless steel tubular legs
- Four swivel rubber casters, two with brakes
- Grind and polish welds to blend with adjacent surfaces

MOBILE WORKTABLE WITHOUT BACKSPLASH

(OBO Component Code CM011)
(OBO Component Code CM100)

- Sized per Drawings
- 14 gauge type 304 or equal quality stainless steel top with sound deadening and rolled rim on all edges
- 18 gauge or equal quality stainless steel undershelf with turned down edges
- Stainless steel tubular legs
- Four swivel rubber casters, two with brakes
- Grind and polish welds to blend with adjacent surfaces

MOBILE WORKTABLE

(OBO Component Code CM063)

- 14 gauge type 304 or equal quality stainless steel top with sound deadening, integral stainless steel backsplash, and rolled rim on all edges
- Table size per Drawings
- 18 gauge or equal quality stainless steel undershelf with turned down edges
- Stainless steel tubular legs with full cross bracing
- Four swivel rubber casters, two with brakes
- Grind and polish welds to blend with adjacent surfaces
- Refer to elevations and details for additional requirements

TOASTER

(OBO Component Code CM025)

- Stainless steel construction with stainless steel conveyor

- High product entry opening
- Sized to accommodate population
- Cord and plug

HOT CUP/ CONDIMENT DISPENSER

(OBO Component Code CM029)

- Stainless steel countertop cabinet to horizontally hold three adjustable cup dispensers of varying diameters and three adjacent compartments for lids and stirrers

COFFEE DISPENSER

(OBO Component Code CM030)

- Matches Coffee Brewer, with brew through lid
- Thermal insulation to maintain coffee temperature for multiple hours

COFFEE BREWER

(OBO Component Code PL050)

- Automatic brewing directly into Coffee Dispenser
- Single dispenser capacity
- Hot Water dispensing faucet
- Sized to accommodate population

COFFEE BREWER, TWIN

(OBO Component Code PL054)

- Automatic brewing directly into Coffee Dispenser
- Dual dispenser capacity
- Hot Water dispensing faucet
- Sized to accommodate population

WATER FILTER, DOUBLE

(OBO Component Code PL051)

- Water Filtration System, twin configuration.
- Rated NSF Class 1, STD 42, for taste, odor and chlorine reduction
- Mechanical filtration (99.9+% removal of particles 1/2 micron and larger in size.)
- Also takes out cysts with sub-micron filtration.
- Max. Flow Rate: 4 gpm, Working Pressure: 10 – 125 psi, Temperature: 35 – 100°F, Capacity: 42,000 gal

WATER FILTER

(OBO Component Code PL052)

- Water Filtration System, single configuration.
- Rated NSF Class 1, STD 42, for taste, odor and chlorine reduction
- Mechanical filtration (99.9+% removal of particles 1/2 micron and larger in size.)
- Also takes out cysts with sub-micron filtration.
- Max. Flow Rate: 2 gpm, Working Pressure: 10 – 125 psi, Temperature: 35 – 100°F, Capacity: 21,000 gal

JUICE DISPENSER

(OBO Component Code CM059)

- 4-Flavor Cold Beverage System, (3) 12 oz. drinks/min capacity
- 2-modular quick dispense decks with 1.0 to 1.5oz (29.6 to 44.4ml) per second flow rate
- 18 lb. ice bank capacity
- 7" cup clearance
- Pumps & mixes 2+1 to 11+1 concentrated beverages, 4+1 high viscosity & 5+1 juices, dispenses cold water, frozen and ambient products
- Push button and portion control, cold water dispense, door lock, juice display
- 120v/60/1-ph, 6amps, NEMA 5-15P, NSF, ETL.

DRAINBOARD

(OBO Component Code CM071)
(OBO Component Code CM072)

- Underbar Drainboard, embossed stainless steel top, Stainless steel drain socket
- 6"H backsplash, 6" rear deck
- Stainless steel legs with adjustable thermoplastic feet
- Stainless steel construction, NSF

BLENDER

(OBO Component Code CM073)

- High Performance Blender
- Two speed motor
- 64 oz. capacity, stackable polycarbonate container
- Variable timer, jump cycle, pulse switch, auto shutoff
- Jar pad sensor
- Stainless steel blades, 3 Hp, cULus, NSF

ESPRESSO MACHINE

(OBO Component Code CM116)

- Two group automatic espresso machine 60 hertz, 220-240V, 4,700 watts
- Stainless steel construction with top storage area for espresso cups
- Minimum four programmable settings per group head with continuous flow option
- Hot water outlet and two steam wands
- Minimum 3.25 gallon stainless steel heat exchange boiler
- Steam and pressure gauges
- (1) single portafilter and (2) double portafilters
- 1/2" water connection, hardwired, ETL US & Canada, NSF listed

PASTRY CASE

(OBO Component Code CM117)

- Three tier acrylic bakery display case
- Slanted front with rear door for full attendant service
- Three clear acrylic trays

DOUBLE SIDED BREATH PROTECTOR

(OBO Component Code CM032)

- Custom food shield per elevations and details
- Tubular construction with finish as selected by Project Director/COR
- Adjustable front tempered glass panel
- Fixed tempered glass panel on top of each side with lights and slimline heat lamps below
- Matching end panels as required by code
- Mounted on Service Island
- Wiring for lights and heat lamps to run through protector case upright to manufacturer-provided switches mounted under counter behind access panels
- Coordinate installation with millwork
- Refer to elevations and details for additional requirements

BREATH PROTECTOR

(OBO Component Code CM033)

- Custom food shield per elevations and details
- Tubular construction with finish as selected by Project Director/COR
- Adjustable front tempered glass panel
- Fixed tempered glass panel on top to form pass shelf with lights and slimline heat lamps below
- Mounted on Service Counter

- Wiring for lights and heat lamps to run through protector case upright to manufacturer-provided switches mounted on counter face on chef's side
- Coordinate installation with millwork
- Refer to elevations and details for additional requirements

BREATH PROTECTOR, SNEEZEGUARD

(OBO Component Code CM118)

- Custom food shield per elevations and details
- Tubular construction with finish as selected by Project Director/COR
- Fixed tempered glass front and end panel
- Open on top
- Mounted on Servery Counter
- Coordinate installation with millwork
- Refer to elevations and details for additional requirements

C. OFOI Equipment Types: Please refer to the SRP-Ms for coordination of food service equipment which will be furnished and installed by others in accordance with the SRP-M Schedules on the Project Documents.

END OF SECTION 114000

SECTION 115355 – CLASS I BIOLOGICAL SAFETY CABINETS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Class I Biological Safety Cabinets.

B. Related Sections include the following:

1. Section 133435 “Mail Screening Facilities” for location and coordination of cabinet installation.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings.

C. Installation Instructions.

D. Operations and Maintenance Manual.

1.3 QUALITY ASSURANCE

A. Safety Glass: Products complying with testing requirements in 16 CFR 1201 for Category II materials.

1. Subject to compliance with requirements, permanently mark safety glass with certification label of Safety Glazing Certification Council or another certification agency acceptable to Project Director/COR based on input from OBO/PDCS/DE.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.4 DELIVERY

A. Protect finished surfaces during handling and installation with protective covering of polyethylene film or other suitable material.

1.5 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install Class I Biological Safety Cabinet until mail screening facility is enclosed, utility roughing-in is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis of Design: Subject to compliance with requirements, provide units which are comparable to the following:

1. Purifier Class I Safety Enclosure, model number 3980323, as manufactured by Labconco Corporation.

2.2 CLASS I BIOLOGICAL SAFETY CABINETS

A. Purifier Class I Safety Enclosure designed for work with agents that require Biosafety Level 1, 2 or 3 containment, but no product protection. Provide with the following specifications and features:

1. Size: approximately 0.9m wide x 0.7m deep x 0.9m high.
2. Sash Opening: 0.2m.
3. Tempered safety glass sides
4. Angled pivoting sash with prop bar - hinged
5. Electrical Specification: 230 volts, 50 Hz, 1.5 amps, International. (Match local power, voltage phase, and frequency)
6. Power Cord & Plug: 230 volts, 10 amps, no plug.
7. Exhaust Volume: 165-230 CFM.
8. Nominal inflow velocity of 90 fpm
9. HEPA filter rated 99.99% efficient on 0.3 micron particles
10. Airflow alarm
11. Two-light filter condition indicator, with audible alarm.
12. Spring-loaded filter clamps
13. Variable speed motor/blower with solid state control rated for 10 amps
14. Blower switch
15. Aerodynamic air foil
16. Protective upper panel/baffle
17. Utility ports with plugs
18. Lighting: Fluorescent lights and 254nm UV light
19. 3-way light switch: UV, off, and fluorescent
20. Epoxy-coated steel and aluminum construction.
21. 100 percent exhaust canopy connection with 150 mm (6 inch) diameter exhaust collar (Manufacturer's PVC or stainless steel through-wall ducting)

22. Exhaust duct out of building with weather protection
23. One spare HEPA filter.
24. Maintenance manual and illustrated parts breakdown

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of Safety Cabinets.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. See Section 133435 “Mail Screening Facilities” for installation at the walls of those facilities.

B. Comply with requirements in Division 26 Sections for installing electrical devices and wiring. Securely anchor conduit to Safety Cabinets, unless otherwise indicated.

3.3 ADJUSTING AND CLEANING

A. Adjust moving parts for smooth, near silent, accurate sash operation with one hand. Adjust sashes for uniform contact of rubber bumpers. Verify that counterbalances operate without interference.

B. Clean finished surfaces, including both sides of glass; touch up as required; as accepted by Project Director/COR.

END OF SECTION 115355

SECTION 115700 – SHOP EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes shop equipment and accessories for Facility Management Shops and Vehicle Maintenance Bays as identified in Construction Drawings.

B. Related Sections include the following:

1. Division 03 Section on “Cast-in-Place Concrete” for rough-in interface as required for equipment.
2. Division 10 Section on “Metal Storage Shelving” for metal shelving, cabinets, and racks associated with shop spaces.
3. Division 10 Section on mobile storage shelving for high density rolling shelving.
4. Division 10 Section on “Safety Storage Cabinets” for special cabinets used to store small quantities of flammable or similar material.
5. Division 12 Section on “Work Benches” for benches associated with shop spaces.
6. Division 14 Section on “Vehicle Lifts.”
7. Division 22 Sections related to plumbing system for piping, connections, and other plumbing materials required to complete shop equipment installation.
8. Division 22 or 11 Sections related to general-service compressed-air systems, including air compressors and compressed-air piping that serves both Vehicle Maintenance Bays and selective Shop spaces.
9. Division 22 Sections on washing machine outlet box.
10. Division 23 Sections related to general HVAC system, including for ventilation, required to complete shop equipment installation.
11. Division 26 Sections for electrical system for connections to wiring between starters, disconnects, wall receptacles, and other electrical materials required to complete shop equipment installation.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer’s product information, specifications, and installation instructions for each item of equipment furnished. Confirm power compatibility as indicated.

B. Rough-In Drawings: Provide rough-in drawings for mechanical and electrical services.

C. Shop Drawings: Provide drawings showing, in large scale, methods of construction, joining, dimensions, materials, thicknesses, finishes of materials, installation, relation to adjoining work, and all other details to fully illustrate the work.

D. Connection Drawings: Submit complete and coordinated set of documents for plumbing, mechanical, and electrical connection information.

1. Indicate connections to power for all electrical-based equipment listed within this Section and Division 14 Section on “Vehicle Lifts”.
2. Coordinate air compressors and accessories, and compressed air system piping and related specialties with Division 22 Section related to general-service compressed-air systems.

E. Operations and Maintenance Manuals: Provide manufacturer’s maintenance and operation manuals for each piece of equipment listed within this section. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include product schedule for each equipment item with the following data:

1. Designation indicated on Drawings.
2. Manufacturer’s name and model number.
3. Voltage/Phase/Frequency (Hz).
4. List of factory-authorized service agencies, including addresses and telephone numbers.
5. Manufacturer recommended spare parts list.

1.3 QUALITY ASSURANCE

A. Single Subcontractor Responsibility: The work of this Section shall be the responsibility of one subcontractor.

B. Materials and equipment shall be standard products of manufacturer regularly engaged in manufacture of products that are of similar material, design, function, and workmanship.

C. UL Certification: Provide electric and fuel-burning equipment and components that are evaluated by UL for fire, electric shock, and casualty hazards according to applicable safety standards, and that are UL certified for compliance and labeled for intended use.

D. Occupational Safety and Health Act (OSHA): The intent is for shop equipment to conform closely with OSHA requirements. Variations from OSHA requirements shall be limited in extent and degree.

E. Pre-installation Conference: Conduct conference at Project site.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Equipment delivered and placed in storage shall be stored with protection from weather, humidity, temperature variation, dirt and dust, or other contaminants.

B. Prior to shipping from factory each item of shop equipment shall bear identification with manufacturer's name and model number. For major equipment, refer to identification requirements in Part 3 of this Section.

C. Protect machines, tools, parts, and similar components damage due to handling or exposure. Lubricate machine parts, and coat exposed surfaces with thin layer of oil.

D. Take adequate precautions to prevent damage to small tools, parts, and similar items due to oxidation. Coat machined surfaces of small parts or similar components with suitable lubricant.

1.5 COORDINATION

A. Coordinate shop equipment layout and installation with other work, including layout and installation of lighting fixtures, HVAC equipment, electrical, plumbing, and air compressor distribution system and fire-suppression system components.

B. Coordinate locations and requirements of utility service connections.

C. Coordinate sizes, locations, and requirements of the following:

1. Overhead equipment supports.
2. Equipment bases.
3. Floor depressions.
4. Floor areas with positive slopes to drains.
5. Floor-mounted sinks.
6. Roof curbs, equipment supports, and penetrations.
7. Compressed air connections.
8. Voltage/Phase/Frequency (Hz).

1.6 EXTRA MATERIALS

A. Furnish general extra materials identified in this Article, and those identified with specific equipment in Part 2 of this Section. Package each with protective covering for storage, and identify with labels describing contents and identifying associated equipment as applicable.

1. Lubricants: Three sets of lubrication data for each machine. Identify type of lubricant used and frequency of application. Tape one set to associated machine, and deliver other two sets to Project Director/COR.
2. Compressed Air Hose Accessories: One set each of the following for each air hose and reel:

   a. End-barbed style European air chuck.
   b. Serrated shank for 6.35mm (1/4") I.D. hose.
   c. Inflator hose assembly with open-end female style European air chuck; 1.5M (60") long.
   d. Male brass connectors for 6.35mm ((1/4") I.D. (19 BSP) hose; includes European air chuck.
   e. Air Gun Kit, Pistol Grip. Basis of Design; Speedaire Model 22YK43. Inlet size of 6.35mm (1/4 inch) (F)NPT. Outlet size of M14 x 25.4mm (1 inch) (F)NPT. Air consumption of 8 scfm.

3. Plugs with Cords:

a. Basis of Design: Hubbell HBL5466C.
b. Provide one 20 A and one 15 A cord plug cap for each duplex receptacle.
c. Provide two for each quadruplex receptacle installed shop spaces.
d. Plug caps shall be of grounding types, utilizing only screw terminals for terminating conductors.
e. Tape one set to machine, and deliver other two to Project Director/COR.

PART 2 - PRODUCTS

2.1 SAFEGUARD FEATURES

A. General:

1. Provide equipment with safeguard features consistent with Occupational Safety and Health Act (OSHA) Standards - 29 CFR.

a. Guards: Provide belt guards, eye shield guards at wheels of grinders, guards at front of drill press spindles, finger guards at printing presses, finger guard at cutters, and finger guard at shears. There shall be no exposed set screws or keys on moving parts. Belt gear and chain drives on machines shall be completely enclosed in manner consistent with OSHA requirements.

B. Circular Saw: Circular saws shall be provided with saw guard. Saw guards shall:

1. Include kick back attachment.
2. Be fully adjustable over saw blade so as not to hinder any operations performed, except for dadoing or routing on circular saw.
3. Be capable of acting as hold down device and capable of providing horizontal pressure against rip fence.
4. Be completely installed on circular saws with all necessary brackets, and with locating holes drilled and tapped in saw table.

C. Grinder Wheels: Grinder wheels shall:

1. Be fully enclosed at both sides and around circumference, except at front tool rest. Enclosure shall either use manufactured cast iron casing or use fabrication of 2.7 mm (No. 12 USS gage) sheet steel properly formed, either riveted or welded together to suit conditions. Securely bolt enclosure to machine frame. Provide guard with hinged-and-latched or removable side piece at spindle end; fasten with self-tapping screws set into double thickness of metal in manner to facilitate easy removal or replacement of grinding wheel.
2. Be provided with shatter-proof glass (not wire glass) eye shield, 127 x 1778 mm (5 x 7 inch) size, in metal frame with adjustable bracket arm. Arm shall be long enough to locate eye shield directly in front of grinding wheel face. Securely fasten arm to machine frame.

D. Lockup Devices: For equipment operated by foot treadle, provide lockup device. Device shall:

1. Consist of proper length of steel machine chain No. 3, welded straight link.
2. Include cast bronze padlock, 38 mm (1-1/2 inch) size, keyed for use with size No. 47 key. Deliver two keys with each lock.
3. Have padlock and chain securely fastened to each other and to machine by riveted fastenings in such location and arrangement that operating lever or treadle can be securely locked in place when equipment is not in use.
4. Be furnished for squaring shears, paper cutters, and similar machines.

E. Chuck Keys: Where equipment requires chuck keys, they shall be safety type self-ejecting in lieu of standard chuck keys.

2.2 AIR HOSE REEL (COMPRESSED AIR) (OBO COMPONENT CODE SQ031):

A. Basis-of-Design Product: LINCOLN Model 83753 or equivalent product.

B. Minimum Characteristics:

1. Reel Type: Spring driven, automatic rewind with ratchet mechanism (eight locking positions per revolution).
2. Connectors: Brass.
3. Length: 15 m (50 feet) 9.5 mm (3/8”) hose.
4. Incoming air connection: 6.35 mm (¼”) NPT.
5. Hose connections: Male at 6.35 mm (¼”) NPT.
6. Maximum Pressure: 2,068 kPa (300 psi).
7. Maximum Air Flow: 11.8 lps (25 cfm).

2.3 POWER CORD REEL (OBO COMPONENT CODE SQ030):

A. Basis-of-Design Product: Subject to compliance with requirements, provide REELCRAFT model no. L5550 123 X 1 or equivalent product.

B. Power cord reel characteristics and specifications shall be the following (at a minimum):

1. Reel Type: Spring driven, automatic rewind with ratchet mechanism (eight locking positions per revolution).
2. Length: 15 m (50 Feet) cord.

2.4 ADJUSTABLE CLAMP (OBO COMPONENT CODE SQ087):

A. Basis-of-Design Product: Subject to compliance with requirements, provide BESSEY TOOLS model no. BV-HD60 or equivalent product.

B. Adjustable clamp characteristics and specifications shall be the following (at a minimum):

1. Material: Forged alloy steel.
2. Spin Handle: Long length, alloy steel.
3. Base: 360 degree swivel base with two locking handles, alloy steel.
4. Jaws: 152 mm (6 inches) width and opening, serrated.
5. Throat Depth: 75 mm (3 inches).

C. Adjustable clamp shall comply with the following standards:

1. ISO 14001, "Environmental Management System."
2. ISO 9001, "Quality Management Systems – Requirements."

2.5 UTILITY SINK – WITH FAUCET (OBO COMPONENT CODE PL020):

A. Basis-of-Design Product: Product: Subject to compliance with requirements, provide MUSTEE model no. 1RLN8 or equivalent product.

B. Conform to ANSI 124.6. Utility sink and faucet characteristics and specifications shall be the following (at a minimum):

1. Bowl:

a. Color: White.
b. Shape: Square.
c. Size: 609 mm (24 inches) length x 508 mm (20 inches) width x 863 mm (34 inches) height.
d. Bowl Depth: 330 mm (13 inches).
e. Drain Opening: 38 mm (1 ½ inch).

2. Faucet:

a. Color/Finish: Chrome.
b. Operation: Dual handle (lever).
c. Mounting Centers: 100 mm (4 inches).
d. Holes: Two.
e. Flow Rate: 8.33 lpm (2.2 gpm).

2.6 DRILL PRESS – FLOOR (WOOD) (OBO COMPONENT CODE SQ017):

A. Basis-of-Design Product: Subject to compliance with requirements, provide JET model no. J-2550 or equivalent product.

B. Drill press characteristics and specifications shall be the following (at a minimum):

1. Drill Length: 508 mm (20 inches).
2. Motor Size: 1 hp.
3. Motor Speed: 220 – 2,450 rpm (variable speed).

4. Table Surface Dimensions: 457 mm (18 inches) length x 406 mm (16 inches) width.
5. Quill Diameter: 75 mm (3 inches).
6. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. One drill bit set (woodworking); minimum 6 mm, 12 mm, and 18 mm diameters.
2. Safety type self-ejecting chuck key in lieu of standard key.
3. One dust collector connector.

2.7 JOINTER – CLOSED STAND (OBO COMPONENT CODE SQ023):

A. Basis-of-Design Product: Subject to compliance with requirements, provide JET model no. JWJ-8CS (718200K) or equivalent product.

B. Jointer characteristics and specifications shall be the following (at a minimum):

1. Cutting Capacity: 203 mm (8 inches) width x 12.7 mm (1/2 inch) depth.
2. Motor Size: 2 hp.
3. Motor Speed: 5,500 rpm (cutting).
4. Number of Knives: 3.
5. Knife Size: 203 mm (8 inches) length x 17.4 mm (11/16 inch) width x 3.17 mm (1/8 inch) height.
6. Table Surface: 229 mm (9 inches) width x 1.83 m (72 inches) length.
7. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. One cutter head.
2. One set of three high speed steel knives.
3. One magnetic type knife setting jig.
4. One dust collector connector.

2.8 PLANER – WOODWORKING (OBO COMPONENT CODE SQ022):

A. Basis-of-Design Product: Subject to compliance with requirements, provide JET model no. JPM-13CS or equivalent product.

B. Planer characteristics and specifications shall be the following (at a minimum):

1. Cutting Capacity: 330 mm (13 inches) width x 5 mm to 156 mm thickness x 1.59 mm (1/16 inch) depth.
2. Motor Speed: 4,500 rpm (cutting).
3. Voltage and Phase: Conform to host country electrical standards,

C. Extra Materials:

1. Two replacement drive belts.
2. Two sets of three high speed planer knives.
3. One shaving hood with dust collector connector.
4. One bed and feed roll gauge.
5. One cutterhead gauge.
6. One knife grinding attachment, with indexing mechanism.

2.9 BAND SAW – VERTICAL (OBO COMPONENT CODE SQ018):

A. Basis-of-Design Product: Subject to compliance with requirements, provide JET model no. JWBS-14CS or equivalent product.

B. Band saw shall meet the following characteristics and specifications (at a minimum):

1. Blade Length: 2.37m (93.5 inches).
2. Cutting Capacity: 152 mm (6 inches) x 343 mm (13.5 inches).
3. Motor Size: 3/4 hp.
4. Blade Speed: 3,000 rpm.
5. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. One auto miter gage with 60-degree swing both right and left.
2. One rip fence complete with guide bars.
3. One dust collector connector.
4. Five of each of the following new blades to fit machine; these standard blades shall be of required length to fit band saw supplied:

a. 1/4" blade, 5 teeth/inch.
b. 3/8" blade, 5 teeth/inch.
c. 1/2" blade, 4 teeth/inch.
d. 1/4" Skip tooth Blade, 4 teeth/inch.
e. 3/8" Skip tooth Blade, 4 teeth/inch.
f. 1/2" Skip tooth Blade, 4 teeth/inch.

2.10 DUST COLLECTOR – CYCLONIC (OBO COMPONENT CODE SQ019):

A. Basis-of-Design Product: Subject to compliance with requirements, provide ONEDIA model no. Dust Gorilla Pro XGK050055 or equivalent product.

B. Dust collector shall meet the following characteristics and specifications (at a minimum):

1. Motor Size: 5 hp.
2. Airflow Capacity: **[1,625 cfm (designer shall confirm based on project specific equipment)]**.
3. Dust Bin: One 200 L (55 gallon) drum with liner and dolly (portable).
4. Pre-filter: HEPA Grade ePTFE Media (E12 minimum efficiency rating).

5. Stand: Leg extensions shall accommodate 200 L (55 gallon) drum.

C. Dust collector shall be complete, adjusted and ready for use and equipped with the following accessories for equipment connections (at a minimum):

1. One cabinet saw connector and quick disconnect.
2. One jointer connector and quick disconnect.
3. One band saw connector and quick disconnect.
4. One panel saw connector and quick disconnect.
5. One planer connector and quick disconnect.
6. One drill press connector and quick disconnect.

D. Motor for Dust Collector shall have TEFC enclosure and shall be designed to operate on local electrical requirements. Unit shall be fitted with 1800 mm (6 feet) long heavy duty, four conductor (one grounding) cord set and twist-lock plug to match the receptacle. Dust Collector shall be approved for Class II, Division 1, Group G locations as per Article 502 of NFPA 70.

E. Provide in convenient location on Dust Collector a magnetic starter wired to motor with approved materials.

F. Dust collector shall be exhausted to the exterior in accordance to ACGIH Ventilation manual.

G. Extra Materials:

1. One HEPA Grade ePTFE Media (MERV 16+ rated).
2. Three 200 L (55 gallon) plastic bag liners for dust bin.

2.11 CABINET SAW (OBO COMPONENT CODE SQ024):

A. Basis-of-Design Product: Subject to compliance with requirements, provide POWERMATIC model no. PM2000B (kit no. PM25130K) or equivalent product.

B. Cabinet saw shall meet the following characteristics and specifications (at a minimum):

1. Blade Size: 254 mm (10 inches).
2. Table Surface: 1.06 m (42 inches) x 775 mm (30.5 inches) inclusing extension table. Include 762 mm (30 inches) rail set.
3. Motor Size: 5 hp.
4. Motor Speed: 3,450 rpm.
5. Blade Tilt: 0-45 degrees; left.
6. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. One 12", 72 tooth carbide tipped blade (trim cut with grain).
2. One 12", 80 tooth carbide tipped blade (trim cut across grain).
3. One 12", 50 tooth carbide tipped blade (combination).
4. One 12", 50 tooth steel combination blade.
5. One dust collector connector

D. Provide a blade safety guard to fit the saw supplied. Safety guard shall comply with OSHA Regulations, Sections 1910-213-C and 1910-213-D.

2.12 PANEL SAW (OBO COMPONENT CODE SQ020):

A. Basis-of-Design Product: Subject to compliance with requirements, provide SAFETY SPEED model no. 7400 or equivalent product.

B. Panel saw shall meet the following characteristics and specifications (at a minimum):

1. Blade Size: 210 mm (8.25 inches).
2. Cutting Capacity: 1.27 m (50 inches).
3. Surface Dimensions: 1.78 m (70 inches) x 1.52 mm (60 inches).
4. Motor Size: 3 hp.
5. Motor Speed: 5,800 rpm.
6. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. Three 210 mm (8.25 inch) saw blades.
2. One dust collector connector.

D. Provide a blade safety guard to fit saw supplied. Safety guard shall comply with OSHA Regulations, Sections 1910-213-C and 1910-213-D.

2.13 BELT/DISC SANDER (OBO COMPONENT CODE SQ298):

A. Basis-of-Design Product: Subject to compliance with requirements, provide POWERMATIC model no. 1791291K or equivalent product.

B. Belt/Disc sander shall meet the following characteristics and specifications (at a minimum):

1. Belt Size: 153 mm (6 inches) x 1.22 m (48 inches).
2. Disc Size: 305 mm (12 inches).
3. Tilt: 0, 45, 90 degrees.
4. Motor Size: 1.5 hp.
5. Motor Speed: 2,375 rpm (disc) and 2410 srpm (belt).
6. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. Three fine sanding belts.
2. Three coarse sanding belts.
3. Three fine sanding discs.
4. Three coarse sanding discs.
5. One dust collector connector.

2.14 TIRE CHANGER (OBO COMPONENT CODE SQ026):

A. Basis-of-Design Product: Subject to compliance with requirements, provide COATS model no. 60XA or equivalent product.

B. Tire changer shall conform to the following characteristics and specifications (at a minimum):

1. Wheel Size: 610 mm (24 inches) min.
2. Tire Size: 356 mm (14 inches) width x 1.27 m (50 inches) diameter.
3. Motor Type: compressed air at 1.21 MPa (175 psi) / electric.
4. Motor Size: 1.5 hp min.

2.15 TIRE BALANCER (OBO COMPONENT CODE SQ028):

A. Basis-of-Design Product: Subject to compliance with requirements, provide COATS model no. 1300 or equivalent product.

B. Tire balancer shall conform to the following characteristics and specifications (at a minimum):

1. Balancing Modes: 8.
2. Tire Size: 508 mm (20 inches) width x 1.12 m (44 inches) diameter.
3. Motor Type: Electric.
4. Motor Size: 1.5 hp min.
5. Voltage and Phase: Conform to host country electrical standards.

2.16 TIRE RACK (OBO COMPONENT CODE SQ027):

A. Basis-of-Design Product: Subject to compliance with requirements, provide EDSAL model no. TRWS7218 or equivalent product.

B. Tire rack shall conform to the following characteristics and specifications (at a minimum):

1. Dimensions: 1.83 m (72 inches) width x 1.83 m (72 inches) height x 457 mm (18 inches) depth.
2. Material: Heavy-duty steel.

2.17 YOKE PIPE VISE – PORTABLE (OBO COMPONENT CODE SQ096):

A. Basis-of-Design Product: Subject to compliance with requirements, provide RIDGID model no. 40A or equivalent product.

B. Yoke pipe vise characteristics and specifications shall meet the following (at a minimum):

1. Type: Pipe Chain Vise.
2. Pipe Capacity: 3 mm (1/8 inch) to 60 mm (2.5 inches).
3. Integrated ground lug.
4. Rugged tool tray.

2.18 PIPE CUTTER (SH004 PLUMBING AND APPLIANCE REPAIR):

A. Basis-of-Design Product: Subject to compliance with requirements, provide RIDGID model no. 32820-2A or equivalent product.

B. Pipe cutter characteristics and specifications shall meet the following (at a minimum):

1. Cutter Style: Heavy duty pipe.
2. Pipe Capacity: 3 mm (1/8 inch) to 50 mm (2 inches).

C. Extra Materials:

1. Three replacement blades.

2.19 PIPE THREADING MACHINE (OBO COMPONENT CODE SQ098):

A. Basis-of-Design Product: Subject to compliance with requirements, provide RIDGID model no. 1224 or equivalent product.

B. Pipe threading machine characteristics and specifications shall meet be the following (at a minimum):

1. Motor Size: 1.3 hp (universal).
2. Motor Control: Heavy-duty FOR/OFF/REV switch with integral foot switch.
3. Spindle Speed: 36 / 12 rpm (standard).
4. Pipe Capacity: 3 mm (1/8 inch) to 102 mm (4 inches).
5. Bolt Capacity: 6 mm (1/4 inch) to 50 mm (2 inches).
6. Chuck Type: Auto / Hammer.
7. Oil Pump: Self-priming.
8. Cutter: Self-centering, full-floating.
9. Stand: Correspond with RIDGID 200A or equivalent product.

C. Extra Materials:

1. Three replacement blades.

2. Three hammer-type chuck with replaceable rocker-action jaw inserts.

2.20 PIPE REAMER (ACCESSORY TO OBO COMPONENT CODE SQ098):

A. Basis-of-Design Product: Subject to compliance with requirements, provide RIDGID model no. 42365-341 or equivalent product. The pipe reamer is an accessory to the pipe threading machine.

B. Pipe reamer characteristics and specifications shall meet be the following (at a minimum):

1. Pipe Capacity: 3 mm (1/8 inch) to 50 mm (2 inches).
2. Positive locking.
3. 5-flute cone.

2.21 REFRIGERANT RECOVERY UNIT (SH005 HVAC AND ELECTRICAL):

A. Basis-of-Design Product: Subject to compliance with requirements, provide BACHARACH model no. 2020-8001 or equivalent product. The refrigerant recovery unit shall be used with Category III, IV and V Refrigerants only, no explosive, flammable or corrosive coolants.

B. Refrigerant recovery unit characteristics and specifications shall be the following (at a minimum):

1. Type: 2-port.
2. Compressor: Air-cooled.
3. Electrical Connections: NEMA 5-15P Male Plug.
4. Motor Size: 1 hp.

2.22 PVC HEATER – BENDER (OBO COMPONENT CODE SQ097):

A. Basis-of-Design Product: Subject to compliance with requirements, provide GREENLEE model no. 847 or equivalent product.

B. PVC heater-bender characteristics and specifications shall meet the following (at a minimum):

1. Motor Type: Electric.
2. Capacity: 13 mm (1/2 inch) to 152 mm (6 inches).
3. Material: heavy duty metal.
4. Timer.
5. Optional PVC plug.
6. Optional Roller Support.

2.23 CHOP SAW – METAL (OBO COMPONENT CODE SQ036):

A. Basis-of-Design Product: Subject to compliance with requirements, provide M.K MORSE model no. CSM14MB or equivalent product.

B. Chop saw metal characteristics and specifications shall conform to the following (at a minimum):

1. Motor Speed: 1,300 rpm.
2. Blade Diameter: 356 mm (14 inch).
3. Arbor Hole: 25 mm (1 inch).
4. Voltage and Phase: Conform to host country electrical standards.

C. Standard equipment shall be furnished with chop saw and include the following:

1. Safety guard.
2. Mitering vice.
3. 8 mm hex wrench.
4. 6 mm hex wrench.

D. Extra Materials:

1. Two 356 mm (14 inch) metal cutting replacement blades.

2.24 MIG/TIG WELDER (OBO COMPONENT CODE SQ035):

A. Basis-of-Design Product: Subject to compliance with requirements, provide LINCOLN model no. POWER MIG 360MP (K4467-1) or equivalent product.

B. MIG/TIG welder characteristics and specifications shall conform to the following (at a minimum):

1. Output Range: 5 – 360 amps DC.
2. Package: Ready to weld; Educational One-Pak (K4778-1) or equivalent package.
3. Cover: Manufacturer's standard.
4. Options: Wheeled.

2.25 EXTRACTOR ARM – FUME (OBO COMPONENT CODE SQ034):

A. The Basis-of-Design Product: Subject to compliance with requirements, provide EXTRACT-ALL model no. EA76 or equivalent product.

B. Extractor arm characteristics and specifications shall conform to the following (at a minimum):

1. Arm Diameter: 152.4 mm (6 inches).
2. Length: 2.13 m (84 inches).
3. Arm Assembly: Two 0.61 mm (24-gauge) galvanneal steel tubes connected via flex hose and two external joints at the middle joint.
4. Damper: Rotated open and shut via handle on side of arm-standard.
5. Hood: 1.5 mm (16-gauge) steel with 360-degree swivel.
6. Arm support: Sealed gas shock absorber.
7. Exhauster/Blower: Provide blower, compatible with selected extractor arm.
8. Airflow Capacity: **[designer shall confirm based on project specific equipment)]**.

2.26 DRYING AND STORAGE CABINET – CATHODE (OBO COMPONENT CODE SQ088):

A. Basis-of-Design Product: Subject to compliance with requirements, provide LINCOLN model no. K2942-2 or equivalent product.

B. Drying storage cabinet characteristics and specifications shall meet the following (at a minimum):

1. Capacity: 159 kg (350 lbs).
2. Capacity Length: 457 mm (18 inches).
3. Storage Temperature: 38-288 ºC (100-550ºF).
4. Drying Temperature: 38-288 ºC (100-550ºF).
5. Thermostat: adjustable.
6. Voltage and Phase: Conform to host country electrical standards.

2.27 DRILL PRESS – FLOOR (METAL) (OBO COMPONENT CODE SQ279):

A. Basis-of-Design Product: Subject to compliance with requirements, provide JET model no. J-2550 or equivalent product.

B. Drill press characteristics and specifications shall be the following (at a minimum):

1. Drill Length: 508 mm (20 inches).
2. Motor Size: 1 hp.
3. Spindle Speed: 150 – 4,200 rpm (variable speed).
4. Table Surface Dimensions: 470 mm (18.5 inches) length x 419 mm (16.5 inches) width.
5. Quill Diameter: 57 mm (2.25 inches).
6. Voltage and Phase: Conform to host country electrical standards.

C. Extra Materials:

1. One drill bit set (metal); minimum 6 mm, 12 mm, and 18 mm diameters.
2. Furnish one safety type self-ejecting chuck key in lieu of standard key.

2.28 BENCH GRINDER (OBO COMPONENT CODE SQ297):

A. Basis-of-Design Product: Subject to compliance with requirements, provide BALDOR model no. 1021W or equivalent product.

B. Bench grinder shall meet the following characteristics and specifications (at a minimum):

1. Wheel Size: 254 mm (10 inches).
2. Number of Wheels: two.
3. Motor Size: 1.5 hp.
4. Motor Speed: 1,500 to 1,800 rpm.
5. Voltage and Phase: Conform to host country electrical standards.

2.29 PAINT SPRAY BOOTH BENCH (OBO COMPONENT CODE SQ033):

A. Basis-of-Design Product: Subject to compliance with requirements, provide GLOBAL FINISHING SOLUTIONS Model IFP-5 or equivalent product.

B. Paint spray booth bench characteristics and specifications shall conform to the following (at a minimum):

C. Exhaust Fan System: Propeller shall be of balanced, one-piece cast aluminum construction located at the terminus of exhaust duct except if indicated otherwise on Drawing. Coordinate with requirements in Division 23 and Division 26 Sections.

1. Dimensions (Overall): 1.63 m width x 2.18 m height x 1.57 m depth.
2. Dimensions (Working): 1.52 m width x 1.22 m height x 915 mm depth.
3. Light Fixture: One 1,220 mm (48 inch) LED.
4. Fan Size: 457 mm (18 inch).
5. Motor Size: 1/2 hp.
6. Voltage and Phase: Conform to host country electrical standards.
7. Accessories: Manometer; exhaust filter pads with grid retainers.

D. Extra Materials:

1. Provide two sets of filters.

2.30 PAINT MIXER – SHAKER (OBO COMPONENT CODE SQ032):

A. Basis-of-Design Product: Subject to compliance with requirements, provide HERO model no. S2700 or equivalent product.

B. Paint mixer characteristics and specifications shall conform to the following (at a minimum):

1. Load Capacity: 50 kg (110 lbs.).
2. Mixing Capacity: Up to 19 liters (5 gal.).
3. Motor Size: 3/4 hp.
4. Voltage and Phase: Conform to host country electrical standards.
5. Accessories: 7-position quart can adapter and two can pads.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that field conditions are acceptable and that installation of equipment and furniture may proceed. Notify the PD/COR in writing of conditions which adversely affect the Work. Do not proceed with installation until conditions have been corrected.

B. Verification of Dimensions: Contractor shall become familiar with all details of the work, verify all dimensions in the field.

3.2 PREPARATION

A. Verify dimensions of supporting structure by field measurements so that equipment work will be accurately designed, fabricated and fitted to the structure. Examine roughed-in mechanical and electrical services, installation of floors, walls, columns, and ceilings, and other conditions under which equipment work is to be installed. Notify Contractor in writing, of any dimensions found to be different than shown. Use Contractor's benchmarks as basis of measurements.

3.3 INSTALLATION, GENERAL

A. Coordinate equipment work with the work of other Sections and provide items to be placed during the installation of other work at the proper time to avoid delays in the work. Furnish installation templates, diagrams, and other data to fabricators and installers of related work as necessary for coordination of the installation. Place such items, including pipes, conduit, inserts and anchors, accurately in relation to the final location of equipment components.

B. Install all components of the equipment in accordance with the manufacturer's written instructions and recommendations.

C. Verify plumbing, mechanical, and electrical connection requirements for all equipment with manufacturer and coordinate connections with Division 14 Section on “Vehicle Lifts,” and with requirements in Division 22, Division 23, and Division 26 Sections.

D. Paint Spray Booth Exhaust Fan System: Exhaust fan installation with ductwork shall discharge directly outside with minimum static pressure. Conform to requirements of Chapter 5 in the OBO Mechanical Code. Coordinate with general installation requirements in Division 23, and Division 26 Sections.

3.4 IDENTIFICATION

A. Nameplates: Each major equipment item shall have the manufacturer’s name, address, and catalog or serial number permanently affixed to a plate securely attached to the equipment.

3.5 CLEANING

A. After completion of installation and other major construction work in equipment areas, remove protective coverings, if any, and clean equipment, internally and externally. Restore exposed and semi-exposed finishes to remove abrasions and other damages; and touch-up painted surfaces. Replace work that cannot be successfully restored.

B. Final Cleaning: After testing and start-up, and before time of Substantial Completion, clean equipment, and leave in condition ready for use.

3.6 DEMONSTRATION AND TRAINING

A. Contractor shall provide a minimum of 30 minutes of training for each piece of electrically-powered, pneumatic, and mechanically-assisted piece of equipment

3.7 SCHEDULE

A. **[Provide shop equipment as indicated in the shop equipment and furnishing schedule in the Construction Drawings.]**

END OF SECTION 115700

SECTION 117000 - MEDICAL EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes medical equipment.

B. Government Furnished Equipment (GFE) Responsibility:

1. Medical equipment and accessories that are identified as GFGI (or OFOI) will be furnished and installed by Post separate from this contract.
2. Associated furniture and accessories that are identified as GFCI are included as items of GFE Furniture Installation in Section 125005, “GFE Furniture Installation.”
3. Associated computer and telephone equipment that are identified as GFGI (or OFOI) will be furnished and installed by Post separate from this contract.

1.2 SUBMITTALS.

A. Product Data: Submit manufacturer's product information, specifications, and installation instructions for each item of equipment furnished.

1. Include upholstery, laminate, and all other required finish material samples from the manufacturer’s standard finishes for all equipment.

B. Rough-In Drawings: Provide rough-in drawings for mechanical, electrical, and telecommunications services.

C. Shop Drawings: Provide drawings showing, in large scale, dimensions, materials, thicknesses, finishes of materials, installation, relation to adjoining work, methods of construction and joining, and all other details to fully illustrate the work.

D. Connection Drawings: Submit complete electrical, plumbing, and mechanical connection information and coordinate with Divisions 22, 23, 26, and 27.

E. Maintenance and Operation Manuals: Provide manufacturer's maintenance and operation manuals.

1.3 QUALITY ASSURANCE

A. Single Subcontract Responsibility: Materials and equipment shall be standard products of a manufacturer regularly engaged in the manufacture of products that are of a similar material, design, and workmanship.

B. Nameplates: Each major item of equipment shall have the manufacturer's name, address, and catalog or serial number permanently affixed to a plate securely attached to the equipment, and readily visible.

C. Verification of Dimensions: Contractor shall become familiar with all details of the work and verify all relevant dimensions in the field.

1.4 DELIVERY AND STORAGE

A. Equipment delivered and placed in storage shall be stored with protection from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

PART 2 - PRODUCTS

2.1 TABLE OVER BED (OBO COMPONENT CODE MD001)

A. Description:

1. Overbed table with low profile, U-shaped base, and approximately 475 mm x 800 mm top surface, without vanity.
2. Dimensions: Approximately 800 mm wide x 550 mm deep x 1100 mm high (in raised position).
3. Table height shall be adjustable and provide automatic adjustment as bed/stretcher is raised.
4. Provide hidden casters with polystyrene covers.
5. Provide Dura-Edge to protect table and contain spills.

B. Finish: Colors to be approved by Project Director/COR, in coordination with A/E of Record documentation and with OBO SME input, from manufacturer's standard colors.

C. Basis of Design: Stryker Medical, model 3150-000-001, single top without vanity.

D. NOTE – This equipment would only be required in rare circumstances for a facility that anticipates multi-day hospitalization services such as in high threat/high risk locations.

2.2 EXAMINATION TABLE (OBO COMPONENT CODE MD002)

A. Description: Ergonomically designed manual back examination table equipped with extendable footrest, heated drawer, footstep, paper roll holder, and stainless steel treatment pan.

B. Electrical: Single point of connection. Coordinate plug type and project electrical.

C. Finish: Color to be approved by Project Director/COR, in coordination with A/E of Record documentation and with OBO SME input, from manufacturer's standard colors.

D. Basis of Design: Midmark/Ritter, model 204 Manual Examination Table.

2.3 REFRIGERATOR/FREEZER/ICE MACHINE

A. Pharmaceutical or Lab Refrigerator (OBO Component Code MD004)

1. General: 376-liter (13.3-cf) capacity – Full size
2. Basis of Design: Helmer iPR113-GX

B. Pharmaceutical or Lab Refrigerator (OBO Component Code)

1. General: 150-liter (5.3-cf) capacity - Undercounter
2. Basis of Design: Helmer iPR105-GX

C. Pharmaceutical or Lab Freezer (OBO Component Code)

1. General: 572-liter (20.2-cf) capacity – Full size
2. Basis of Design: Helmer iLF120-GX

D. Pharmaceutical or Lab Freezer (OBO Component Code _____)

1. General: 150-liter (5.3-cf) capacity - Undercounter
2. Basis of Design: Helmer iLF105-GX

E. Full-Size Refrigerator/Freezer (for staff/breakroom use only) (OBO Component Code MD037):

1. General: 510-liter (18-cf) capacity
2. Basis of Design: Summit Model BKRF18W

2.4 ULTRA-LOW FREEZER, (OBO COMPONENT CODE MD038)

A. Description: Ultra-low freezer for storing vaccines with the following features:

1. General: Full size; 370-liter (13-cf) capacity. Undercounter: 54- liter (2 cf) capacity.
2. Temperature Range: -40 dec C to -85 deg C.
3. Controls: Digital datalogging, battery back-up, hi/low alarm

B. Basis of Design: Full Size: So-low model U85-13.UNDERCOUNTER So-Lo model MV85-2

2.5 CART, PROC (OBO COMPONENT CODE MD006)

A. Description: General Procedure Cart with the following features:

1. Aluminum push handle with stainless steel top.
2. Powder-coated steel body; red.
3. Two-drawers; two locking doors

4. Wrap-around vinyl bumper.
5. Removable plastic top.
6. Full extension drawer slides.
7. Heavy-duty casters.

B. Basis of Design: Harloff Cart, model 6200 Standard

2.6 [LABORATORY BIOLOGICAL SAFETY CABINET (BSC) HOOD (OBO COMPONENT CODE MD020)

A. Description: A small biosafety cabinet that can be used into any laboratory space due to it's small footprint. conforming to the following:

1. Airflow: 70% air re-circulation, 30% air exhaust with sash
2. D.
3. Plumbing: None required.
4. Controls: Provide with display and power supply (face velocity sensor).
5. HVAC: Fan shall run continuously during occupied hours.
6. HEPA filter: 99.99% efficiency at 0.3µm

B. Electrical:

1. Fabricate one 20-amp GFI outlet on front exterior face of hood.
2. Hood shall be fabricated with LED light.
3. Fabricate light switch on front exterior face of hood.
4. UV Lamp 15W

C. Lights and outlet shall be pre-wired by hood manufacturer Basis of Design: Pro-Safe Class II (A2) Biosafety Cabinet PLS150

1. Alarm with Digital Meter Display: .
2. One ground fault interrupter outlet on hood:

2.7 SPECIMEN PASS THRU (OBO COMPONENT CODE MD026)

A. Description: Recessed Specimen Pass-Thru Cabinet. Type 304 stainless steel, satin finish. Self-closing doors. Interlocking mechanism prevents both doors from being open at the same time; provides sight barrier. Removable stainless steel tray.

B. Basis of Design: Bobrick model B-505.

2.8 PROCEDURE STRETCHER, OB/GYN (OBO COMPONENT CODE MD027)

A. Description: Lightweight manual ambulance cot with height adjustment, release handle design, dampened action during hot drops, fold-down side rails, wheel lock.

B. Finish: Manufacturer's standard colors.

C. Basis of Design: Stryker, model MX-PRO R3.

2.9 CHAIRS AND STOOLS

A. Chair, Blood Draw with Drawer (OBO Component Code MD032)

1. Description: Upholstered blood-drawings chair, with the following features:

a. Adjustable pivot armrest.
b. Upholstered seat & back.
c. Weight capacity of 450 lbs.
d. Storage cabinet.

2. Basis of Design: Winco, model Unity BDC #2574.

B. Exam Stool (OBO Component Code FN110)

1. Description: Pneumatic physician's stool with heavy-gage vinyl cover and foam padding, with the following features:

a. Seat height adjustable from 457 mm to 622 mm.
b. Backless.
c. 5-star base for stability.
d. 82 mm thick high-density foam.

2. Basis of Design: Midmark/Ritter, model 272 Air Lift.

C. Finish: Colors to be approved by Project Director/COR, in coordination with A/E of Record documentation and with OBO SME input, from manufacturer's standard colors.

2.10 RECEPTACLE WASTE, SHARPS COLLECTION (OBO COMPONENT CODE MD033)

A. Description: Container and wall-mounted bracket for attachment.

1. Capacity: 11-liters
2. Color: Red with appropriate markings and warnings stenciled on container.

B. Basis of Design: Harloff, model ML 684802.

2.11 DISPENSER GLOVE BOX (OBO COMPONENT CODE MD034)

A. Description: Wall-mounted dispenser with capacity for three boxes of disposable gloves.

B. Basis of Design: MarketLab, Inc., model ML 1052, white epoxy.

2.12 CABINET, DEFIBRILLATOR / AUTO-INJECTOR, RECESSED

A. Description: Tall AED Wall Cabinet with adjustable shelf and Alarm. Recessed wall installation.

1. Capacity: Combined AED Storage and Auto-Injector Storage.
2. Color: Coordinate selection with interior finishes and/or fire extinguisher cabinets. Provide appropriate markings stenciled on cabinet.

B. Basis of Design: AED Brands model TWR-A.

1. CABINET, DEFIBRILLATOR / AUTO-INJECTOR, SEMI-RECESSED

C. Description: Tall AED Wall Cabinet with adjustable shelf and Alarm. Semi-recessed wall installation.

1. Capacity: Combined AED Storage and Auto-Injector Storage.
2. Color: Coordinate selection with interior finishes and/or fire extinguisher cabinets. Provide appropriate markings stenciled on cabinet.

D. Basis of Design: AED Brands model TWSR-A.

2.13 MAYO STAND

A. Description: Instrument stand with steel based and removable tray.

1. Stable, heavy 23” diameter base design with 5-leg, all stainless steel construction.
2. Easy positioning with no need to tip style base.
3. Adjustable height range of 33” (838mm) to 49” (1245mm) high.
4. Removable stainless steel tray, minimum 19”x12.75”x0.75” (483mm x 324mm x 19mm)
5. 4 Easy-roll casters with 4 ball hearings
6. Knob lock height adjustment
7. 15lbs. load capacity under normal use.
8. 5-year limited warranty.

B. Basis of Design: Medicus Health, SKU#: 2721M1

2.14 SURGICAL LIGHT

A. Description: Ceiling mounted LED surgical light.

1. Illuminance: 45,000 lux at 1 meter
2. Color Temperature: 4300 Kelvin
3. Color Rendering Index: 92
4. Diameter of Lighthead: 51cm (20”)
5. Focusing: Adjustable using center handle
6. Light Source: Light Emitting Diodes (LED)
7. Number of LED Modules: 3
8. Swivel Radius of Lamp Housing: 160 cm (63”) maximum
9. Total Weight: 45 lbs (20.4 kg)
10. 5-year limited warranty.

B. Basis of Design: AIM LED Light Ceiling Mount, 7110037 Burton Medical LLC ALEDSC00

PART 3 - EXECUTION

3.1 CONDITION OF SUBSTRATES

A. Examine the substrates, adjoining construction and conditions under which the Work is to be installed. Do not proceed with the Work until unsatisfactory conditions detrimental to the proper and timely completion of the work have been corrected.

3.2 PREPARATION

A. Verify dimensions of supporting structure by field measurements so that equipment work will be accurately designed, fabricated and fitted to the structure. Examine roughed-in mechanical and electrical services, installation of floors, walls, columns, and ceilings, and other conditions under which medical equipment work is to be installed. Notify Contractor in writing, of any dimensions found to be different than shown. Use Contractor's benchmarks as basis of measurements.

3.3 INSTALLATION, GENERAL

A. Coordinate equipment work with the work of other Sections and provide items to be placed during the installation of other work at the proper time to avoid delays in the work. Furnish installation templates, diagrams, and other data to fabricators and installers of related work as necessary for coordination of the installation. Place such items, including pipes, conduit, inserts and anchors, accurately in relation to the final location of equipment components.

B. Install all components of the equipment in accordance with the manufacturer's written instructions and recommendations.

C. Verify plumbing, ventilation and electrical connection requirements for all equipment with manufacturer and coordinate connections with Division 22, 23, and 26 work.

D. Each AED cabinet shall display emergency phone number and procedures for notification of an emergency for the facility or local EMS. Signage and instructions shall be in English and in the official language of the host nation.

E. Install AED cabinets in compliance with the Architectural Barriers Act guidelines for AEDs in public areas.

F. AED Cabinets shall be installed in locations as follows:

1. In close proximity to Post 1 in the general work area.
2. Exercise rooms/gyms and at Recreation Buildings/Cabanas.
3. Outside electrical and telecom rooms.
4. Outside the entrance into the Health Unit.
5. Near elevators or stairwells.
6. Representational spaces, including but not limited to Main Lobby, Consular Waiting Rooms, American Centers, Gallery, Cafeteria, Chief of Mission Residences.
7. RSO Office Suite.
8. Inside each Compound Access Control building within close proximity to the guard booth.

3.4 CLEANING

A. Install medical equipment when there is no longer danger of damage to from other construction work. Remove all protective coverings and packing material, and leave units in clean condition internally and externally, ready for operation. Restore exposed and semi-exposed finishes to remove abrasions and other damage; touch-up painted surfaces. Remove and replace damaged products that cannot be successfully restored.

B. Final Cleaning: After testing and start-up, and before time of Substantial Completion, clean and sanitize medical equipment, and leave in condition ready for use in medical service.

END OF SECTION 117000

SECTION 118126 – FACADE MAINTENANCE AND FALL PROTECTION ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes systems and components to facilitate façade maintenance where required due to building height or grade conditions. Façade maintenance fall protection systems shall include fall arrest anchors.

1. [Suspended Scaffold: Provide suspended scaffold with associated davits for window washing and façade maintenance.]
2. [Monorails with Motorized Trolleys: Provide monorail systems with associated motorized trolleys and integrated hoists for interior locations.]
3. [Horizontal Lifelines: Provide horizontal lifelines and accessories for locations requiring access without parapets (i.e., canopies)]
4. [Other systems and equipment based on operations and maintenance and façade strategies in coordination with ODR10.]

B. Related Sections:

1. Section 033000 “Cast-in-Place Concrete.”
2. [Section 075558 “Fluid-Applied Protected Membrane Roofing.”]
3. [Division 07 roofing section.]
4. Division 07 Section on joint sealants.

1.2 SYSTEM DESCRIPTION

A. Fall Arrest Anchor Design Requirements:

1. Safety anchor design shall comply with ANSI/IWCA I-14.1, “Window Cleaning Safety” and OSHA 1910.66, Appendix C, “Personal Fall Arrest.”
2. Structural design requirements:

   a. Anchorage shall be capable of sustaining minimum ultimate load of 2,200 kg (5,000 lbs) in any direction load may be applied, without fracture or failure.
   b. Anchorage shall be capable of sustaining minimum proof load of 1,100 kg (2,500 lbs) in any direction load may be applied, without permanent deformation or damage to anchorage.
   c. Anchorage shall be designed with minimum 550 kg (1,250 lbs) in any direction load may be applied.

3. Each anchor shall be placed in line with work areas serviced by the respective anchor.
4. Anchors shall be placed to allow for two workers to make descents from rope descending system in same work area of the facade for both suspension line and fall arrest line.
5. [Provide fall arrest anchors in parapets in locations identified on Drawings.]

6. Space fall arrest anchors to allow maximum angle of 15 degrees from perpendicular and maximum spacing of 3.5 meters (12 ft.).

B. [Suspended Scaffold System:

1. Scaffolds: Xxx.
2. Associated Davits: Xxx.]

C. [Monorail System:

1. Monorail: Xxx.
2. Motorized Trolley: Xxx.
3. Motorized Hoist: Xxx.]

D. [Horizontal Lifeline System:]

1.3 SUBMITTALS

A. Product Data: General product data.

B. Shop Drawings:

1. Fall Arrest Anchors:

a. Location plan.
b. Detailed plan and section showing typical anchor installation at parapet.

2. [Suspended Scaffold System: Include associated davits. XXX.]
3. [Monorails with Motorized Trolleys: Include associated equipment. XXX.]
4. [Horizontal Lifeline System: Include associated components. XXX.]

C. Laminated Anchorage Drawings: Provide two A3 sheet (11x 17 inch) plastic laminated drawings showing all anchor locations to Project Director/COR. One copy will be for placing on interior of roof level door by Project Director/COR. The other copy will kept with hardcopy O&M Data to serve as replacement drawing.

D. Installation Instructions: Manufacturer's instructions for each type of system. Include guidance on field testing each system.

E. Field Inspection Report: Include completed inspection logbook for inspection of anchorage for each system in accordance with Article on FIELD QUALITY CONTROL.

1. Include anchor layout plan on A3 sheets (11x17 inch) or larger drawing.

F. Field Test Reports: For each type of system.

G. Certification: Letter of certification by registered U.S. Professional Engineer verifying that installed anchorages are in compliance with OSHA regulations and ANSI/IWCA standards referenced in Article on SYSTEM DESCRIPTION.

1. Fall Arrest Anchors:.
2. [Suspended Scaffold: XXX.]
3. [Monorail with Motorized Trolley: XXX.]
4. [Horizontal Lifelines: XXX.]

H. O&M Manual: Provide written operation and maintenance instructions, including ongoing inspection managed by post maintenance personnel, and use of fall protection equipment.

I. O&M Logbook:

1. Provide safety inspection logbook for use in yearly inspections managed by post maintenance personnel. Include instructions on verifying compliance with OSHA regulations and ANSI/IWCA standards referenced in Article on SYSTEM DESCRIPTION.

1.4 QUALITY ASSURANCE

A. Manufacturer:

1. Provide products from company specializing in design, fabrication, and installation of permanent window washing equipment with a minimum of five years of documented experience.
2. Engineering Responsibility: Preparation of engineering analysis and Shop Drawings by a U.S. Professional Engineer who is legally qualified to practice in jurisdiction where Project is located.

B. Installer: Trained or approved by manufacturer in installation techniques and procedures, with minimum five years of documented experience installing permanent window washing equipment.

C. Inspector: Registered U.S. Professional Engineer with experience on suspended maintenance equipment.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original unopened packaging.

B. Storage and Protection:

1. Store materials in area protected from construction activities, and protected from materials and chemicals that are not compatible with anchors.
2. Before installing, clean bolts that have become dirty.

1.6 SEQUENCING AND COORDINATION

A. Contractor is responsible for coordinating submittal process, fabrication, and delivery with construction of building elements receiving anchors.

B. Coordinate anchor installation with parapet construction and coating.

1.7 MAINTENANCE SERVICE PROPOSAL

A. Commencing at the contract's Substantial Completion date for a period of one calendar year with a renewable option for an additional year, provide proposal for system maintenance service based on manufacturer's recommended daily, weekly, quarterly, semi-annual, and annual maintenance activities. The proposal shall be submitted to the COR/Project Director at least 120 days prior to Substantial Completion

B. The proposal shall be inclusive of annual façade cleaning and inspection, as well as the elements identified in the Facade Maintenance Strategy Report in compliance with industry standards and load testing.

C. Maintenance service shall include preventive maintenance, repair or replacement of worn or defective components, required supply of cleaning solutions, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks shall also align with the manufacturer's recommended checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 FALL ARREST ANCHORS

A. Structural Component Materials

1. Exposed Structural Components:

a. Steel: ASTM A572, GR 50.
b. Steel: ASTM A36.
c. Galvanizing: ASTM A123.
d. Stainless Steel: 304 ASTM A 193 Grade B8, Class 2.

2. Plates: High strength steel, 35 kg/sq. mm (50 ksi) minimum.
3. Nuts and Washers:

a. Stainless Steel: 304 in accordance with ASTM A 193 B8 or F593C.
b. Galvanized Flat Washers: ASTM F-436 or 18-8 stainless steel.

4. Anchors:

a. Stainless Steel: 304 in accordance with ASTM A 193 Grade 8, B8.
b. Size: 16 mm (5/8 inch) diameter minimum.

B. Manufactured Units

1. Anchor:

a. Anchor eye size: 20 mm (3/4 inch) diameter with 60 mm (2-1/4 inch) eye opening minimum.
b. Basis of Design: Summit Anchor Company, Inc. Model SM-81-8-1 anchor/plate with SM-TRA-ADH-7 bolt assembly.

C. Fabrication

1. Fabricate work to dimension, and free from defects detrimental to performance.
2. Grind off surplus welding material to ensure exposed surfaces are smooth to prevent to worker's ropes.
3. Welding: AWS D1.1/D1, "Structural Welding Code."

2.2 [SUSPENDED SCAFFOLDS

A. Scaffold: Xxx

B. Davits: Xxx.]

2.3 [MONORAIL WITH MOTORIZED TROLLEY:

A. Monorail: Xxx.

B. Motorized Trolley: Xxx.

C. Motorized Hoist: Xxx.]

2.4 HORIZONTAL LIFELINE SYSTEM:

A. Cables: Xxx.

B. Anchors: Xxx.]

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine construction in which all components will be installed with Installer present.

B. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Fall Arrest Anchors:

1. Install anchors in accordance with manufacturer's instructions. Install anchors tightly fitted and flush to adjacent construction.
2. When components come into contact with dissimilar metals, prevent surfaces from direct contact.
3. Deform a minimum of two threads of tail end of anchor studs after nuts have been tightened to prevent accidental removal. Deform threads with 2 mm (2/32 inch) stainless steel punch.

B. [Suspended Scaffold:

1. Associated Davits: Xxx.
2. Scaffold Equipment: Xxx.]

C. [Monorail with Motorized Trolley:

1. Monorail: Xxx.
2. Motorized Trolley: Xxx.
3. Motorized Hoist: Xxx.]

D. Horizontal Lifeline System:

1. Cables: Xxx.
2. Anchors: Xxx.]

3.3 FIELD QUALITY CONTROL

A. Fall Arrest Anchors:

1. Inspection and Site Visits:

a. Perform inspections and site visits while installation of anchors is in progress under supervision of qualified Professional Engineer.
b. Perform on-site inspection on cast items while being tied in with rebar with sufficient time before concrete is poured to allow adjustments to embedded items.
c. Contractor is responsible to schedule site visits and inspections with sufficient advanced notice to Inspector.

2. Field Tests:

a. Test on site in accordance with manufacturer's recommendations and ANSI/IWCA I-14.1, "Window Cleaning Safety Standards" before anchors are placed in service.
b. Test under supervision of qualified Professional Engineer.

c. Inspection Logbook: Complete inspection logbook to certify system for use, noting any deviations, changes, or corrections from shop drawings.

B. [Suspended Scaffold Systems:

1. Inspection and Site Visits: XXX
2. Field Tests: XXX]

C. [Monorail with Motorized Trolley:

1. Inspection and Site Visits: XXX
2. Field Tests: XXX]

D. [Horizontal Lifelines:

1. Inspection and Site Visits: XXX
2. Field Tests: XXX]

3.4 DEMONSTRATION

A. Manufacturer's service representatives shall train Government personnel to operate the equipment and adjust and test anchorage. Review "O&M Manual" and "O&M Logbook" submittals; see Article on SUBMITTALS. Refer to Division 01 Section "Demonstration and Training."

1. Schedule as follows:

a. Classroom Instruction: Four (4) hours.
b. Field Demonstration: Four (4) hours.

END OF SECTION 118126

SECTION 122413 - ROLLER WINDOW SHADES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Manually operated roller shades.
2. Motor-operated roller shades.

B. Material Index / Material Codes Include:

1. WSG-[##] <(MANUALLY OPERATED) ROLLER WINDOW SHADES.>
2. WSG-[##] <(MOTOR-OPERATED) ROLLER WINDOW SHADES.>
3. FBG-[##] <FABRIC.>

C. Related Requirements:

1. Division 06 Section on "Rough Carpentry" for wood blocking and grounds for mounting roller shades and accessories.
2. Division 07 Section on "Joint Sealants" for sealing the perimeters of installation accessories for light-blocking shades with a sealant.
3. **[Division 12 Section on “Horizontal Louver Blinds.”]**
4. **[Division 12 Section on “Drapes.”**]
5. Division 26 Sections for associated general electrical work.
6. Division 26 Section on “Lighting Control Devices” for coordinated control of window shades at Consular Waiting Area.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 USE OF MOTORIZED MECHANISMS

A. Motorized Shade Mechanisms:

1. Sensor-controlled motors are not permitted in CAA areas.
2. In CAA, use of motors is governed by restrictions in Chapter 1 of the OBO Electrical Code. Motors shall be incapable of Wi-Fi, Bluetooth, or near-field communication.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, features, finishes, and operating instructions for roller shades.

B. Shop Drawings: Show fabrication and installation details for roller shades, including shadeband materials, their orientation to rollers, and their seam and batten locations.

1. Manually Operated Shades:

a. Show location and extent of roller shades.
b. Include elevations, sections, details, and dimensions not shown in Product Data. Show installation details, mountings, attachments to other work, operational clearances, and relationship to adjoining work.
c. Include reflected ceiling plans showing ceiling suspension system members and attachment to building structure.

2. Motor-Operated Shades:

a. Show location and extent of roller shades.
b. Include elevations, sections, details, and dimensions not shown in Product Data. Show installation details, mountings, attachments to other work, operational clearances, and relationship to adjoining work.
c. Include reflected ceiling plans showing ceiling suspension system members and attachment to building structure.
d. Show size and location of access to shade operator, motor, and adjustable components.
e. Show locations and details for installing operator components, switches, and controls.

1) Indicate motor size, electrical characteristics, drive arrangement, mounting, and grounding provisions.
2) In relation to the Consular Waiting Area show interface of lighting controls, located in the staff side of the Consular Section, with window shades at exterior walls of the Consular Waiting Area. Refer to Division 26 Section on “Lighting Control Devices.”

f. Include wiring diagrams showing power, system, and control wiring.

3. Include field-measured dimensions of each opening to receive shades.
4. Number each shade on Shop Drawing to correspond to identification number given each shade and applied on an unexposed face of shade unit.

C. Samples for Verification: For each type of roller shade.

1. Shadeband Material: Not less than [**250 mm**] square. Mark interior face of material if applicable.
2. Roller Shade: Full-size operating unit, not less than 400 mm wide by 900 mm long for each type of roller shade indicated.
3. Installation Accessories: Full-size unit, not less than 250 mm long.

D. Glare Analysis at Consular Waiting Area:

1. At consular window where officer and applicant interact, the applicant backdrop commonly has exterior glazing. Background luminance can make it challenging for officer to clearly see applicant's face. Light-filtering fabric that appropriately supports an environment with imperceptible glare is required.
2. Utilizing 3D geometry and shade performance data (reflectance, transmission, and openness factor), perform Daylight Glare Probability (DGP) analysis to confirm DGP rating of 0.35 or less as viewed from position of officer.
3. Analysis shall be undertaken with clear sky condition at time of day and year where sun's incident angle is most aligned with surface normal of glazing.
4. Submit analysis with shop drawings for approval.

E. Product Schedule: For roller shades.**[Use same designations indicated on Drawings.]**

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data:

1. For Installer.
2. For Trainer.

B. Product Certificates: For each type of shadeband material.

C. Product Test Reports: For each type of shadeband material, for tests performed by manufacturer and witnessed by a qualified testing agency.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data:

1. Include the following:

a. Methods for maintaining roller shades and finishes.
b. Precautions about cleaning materials and methods that could be detrimental to shadecloth, finishes, and performance.
c. Operating hardware.
d. Motorized shade operator.

2. Include copy of submittal in Project information manual.

B. Warranties: Submit signed and dated warranties.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Furnish minimum of five sets of the following for each type and size of shading system.

1. Fabric Material: Pre-cut solar shade and blackout panels sized to match each type of installation (to facilitate replacement).
2. Hardware: All hardware, brackets, anchors, fasteners, and accessories necessary for complete, finished installation.
3. Motor Kit: Replacement motor kits for each type of motorized system installed.
4. Repair Kit: Manufacturer's recommended kits for each type of installed shade (solar and blackout).

1.8 QUALITY ASSURANCE

A. Source Limitations: Obtain shades for windows through one source from a single manufacturer.

B. Installer Qualifications: Fabricator of products.

C. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

1. Approval of mockups sample installations does not constitute approval of deviations from the Contract Documents contained in sample installations unless Project Director/COR, based on input from the A/E of Record, specifically approves such deviations in writing.
2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

D. Training Instructor: At least five years' experience in installation and operation of installed system.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver roller shades in factory packages, marked with manufacturer, product name, fire-test-response characteristics, and location of installation using same designations indicated on Drawings.

B. Store in protected and dry area in manufacturer's unopened protective shipping packaging.

1.10 FIELD CONDITIONS

A. Environmental Limitations: Do not install roller shades until construction and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Field Measurements: Where roller shades are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Notify Project Director/COR of installation conditions that vary from Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

PART 2 - PRODUCTS

2.1 MANUALLY OPERATED SHADES WITH SINGLE ROLLERS **[WSG-[##]]**:

A. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.

1. Bead Chains: **[Manufacturer's standard] [Nickel-plated metal] [Stainless steel] [Plastic] <Insert description>**.

a. Loop Length: **[Full length of roller shade] [As indicated on Drawings] <Insert length>**.
b. Limit Stops: Provide upper and lower ball stops.
c. Chain-Retainer Type: **[Clip, jamb mount] [Chain tensioner, jamb mounted] [Chain tensioner, sill mounted] <Insert description>**.

2. Spring Lift-Assist Mechanisms: Manufacturer's standard for balancing roller shade weight and for lifting heavy roller shades.

a. Provide for shadebands that weigh more than [**4.5 kg**] <**Insert value**> or for shades as recommended by manufacturer, whichever criterion is more stringent.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

1. Roller Drive-End Location: [Right side of interior face of shade] [Left side of interior face of shade] [As indicated on Drawings] <Insert requirements>.

2. Direction of Shadeband Roll: **[Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller]**.
3. Shadeband-to-Roller Attachment: **[Manufacturer's standard method] [Adhesive strip] [Removable spline fitting into integral channel in tube] <Insert description>**.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.

D. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.

E. Shadebands:

1. Shadeband Material: **[Light-filtering fabric] [Light-blocking fabric] <Insert requirements>**.
2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.

a. Type: **[Enclosed in sealed pocket of shadeband material] [Exposed with endcaps] [Exposed with endcaps and integral light seal at bottom where it meets the sill] <Insert description>**.

b. Color and Finish: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color and finish>**.

F. Installation Accessories:

1. Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.

a. Shape: **[L-shaped] [Curved] <Insert requirements>**.
b. Height: Manufacturer's standard height required to conceal roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] <Insert dimension>**.

2. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.

a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] [height indicated on Drawings] <Insert dimension>**.

3. Endcap Covers: To cover exposed endcaps.

4. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.

a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[150 mm] [125 mm] [100 mm] [height indicated on Drawings] <Insert dimension>**.
b. Provide pocket with lip at lower edge to support acoustical ceiling panel.

5. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

a. Closure-Panel Width: **[As indicated on Drawings] [50 mm] <Insert dimension>**.

6. Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops. Side channels are required at every black-out shade location unless otherwise noted.

7. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed. Sill channels are required at every black-out shade location unless otherwise noted.
8. Installation Accessories Color and Finish: [As selected from manufacturer's full range] <Insert color and finish>.

2.2 MANUALLY OPERATED SHADES WITH DOUBLE ROLLERS **[WSG-[##]]**:

A. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.

1. Bead Chains: **[Manufacturer's standard] [Nickel-plated metal] [Stainless steel] [Plastic] <Insert description>**.

a. Loop Length: **[Full length of roller shade] [As indicated on Drawings] <Insert length>**.
b. Limit Stops: Provide upper and lower ball stops.
c. Chain-Retainer Type: **[Clip, jamb mount] [Chain tensioner, jamb mounted] [Chain tensioner, sill mounted] <Insert description>**.

2. Spring Lift-Assist Mechanisms: Manufacturer's standard for balancing roller shade weight and for lifting heavy roller shades.

a. Provide for shadebands that weigh more than **[4.5 kg] <Insert value>** or for shades as recommended by manufacturer, whichever criterion is more stringent.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

1. Double-Roller Mounting Configuration: **[Side by side] [Offset, outside roller over and inside roller under] <Insert requirements>**.
2. Inside Roller:

a. Drive-End Location: **[Right side of interior face of shade] [Left side of interior face of shade] [As indicated on Drawings] <Insert requirements>**.

b. Direction of Shadeband Roll: **[Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller]**.

3. Outside Roller:

   a. Drive-End Location: **[Right side of interior face of shade] [Left side of interior face of shade] [As indicated on Drawings] <Insert requirements>**.

   b. Direction of Shadeband Roll: **[Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller]**.

4. Shadeband-to-Roller Attachment: **[Manufacturer's standard method] [Adhesive strip] [Removable spline fitting into integral channel in tube] <Insert description>**.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller mounting configuration, roller assemblies, operating mechanisms, installation accessories, and installation locations and conditions indicated.

D. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.

E. Inside Shadebands:

1. Shadeband Material: Light-filtering fabric.
2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.

   a. Type: **[Enclosed in sealed pocket of shadeband material] [Exposed with endcaps] <Insert description>**.

   b. Color and Finish: **[As selected by Project Director/COR from manufacturer's full range] <Insert color and finish>**.

F. Outside Shadebands:

1. Shadeband Material: Light-blocking fabric.
2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.

   a. Type: **[Enclosed in sealed pocket of shadeband material] [Exposed with endcaps] [Exposed with endcaps and integral light seal at bottom where it meets the sill] <Insert description>**.

   b. Color and Finish: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color and finish>**.

G. Installation Accessories:

1. Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.

   a. Shape: **[L-shaped] [Curved] <Insert requirements>**.

b. Height: Manufacturer's standard height required to conceal roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] <Insert dimension>**.

2. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.

   a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] [height indicated on Drawings] <Insert dimension>**.

3. Endcap Covers: To cover exposed endcaps.

4. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.

   a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[150 mm] [125 mm] [100 mm] [height indicated on Drawings] <Insert dimension>**.
   b. Provide pocket with lip at lower edge to support acoustical ceiling panel.

5. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

   a. Closure-Panel Width: **[As indicated on Drawings] [50 mm] <Insert dimension>**.

6. [Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops. Side channels are required at every black-out shade location unless otherwise noted.]

7. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed. Sill channels are required at every black-out shade location unless otherwise noted.
8. Installation Accessories Color and Finish: **[As selected from manufacturer's full range] <Insert color and finish>**.

2.3 MOTOR-OPERATED, SINGLE-ROLLER SHADES **[WSG-[##]]**:

A. Motorized shades are required in Consular applicant waiting area at exterior glazing.

B. Motorized Operating System: Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation

without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

1. Electrical Components: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2. Electric Motor: [**Manufacturer's standard**] <**Insert description**> tubular, enclosed in roller.

   a. Electrical Characteristics: **[As indicated on Drawings] <Insert requirements>**.
   b. Maximum Total Shade Width: **[As required to operate roller shades indicated] <Insert requirements>**.
   c. Maximum Shade Drop: **[As required to operate roller shades indicated] <Insert requirements>**.
   d. Maximum Weight Capacity: **[As required to operate roller shades indicated] <Insert requirements>**.

3. Remote Control: Electric controls with NEMA ICS 6, Type 1 enclosure. Provide the following for remote-control activation of shades where scheduled or indicated on Drawings:

   a. Group Control Station: **[Maintained] [Momentary]**-contact, three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for single-switch group control.
   b. Consular Waiting Area: See Division 26 Section on “Lighting Control Devices” for control of motorized shade. Provide override function to control shades on exterior wall of that area.
   c. [Sun Sensor Control: Adjustable system consisting of digital displays detecting sun intensity and responding by automatically adjusting shades.]
   d. [Timer Control: Clock timer, [24-hour] [seven-day] <Insert period> programmable for regular events.]

   e. Color: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color>**.

4. Crank-Operator Override: Crank and gearbox operate shades in event of power outage or motor failure.
5. Limit Switches: Adjustable switches interlocked with motor controls and set to stop shades automatically at fully raised and fully lowered positions.
6. Operating Features:

   a. Group switching with integrated switch control; single faceplate for multiple switch cutouts.
   b. Capable of accepting input from building automation control system.

   c. Override switch.

7. Accessories:

a. **<Insert accessory>**.

C. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

1. Roller Drive-End Location: **[Right side of interior face of shade] [Left side of interior face of shade] [As indicated on Drawings] <Insert requirements>**.

2. Direction of Shadeband Roll: **[Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller]**.
3. Shadeband-to-Roller Attachment: **[Manufacturer's standard method] [Adhesive strip] [Removable spline fitting into integral channel in tube] <Insert description>**.

D. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.

E. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers that are operated by one roller drive-end assembly.

F. Shadebands:

1. Shadeband Material: **[Light-filtering fabric] [Light-blocking fabric] <Insert requirements>**.
2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.

a. Type: **[Enclosed in sealed pocket of shadeband material] [Exposed with endcaps] [Exposed with endcaps and integral light seal at bottom where it meets the sill] <Insert description>**.

b. Color and Finish: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color and finish>**.

G. Installation Accessories:

1. Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.

a. Shape: **[L-shaped] [Curved] <Insert requirements>**.
b. Height: Manufacturer's standard height required to conceal roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] <Insert dimension>**.

2. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.

a. Height: Manufacturer's standard in height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] [as indicated on Drawings] <Insert dimension>**.

3. Endcap Covers: To cover exposed endcaps.

4. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.

   a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[150 mm] [125 mm] [100 mm] [height indicated on Drawings] <Insert dimension>**.
   b. Provide pocket with lip at lower edge to support acoustical ceiling panel.

5. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

   a. Closure-Panel Width: **[As indicated on Drawings] [50 mm] <Insert dimension>**.

6. Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops. Side channels are required at every black-out shade location unless otherwise noted.

7. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed. Sill channels are required at every black-out shade location unless otherwise noted.
8. Installation Accessories Color and Finish: [As selected from manufacturer's full range] <Insert color and finish>.

2.4 MOTOR-OPERATED, DOUBLE-ROLLER SHADES **[WSG-[##]]**:

A. Motorized Operating Systems: Provide factory-assembled, shade-operator systems of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

   1. Electrical Components: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

   2. Electric Motor: **[Manufacturer's standard] <Insert description>** tubular, enclosed in rollers.

a. Electrical Characteristics: **[As indicated on Drawings] <Insert requirements>**.
b. Maximum Total Shade Width: **[As required to operate roller shades indicated] <Insert requirements>**.
c. Maximum Shade Drop: **[As required to operate roller shades indicated] <Insert requirements>**.
d. Maximum Weight Capacity: **[As required to operate roller shades indicated] <Insert requirements>**.

3. Remote Control: Electric controls with NEMA ICS 6, Type 1 enclosure. Provide the following for remote-control activation of shades where scheduled or indicated on Drawings:

a. Group Control Station: **[Maintained] [Momentary]**-contact, three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for single-switch group control.
b. [Sun Sensor Control: Adjustable system consisting of digital displays detecting sun intensity and responding by automatically adjusting shades.]
c. [Timer Control: Clock timer, [24-hour] [seven-day] <Insert period> programmable for regular events.]

d. Color: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color>**.

4. Crank-Operator Override: Crank and gearbox operate shades in event of power outage or motor failure.
5. Limit Switches: Adjustable switches, interlocked with motor controls and set to stop shade movement automatically at fully raised and fully lowered positions.
6. Operating Features:

a. Group switching with integrated switch control; single faceplate for multiple switch cutouts.
b. [Capable of accepting input from building automation control system.]

c. Override switch.

7. Accessories:

a. **<Insert accessory>**.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shades for service.

1. Double-Roller Mounting Configuration: **[Side by side] [Offset, outside shade over and inside shade under] <Insert requirements>**.
2. Inside Roller:

a. Drive-End Location: **[Right side of interior face of shade] [Left side of interior face of shade] [As indicated on Drawings] <Insert requirements>**.

b. Direction of Shadeband Roll: **[Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller]**.

3. Outside Roller:

a. Drive-End Location: **[Right side of interior face of shade] [Left side of interior face of shade] [As indicated on Drawings] <Insert requirements>**.

b. Direction of Shadeband Roll: **[Regular, from back (exterior face) of roller] [Reverse, from front (interior face) of roller]**.

4. Shadeband-to-Roller Attachment: **[Manufacturer's standard method] [Adhesive strip] [Removable spline fitting into integral channel in tube] <Insert description>**.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller mounting configuration, roller assemblies, operating mechanisms, installation accessories, and installation locations and conditions indicated.

D. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.

E. Inside Shadebands:

1. Shadeband Material: Light-filtering fabric.
2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.

a. Type: **[Enclosed in sealed pocket of shadeband material] [Exposed with endcaps] <Insert description>**.

b. Color and Finish: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color and finish>**.

F. Outside Shadebands:

1. Shadeband Material: Light-blocking fabric.
2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.

a. Type: **[Enclosed in sealed pocket of shadeband material] [Exposed with endcaps] [Exposed with endcaps and integral light seal where bottom (sill) channels are indicated] <Insert description>**.

b. Color and Finish: **[As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color and finish>**.

G. Installation Accessories:

1. Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.

    a. Shape: **[L-shaped] [Curved] <Insert requirements>**.
    b. Height: Manufacturer's standard height required to conceal roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] <Insert dimension>**.

2. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.

    a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[100 mm] [75 mm] [as indicated on Drawings] <Insert dimension>**.

3. Endcap Covers: To cover exposed endcaps.

4. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.

    a. Height: Manufacturer's standard height required to enclose roller and shadeband assembly when shade is fully open, but not less than **[150 mm] [125 mm] [100 mm] [height indicated on Drawings] <Insert dimension>**.
    b. Provide pocket with lip at lower edge to support acoustical ceiling panel.

5. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recesses or pockets and for snap-in attachment to wall clip without fasteners.

    a. Closure-Panel Width: **[As indicated on Drawings] [50 mm] <Insert dimension>**.

6. Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops. Side channels are required at every black-out shade location unless otherwise noted.

7. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed. Sill channels are required at every black-out shade location unless otherwise noted.
8. Installation Accessories Color and Finish: **[As selected from manufacturer's full range] <Insert color and finish>**.

2.5 SHADEBAND MATERIALS

A. Shadeband Material Flame-Resistance Rating: Comply with NFPA 701. Testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

B. Light-Filtering Fabric: Woven fabric, stain and fade resistant **[FBG-[##]]**:

1. Source: **[Roller shade manufacturer] <Insert source for custom fabrics>**.
2. Type: **[PVC-coated fiberglass] [PVC-coated polyester] [Woven PVC-coated fiberglass and PVC-coated polyester] [Woven polyester and PVC-coated polyester] [Acrylic-coated fiberglass] [PVC-coated fiberglass with silver backing] <Insert description>**.
3. Weave: **[Mesh] [Basketweave] <Insert description>**.
4. Thickness: **<Insert thickness>**.
5. Weight: **<Insert g/sq. m>**.**[900 mm] [1200 mm] [1500 mm] [1800 mm] [2100 mm] <Insert dimension>**Orientation on Shadeband: **[Up the bolt] [Railroaded] [As indicated on Drawings] <Insert requirements>**.
8. Openness Factor:

   a. **[1] [3] [5] [10] [11] [22] <Insert number>** percent.
   b. Consular Waiting Area: 1 percent, or as identified by Glare Analysis to facilitate more openness without compromising officer visibility; see Part 1 Article on ACTION SUBMITTALS.

9. Color:

   a. General Usage: **[As indicated on Drawings] [Match Project Director/COR's sample] [As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color>**.
   b. Consular Waiting Area: Consular Waiting Area: Black, or lighter color fabric where usage is supported by findings of Glare Analysis; see Part 1 Article on ACTION SUBMITTALS.

C. Light-Blocking Fabric: Opaque fabric, stain and fade resistant **[FBG-[##]]**:

1. Source: **[Roller shade manufacturer] <Insert source for custom fabrics>**.
2. Type: **[Fiberglass textile with PVC film bonded to both sides] [Fiberglass with acrylic backing] [Acrylic-coated fiberglass] [Polyester-cotton blend] [Polyester with foamed-acrylic backing] [PVC-coated fiberglass with bonded PVC film] <Insert description>.**
3. **Thickness: <Insert thickness>**.
4. Weight: **<Insert g/sq. m>**.
5. Roll Width: **[900 mm] [1200 mm] [1500 mm] [1800 mm] [2100 mm] <Insert dimension>**.

6. Orientation on Shadeband: **[Up the bolt] [Railroaded] [As indicated on Drawings] <Insert requirements>**.
7. Features: **[Washable] [Antistatic treatment] <Insert requirements>**.

8. Color: **[As indicated on Drawings] [Match Project Director/COR's sample] [As selected by Project Director/COR, based on input from the A/E of Record, from manufacturer's full range] <Insert color>**.

2.6 ROLLER SHADE FABRICATION

A. Product Safety Standard: Fabricate roller shades to comply with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.

B. Unit Sizes: Fabricate units in sizes to fill window and other openings as follows, measured at 23 deg C:

1. Between (Inside) Jamb Installation: Width equal to jamb-to-jamb dimension of opening in which shade is installed less 6 mm per side or 13-mm total, plus or minus 3.1 mm. Length equal to head-to-sill or -floor dimension of opening in which shade is installed less 6 mm, plus or minus 3.1 mm.

2. Outside of Jamb Installation: Width and length as indicated, with terminations between shades of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.

C. Shadeband Fabrication: Fabricate shadebands without battens or seams to extent possible, except as follows:

1. Vertical Shades: Where width-to-length ratio of shadeband is equal to or greater than **[1:4] <Insert ratio>**, provide battens and seams at uniform spacings along shadeband length to ensure shadeband tracking and alignment through its full range of movement without distortion of the material.

2. Railroaded Materials: Railroad material where material roll width is less than the required width of shadeband and where indicated. Provide battens and seams as required by railroaded material to produce shadebands with full roll-width panel(s) plus, if required, one partial roll-width panel located at top of shadeband.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, locations of connections to building electrical system, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ROLLER SHADE INSTALLATION

A. Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions.

1. Opaque Shadebands: Located so shadeband is not closer than **[50 mm] <Insert dimension>** to interior face of glass. Allow clearances for window operation hardware.

B. Controls for Motorized Shades in Consular Waiting Area:

1. Refer to Division 26 Section on "Lighting Control Devices" for controls serving this area that integrate both lighting and shade operation of the Consular Waiting Area; that referenced Section also identifies location for those controls.
2. Install override control for shade operation adjacent to lighting controls serving this area.

C. Electrical Connections: Connect motor-operated roller shades to building electrical system.

D. Roller Shade Locations: As indicated on Drawings **<Insert requirements>**.

3.3 ADJUSTING

A. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

3.4 CLEANING AND PROTECTION

A. Clean roller shade surfaces, after installation, according to manufacturer's written instructions.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, to ensure that roller shades are without damage or deterioration at time of Substantial Completion.

C. Replace damaged roller shades that cannot be repaired, in a manner approved by Project Director/COR, before time of Substantial Completion.

3.5 DEMONSTRATION

A. Engage a factory-trained service representative to train Project Director/COR's maintenance personnel to adjust, operate, and maintain motor-operated roller shades. Provide two hours of classroom training, and four hours of demonstration.

B. Training Plan: Develop training materials for this system and its interface with other systems and assemblies. Training materials shall include the following:

1. Wiring Diagrams: As-built diagrams with sizes for all motorized systems, cables, connectors, and equipment. Identify connection points.
2. Activation Controls of Shades: Review sequence of operations of controls for system.
3. Equipment List: Manufacturer's list of system and component parts for each type of shade system (including solar and blackout).

4. Maintenance Procedures: Manufacturer recommended procedures for maintaining and troubleshooting system.

END OF SECTION 122413

SECTION 124816 – ENTRANCE FLOOR GRILLES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Recessed floor grilles and frames.

B. Material Index / Material Codes Include:

1. **EMF-[##]** ***<ENTRANCE MAT FLOOR (GRILLE).>***

C. Related Requirements:

1. Division 03 Section on "Cast-in-Place Concrete" for concrete recess to receive grilles.
2. Division 05 Section on metal fabrications for grout.
3. Division 08 door hardware Sections for door control devices.
4. Division 09 Sections for floor finishes which interface with grilles.

1.2 COORDINATION

A. Coordinate size and location of recesses in concrete to receive floor grilles and frames.

B. Coordinate floor grille drain with storm drain system.

1.3 PERFORMANCE

A. Structural Performance: Provide floor grilles and frames capable of withstanding the following loads and stresses:

1. Rolling Load: 500 lb. per wheel, as applied by solid 125-mm x 50-mm polyurethane wheel in 1,000 passes, with no damage.

B. Accessibility Requirements: Comply with accessibility provisions in the Chapter 11 of the OBO Building Code (International Building Code as amended by OBO).

C. Sustainability: Conform to sustainability requirements and selections for the Project.

D. Flammability: ASTM E648, Class I, Critical Radiant Flux minimum 0.45 watts/m2.

E. Slip Resistance: ASTM D-2047, Coefficient of Friction minimum 0.60 at accessible routes.

1.4 SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for entrance grilles.

B. Shop Drawings:

1. Layout of grid and frames. Include direction of travel, divisions between grille sections, spline locations, profiles, anchors, and accessories.
2. Items penetrating floor grilles and frames, including placement of with door control devices.
3. Perimeter floor moldings and interface with adjacent finishes.
4. **[Radiant Snow Melting: Provide schematics, including identifying location of controls.]**

C. Samples: For the following products, in manufacturer's standard sizes:

1. Floor Grille: Minimum 100-mm x 100-mm section for each grille type, including insert.
2. Frame Members: Minimum 100-mm long sample of each frame type and color.

D. Maintenance Data: For floor grilles and frames to include maintenance manuals.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to project site ready for use and fabricated in as large sections and assemblies as practical, in unopened original factory packaging clearly labeled to identify manufacturer and location for installation.

1.6 FIELD CONDITIONS

A. Field Measurements: Indicate measurements on Shop Drawings.

1.7 SEQUENCING AND SCHEDULING

A. Delay installation of floor mat frames until after building enclosure is complete and related interior finish work is complete.

B. Recessed Frame: Install floor mat frames concurrently with stone floor system installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis of Design: Subject to compliance with requirements, provide products comparable to the following in accordance with the Schedule:

1. Type I Entrance Grilles: GridLine 2 w/ carpet Insert, C/S Group.
2. [Type II Entrance Grilles: GridLine 2 w/o insert, C/S Group.]
3. [Type III Entrance Grilles: PetiTred LP G3 w/ vinyl insert, C/S Group.]

4. [Type IV Entrance Grilles: Heated PediTred G4 w/ carpet insert, C/S Group.

a. **Radiant Snow Melting: Heatizon Systems.]**

2.2 FLOOR GRILLES **[EMF-[##]]**

A. General: Provide manufacturer's standard floor-grille assemblies consisting of treads of type and profile identified, interlocked or joined together by cross members, and with support legs (if any) and other components needed to produce a complete installation.

B. Stainless-Steel Floor Grille (Type I and II Grilles): Type 304 for surface wires and U-clip support structures.

1. Depth: 19-mm (3/4 inch) or 28-mm (1-1/8 inch), as coordinated with adjacent walkway surface finish.
2. Carpet Receiver Insert: 30 mm (1-1/4 inch) stainless steel. Spacing insert at **[XX mm]**.
3. Lockdown: Manufacturer's standard hidden lockdown mechanism.

C. Aluminum Floor Grille (Type III and IV Grilles):

1. Extruded Aluminum: ASTM B 221M, Alloy 6061-T6 or Alloy 6063-T5, T6, or T52 as standard with manufacturer. Coat surface of frame in contact with cementitious materials with manufacturer's standard protective coating.

D. Tread Inserts:

1. Carpet (Type II and IV Grilles): Carpet conforming to Carpet and Rug Institute's standard for indoor air quality. Fibers shall be minimum 100, 0.3 mm (12 mil) monofilament fibers per 650 sq. mm. (1 square inch), and colorfast solution-dyed nylon. Each carpet fiber and monofilament shall be fusion-bonded to rigid two-ply backing to prevent fraying, and provided in continuous splice-free lengths. Anti-static carpet fiber shall contain antimicrobial additive, and treated to reduce soiling. Carpet weight shall be 1,100 g/sq. m

(33-oz/yd^2). Color as selected by Project Director/COR from manufacturer's standard selections, with minimum of 10 choices.

a. Basis of Design: MonoTuft HD.

2. Vinyl (Type III Grilles).

2.3 FRAMES

A. Provide manufacturer's standard frame of size and style for grille type, for permanent installation in subfloor, complete with installation anchorages and accessories. Fabricate frame of same material and finish as grilles.

1. Type I and II Grilles:

a. Angle frame, 22 mm (7/8 inch) deep recess, Type 304 stainless steel, 3.2 mm (1/8 inch) exposed surface.

2. Type III and IV Grilles:

a. Recessed tapered angle frame, deep recess, ASTM B 221M, Alloy 6061-T6 or Alloy 6063-T5, T6, or T52 as standard with manufacturer.

2.4 FABRICATION

A. Shop fabricate floor grilles to greatest extent possible in sizes as indicated. Unless otherwise indicated, provide each grille as a single unit; do not exceed manufacturer's recommended sizes for units that are removed for maintenance and cleaning. Where joints are necessary, space symmetrically and away from normal traffic lanes.

B. Fabricate frame members in single lengths or, where frame dimensions exceed maximum available lengths, provide minimum number of pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins.

2.5 METAL FINISHES

A. Stainless Steel: Satin finish.

B. Aluminum: Clear anodized.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and floor conditions for compliance with requirements for location, size, minimum recess depth, and other conditions affecting installation of floor grilles and frames.

B. Examine roughing-in for drainage piping systems to verify actual locations of piping connections before floor grille and frame and drain pan installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install recessed floor grilles and frames to comply with manufacturer's written instructions at locations indicated, and with top of floor grilles and frames in relationship to one another and to adjoining finished flooring as recommended by manufacturer.

1. Set floor-grille tops at height for most effective cleaning action.
2. Coordinate top of floor-grille surfaces with bottom of doors that swing across grilles to provide clearance under door.
3. Finish surface beneath grill with leveling screed.

B. Drainage: For grilles installed outside of buildings, grille units shall facilitate interface with building storm drain system.

1. Install with trench drains rather than sloped drain.
2. Tie drains to building storm sewer system.

C. [Snow Melt Controls:

1. CACs: Place controls in Guard Booth for Main and Service CAC, and at Guard Station for Consular CAC.
2. Consular Waiting: Place controls at Guard Desk.]

3.3 CLEANING

A. Clean mats as recommended by manufacturer.

1. Do not use materials or methods which may damage metal finish, insert surfaces, or surrounding construction.
2. Clean recesses to remove dust and debris before final installation of mat.

3.4 PROTECTION

A. After completing frame installation, provide temporary filler of plywood or fiberboard in floor-grille recesses, and cover frames with plywood protective flooring. Maintain protection until construction traffic has ended and Project is near Substantial Completion.

END OF SECTION 124816

SECTION 125005 – GFE FURNITURE INSTALLATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section identifies administrative and execution requirements of "furniture, furnishings, and equipment (FF&E)" installation by Contractor. These items are Government Furnished Equipment; Contractor Installed (GFCI) items. Approximate locations of these items are identified on Construction Drawings, with detailed locations and information provided on Furniture Installation Plans prepared by U.S. Government. GFE furniture items are located in various building types, including the following where indicated on the Drawings:

1. [Office Building: Systems and freestanding FF&E.]
2. [Residential FF&E.]

a. [Marine Security Guard Residence (MSGR).]
b. [Staff housing (SDA).]
c. [Representational residence.]

3. Other building types:

a. [Warehouse.]
b. [American Club.]
c. **[Xxx.]**

B. Related Requirements:

1. Division 26 and Division 27 sections for conduits, wire ways, connection boxes, pull boxes, junction boxes, electrical breaker panels required to power FF&E.

1.2 DEFINITIONS

A. Furniture, Furnishings, and Equipment (FF&E): The term is used by OBO in relation to items that are Government Furnished.

1. Equipment: While FF&E includes the term Equipment which is typically indicated as Other Furnished, Other Installed (OFOI), in this context, the term FF&E is used generically and excludes OFOI.

B. Furniture:

1. **[Systems Furniture: A completely integrated office furniture system, capable of configuration as panel system with panel-mounted components, or as freestanding desk or storage system. Components include power and telecommunications**

distribution, specific to the project, and other components such as associated lighting, computer support accessories, and paper management accessories.]

2. Freestanding Furniture: Non-system furniture; these stand independent of systems furniture in places where they are co-located. Assembly, support, or attachment is required for some freestanding furniture items. Freestanding furniture are used in all building types for which GFE furniture installation is used.

C. Furnishings: Supplemental products such as letter trays, and waste receptacles. Furnishings are used in all building types for which GFE furniture installation is used.

1.3 SUBMITTALS

A. Project Execution Schedule: The Contractor shall include as minimum the following activities in Baseline Project Execution Schedule being submitted under requirements of Division 01 Section "Project Schedule": The schedule shall include:

1. Contractor's review period and date of submission of Contractor's e-Binder Systems Furniture Report.
2. 90 day period when all furniture will be received at Central Receiving/Consolidation Point (CRP) in accordance with Furniture Installation Plan outlined in Article on SUBMITTALS.
3. Contractor's Review of Vendor Order Bill of Materials (BOM).
4. Date of confirmation of 90 day window of furniture delivery.
5. Electrical and telecommunications rough-in work.
6. Furniture installation mock up for review.
7. Furniture installation phasing/sequencing.
8. Pre-shipment Inspection of existing conditions.
9. Delivery of furniture to site.
10. Request for Inspection of completed furniture installation.

B. Confirmation of GFCI FF&E CRP delivery dates: The Contractor shall confirm in writing to Project Director/COR 400 days in advance of delivery of furniture to their CRP. This confirmation will initiate OBO's procurement process for GFCI FF&E and will establish the period when items are to be delivered to Contractor's CRP. This Letter should also include shipping requirements, warehouse delivery requirements and furniture phasing information.

C. Contractor Report on E-binder Office Systems Furniture Configuration: Contractor shall provide report to Project Director/COR in accordance with requirements in Article on COORDINATION.

1. Contractor shall review plans, configurations and bills of materials for coordination with electrical, telecommunication and architectural work and shall verify quantity take-offs in Bill of Materials (BOM). This report shall be prepared by Furniture Installation Manager. Report shall include comments and discrepancies on accuracy and quantity take-offs of layouts and specifications to build each typical and cluster; and identify any coordination issues with electrical, telecommunications, architectural elements of work.

2. Contractor shall provide Report to Project Director/COR via official letter within 14 days of being notified that e-binder has been uploaded in ProjNet. OBO will complete all vendor orders, both systems and freestanding upon completion of the Contractor's review of e-binders.

D. Vendor Purchase Order Report: Contractor shall provide report to Project Director/COR in accordance with Article on COORDINATION.

1. Submit Report to Project Director/COR via official letter within 14 days of receiving Vendor orders, to accommodate delivery of furniture to CRP during 90-day delivery period.

E. Receiving Reports: Contractor shall provide receiving reports to Project Director/COR in accordance with Article on COORDINATION.

F. Pre-Shipment Inspection Report: Contractor shall submit pre-shipment inspection report in accordance with Article on DELIVERY, STORAGE AND HANDLING.

G. Installer Qualifications: Contractor shall submit qualifications for Furniture Installation Manager and installers in accordance with Article on QUALITY ASSURANCE.

1. Contractor shall submit resumes for OBO approval with initial "Bios of Personnel" for Furniture Installation Manager and installers.
2. Contractor shall submit confirmation of personnel security clearance level.

H. Installation Plan: Contractor shall submit to Project Director/COR detailed installation plan for phasing, placement, and assembly of furniture.

1. Contractor shall provide detailed installation plan for phasing (breakdown of floor by floor and zone by zone), placement, and assembly of furniture. Contractor shall provide detailed plan which outlines on-site storage, handling and phasing/sequencing of GFCI FF&E installation, and confirms scope of mock-up that will be constructed. Plan shall identify Furniture Installers, Furniture Installation Manager and their respective qualifications. Plan shall include installation dates which have been coordinated with completion of work of other trades. This plan will be used by OBO to sequence and organize procurement (and subsequent delivery to the Contractor's CRP) of GFCI FF&E. Installation plan must be approved prior to shipment of any GFCI FF&E to site.

I. Coordination Drawings: Contractor shall prepare and submit to Project Director/ COR coordination drawings in accordance with requirements in Article on QUALITY ASSURANCE.

1. Contractor shall verify and provide updated detailed coordination shop drawings, based on Construction Drawing elevations and details in architectural and electrical drawings, for open plan systems furniture typical conditions for both non-CAA and CAA, which illustrate electrical and telecommunications delivery and termination connectivity in systems furniture to building services; and based on selected GFCI systems furniture product. Coordination Drawings must be submitted and approved by OBO prior to rough-in installation of electrical and telecommunications services in building.

J. Contractor shall verify building systems access points with overlay of furniture plans. The contractor is required to coordinate the layout of items above ceilings or in walls adjacent to furniture that need to be accessed for inspection or maintenance (ie; larger junction boxes, VAVs, mechanical filters, FE/BR inspection hatches, LAA inspection hatches, etc.) should all be show not in conflict with furniture below or item in question.

K. Contractor shall provide an Access Point Conflict Report to the Project Director/COR for coordination of relocation with appropriate OBO discipline.

L. Confirmation of Installation Plan: Contractor shall confirm in writing to Project Director/COR prior shipping furniture to Post, and shall confirm that deficiencies or coordination issues identified in Pre-Shipment Inspection Report have been resolved.

M. [Secure Logistics Requirements: Contractor shall submit the following:

1. **Documentation associated with security clearances for Installers and Installer Manager in accordance with Division 01 Section "Construction Security," and documentation associated with General Shipping Plan and Individual Shipping Plans in accordance with Division 01 section "Secure Shipment."]**

N. Notification of Request for Inspection of Installed Furniture: Contractor shall submit written notice to Project Director/COR that GFCI FF&E furniture is installed, is ready for final inspection and requests date for inspection of completed work 60 days prior to DS Final Accreditation.

O. Record Documents: Contractor shall submit record set of as-installed documents in accordance with requirements of Division 01 Section "Project Closeout". Documents must include:

1. Drawings of actual installation to include any deviations from final OBO Furniture Installation Drawings.
2. Digitized photographs of any damaged material or irregularities.
3. Inventory of any excess material turned over at the completion of installation.

P. Operations and Maintenance Data: Contractor shall collect and organize user maintenance information and materials which are provided by furniture vendors and which are supplied with GFCI FF&E. These materials shall be organized and submitted in time frame in accordance with requirements in Division 01 Section "Project Closeout" record documents. This includes the following:

1. All brochures, tags and other literature enclosed in the protective wrappings or attached to the FF&E furnished for this Section.
2. All excess materials remaining at completion of final inspection.

Q. Warranty Information: Contractor shall collect and organize warranty materials of the FFE, which are Government-Furnished; warranty information is initially provided by furniture vendors. These materials shall be organized and submitted in time-frame in accordance with requirements in Division 01 Section "Project Closeout" warranty information.

1.4 QUALITY ASSURANCE - FURNITURE INSTALLATION IMPLEMENTATION MANAGEMENT:

A. Qualifications: Contractor shall utilize Furniture Installation Manager with minimum five years experience in planning and execution of major furniture installation projects overseas (consisting of minimum of 100 systems furniture workstations and freestanding furniture) where comprehensive pack-out of furniture for overseas shipping and phased installation is required, where alternate power supplies are used, where extreme environmental conditions are present if applicable to this project, and where personnel security and secure logistics are required. Furniture Installation Manager shall employ experienced installers trained by systems furniture manufacturers Allsteel, Haworth, and MillerKnoll. Qualified Furniture Installation team must remain on site for the full duration of the GFE Furniture Installation period.

B. Mock-Up Installation: Mock-up workstation, conference credenza, conference table, and consular window furnishings to be identified during Installation Planning Phase. Prepare mock-up installation to establish level of workmanship for evaluating overall performance under contract documents. Furniture Installation Manager shall monitor and certify workmanship of each installer to ensure compliance with mock-up installation. **[Contractor shall demonstrate an understanding of assembly and integration of office furniture system components.]** Furniture Installation Manager shall obtain Project Director/COR's approval of completed mockups before starting systems furniture installation. Contractor shall protect mock-up installation from damage or other compromise.

1. Mock-up installations shall be agreed upon prior to installation. Installations shall include range of workmanship requirements, including connections to electrical and telecommunications systems, signage coordination, and lighting.
2. **[Mock-ups shall include furniture as identified in agreed-upon drawings for demonstration of open plan condition for both non-CAA and CAA, including distribution of electrical, telecommunications, and audio/visual within furniture. Installation shall include freestanding furniture and furnishings.]**
3. **[Include furniture as identified in agreed-upon drawings for demonstration of closed office condition where electrical and telecommunications are accessed at wall. Installation shall include freestanding furniture and accessories.]**
4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

C. Installation team to provide Phasing Installation updates and reports to Project Director/COR and OBO Interior Designer including but not limited to: missing products, punch-list items, explanation of deviations from tagged furniture plans provided by Government.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Scheduling Parameters Interface: Refer to Article on SCHEDULING PARAMETERS for key scheduling related to delivery of GFE furniture.

B. Receiving and Storage Timing: Scheduling Delivery of GFCI FF&E to Contractor's CRP must be done accurately to avoid damaging furniture while stored for extended periods.

1. Central Receiving/Consolidation Point (CRP): Contractor shall establish CRPs in U.S. OBO furniture Vendors will ship all GFCI FF&E, both secure and non-secure, to Contractor at these locations.

   a. [Secure CRP: For CAA furniture only, Contractor shall establish secure CRP. This CRP shall be located near an embarkation point. Refer to paragraph on "Secure Logistics" in this Article and Division 01 for requirements.]
   b. Contractor is responsible for off-loading shipments from vendors at this CRP.

2. Storage of Containers on Site: Contractor shall establish storage at the project site where items will be received from Contractor's CRP.

   a. [For CAA furniture only, containers shall be stored in Secure Storage Area (SSA). Refer to paragraph on "Secure Logistics" in this Article and in Division 01 for requirements.]

3. Protection of GFCI Items: From the time of receipt of GFCI FF&E at Contractor's CRP, Contractor is responsible to protect furniture from damage, from theft, and from exposure to adverse weather. Prolonged storage of these materials on site increases potential for damage to fabrics and finishes.

C. [Security Logistics: For CAA furniture only, Contractor shall provide secure logistics. See requirements in Division 01 Section "Construction Security," Section "Temporary Security Facilities and Controls," and Section "Secure Shipment."

1. Contractor is responsible for:

   a. Arrangements for advance security clearances for installation personnel.
   b. Process and responsibilities for protection of furniture from compromise during execution of Work. Project warehousing controls at secure CRP and SSA.
   c. Installation requirements related to the use of cleared American contractors and local labor force.

2. **Individual Shipping Plan: Contractor shall develop and implement Individual Shipping Plans for CAA office furniture systems, freestanding furniture and accessories.]**

D. Contractor Review of Vendor Purchase Order: Refer to Article on COORDINATION.

E. Receiving Reports: Contractor shall submit receiving reports to the Government within seven calendar days of receipt of goods at Contractor's CRP. Government will certify vendor payments and file claims based on Contractor's receiving reports. Failure to identify and report discrepancies within established timeframe will be Contractor's liability, as will any interest accrued in vendor interest payments. Receiving reports shall include items listed below. In addition, Contractor shall notify USG of damages in accepted deliveries within 48 hours, and notify USG of deliveries which are not accepted by Contractor within 24 hours. Contractor shall prepare and submit Receiving Reports to confirm receipt of all FF&E as per Vendor Orders and identify any damaged materials

1. Include date of delivery and quantities of each item identified in packing list.

   a. Packing List from the GC Warehouse shall provide the following information:

      1) Number of pallets received
      2) Dimensions (L x W x H) per pallet
      3) Number of cartons and/or boxes per pallet
      4) Weight of pallet
      5) Identify received line items from the OBO PO and OBO PO Number
      6) Quantities of each line item received
      7) Date items received

2. Include digital photographs of evident damage to packaging, attempted date of delivery/rejection of delivery, and of damage to individual furniture items.
3. Include discrepancies between packing list and the Government's Purchase Order shall be noted at time of delivery on trucker's bill of lading. These shall also be identified in receiving report.
4. Include printed name and signature of receiving individual.

F. Pre-Shipment Inspection of Site: Contractor shall arrange for Furniture Installation Manager to complete site inspection visit prior to commencing shipment of Government-furnished materials. Timing of inspection shall be consistent with requirement to minimize time furniture will be stored in containers on site. Furniture Installation Manager shall determine availability of facilities for access, delivery, and physical restrictions imposed by separate building trades. Inspection shall also include confirmation of critical dimensions and locations of power feeds by field measurement and identification of conflicts with air distribution systems, light switches, thermostats, etc. and that buildings environment is controlled.

   1. Contractor shall submit written Pre-Shipment Inspection Report prepared by Furniture Installation Manager to Project Director/COR 14 days prior to shipping GFCI FF&E to Post.

1.6 PROJECT CONDITIONS

A. Environmental Limitations in Buildings: Contractor shall not install GFE furniture until applicable building is enclosed and weatherproof, wet work in space is completed and nominally dry, and HVAC system is operating and maintaining the interior at designated permanent settings.

B. Floor Tolerances: Floors must meet tolerances established by systems furniture manufacturer.

C. Weather Limitations on Site: Contractor shall transfer furniture from on-site storage to building for installation only when existing and forecasted weather permits work to be performed in accordance with manufacturer's written instruction and warranty requirements.

1.7 SCHEDULING PARAMETERS

A. CRP Delivery Period:

1. Delivery of GFCI FF&E: Contractor shall establish 90-day window with Start ("no earlier than") and Finish ("no later than") dates, during which delivery of GFCI FF&E to Contractor's CRP. All furniture shall be received at Central Receiving/Consolidation Point (CRP) during 90-day period. This window must be coordinated with OBO's preparation of GFCI FF&E purchase orders and subsequent shipment of items to construction site.

B. Confirmation of 90 day window of furniture delivery shall be obtained, and Project Execution Schedule adjusted accordingly.

1. Confirmation of GFCI FF&E CRP delivery dates: Contractor shall confirm in writing to Project Director/COR 400 days in advance of delivery of furniture to their CRP. This confirmation will initiate OBO's procurement process for GFCI FF&E and will establish period when items are to be delivered to Contractor's CRP. This Letter should also include shipping requirements and furniture phasing information.
2. Scheduling Delivery of GFCI FF&E to Contractor's CRP and subsequently to construction site must be done accurately to avoid damaging the furniture while stored for extended periods, during extra handling due to delays and storage in shipping containers.

1.8 COORDINATION

A. Coordination of procurement, delivery, shipment, and installation of GFCI FFE is essential to successful incorporation of these items within a project. The basis for organizing work are dates for furniture activities established in Baseline Project Schedule.

B. **[E-binder Office Systems Furniture Configuration: OBO will prepare an e-binder that includes systems furniture overall floor plans, typical workstations and clusters configurations and respective bill of materials for each workstation and/or cluster, based on final A/E design. Configurations will be more detailed and complete than final A/E design. The e-binder will be uploaded in Projnet in accordance with dates included in approved Project Execution Schedule to assist with Contractor's coordination effort.]**

C. Vendor Purchase Order: OBO will upload the Vendor Purchase Orders and Bill of Materials (BOM) in ProjNet as soon as they are available. Contractor shall review (BOM) and supply discrepancy report prepared by Furniture Installation Manager, and shall include comments and discrepancies on accuracy and quantity take-offs of all FF&E and specifications based on final OBO Furniture Installation Drawings, and identify any coordination issues with electrical, telecommunications, architectural elements, and other construction work.

D. Update of Drawings for Coordination: Refer to Article on SUBMITTALS for requirement to prepare Coordination Drawings.

E. Related Units of Work and Related Government Installation: Contractor shall coordinate GFE furniture installation with related units of work specified in other Sections, and with installation interface with associated Government-Installed items (e.g., co-located functional equipment) to ensure that Government–Furnished products associated with this Section can be installed and supported as indicated and per Design Intent.

1. Includes products requiring "critical measurements."
2. Includes interfacing wall and other construction to ensure that actual dimensions correspond to established critical dimensions.
3. Includes interfacing architectural millwork and casework.
4. Includes interfacing interior finishes.
5. Includes interior specialties, operational equipment, and furnishings.
6. Includes electrical and telecommunications in-feeds.

1.9 EXTRA MATERIAL MANAGEMENT

A. To extent that Government provides extra materials or that spare parts remain available, Contractor has responsibility for inventorying, packaging with protective covering for storage, and labeling contents for identification.

PART 2 - PRODUCTS

2.1 [OFFICE SYSTEMS FURNITURE

A. Products: GFCI products are produced by Allsteel, Haworth, or MillerKnoll. Systems furniture may include a single furniture system or combination of product lines.

B. Systems furniture will mostly be placed in open office area, but in some cases may be installed in closed office spaces.]

2.2 FREESTANDING NON-RESIDENTIAL FURNITURE

A. Products: Government-Furnished products are produced by various commercial furniture vendors or suppliers.

2.3 RESIDENTIAL FURNITURE

A. Products: Government-Furnished products are produced by various commercial and residential furniture vendors or suppliers

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine floors and conditions, with Contractor's Furniture Installation Manager present, for compliance with requirements, installation tolerances, and other conditions affecting performance of the Work. Correct unsatisfactory conditions prior to proceeding with Work.

B. The Work requires finished ceiling grid and tiles; walls primed with final finish coat dry to touch; final floor finish in place; power, data and communications ready for distribution; environmental controls in service and operation, and only superficial punchlist items outstanding.

C. Inspect furniture components, removing and replacing components that are warped, bowed, deformed or otherwise damaged.

1. Refer to Article on FIELD QUALITY CONTROL process of addressing any missing or damaged items.

3.2 PREPARATION

A. Clean prior to proceeding with, including vacuuming floors and removal of dust, dirt, and debris.

3.3 INSTALLATION

A. Install furniture systems and freestanding furniture shall be in accordance with manufacturer's instructions to include coordination of blocking requirements for any FF&E components that are wall mounted.

B. Manufacturer Installation Instructions and Installation Tools: Contractor is responsible for acquiring necessary manufacturer's installation instructions and any specific tools required to successfully complete installation of Government-Furnished product.

3.4 FIELD QUALITY CONTROL

A. Inspection and Acceptance: OBO Project Director/COR and OBO/PDCS/DE/ID Interior Designer will complete inspection of the work on site to verify quantities and identify any defects, damage, deficiencies or failure to conform to contract requirements. Contractor payment for the Work is contingent on this inspection and acceptance.

B. Notify Project Director/COR of any missing or damaged items. Contractor is responsible for ordering replacement items and for all costs including purchase, shipping, and installation associated with those items.

1. Work may be repaired or refinished if it complies with requirements and shows no evidence of repair or refinishing.
2. Contractor is required to provide a punch list inspection report prior to departure of site.

3.5 CLEANING AND PROTECTING

A. Clean Government-Furnished products to produce ready-for-use condition.

B. Protection of Work: Contractor may allow separate contractors and building trades to continue to be engaged in punchlist and commissioning activities. The Work requires protection from

damage or theft, covering of exposed surfaces and secure areas where Work is complete. Contractor assumes liability for replacement of destroyed, damaged or lost property.

3.6 DEMONSTRATION

A. Training: Contractor shall provide training to Locally Engaged Staff (LES), managed by post's Facility Management office, in assembly and maintenance of the Government–Furnished products.

1. Include training minimum of three LES employed by post.
2. **[Include demonstration and training of use of systems furniture e-binder as directions for installation, us of any tools, templates or products provided by the vendor and specific to the product.]**
3. Include hands-on exercise where trained employees can demonstrate efficacy in installation and maintenance skills.

END OF SECTION 125005

SECTION 125705 - WORK BENCHES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Work benches and associated stools as identified in Construction Drawings.

B. Related Sections include the following:

1. Section 115700 “Shop Equipment.”
2. Section 125005 “GFE Furniture Installation.”

1.2 SUBMITTALS

A. Product Data: For each type of product indicated. Include manufacturer’s specifications and installation instructions, dimensions of individual components and profiles, material descriptions and thickness, rated capacities, bracing, accessories, fasteners, and finishes.

1. Each work bench.
2. Stools.

1.3 DELIVERY, STORAGE, AND HANDLING

A. Protect finished surfaces during handling and installation with protective covering of polyethylene film, corrugated cardboard or other suitable material.

B. Shop work benches in this Section shall be packaged and set up for on-site placement using forklift.

1.4 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install shop furniture until building is enclosed, wet work and utility roughing-in are complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

PART 2 - PRODUCTS

2.1 BASIS-OF-DESIGN

A. Product Designations: Work benches reference manufacturer's catalog numbers as the Basis-of-Design. Subject to compliance with requirements of this Section, other manufacturers' work benches of similar sizes, similar drawer configurations may be considered.

2.2 WORKBENCHES

A. Shop Work Benches:

1. Shop Work Bench Type A1 (OBO Component Code FN104):

a. Basis-of-Design Model: Strong Hold 63-W-303-6DB-12B or equivalent.
b. Dimensions: 1800 mm (72 inches) length x 750 mm (30 inches) depth x 1800 mm (72 inches) total height.
c. Load Capacity: 544 kg (1,200 lbs).
d. Material: 2.78mm (12-gauge) steel with an electrostatically-coated power paint finish.
e. Drawers: Two stacked 152mm (6 inch) high drawers side-by-side with four stacked 75mm (3 inch) high drawers.
f. Shelving: Three adjustable shelves below working surface.
g. Bins: Twelve small along rear of working surface.
h. Power: One electrical outlet strip w/ minimum four receptacles that meet local plug configurations and are protected with GFCI.
i. Lock: 3-point locking system.

2. Shop Work Bench Type A2 (OBO Component Code FN105):

a. Basis-of-Design Model: Jamco UN472GP or equivalent.
b. Dimensions: 1800 mm (72 inches) length x 900 mm (36 inches) depth x 850 mm (34 inches) height.
c. Load Capacity: 1,360kg (3,000 lbs).
d. Material: (12-gauge) steel with an electrostatically-coated power paint finish.
e. Drawers: Two stacked 127mm (5 inch) x 406mm (16 inch) wide drawers under bench top and to one side (allowing open space under the other side of the bench top).

3. Shop Work Bench Type A3 (OBO Component Code FN103): Wood working bench.

a. Basis-of-Design Model: Rockler – Beech N2000.
b. Dimensions: 1820 mm (72 inches) length x 496 mm (19-1/2 inches) width x 864 mm (34 inches) height.
c. Working Area: 0.99 sq m (10.7 sq ft).
d. Edge Thickness: 82.6 mm (3-1/4 inch).
e. Center Thickness: 30 mm (13/16 inch).

f. Wood Species and Finish: Beech with linseed oil finish.
g. Shelving: One shelf below work surface.
h. Vise: Quick acting type. Install with securely bolted stainless steel fasteners.

1) Front Width: 359 mm (14-1/8 inch)
2) Front Max. Opening: 146 mm (5-3/4 inch).
3) Tail Width: 292 mm (11-1/2 inch).

4. Shop Work Bench Type A4 (OBO Component Code SQ086): Rolling, Work Bench.

a. Basis-of-Design Model: KNAACK StorageMaster 58 or equivalent.
b. Dimensions: 1.37 m (54 inches) length x 660 mm (26 inches) width x 940 mm (37 inches) height.
c. Load Rating: 1,202 kg (2,650 lbs.).
d. Material: Steel, heavy duty.
e. Caster Size: 152 mm (6 inches) diameter.
f. Caster Type: Two fixed with lock, two swivel.
g. Locking System: Standard key cylinder lock.

5. Shop Work Bench Type A5 (OBO Component Code SQ029): Rolling, Toolbox.

a. Basis-of-Design Model: PROTO JSTV4239RD14RG or equivalent.
b. Dimensions: 558 mm (22 inches) length x 1066 mm (42 inches) width x 978 mm (38.5 inches) height.
c. Storage Capacity: 0.21 m^3 (12,427 in^3).
d. Load Rating: 816 kg (1,800 lbs.).
e. Material: Steel, heavy duty.
f. Caster Size: 152 mm (6 inches) x 51 mm (2 inches).
g. Caster Capacity: 204 kg (450 lbs.) per caster.
h. Caster Type: Two fixed with lock, two swivel.
i. Locking System: Standard key cylinder lock.

6. Shop Work Bench Type A6 (OBO Component Code SQ288): Mobile, Work Bench.

a. Basis-of-Design Model: Tennsco MB-3-2545 or Equivalent.
b. Dimensions: 635 mm (25 inches) length x 1.22 m (48 inches) width x 1.02 m (40 inches) height.
c. Load Capacity: 454 kg (1,000 lbs.).
d. Material: Steel.
e. Handle: Electronic with MHE-25 Push Handle Power Strip or equivalent.
f. Drawers: Three stacked high drawers with two box drawers and a file drawer.
g. Door Unit: Single lockable storage cabinet with one adjustable shelf.
h. Bins: Twenty bin box compartments.

7. Shop Work Bench Type A7: Mobile Tool Cabinet.

a. Basis-of-Design Model: Uline H-8947BL or Equivalent.

b. Dimensions: 1067 mm (42 inches) length x 485 mm (19 inches) width x 1.02 m (40 inches) height.
c. Load Capacity: 952.5 kg (2100 lbs).
d. Material: Steel.
e. Color: Black.
f. Drawers: 11 drawers Lockable.
g. Caster Size: 127 mm (5 inches).
h. Caster Type: Two fixed with lock, two swivel.

8. Shop Work Bench A8 (OBO Component Code: FN024): Table, Drafting.

a. Basis-of-Design Model: Diversified Spaces DT-9SA30 or Equivalent.
b. Dimensions: 900 mm (36 inches) length x 600 mm (24 inches) width x 750 mm (30 inches) height.
c. Load Capacity: 226.8 kg (500 lbs).
d. Material: Wood.
e. Top Material: Laminate.
f. Tilt: 17 to 90 degrees.

B. Technical Work Benches:

1. Technical Work Bench Type A (OBO Component Code FN027):

a. Basis of Design Model: Wright Line/Eaton ‘TechBench’ or equivalent.
b. Dimensions: 1800 mm (72 inches) wide x 750 mm (30 inches) deep x 1930-2134 mm (76-84 inches) adjustable total height.
c. Factory assembled ready-to-install vertical workbench system designed to accommodate computer technicians.
d. Features and Accessories:

1) Adjustable frame package with static controlled (ESD) laminate top.
2) 1800 mm (72 inches) ESD upper laminate shelf.
3) 1200 mm (48 inches) organizer frame.
4) 475 mm (19 inches) high x 600 mm (24 inches) wide white board.
5) 900 mm (36 inches) high x 600 mm (24 inches) wide peg board.
6) Three small bin rails.
7) One case of 24 quantity of 75 mm (3inch) parts bins.
8) Suspended pedestal with 150 mm (6 inch) x 300 mm (12 inch) drawers.
9) Keyboard/mouse platform.
10) Slatwall-mounted articulating monitor arm.

2. Technical Work Bench Type B (OBO Component Code FN079):

a. Basis-of-Design Model: Wright Line/Eaton ‘TechBench’ or equivalent.
b. Dimensions: 1800 mm (72 inches) wide x 750 mm (30 inches) deep x 1930-2134 mm (76-84 inches) adjustable total height.
c. Factory assembled ready-to-install vertical workbench system designed to accommodate computer technicians.

d. Features and Accessories:

1) Adjustable frame package with laminate top.
2) 1800 mm (72 inches) upper laminate shelf.
3) 1200 mm (48 inches) organizer frame.
4) 475 mm (19 inches) high x 600 mm (24 inches) wide white board.
5) 900 mm (36 inches) high x 600 mm (24 inches) wide peg board.
6) Three small bin rails.
7) One case of 24 quantity of 75 mm (3inch) parts bins.
8) Mobile storage under-cabinet; 750 mm (30 inches) high with four 150 mm (6 inch) drawers.

3. Packing Workbench Type (OBO Component Code FN283):

a. Basis-of-Design Model: Global Industrial 'Complete Packing Workbench with Riser & Lower Shelf Kit' or equivalent.
b. Dimensions: 1830 mm (72 inches) wide x 915 mm (36 inches) deep x 1930-2134 mm (76-84 inches) adjustable total height.
c. Factory assembled ready-to-install vertical workbench system designed to accommodate packing and wrapping parcels and supply storage.
d. Features and Accessories:

1) Adjustable frame package with 45 mm (1-3/4 inch) thick maple safety top.
2) Adjustable heavy-duty tubular steel legs and leveling floor glides.
3) 1200 mm (48 inch) riser kit with bin rail, reel holder, and adjustable shelves with carton dividers.
4) One case of 24 quantity of 75 mm (3inch) parts bins.
5) Lower shelf kit with four carton dividers and storage shelf.

2.3 MATERIALS

A. Metal: Cold-rolled commercial steel sheet, complying with ASTM A 1008/A 1 008M; matte finish; suitable for exposed applications.

B. Minimum Metal Thickness: Manufacturer's standard.

2.4 STEEL SHEET FINISHES

A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Factory finish steel surfaces and accessories except stainless-steel and chrome-plated surfaces.

C. Surface Preparation: Clean surfaces of dirt, oil, grease, mill scale, rust, and other contaminants that could impair paint bond. Use manufacturer's standard methods.

D. Baked-Enamel Finish: Immediately after cleaning, pretreating, and phosphatizing, apply manufacturer's standard thermosetting baked-enamel finish. Comply with paint manufacturer's written instructions for application, baking, and minimum dry film thickness.

2.5 STOOLS

A. Provide workbench stools from same manufacturer as the workbench. Finish shall match workbench.

1. Height: Accommodate ergonomically sufficient height for workbench seating.

2.6 HARDWARE

A. General: Provide manufacturer's standard satin-finish, commercial-quality, heavy-duty hardware complying with requirements indicated for each type.

B. Pulls: Manufacturer's standard pulls.

C. Drawer Slides: Powder-coated, full-extension, self-closing, heavy-duty drawer slides; designed to prevent rebound when drawers are closed; with nylon-tired, ball-bearing rollers; complying with BHMA A156.9, Type B05091, and rated for 670 N.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Comply with manufacturer's written instructions.

B. Shop Work Benches: Place units in final locations after finishes have been completed in each area.

C. Technical Work Benches: Coordinate the delivery and placement of the Technical Work Benches with the GFE Furniture installation.

D. Install level, plumb, and true; shim as required, using concealed shims.

E. Adjust work benches and hardware so drawers align and operate smoothly without warp or bind and contact points meet accurately. Lubricate operating hardware as recommended by manufacturer.

3.3 CLEANING AND PROTECTION

A. Inspect each item of work bench. Make necessary adjustments.

B. Verify that accessories required have been furnished and installed.

C. Remove packing material from shop furniture and leave units in clean condition, ready for use.

END OF SECTION 125705

SECTION 133435 – MAIL SCREENING FACILITIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes prefabricated mail screening facility.

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete.”
2. Section 099602 “High-Performance Coatings for General Usage.”
3. Section 115355 “Class I Biological Safety Cabinet.”

1.2 SUBMITTALS

A. Product Data.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

C. Samples for Verification: For each type of exposed control finish required.

D. Product test reports.

E. Operations and Maintenance manuals.

F. Installation Instructions: Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. See Article on DELIVERY, STORAGE, AND HANDLING for inclusion of these Instructions with shipping of facilities to project site.

G. Field Testing of Biological Safety Cabinet: Documentation of field testing, as required in Article on FIELD QUALITY CONTROL.

1.3 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," AWS D1.2, "Structural Welding Code--Aluminum," and AWS D1.3, "Structural Welding Code--Sheet Steel."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in National Electrical Code (NFPA 70) Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.4 COORDINATION

A. Coordinate installation of anchorages for mail screening facility. Deliver such items to Project site in time for installation.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver components, panels, HVAC unit, biological safety cabinet, and work table and other manufactured items inside of prefabricated facility so as to avoid damage or deformity to these components or the overall facility during shipping. Package panels for protection during transportation and handling.

B. Ship the anchor bolts with unit, including anchoring dimensions and installation instructions.

C. Ship Installation Instructions with manufactured facility; see Article on SUBMITTALS.

D. Unload, store, and erect components in a manner to prevent damage.

1.6 WARRANTY

A. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace wall panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Charleston; Marine Containers Corporation (CMCI)
2. Veyka Construction Inc
3. RedGuard.

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by aluminum producer and manufacturer for type of use and finish indicated, and as follows:

1. Sheet: ASTM B 209M.
2. Extruded Shapes: ASTM B 221M.

3. Rolled Tread Plate: ASTM B 632/B 632M, Alloy 6061-T4 or 6061-T6.

B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.

C. Zinc-Coated (Galvanized) Steel Sheet: ASTM A 653/A 653M, commercial quality, Z275 coating designation; mill phosphatized.

D. Galvanized, Rolled Steel Tread Plate: ASTM A 786/A 786M, rolled from steel plate complying with ASTM A 572/A 572M, Grade 380; hot-dip galvanized according to ASTM A 123/A 123M.

E. Steel Structural Tubing: ASTM A 500, Grade B, hot-dip galvanized according to ASTM A 123/A 123M.

F. Steel Mechanical Tubing: ASTM A 513, welded steel mechanical tubing, hot-dip galvanized according to ASTM A 123/A 123M.

G. Stainless-Steel Sheet: ASTM A 666, Type 304.

H. Plastic Laminate: NEMA LD 3, HGS or HGL grade.

I. Plywood: DOC PS 1, Exterior grade.

J. Particleboard: ANSI A208.1, Grade M-2.

K. Anchorages: Anchor bolts, stainless steel.

2.3 PREFABRICATED MAIL SCREENING FACILITY

A. General: Other than HVAC unit, biological safety cabinet, and work table, prefabricate and assemble most of the facility, ready for installation on Project site. Mail screening facility shall be capable of withstanding structural and other loads, thermally induced movement, and exposure to weather without failure or infiltration of water into facility interior. Include structural framing, roof and wall panels, doors, as well as items identified in the Part 2 Article on COMPONENTS, MATERIALS AND ACCESSORIES; all of those shall comply with requirements of this Section. Provide means for anchoring facility to foundation.

1. Two-Room Facility (Standard): For mail screening facilities 4.88 m or more in length, divide facility into two rooms; Initial Screening Area and Secondary Screening Area, each area conforming to requirements identified below.
2. **[One-Room Facility (for applications with limited site space): For mail screening facilities shorter than 4.88 m, there shall only be one room conforming to requirements identified below. Use of One-Room Facilities first requires written approval of DS/WMD or OBO/DE/ME Mail Screening Facility COR.]**

B. Dimensions: Two-room mail screening facilities shall be nominal 6m x 2.5m x 2.5m**.**. Longer dimensioned facilities require written approval by Mail Screening Facility COR or Project Director. To facilitate shipment, in no case shall dimensions exceed ISO 668 – Series 1C freight containers.

C. Facility Configuration - Two-Room Facility:

1. Initial Screening Area: Initial screening area will be occupied when mail is delivered and screened.

   a. Exterior Door: 1220 mm (4 feet) width.

2. Secondary Screening Area (for opening suspect mail): Secondary area will normally be unoccupied, and shall be accessible only through the initial screening area. Separate secondary area from initial screening area by one wall with door having a swing into initial screening area.

   a. Door: 915mm with louver. Interior door shall have transfer louver sized for larger of ventilation fan or Biological hood exhaust.
   b. Class I Biological Safety Cabinet mounted on work table with cabinet's exhaust through side wall.
   c. Room Light Interlock: Class I Biological Safety Cabinet's on/off light switch shall be located in initial screening area behind door of secondary screening area, and shall simultaneously activate Class I Biological Safety Cabinet's dedicated power receptacle and lights. On/Off switch for Class I Biological Safety Cabinet shall always be in the "On" position.

D. [Facility Configuration - One-Room Facility:

1. Exterior Door: 1220 mm (4 feet) width.
2. Class I Biological Safety Cabinet mounted on work table with cabinet's exhaust through side wall.
3. Room Light Interlock: Class I Biological Safety Cabinet's on/off switch shall always be in the on position. Light switch shall simultaneously activate Class I Biological Safety Cabinet's dedicated power receptacle and screening area lights.]

2.4 COMPONENTS, MATERIALS AND ACCESSORIES

A. Electrical Power Service:

1. Two-Room Facility:

   Provide 60-A of electrical capacity at local power characteristics.
   a. Provide three duplex power receptacles in initial screening area, and two duplex power receptacles in secondary screening area, at local power characteristics. One of receptacles in secondary screening area shall be a dedicated power receptacle serving only the Class I Biological Safety Cabinet. Receptacles shall each be grounded.

2. [One-Room Facility:

   a. Provide 40-A of electrical capacity at local power characteristics.
   b. Provide four duplex power receptacles, each grounded.]

3. Breaker (Electrical) Panel: Single-phase, 3-wire load center, with not less than 4 open circuits; located adjacent to entry door. Run copper wiring in conduit.

B. Lighting Fixtures: Provide a minimum of 645 Lux (60 foot candles) lighting level at working level of 915 mm in each screening area, as applicable. Lighting fixtures shall be LED, waterproof, and dustproof. Fixtures and switches shall conform to NEMA 3 minimum.

C. Telephone Jacks: Provide one for each screening room, for termination by others.

1. Two-Room Facility: One jack in each screening area.
2. [One-Room Facility: One jack for facility]

D. HVAC Unit: Provide system to maintain temperature between 16 and 25 degrees Celsius year round.

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into this work include but are not limited to:

a. Bard HVAC.

2. Digitally thermostatically controlled, through-the-wall unit, utilizing local power characteristics and providing ventilation/make-up air. Refrigerant shall be either R407c or R410a.

E. Ventilation Fan for Two-Room Facility: Two room mail screening facilities in locations having extreme temperatures (colder than -17 deg C or warmer than 38 deg C) requires continuous conditioned air to secondary screening room. Provide 15 l/s fan installed in wall which divides secondary and initial screening rooms.

F. Exhaust Termination: Provide wall cap on exterior of facility with integral backdraft damper and bird screen.

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into this work include but are not limited to:

a. Broan-NuTone LLC.

2. Exhaust Connection: 152 mm.
3. Flange Size: 228 mm x 228 mm.

G. Decontamination Water Piping Components: One external hose bibb shall be piped to two internal hose bibbs located in each screening room (initial and secondary). Install external hose bibb on exterior skin of facility to allow hose connection. Do not make permanent water connection; unit is served by hose connection for decontamination purpose only. Provide one 15 m garden hose for use on interior hose bibb.

H. Duress Buttons: Coordinate with compound duress system, with work for termination of buttons by those involved with that system.

1. Two-Room Facility: Provide and install duress button on interior wall inside secondary room.
2. **[One-Room Facility: Provide and install duress button on wall to right of biological hood.]**
3. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into this work include but are not limited to:

    a. GE Security 3045-W Panic switch with terminals.

I. Metal Coated Exposed Finish: Finish exposed metal surfaces, including structural framework, walls, canopy, and ceiling with pigmented aliphatic acrylic polyurethane coating system.

J. Other Interior Wall and Ceiling Finishes: Non-metal surfaces shall be finished with washable semi-gloss or gloss enamel paint.

K. Sheet Vinyl Floor Covering With Backing: ASTM F 1303 or equal.

1. Type (Binder Content): II, minimum binder content of 34 percent.
2. Backing Class: Class A (fibrous).
3. Wear-Layer Thickness: Grade 1, 1.52 mm thick
4. Wearing Surface: Smooth.
5. Overall Thickness: 2.0 mm thick.
6. Sheet Width: 1.8 meters.
7. Seaming Method: Heat welded.
8. Heat-Welding Bead: Solid-strand product of floor covering manufacturer. Color to match floor covering.
9. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm per ASTM E 648.
10. Sanitary radius cove at intersection of floor and walls.
11. Integral-Flash-Cove Strip: 25 mm radius provided or approved by floor covering manufacturer.
12. Cap Strip: Square metal, vinyl, or rubber cap provided or approved by floor covering manufacturer.

L. Work Table: Provide commercial grade kitchen stainless steel table to span width of secondary room.

1. Material: 1.9 mm thick, stainless steel sheet.
2. Depth: Sufficient depth to support biological safety cabinet.
3. Height: 813 mm above finished floor.

2.5 FABRICATION

A. Fabricate mail screening facility completely in factory.

B. Prewire mail screening facility at factory, ready for connection to service at Project site.

C. Seal all interior and exterior penetrations (e.g., lights, electrical panel, switches) at walls and ceiling with waterproof caulk to prevent damage from weather or from interior/exterior pressure wash.

D. Fabricate mail screening facility with removable lifting eyes on roof.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

A. [Mail screening facility shall be placed within 60 meters of a water hydrant to allow a temporary connection for decontamination purposes only.]

B. Install mail screening facility on 100-mm- thick concrete, asphalt, or gravel base that is 305 mm larger than facility on all sides.

C. Set mail screening facility plumb and aligned. Level base plates true to plane with full bearing on bases.

D. Anchor mail screening facility to foundation.

E. Connection of Services: Where mail screening facilities are provided as part of a larger project, connection of services below is normally performed as the Work of other Sections. Where mail screening facilities are procured by post as a standalone effort, post will identify responsibility for these connections.

1. Connection of electrical power service to power distribution system is addressed in Division 26 Sections.
2. Connection of telephone line to telephone jack is addressed in Division 27 Sections.
3. Connect duress button to compound technical security system; refer to Section 282605 “Technical Security Duress Systems.”
4. Permanent connection of decontamination water supply is prohibited.

F. Work Table: Install stainless steel work table in secondary room.

G. Biological Safety Cabinet: Install biological safety cabinet on stainless steel table with exhaust ductwork through side wall; see Section 115355 “Class I Biological Safety Cabinet.”

1. Install and connect two 2-meter grounding rods.
2. Secure table and biological safety cabinet to prevent movement.

3.2 FIELD QUALITY CONTROL

A. After completing installation, inspect exposed finishes and repair damaged finishes.

B. Perform and document field testing to verify functionality of biological safety cabinet in accordance with installation instructions of manufacturer of biological safety cabinet; see Section 115355 "Class I Biological Safety Cabinet."

3.3 ADJUSTMENTS

A. Adjust doors and door hardware to operate without binding.

B. Lubricate hardware and other moving parts.

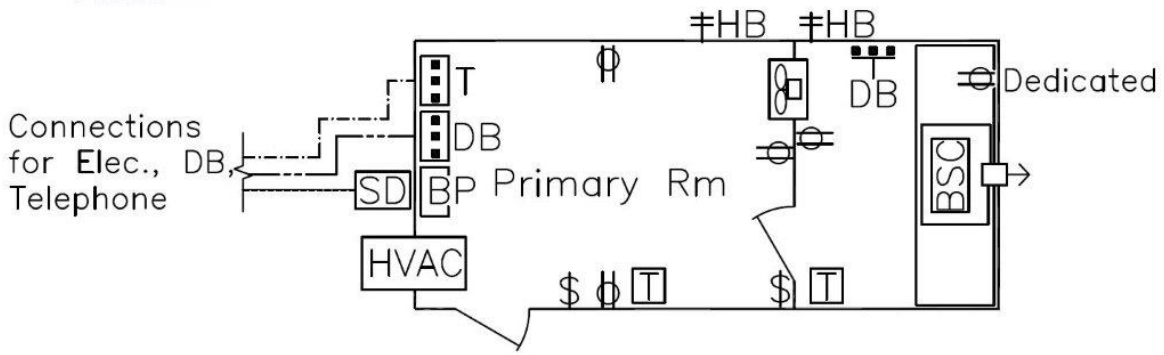
C. Seal seams with clear silicone gel seal.

3.4 ILLUSTRATIVE CONFIGURATION OPTIONS FOR TWO-ROOM MAIL SCREENING FACILITY:

A. See Attachments A, B, and C for illustrations of three potential configurations of the facility, customizable to location of entry to facility. In addition, see Attachment D for Legend with notes that applies to all three configurations.

END OF SECTION 133435

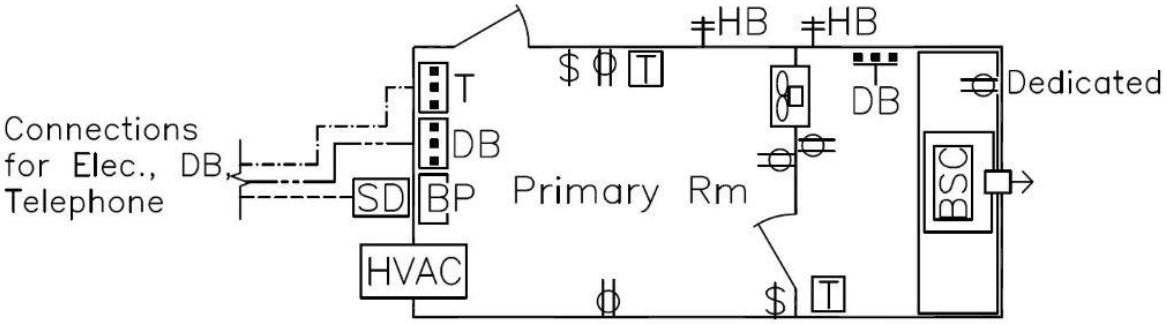
ATTACHMENT A – FRONT ENTRY LAYOUT



MAIL SCREENING FACILITY
LAYOUT A

Legend: See Attachment D.

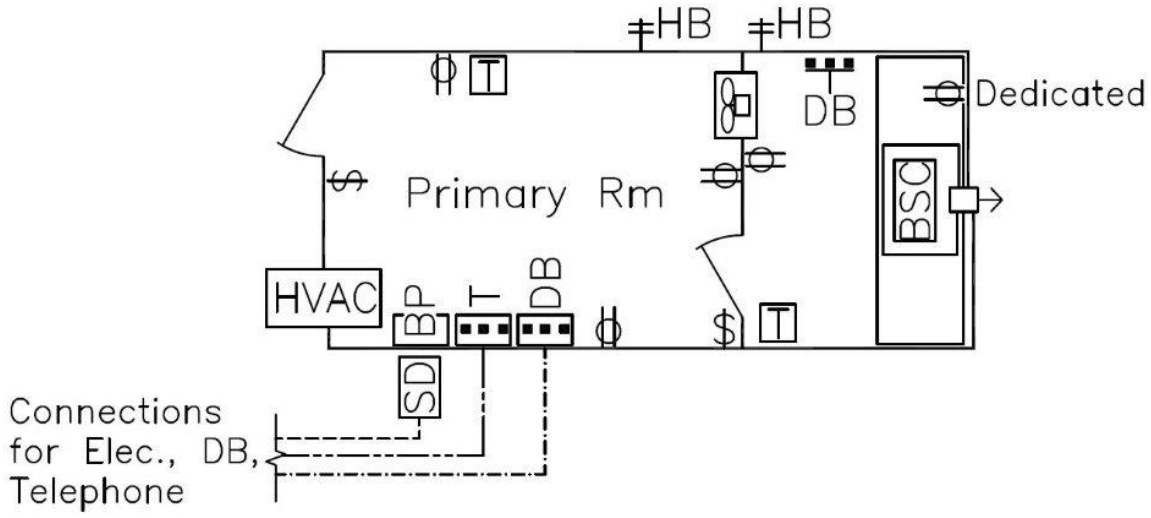
ATTACHMENT B – REAR ENTRY LAYOUT



MAIL SCREENING FACILITY
LAYOUT B

Legend: See Attachment D.

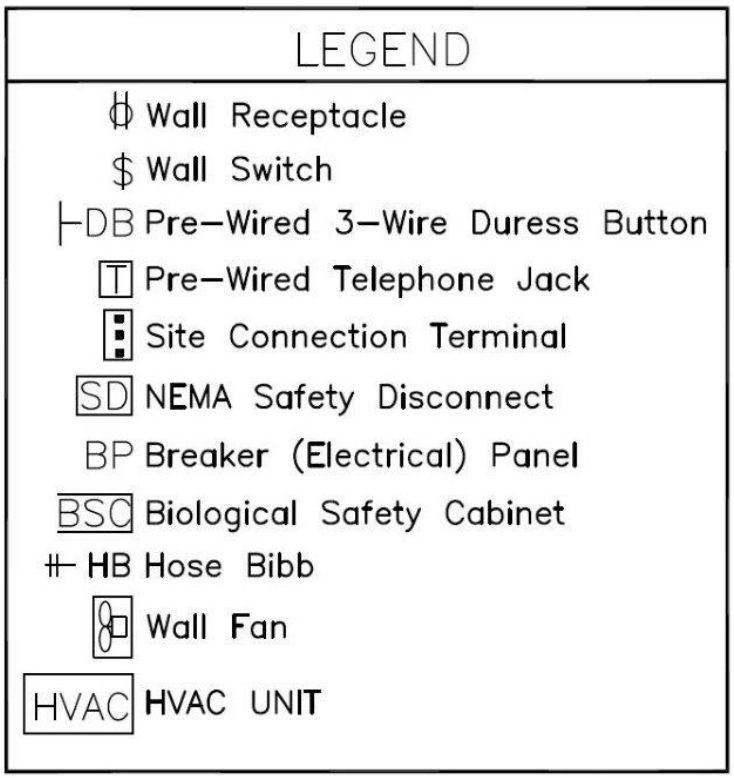
ATTACHMENT C – END ENTRY LAYOUT



MAIL SCREENING FACILITY
LAYOUT C

Legend: See Attachment D.

ATTACHMENT D – LEGEND FOR ILLUSTRATIVE FACILITY CONFIGURATIONS



General Notes: For the following, also see Part 2 of this Section for more specific requirements.

- HVAC Unit: Heat pump or A/C per project conditions
- Ventilation Fan between rooms: Place on room-separating wall.
- Secondary Room Light Switch: Place on exterior wall of Initial Room, near hinge side of door at room-separating wall (i.e., "hidden" by door when door is fully opened); interconnect switch with bio safety cabinet hood.
- Duress Button: Within Secondary Room; place on room-separating wall next to door latch.
- Hose Bibbs: One external hose bibb piped to two internal hose bibbs (one in each room)

SECTION 142105 – ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes machine-room-less electric traction passenger and service elevators. The project includes the following number of elevators:

1. Passenger Elevators: **[XX].**
2. Passenger/Service Elevators: **[XX].**

B. Related Requirements:

1. Division 01 Section "Temporary Facilities and Controls" for temporary use and elevators for construction purposes.
2. Division 01 Section "Operation and Maintenance Data."
3. Section 033000 "Cast-in-Place Concrete" for setting sleeves, inserts, and anchoring devices in concrete.
4. **[Division 04 Section on unit masonry for setting sleeves, inserts, and anchoring devices in masonry and for grouting elevator frames installed in masonry walls.]**
5. **[Division 05 Section on structural steel framing for the following:**

   a. **Attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.**
   b. **Divider beams.**
   c. **Hoist beams.**
   d. **Structural-steel shapes for sub-sills.]**

6. Section 055005 "Metal Fabrications" for the following:

   a. Attachment plates and angle brackets for supporting guide-rail brackets.
   b. Divider beams.
   c. Hoist beams.
   d. Structural-steel shapes for subsills.
   e. Pit ladders.
   f. Cants in hoistways made from steel sheet.

7. Section 057005 "Decorative Metal" for combination hall push-button stations.
8. Division 09 Section on **[xxx xxx]** for finish flooring in elevator cars.
9. Division 09 Section on interior painting for field painting of hoistway entrance doors and frames.
10. [Division 10 Section on wire mesh partitions for guards between adjacent elevator pits.]
11. Division 22 Section on sump pumps for sump pumps, sumps, and sump covers in elevator pits.
12. Section 230905 "Instrumentation and Controls for HVAC" for interface with the building automation system (BAS).

13. Division 26 Sections for interface with the general electrical system, including interface with the automatic transfer switch (ATS).
14. Section 271505 "Communications Horizontal Cabling" for telephone service for elevators and connection to elevator controllers for remote monitoring of elevator performance.
15. Section 284626 "Addressable Fire Alarm System" for smoke detectors in elevator lobbies to initiate emergency recall operation**[and heat detectors in shafts [and machine rooms]to disconnect power from elevator equipment before sprinkler activation]** and for connection to elevator controllers.

1.2 APPLICABLE CODES AND STANDARDS

A. General:

1. Applicability of either U.S. Codes/Standards set or Non-U.S. Codes/Standards set cited below is dependent upon which set is utilized by vendor servicing elevator.

   a. Refer to Article on QUALITY ASSURANCE for support service capability related to distance from project site. Refer also to Article on ACTION SUBMITTALS; the accepted submittal identifies which Codes/Standards set is used by servicing vendor, and hence which set governs for this Section.

2. Applicability of NFPA Codes: All elevators shall additionally conform to NFPA Codes identified below.

B. U.S. Codes and Standards Set:

1. ASME A17.1/CSA B44 "Elevator and Escalator Safety Code." When there is a Security requirement for installation by cleared Americans. Current addition at the time of Award.
2. Accessibility standards identified in Chapter 11 of the OBO Building Code, which amend the Architectural Barriers Act (ABA).

C. Non-U.S. Codes and Standards Set:

1. ISO 14798: "Risk Assessment."
2. EN 81-20: "Safety Rules for the Construction and Installation of Lifts" (Electric Lifts).
3. EN 81-21: "New Passenger and Goods Passenger Lifts in Existing Buildings."
4. EN 81-28: "Remote Alarm on Passenger and Goods Passenger Lifts."
5. EN 81-50: "Safety Rules for the Construction and Installation of Lifts."
6. EN 81-58: "Landing Doors Fire Resistance."
7. EN 81-70: "Accessibilities to Lifts for Persons Including Persons with Disability."
8. EN 81-71: "Vandal Resistant Lifts."
9. EN 81-72: "Firefighters' Lifts."
10. EN 81-73: "Behavior of Lifts in Event of Fire."
11. EN 81-77: "Safety Rules for the Construction and Installation of Lifts."

D. NFPA Codes:

1. OBO Electrical Code (NFPA 70 "National Electric Code" as amended by OBO).

2. NFPA 72 "National Fire Alarm and Signaling Code."

1.3 DEFINITIONS

A. Definitions: Refer to ASME A17.1/CSA B44 or EN 81-20, as applicable to this project (see Article on APPLICABLE CODES AND STANDARDS).

B. Authority Having Jurisdiction (AHJ): The overall AHJ is OBO Elevator Management (OBO/OPS/FAC/PS). Host Country local AHJ's may also have limited jurisdiction.

C. Passenger/Service Elevator: A passenger elevator with horizontal side sliding doors and a cab configuration where the depth of the cab is greater than the width that is also used to carry freight.

1.4 ACTION SUBMITTALS

A. General: Initial set of Action Submittals shall include all the following submitted together:

1. Product data.
2. Shop drawings.
3. Qualification data, including identification of applicable Codes/Standards set.

B. Product Data: Include capacities, sizes, performances, operations, safety features, finishes, and similar information. Include product data for car enclosures, hoistway entrances, and operation, control, and signal systems. Requires approval of Manufacturer, model, and coordinated components by OBO Elevator Management.

C. Shop Drawings:

1. Include plans, elevations, sections, and large-scale details indicating service at each landing, coordination with building structure, relationships with other construction, and locations of equipment.
2. Include large-scale layout of car-control station and standby power operation control panel. Provide a detailed drawing for the elevator alarm control panel in Marine Security Guard Post 1.
3. Indicate maximum dynamic and static loads imposed on building structure at points of support, and maximum and average power demands.

D. Samples for Initial Selection: For finishes involving color selection.

E. Samples for Verification: For exposed car, hoistway door and frame, and signal equipment finishes; 75-mm (3-inch) square Samples of sheet materials; and 4-inch (100-mm) lengths of running trim members.

F. Qualification Data: Document required qualifications as identified in Article on QUALITY ASSURANCE. Requires approval by OBO Elevator Management.

1. Installer.

2. Support Service and Maintenance Technicians. Include information on location of local service center. Identify whether U.S. Codes/Standards set or Non-U.S. Codes/Standards set govern operations of service vendor; see Article on APPLICABLE CODES AND STANDARDS.

G. Contractor Pre-Testing Inspection: Written verification by Contractor that installation is 100 percent completely tested with full load.

1.5 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For elevator equipment, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Manufacturer Certificates: Signed by elevator manufacturer certifying that hoistway, pit, and control closet layout and dimensions, as shown on Drawings, and electrical service including standby power generator, as shown and specified, are adequate for elevator system being provided.

C. Sample Warranty: For special warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For elevators to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include diagnostic and repair information available to manufacturer's and Installer's maintenance personnel.

B. Testing Procedures for Elevator Safety Features: Submit manual in English and local language that describes all procedures.

C. Inspection and Acceptance Certificates and Operating Permits: As required by local Authorities Having Jurisdiction for normal, unrestricted elevator use.

D. Continuing Maintenance Proposal: Submit a continuing maintenance proposal from Installer to Owner, in the form of a standard one-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

E. Training:

1. Training Manuals.
2. Instructor's name and resume, with emphasis on experience in presenting training programs.
3. List of attendees.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: Elevator manufacturer or an authorized representative who is factory trained and certified by manufacturer and has been approved by OBO Elevator Management (OBO/ OPS/FAC/ PS). The Installer shall have a minimum of five years' verifiable experience installing elevator equipment that similar to equipment in this Project.

B. Support Service Capability: Manufacturer-approved support services vendor to start-up generator, and available to provide ongoing maintenance services. Vendor shall be located within 50 km (30 miles) of project site. Vendor shall have performed these services on this product line for at least five years.

1. Maintenance Technician Qualifications: Local elevator technicians who will maintain elevators shall have certified factory training; the service company and personnel shall be approved by OBO Elevator Management.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle materials, components, and equipment in manufacturer's protective packaging. Materials and components shall be stored off the ground, under cover, and in a dry location.

1.9 COORDINATION

A. Coordinate installation of sleeves, block outs, elevator equipment with integral anchors, and other items that are embedded in concrete or masonry for elevator equipment. Furnish templates, sleeves, elevator equipment with integral anchors, and installation instructions and deliver to Project site in time for installation.

B. Coordinate locations and dimensions of other work relating to electric traction elevators including pit ladders; sumps and floor drains in pits; entrance sub-sills; electrical service; and electrical outlets, lights, and switches in hoistways, pits, control spaces, and machine rooms.

1.10 WARRANTY

A. Manufacturer's Special Warranty: Manufacturer agrees to repair, restore, or replace elevator work that fails in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, operation or control system failure, including excessive malfunctions; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.
2. Warranty Period: One year from date of Substantial Completion.

1.11 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include full maintenance by skilled employees of elevator Installer throughout the Project warranty period or for 12 months, whichever is greater. In addition, provide maintenance service for elevator used for construction purposes; see Article on PROTECTION. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

1. Perform maintenance during normal working hours.
2. Perform emergency callback service during normal working hours with response time of one hour or less.
3. Include 24-hour-per-day, 7-day-per-week emergency callback service with response time of two hours or less.
4. During the 12th month of Maintenance required by the Contract, the Contractor shall perform (NO LOAD) safety test and inspection that will be witnessed by OBO Elevator management.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Only manufacturers that have local support service office as required in Article on QUALITY ASSURANCE, have systems which comply with the requirements of this Section, and which have demonstrated capability to perform the work of this Project and have support service capability as identified in Article on Quality Assurance. Other manufacturers than the ones listed below will only be considered when approved by OBO Elevator Management (OBO/OPS/FAC/PM).

1. KONE, Inc.
2. Otis Elevator Co.
3. Schindler Elevator Co.
4. ThyssenKrupp Elevator.
5. NIDEC Elevator Co.

B. Basis of Design:

1. **[XXX]** by **[YYY].**

C. Source Limitations:

1. Major elevator components, including driving machines, controllers, signal fixtures, door operators, car frames, cars, and entrances, shall be manufactured by single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Accessibility Requirements: Comply with Chapter 11 of the OBO Building Code related to ABA-based accessibility requirements for elevators or EN 81-70 Accessibility Standard, as applicable for this project (see Article on APPLICABLE CODES AND STANDARDS).

B. Seismic Performance: Elevator system shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Elevator safety requirements shall comply with ASME A17.1/CSA B44 or EN 81-77, as applicable for this project (see Article on APPLICABLE CODES AND STANDARDS). Where Non-U.S. Codes/Standards are used, Installer shall identify design acceleration (Ad) to determine the European seismic zone level.

1. The term "withstand" means "the system will remain in place without separation of any parts when subjected to the seismic forces specified and the system will be fully operational after the seismic event."
2. Affected peak velocity acceleration (Av) for Project's location is to be provided and confirmed by the elevator manufacturer.
3. Provide earthquake equipment as required by ASME A17.1/CSA B44 or EN 81-77, as applicable to this project (see Article on APPLICABLE CODES AND STANDARDS).
4. Provide seismic switch where required by ASCE/SEI 7.

   a. The seismic switch shall be designed to be fail safe and have a battery backup to prevent an intermittent loss of power from initiating earthquake operation.

5. Design earthquake spectral response acceleration at short periods (S_s) for Project is **[0.XX] [identified in Construction Drawings]**.
6. Design earthquake spectral response acceleration at one-second period (S_1) for the Project is **[0.XX] [identified in Construction Drawings]**.
7. Building Seismic Design Category is **[X for xxx building and Y for yyy building(s)] [identified in Construction Drawings]**.
8. Elevator Component Importance Factor: **[1.0]**.

2.3 ELEVATOR SYSTEM

A. Elevator System, General: Only manufacturer's standard designed certified elevator systems are acceptable. Manufacturer's standard components shall be used for each elevator. Integrated packages made up from components of multiple manufacturers are not acceptable.

B. Shared Elevator Attributes: The following attributes are common for all elevators in the project.

1. Machine Location: Hoistway; no machine room is provided, but control room is required adjacent to elevator in top occupied floor.
2. Machine Type: Gearless traction.
3. Operation System: Selective-collective automatic operation.
4. Auxiliary Operations:

    a. Standby power operation.
    b. Battery-powered rescue operation.
    c. Earthquake Emergency Operation: Comply with requirements in ASME A17.1/CSA B44 or EN 81-77, as applicable for the project (see Article on APPLICABLE CODES AND STANDARDS).
    d. Automatic dispatching of loaded car.
    e. Nuisance call cancel.
    f. Independent service.
    g. Loaded-car call bypass.
    h. Automatic releveling when car is loading or unloading with car and landing doors open.
    i. Car door restrictor devices to prevent opening car door when outside leveling zone.
    j. Dual machine brakes to be used during uncontrolled car movement and ascending overspeed operation.
    k. [In-car fire fighter operations for all elevators where required by Code.]
    l. Programmable operation of lights and ventilation fans to permit scheduled periods where these will be normally out of operation except at time when the elevators are used during those periods.

    m. [Distributed parking not at a security landing.]

5. Car Enclosures:

    a. Door Sills: Material shall be **[Bronze] [Nickel silver] [Stainless steel]**.
    b. Handrails: **[38 mm (1-1/2 inches) round] [13 by 50 mm (1/2 by 2 inches) rectangular] [satin stainless steel, No. 4 finish] [satin bronze, lacquered],** at sides and rear of car.

6. Hoistway Entrances:

    a. Frames: **[Enameled or powder-coated steel] [Satin stainless steel, No. 4 finish] [Satin bronze, lacquered]**.
    b. Doors: **[Enameled or powder-coated steel] [Satin stainless steel, No. 4 finish] [Satin bronze, lacqured]**.
    c. Sills: Material shall be **[Bronze] [Nickel silver] [Stainless steel].**

7. Additional Requirements:

    a. Provide inspection certificate in each car, mounted under acrylic cover with frame made from **[satin stainless steel, No. 4 finish] [satin bronze, lacquered].**

C. Elevator **[[Group] XX]** Description:

1. **[Elevator Alphabetic Identification:]** Each elevator shall be identified with a unique alphabetic identification. Numeric and alphanumeric identification are prohibited.

2. Rated Load: **[900 kg (2000 lb)] [950 kg (2100 lb)] [1150 kg (2500 lb)] [1350 kg (3000 lb)] [1600 kg (3500 lb)] [1800 kg (4000 lb)] [2050 kg (4500 lb)] [2250 kg (5000 lb)] <INSERT VALUE>.**

3. **[Freight Loading Class for Passenger/Service Elevator(s): Class A.]**
4. Rated Speed: **[1.0 m/s (200 fpm] [2.5 m/s (500 fpm)] [3.6 m/s (700 fpm)] [4.1 m/s (800 fpm)] [5.1 m/s (1000 fpm)] [6.1 m/s (1200 fpm)] [7.1 m/s (1400 fpm)] <INSERT VALUE>**.
5. **[Auxiliary Operations:]**

    a. **[Emergency hospital] [Priority] service at [all] <INSERT FLOOR DESIGNATION> floors.]**

6. Security Features**:** No security features are for required for individual elevator; see Article on OPERATION SYSTEMS. Provide conductors and other components to facilitate potential for adding card reader at future time.
7. Car Enclosures:

    a. Inside Width: **[1600 mm (64 inches)] [1700 mm (68 inches)] [2000 mm (80 inches)] [2350 mm (92 inches)] <INSERT DIMENSION>** from side wall to side wall.
    b. Inside Depth: **<Insert dimension> [1300 mm (51 inches)] [1350 mm (53 inches)] [1450 mm (57 inches)] [1650 mm (65 inches)] [2200 mm (87-1/2 inches)] [2300 mm (90 inches)] [2350 mm (93 inches)] [2400 mm (93-1/2 inches)] [2450 mm (96 inches)] [2550 mm (101 inches)] [2600 mm (102 inches)] <INSERT DIMENSION>** from back wall to front wall (return panels).
    c. Inside Height: **[2250 mm (88 inches)] [2350 mm (92 inches)] [2400 mm (94 inches)] [2550 mm (100 inches)] [2650 mm (104 inches)] [2750 mm (108 inches)] [2850 mm (112 inches)] <INSERT DIMENSION>** to underside of ceiling.
    d. Front Walls (Return Panels): **[Satin stainless steel, No. 4 finish] [Satin bronze, lacquered].**
    e. Car Fixtures: **[Satin stainless steel, No. 4 finish] [Satin bronze, lacquered].**
    f. Side and Rear Wall Panels: **[Enameled steel] [Satin stainless steel, No. 4 finish] [Textured stainless steel] [Satin bronze, lacquered]**.
    g. Reveals: **[Enameled steel] [Satin stainless steel, No. 4 finish] [Satin bronze, lacquered]**.
    h. Door Faces (Interior): **[Enameled steel] [Primed steel] [Satin stainless steel, No. 4 finish] [Textured stainless steel] [Satin bronze, lacquered]**.
    i. Door Sills: **[Bronze] [Nickel silver] [Stainless Steel]**.
    j. Ceiling: **[Luminous ceiling] [Polished stainless steel, No. 8 finish] [Satin stainless steel, No. 4 finish] [Polished bronze, lacquered]**.
    k. Floor: **[Recessed and prepared to receive [ceramic] [dimension stone] tile [terrazzo] (specified in Division 09 Section] [Prepared to receive [resilient] [linoleum] flooring (specified in Division 09 Section)**.

8. Hoistway Entrances:

   a. Width: **[1300 mm (52 inches)] [1200 mm (48 inches)] [914 mm (36 inches)]**.
   b. Height: **[2100 mm (84 inches)] [2030 mm (80 inches]**.

   c. **[Type for XXX: [Single-speed side sliding] [Two-speed side sliding].]**
   d. **[Type for YYY: [Single-speed center opening] [Two-speed center opening]**.]

9. Hall Fixtures: **[Satin stainless steel, No. 4 finish] [Satin bronze, lacquered] [Recessed type with no exposed-metal surfaces].**

10. [Additional Requirements:

   a. Provide hooks for protective pads in all cars and two complete set(s) of full-height protective pads.]

2.4 TRACTION SYSTEMS

A. Elevator Machines: Permanent Magnet Variable-Voltage, Variable-Frequency, AC-gearless type hoisting machines are preferred.

   1. Provide regenerative drives systems.
   2. Limit total harmonic distortion of regenerated power to 5 percent per IEEE 519.
   3. Provide means for absorbing regenerated power when elevator system is operating on standby power.
   4. Provide line filters or chokes to prevent electrical peaks or spikes from feeding back into building power system.

B. Fluid for Hydraulic Buffers: If using hydraulic buffers, use only fire-resistant fluid.

C. Inserts: Furnish required concrete and masonry inserts and similar anchorage devices for installing guide rails, machinery, and other components of elevator work. Device installation is specified in another Section.

D. Machine Beams: Provide framing to support elevator hoisting machine and deflector sheaves from the building structure. Comply with Section 055005 "Metal Fabrications" for materials and fabrication.

E. Car Frame and Platform: Bolted- or welded-steel units.

F. Guides: Roller guides, non-lubricated. Provide guides at top and bottom of car and counterweight frames.

G. Suspension Means: Provide either Steel Traction Elevator Ropes or Coated Steel Belts with a FT-1 Fire rating

2.5 OPERATION SYTEMS

A. General: Provide manufacturer's standard microprocessor operation systems as required to provide type of operation indicated.

B. Auxiliary Operations: In addition to primary operation system features, provide the following operational features for elevators where indicated:

1. Group Standby Power Operation: On activation of standby power, cars are returned to a designated floor and parked with doors open.
2. **[Group Battery-Powered Rescue Operation: If power fails, cars that are at a floor remain at that floor, open their doors, and shut down. Cars that are between floors are lowered one at a time to the next floor below, open their doors, and shut down. System includes rechargeable battery and automatic recharging system.]**
3. Automatic Dispatching of Loaded Car: When car load exceeds 80 percent of rated capacity, doors begin closing.
4. Nuisance Call Cancel: When car calls exceed a preset number while car load is less than a predetermined weight, all car calls are canceled. Preset number of calls and predetermined weight can be adjusted.
5. Loaded-Car Bypass: When car load exceeds 80 percent of rated capacity, car responds only to car calls, not to hall calls.
6. Distributed Parking: When cars are not required for response to calls, they are parked with doors closed and distributed in predetermined zones throughout the building. One zone shall include the main floor and adjacent floors; remaining floors shall be divided into approximately equal zones.
7. Independent Service: Key-switch in car-control station removes car from group operation and allows it to respond only to car calls. Key cannot be removed from key-switch when car is in independent service. When in independent service, doors close only in response to door close button.
8. Emergency and Inspection panels (E&I) or Maintenance Access Panels (MAP) shall be located adjacent to top landing hoistway entrances.
9. Fire Access Elevators ; A minimum of two elevators that service all landings shall be provided in a high rise building

C. Security Operation Features: Provide the following security features, where indicated. Security features shall not affect emergency firefighters' service.

1. Marine Security Guard operation is required in all office buildings that have Post 1 and Marines providing security in the building.

D. Control Panel: Provide control panel for Post 1 Marine security guard station for elevator controls. This panel shall include car position indicator, three-position toggle switch with center “OFF,” and indicator lights mounted on engraved plate. Provide separate adjacent plate with instructions. Back box shall conform to applicable codes. Control panel features shall not affect emergency fire-fighting service.

1. Panel Face Plate: Surface mount stainless steel with No. 4 satin finish. Front of panel shall be permanently engraved with the designations below for toggle switch. With these letters at least 20 mm (3/4 inch) high.

   a. Top Position: "CAPTURE (doors locked)."
   b. Center Position: "NORMAL."
   c. Bottom Position: "NIGHT SHUTDOWN (doors open)."

2. Elevator Position Indicator: Provide digital type position indicator on top portion of panel which displays numbers/letters. Characters shall be minimum of 50 mm (2 inches) high showing floor location (e.g., 1, 2 or 3) and travel direction of each elevator.
3. Toggle Switch: Provide a three-position, heavy duty commercial toggle switch to select the "normal," "capture," and "night shutdown" modes.

   a. Capture Feature Operation: With the switch in the "capture (doors locked)" position, the operation of this security system is as follows.

      1) The green light (normal) will go out and the red light (capture) will blink.
      2) Hall calls shall be immediately canceled. The hall station call buttons, door-open button, and door-closed button shall be disabled.
      3) The elevator shall return non-stop to the ground floor lobby just as it would in the fire service recall mode.
      4) The car and hoistway doors shall remain in the closed position secured by retaining power on the car doors. Once the elevator is positioned at the ground floor, the doors can be opened by switching to the "night shutdown" position. The elevator will then remain at the ground floor with the doors open. Switching from the "capture" position to "night shutdown" position will cause the blinking red light to go out and the blue (steady-state) light to illuminate.
      5) The elevator shall remain at the first floor lobby until the switch is returned to the "normal" position, at which point the green (steady-state) light will illuminate.

   b. Night Shutdown: When toggle switch is pointing to "night shutdown (doors open)," sequence of operation is as follows.

      1) Green light "normal" shall go out, and blue (steady-state) light "night shutdown" shall illuminate.
      2) Hall calls shall be immediately canceled. Hall station call buttons, door-open button, and door-closed button shall be disabled.
      3) Elevator shall return non-stop to ground floor lobby just as it would in fire service recall mode.
      4) Car and hoistway doors shall open when at first floor lobby.
      5) Elevator shall remain at first floor lobby until switch is returned to "normal" position, at which point blue light shall go out and green (steady state) light shall illuminate.
      6) The car lights and fan shall turn off and not restart until switch is turned to Normal position.

4. Panel Indicator Lights: Provide red-blinking “capture” lamp, green “normal” lamp, and blue “shutdown” lamp as follows for each elevator.

   a. Red "capture" lamp shall be LED "blinking."
   b. Green "normal" lamp shall be LED.
   c. Blue "night shutdown" lamp shall be LED.

5. Instruction Plate: Provide separate engraved plate with No. 4 brushed stainless steel finish adjacent to elevator control panel which provides description of “Capture” and “Shutdown” modes. The words “capture” and “night shutdown” shall be engraved in black letters 8 mm (3/8 inch) high, with all other words engraved in black letters which are 6 mm (1/4 inch) high. This Instruction Plate shall be installed at same time as elevator control panel. This instruction plate shall include the following inscription:

   a. “CAPTURE: DISABLES PASSENGER COMMANDS. ELEVATOR RETURNS NON-STOP TO THE GROUND FLOOR AND PARKS WITH THE DOORS LOCKED CLOSED. DOORS ARE OPENED WHEN PUT IN THE SHUTDOWN MODE.”
   b. “NIGHT SHUTDOWN: DISABLES PASSENGER COMMANDS. ELEVATOR RETURNS TO GROUND FLOOR LANDING AND PARKS WITH THE CAR DOORS AND LOBBY DOORS IN THE OPEN POSITION AND THE CAR INTERIOR LIGHTS ARE OFF.”

2.6 DOOR REOPENING DEVICES

A. Infrared Array: Provide door reopening device with uniform array of 36 or more microprocessor-controlled, infrared light beams projecting across car entrance. Interruption of one or more light beams shall cause doors to stop and reopen.

B. Nudging Feature: After car doors are prevented from closing for predetermined adjustable time, through activating door reopening device, a loud buzzer shall sound and doors shall begin to close at reduced door speed that reduces kinetic energy.

2.7 CAR ENCLOSURES

A. General: Provide steel-framed car enclosures with non-removable wall panels, with car roof, power door operators, and ventilation.

   1. Provide standard railings complying with ASME A17.1/CSA B44 or EN 81-20, as applicable for the project (see Article on APPLICABLE CODES AND STANDARDS) on car tops.

B. Materials and Finishes: Manufacturer's standards, but not less than the following:

   1. [Subfloor: Exterior, underlayment grade plywood, not less than 16-mm (5/8-inch) nominal thickness for cars with resilient flooring.]

2. **[Subfloor: Exterior, C-C Plugged grade plywood, not less than 22-mm (7/8-inch) nominal thickness for cars with ceramic tile or dimension stone flooring.]**
3. Floor Finish: Specified in Division 09 Section on **[ceramic tile][dimension stone tile] [[resilient] [linoleum] flooring].**
4. **[Enameled-Steel Wall Panels: Flush, hollow-metal construction; fabricated from cold rolled steel sheet. Provide with factory-applied enamel finish; colors as selected by Architect from manufacturer's full range.]**
5. **[Stainless-Steel Wall Panels: Flush, hollow-metal construction; fabricated from stainless-steel sheet.]**
6. **[Bronze Wall Panels: Flush, hollow-metal construction; fabricated from bronze sheet.]**
7. Fabricate car with recesses and cutouts for signal equipment.
8. Fabricate car door frame integrally with front wall of car.
9. **[Enameled-Steel Doors: Flush, hollow-metal construction; fabricated from cold-rolled steel sheet. Provide with factory-applied enamel finish; colors as selected by Architect from manufacturer's full range.]**
10. **[Stainless-Steel Doors: Flush, hollow-metal construction; fabricated from stainless-steel sheet or by laminating stainless-steel sheet to exposed faces and edges of enameled cold-rolled steel doors using adhesive that fully bonds metal to metal without telegraphing or oil-canning.]**
11. **[Bronze Doors: Flush, hollow-metal construction; fabricated by laminating bronze sheet to exposed faces and edges of enameled cold-rolled steel doors using adhesive that fully bonds metal to metal without telegraphing or oil-canning.]**
12. Sight Guards: Provide sight guards
13. Sills: Extruded or machined metal, with groove surface, 6 mm (1/4 inch) thick.
14. Luminous Ceiling: Provide LED cab light fixtures and ceiling panels of translucent acrylic or other permanent rigid plastic.
15. **[Metal]** Ceiling: Flush panels, with **[incandescent downlights in the center of][four low-voltage downlights in]** each panel. **[Align ceiling panel joints with joints between wall panels.]**

2.8 HOISTWAY ENTRANCES

A. Hoistway Entrance Assemblies: Manufacturer's standard horizontal-sliding, door-and-frame hoistway entrances complete with track systems, hardware, sills, and accessories. Frame size and profile shall accommodate hoistway wall construction.

1. Where gypsum board wall construction is indicated, frames shall be self-supporting with reinforced head sections.

B. Fire-Rated Hoistway Entrance Assemblies: Door and frame assemblies shall comply with NFPA 80 or EN 81-58 and be listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction based on testing at as close-to-neutral pressure as possible according to NFPA 252 or UL 10B.

1. Fire-Protection Rating: 1-1/2 hours with 30-minute temperature rise of 250 deg C (450 deg F).

C. Materials and Fabrication: Manufacturer's standards, but not less than the following:

1. **[Enameled-Steel Frames: Formed from cold- or hot-rolled steel sheet. Provide with factory-applied enamel finish; colors as selected by Architect through Project Director/COR from manufacturer's full range.]**
2. **[Stainless-Steel Frames: Formed from stainless-steel sheet.]**
3. Star of Life Symbol: Identify emergency elevators with star of life symbol, not less than 3 inches (76 mm) high, on both inside surfaces of hoistway door frames.
4. **[Enameled-Steel Doors: Flush, hollow-metal construction; fabricated from cold-rolled steel sheet. Provide with factory-applied enamel finish; colors as selected by Architect through Project Director/COR from manufacturer's full range.]**
5. Sight Guards: Provide sight guards on doors matching door edges.
6. Sills: Stainless steel, with grooved surface, 6.4 mm (1/4 inch) thick.
7. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M.

2.9 SIGNAL EQUIPMENT

A. General: **[Provide hall-call and car-call buttons that light when activated and remain lit until call has been fulfilled.][Provide signal equipment designed for destination-based system.]** Fabricate lighted elements with LEDs.

B. Car-Control Stations: Provide manufacturer's standard **[recessed][semi-recessed]** car control stations. Mount in return panel adjacent to car door unless otherwise indicated.

1. Mark buttons and switches for required use or function. Use both tactile symbols and Braille.
2. Provide "No Smoking" sign matching car-control station, either integral with car-control station or mounted adjacent to it, with text and graphics as required by authorities having jurisdiction.

C. Swing-Return Car-Control Stations: Provide car-control stations mounted on rear of hinged return panel adjacent to car door and with buttons, switches, controls, and indicator lights projecting through return panel but substantially flush with face of return panel.

1. Mark buttons and switches for function. Use both tactile symbols and Braille.
2. Provide "

D. Emergency Communication System: Hands-free audio two-way emergency communication between each car and Post 1. Television monitoring shall NOT be installed in cars. System automatically dials preprogrammed number of monitoring service and identifies elevator location to Post 1. System shall be contained in flush-mounted cabinet complete with identification; instructions for use, and battery back-up power supply, and complies with accessibility requirements in Chapter 11 of the OBO Building Code. Emergency communications shall direct calls to Post 1 first.

E. Communication System: Provide additional means to communicate between pit, top of car, and in-car to both Post 1 and emergency inspection control panel.

F. [Firefighters' Two-Way Telephone Communication Service: Provide [flush-mounted cabinet][telephone jack] in each car and required conductors in traveling cable for firefighters' two-way telephone communication service specified in Section 284626 "Addressable Fire Alarm Systems."]

G. Car Position Indicator: Provide illuminated, digital-type car position indicator, located above car door or above car-control station. Also, provide audible signal to indicate to passengers that car is either stopping at or passing each of the floors served. Include travel direction arrows if not provided in car-control station.

H. Hall Push-Button Stations: Provide one hall push-button station at each landing for each single elevator or group of elevators, but not less than one station for each four elevators in a group.

1. Provide **[manufacturer's standard wall-mounted units][units with flat faceplate for mounting with body of unit recessed in wall]**.
2. Equip units with buttons for calling elevator and for indicating desired direction of travel.
3. Equip units with buttons for calling elevator and for indicating direction of travel.

I. Provide telephone jack in each unit for firefighters' two-way telephone communication service specified in Section 284626 "Addressable Fire Alarm Systems."

J. Hall Lanterns: Units with illuminated arrows; but provide single arrow at terminal landings. Provide the following:

1. [Manufacturer's standard wall-mounted units, for mounting above entrance frames.]
2. [Units with flat faceplate for mounting with body of unit recessed in wall and with illuminated elements projecting from faceplate for ease of angular viewing.]

K. Hall Annunciator: With each hall lantern, provide audible signals indicating car arrival and direction of travel. Signals sound once for up and twice for down.

1. At manufacturer's option, audible signals may be placed on cars.

L. Hall Position Indicators: Provide illuminated, digital-display-type position indicators, located above each hoistway entrance at ground floor. Provide units with flat faceplate for mounting and with body of unit recessed in wall.

1. Integrate ground-floor hall lanterns with hall position indicators.

M. [Fire-Command-Center Annunciator Panel: Provide panel containing illuminated position indicators for each elevator, clearly labeled with elevator designation; include illuminated signal that indicates when elevator is operational and when it is at the designated emergency return level with doors open. Provide standby power elevator selector switch(es), as required by ASME A17.1/CSA B44, adjacent to position indicators. Provide illuminated signal that indicates when normal power supply has failed.]

N. Emergency Pictorial Signs: Fabricate from materials matching hall push-button stations, with text and graphics in accordance with “Signage and Wayfinding Design Guide” reference document in

the OBO Design Standards, indicating that in case of fire, elevators are out of service and exits should be used instead. Provide one sign at each hall pushbutton station unless otherwise indicated.

2.10 FINISH MATERIALS

A. General: Provide the following materials for exposed parts of elevator car enclosures, car doors, hoistway entrance doors and frames, and signal equipment as indicated.

B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, commercial steel, Type B, exposed, matte finish.

C. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, commercial steel, Type B, pickled.

D. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304.

E. [Textured Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304 with embossed texture rolled into exposed surface.

1. Product: Subject to compliance with requirements, provide <INSERT PRODUCT NAME> by <INSERT MANUFACTURER'S NAME>.
2. Metal surface is [satin relieved] [titanium nitride colored] [oxide colored] [satin relieved and titanium nitride colored] [satin relieved and oxide colored] [color coated and satin relieved] [color coated and bright relieved] after texturing.]

F. Stainless-Steel Bars: ASTM A 276, Type 304.

G. Stainless-Steel Tubing: ASTM A 554, Grade MT 304.

H. [Bronze Plate and Sheet: ASTM B 36/B 36M, Alloy UNS No. C28000 (muntz metal).]

I. [Bronze Extrusions: ASTM B 455, Alloy UNS No. C38500 (architectural bronze).]

J. [Bronze Tubing: ASTM B 135 (ASTM B 135M), Alloy UNS No. C23000 (red brass, 85 percent copper).]

K. [Nickel Silver Extrusions: ASTM B 151/B 151M, Alloy UNS No. C74500 or No. C77600.]

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elevator areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work. Examine hoistways, hoistway openings, pits, and machine rooms as constructed; verify critical dimensions; and examine supporting structure and other conditions under which elevator work is to be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's written instructions.

B. Welded Construction: Provide welded connections for installing elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment, inspection, maintenance, and replacement of worn parts. Comply with AWS D1.1M Structural Welding Code for workmanship and for qualifications of welding operators.

C. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts to minimize vibration transmission to structure and structure-borne noise due to elevator system.

D. Lubricate operating parts of systems, including ropes, as recommended by manufacturers.

E. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with car. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.

F. Leveling Tolerance: 3 mm (1/8 inch), up or down, regardless of load and travel direction.

G. Set sills flush with finished floor surface at landing. Fill space under sill solidly with non-shrink, nonmetallic grout.

H. Locate hall signal equipment for elevators as follows unless otherwise indicated:

1. For groups of elevators, locate hall push-button stations between two elevators at center of group or at location most convenient for approaching passengers.
2. Place hall lanterns either above or beside each hoistway entrance.
3. Mount hall lanterns at a minimum of 1800 (72 inches) above finished floor.

3.3 FIELD QUALITY CONTROL

A. Contractor Pre-Testing Inspection: Contractor shall completely test that elevators are completed 100 percent prior to requesting OBO Elevator Management Program to witness acceptance testing and final inspection.

B. Acceptance Testing: Upon completion of elevator installation and before permitting elevator use (either temporary or permanent), perform acceptance tests as required and recommended by ASME A17.1/CSA B44 and by local governing regulations and agencies. Acceptance testing shall be witnessed by OBO Elevator Management Program personnel as the Department of State AHJ for elevators.

C. Operating Test: Load elevator to rated capacity and operate continuously for 30 minutes over full travel distance, stopping at each level and proceeding immediately to the next. During a 30-minute test period record the temperature rise of elevator machine. Record failure to perform as required.

D. Advise Project Director/COR and OBO Elevator Management Program a minimum of 21 days in advance of dates and times that tests are to be performed on elevators.

3.4 PROTECTON

A. Temporary Use: Limit temporary use for construction purposes to one service elevator. Comply with the following requirements for elevator used for construction purposes:

1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
2. Provide strippable protective film on entrance and car doors and frames.
3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
5. Do not load elevators beyond their rated weight capacity.
6. Engage elevator Installer to provide full maintenance service. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleanup, and adjustment as necessary for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
7. Engage elevator Installer to restore damaged work, if any, so no evidence remains of correction. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train post Facility Maintenance personnel to operate**[, adjust, and maintain]** elevator(s).

B. Check operation of each elevator with post Facility Maintenance personnel present before date of Substantial Completion and again not more than one month before end of warranty period. Determine that operation systems and devices are functioning properly.

END OF SECTION 142105

SECTION 144500 - VEHICLE LIFTS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes:

1. Heavy-duty four-post surface (above ground) vehicle lift.
2. Associated rolling bridge jacks.

B. Related Sections:

1. Section 033000 "Cast-In-Place Concrete" for thickened slab design to support vehicle lift.
2. Section 115700 “Shop Equipment” for general shop equipment associated with Vehicle Lift.
3. Various Division 26 Sections for general electrical infrastructure and requirements.

1.2 PERFORMANCE REQUIREMENTS

A. Structural Performance: Design, engineer, fabricate, and install vehicle lift to withstand mass weight loads of not less than 5,500 kg (12,000 lbs).

B. Comply with the OBO Electrical Code (National Electrical Code, NFPA 70, as amended by OBO).

1.3 SUBMITTALS

A. Product Data: Include capacities, sizes, performances, operations, safety features, finishes, and similar information. Include Product Data for operation, control, and safety equipment.

B. Shop Drawings: Provide shop drawings including requirements for attachment to strengthened slab and connection to electrical.

C. Qualifications Data: If requested by Project Director/COR, submit list of facilities that have used specific model selected by Contractor for this project, with contact information for those facilities.

D. Maintenance Data: Include manufacturer’s original maintenance information to include in the Operation and Maintenance Manual Data.

E. Warranty: Properly executed warranties from manufacturer of vehicle lift, both as required by these Specifications, and as noted to be available by published product literature.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Vehicle lift manufacturer or manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Equipment Manufacturer: Equipment being offered shall be a model that has been in production for a minimum of five years.

C. Comply with ANSI/ALI/ALCTV "Standard for Automotive Lifts – Safety Requirements for Construction, Testing, and Validation."

D. Vehicle Lift shall bear American Lift Institute (ALI) certification label.

1.5 COORDINATION

A. Coordinate installation of items that are required to be embedded in concrete with on-site manager for concrete subcontractor in consultation with General Contractor. Furnish templates and installation instructions and deliver to Project site in time for installation.

B. Coordinate locations, routing, and dimensions of other work relating to lift including electrical service.

1.6 WARRANTY

A. Warranties: Provide standard manufacturer's written warranty, without monetary limitation, signed by manufacturer agreeing to promptly repair or replace products that fail in materials or workmanship for the following periods:

1. Structural Components: Five years from Substantial Completion.
2. Hydraulic Power Units and Cylinders: Two years from Substantial Completion.

PART 2 - PRODUCTS

2.1 VEHICLE LIFT (OBO COMPONENT CODE SQ025):

A. Basis-of-Design Product: Subject to compliance with requirements, provide BendPak HDS27 or comparable product:

B. Lifting height shall be 1740 mm (68-1/2 inches) minimum. This measurement is measured from floor to top of lifting pad when lift is at full height and when lifting pad is at its lowest position.

C. Provide redundant safety lock system.

1. One acceptable system includes gravity activated locks in each column, working independently of each other. The mechanical locks are released manually. Mechanical

locks re-engage automatically every time lift is raised. Mechanical locks allow operator to release locks and lower lift without continuing to hold lock release.

2. Another system with comparable level of protection may be used with approval of Project Director/COR.

D. Lifting Speed: 120 seconds minimum from floor to full height.

E. Lift Dimensions: Provide the following:

1. Hydraulic line may be adjustable to accommodate minimum vehicle height from undercarriage to roof to 1650 mm (66 inches).
2. Hydraulic line may be adjustable to accommodate minimum vehicle height from undercarriage to roof to 1650 mm (66 inches).
3. Width Between Columns: Approximate standard is 3,000 mm (10 feet). That dimension shall not be reduced.
4. Runway Heights: 215 mm (8-1/2 inches) minimum at lowest position when lift is all the way down.

2.2 HYDRAULICS

A. Lift shall incorporate primary/secondary hydraulic system capable of synchronizing elevations during both raising and lowering operations; this capability shall be achievable when most adverse rated load placed on lift. Lift shall come equipped with fully automatic leveling control and manual over-ride as back up.

B. Internal hydraulic safeties on both cylinders shall detect significant mainside-to-offside pressure differentials. Should pressure change or an imbalance occur for any reason, lift shall lock hydraulically on both sides.

C. Full load working pressure shall be maximum of 1,930 Mg per sq. m (2,750 psi). Higher pressure systems will not be accepted.

D. Provide external hydraulic safeties to prevent collapse in the event of leak, and mechanisms to limit descent speed.

2.3 POWER UNIT

A. Power unit may be mounted on either driver side or passenger side column. Provide manufacturer's standard unit compatible requirements for building.

B. Power unit shall conform to in-country electrical requirements for volts and hertz.

2.4 FABRICATION

A. Vehicles lifts shall be shop-fabricated and delivered to the project site ready for installation.

2.5 FINISHES

A. Steel Finishes: Provide powder coat or baked-enamel finish.

2.6 ACCESSORY UNIT

A. Rolling Bridge Jack (OBO Component Code SQ084): Provide jack that will be used in conjunction with vehicle lift.

1. Basis of Design Product: Subject to compliance with requirements, provide BendPak RJ-15 or comparable product.
2. Salient Characteristics:

a. Lifting Capacity: 6800 kg (15,000 lbs).
b. Width: 1120 mm (44 inches) min., 1475 mm (58 inches) max.
c. Arm Reach: 1145 mm (45 inches) min., 1475 mm (58 inches) max.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Prepare substrate by cleaning, removing projections, filling voids, sealing joints, and as otherwise recommended in vehicle lift manufacturer's written instructions.

B. Set units level, plumb, and true to line, without warp or rack of frames and panels.

C. Fasten vehicle lift securely in place, with provisions for thermal and structural movement. Install with manufacturer-approved and supplied fasteners.

D. Dissimilar metals and metal products shall be separated from contact with wood or cementitious materials by painting each metal surface in area of contact with bituminous coating, or by other permanent separation.

3.2 FIELD QUALITY CONTROL

A. Acceptance Testing: Upon completion of vehicle lift installation, and before permitting use of lift, perform acceptance tests, including any by local authorities having jurisdiction if applicable.

B. If vehicle lift equipment or its installation are deficient, repair or replace vehicle lift, and refinish if necessary as directed by Project Director/COR. If necessary for correction process, remove deficient vehicle lift.

3.3 ADJUSTING, CLEANING, AND PROTECTION

A. Adjust operating parts and hardware for smooth, quiet operation, and ready for use. Lubricate hardware and moving parts.

B. Clean equipment in accordance with manufacturer’s instructions.

C. Protect equipment from damage during remainder of construction period.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Government's maintenance personnel to operate, adjust, and maintain vehicle lift.

1. Additionally include procedures related to start-up, normal operation, shutdown, manual operation, controls set-up and programming, and alarms for maintaining the vehicle lifts and associated rolling bridge jacks. Include interactions with compressed air systems.

B. Duration of training session shall meet the following:

1. Classroom: 1 hour
2. Field Demonstration: 1 hour

END OF SECTION 144500

SECTION 211305 – FIRE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following building fire suppression piping:

1. Automatic wet-type, Class I standpipe systems.
2. Wet-pipe sprinkler systems.
3. Dry-pipe sprinkler systems.

B. Related Requirements:

1. Section 104415 “Fire-Protection Specialties” for cabinets and fire extinguishers.
2. Section 213115 "Fire Pump Assemblies" for fire pumps, pressure-maintenance pumps, and pump controllers.
3. Section 284626 "Addressable Fire Alarm Systems" for alarm devices not specified in this section.
4. Section 331414 "Fire Service Mains and Appurtenances" for piping and fire hydrants outside the building.

1.2 CODES AND STANDARDS

A. Codes: The OBO Building Code consists of the model International Building Code and OBO amendments in the OBO International Codes Supplements (OBO-ICS). Codes adopted by OBO are identified in Chapter 1 of the OBO-ICS IBC (supplement to the Building Code) for the year applicable to the project.

B. Standards:

1. National Fire Protection Association (NFPA): Fire-suppression system equipment, specialties, accessories, installation, and testing shall comply with the following:

a. NFPA 3, "Standard for Commissioning of Fire Protection and Life Safety Systems,” 2024 edition.
b. NFPA 4, "Standard for Integrated Fire Protection and Life Safety Systems Testing,” 2024 edition.
c. NFPA 13, "Standard for the Installation of Sprinkler Systems," 2022 edition.
d. NFPA 13D, "Standard for the Installations of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes," 2022 edition.
e. NFPA 13R, "Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies,” 2022 edition.

f. NFPA 14, "Standard for the Installation of Standpipe and Hose Systems," 2022 edition.
g. NFPA 20, "Standard for the Installation of Stationary Pumps for Fire Protection," 2022 edition.
h. NFPA 22, “Standard for Water Tanks for Private Fire Protection,” 2023 edition.
i. NFPA 24, "Standard for the Installation of Private Fire Service Mains and Their Appurtenances," 2022 edition.
j. NFPA 25, “Standard for the Inspection, Testing and Maintenance of Water-based Fire Protection Systems,” 2023 edition.
k. NFPA 37, "Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines," 2024 edition.
l. NFPA 72, "National Fire Alarm and Signaling Code," 2022 edition.
m. NFPA 170, “Standard for Fire Safety and Emergency Symbols,” 2021 edition.
n. NFPA 241, “Standard for Safeguarding Construction, Alteration and Demolition Operations,” 2022 edition.
o. NFPA 291, “Recommended Practice for Fire Flow Testing and Marking of Hydrants,” 2025 edition.

C. Conflicts: Where applicable codes and standards differ, notify OBO/OPS/FIRE/FPE through the Project Director/COR prior to action. The baseline direction will be to apply the more stringent requirement.

1.3 DEFINITIONS

A. High-Pressure Sprinkler Piping: Wet-pipe sprinkler system piping designed to operate at working pressure higher than standard 1200 kPa (175 psig).

B. Standard-Pressure Sprinkler Piping: Wet-pipe sprinkler system piping designed to operate at working pressure of 1200-kPa (175-psig) maximum.

1.4 ACTION SUBMITTALS

A. General: Submittal of all drawings, calculations, and product data, and qualifications will be deemed incomplete and not reviewed unless all are submitted together; an incomplete submittal will not be reviewed, and is considered not acceptable.

B. Product Data: For each type of product include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

1. Pipes, fittings, and specialties.
2. Pipe hangers, supports, and braces
3. Cover system for sprinkler piping.
4. Specialty valves.
5. Sprinklers.
6. Alarm devices.

7. Manual control stations.
8. Control panels.
9. Pressure gages.
10. Air compressors.
11. Hose connections.
12. Fire department connections.
13. Other miscellaneous items used, Teflon tape, etc.

C. Shop Drawings: For standpipe and sprinkler systems. Prepare code compliant working plans according to NPFA 13, Chapter 22, including hydraulic calculations for acceptance by Project Director/COR based on approval by OBO/OPS/FIRE/FPE. Shop drawings shall be consistent with the Construction Drawing Set, including plans, schematics, and diagrams, which indicate general locations and arrangement of piping. Approved full size shop drawings both Set A & B are required to be onsite when the installation begins.

1. Include plans, elevations, sections, and attachment details.
2. Include hydraulic calculations in both SI (metric) and IP (imperial) units.
3. Include structural design calculations.
4. Include diagrams for power, signal, and control wiring.
5. Include water storage tank detail with water volume, water level monitoring, and other details required for water supply source.

D. Delegated-Design Submittal: For standpipe and sprinkler systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer or NICET designer responsible for their preparation.

1. Submit product data, hydraulic calculations, seismic calculations, and the sprinkler shop drawings simultaneously as one package. Submit two full size hard copies and one electronic copy on a compact disk. Submittal will be deemed incomplete and not reviewed unless it is compliant with the information contained herein, and has attached all drawings, calculations and manufacturers information for review.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Sprinkler systems, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Architectural building features.

   a. Interior Walls.
   b. Partition Assemblies.
   c. Interior Soffits.

2. Domestic water piping.
3. Compressed air piping.
4. HVAC hydronic piping.

5. Items penetrating finished ceiling include the following:

   a. Lighting fixtures.
   b. Air outlets and inlets.
   c. HVAC equipment.

B. Qualification Data:

1. Lead Installer: Provide Journeyman/Journeyperson license from any state or federal program that requires at least a 4-year fire protection apprentice program or a notarized copy of qualifying certificate (NICET III or higher in water based fire protection systems layout or licensed fire protection engineer) to OBO/OPS/FIRE prior to installation.
2. For Qualified Individual and Professional Engineer or NICET designer, furnish a notarized copy of qualifying certificate (NICET III or higher in water based fire protection systems layout or licensed fire protection engineer) to OBO/OPS/FIRE prior to installation.

C. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, that have been approved OBO/OPS/FIRE/FPE and accepted by the Project Director/COR, including hydraulic calculations, product data, and seismic calculations.

D. Welding certificates.

E. Fire-hydrant flow test report or recent fire pump test report.

F. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 3, 4, 13, and 14. Include "Contractor's Material and Test Certificate for Aboveground Piping."

G. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For standpipe and sprinkler systems and specialties to include in emergency, operation, and maintenance manuals.

1. Operation and Maintenance manuals shall include:

   a. Instructions on stopping.
   b. Shutdown instructions for each type of emergency.
   c. Operating instructions for conditions outside normal operating limits.
   d. Required sequences for electric or electronic systems.
   e. Special operating instructions and procedures.
   f. Locations of all drains.

1.7 QUALITY ASSURANCE

A. Fire-Suppression standpipe and sprinkler systems design shall be approved by OBO/OPS/FIRE/FPE.

B. Manufacturer Qualifications: All components of the sprinkler system shall be supplied by a U.S. manufacturer. There shall be no deviations from this requirement except by written approval from OBO/OPS/FIRE/FPE through the Project Director/COR.

C. System continuity: A single installer shall be used for all aspects of the installation, including classified work and unclassified work. Fire pump shall be installed by same contractor as sprinkler system.

D. Installation Subcontractor Qualifications:

1. Installation subcontractor's responsibilities include designing, fabricating, and installing sprinkler systems and providing professional engineering services needed to assume engineering responsibility. Design shall be in accordance with the required and advisory provisions of NFPA 13 and other applicable codes listed in the Article on CODES AND STANDARDS.
2. Lead Installer: The lead on-site fire protection system installer shall be a licensed sprinkler journeyman/journeyperson, NICET III or higher, or licensed fire protection engineer and have a minimum of five years hands-on recent experience in the design and installation of fire protection systems for the different building types included in this project.

   a. On-Site Presence: The Lead Installer shall be on-site from the beginning of the fire protection system installation through completion, including commissioning and acceptance. This individual shall furnish to OBO/OPS/FIRE thru the Project Director a monthly report detailing status of the job on a per- building / per-floor basis. This report shall include resolution of punch list items, if applicable, whether generator by contractor or OBO personnel.

3. Qualified Individual: Employ at least one person with current qualifications that meet the referenced standard (NICET III or higher or licensed fire protection engineer). This individual is ultimately responsible for the quality control of the installation. This person is designated as the qualified individual.

   a. Required Consultation: The qualified individual must meet and consult with site management and lead fire protection system installer to establish means and methods to install the fire protection system. This meeting shall be held prior to the installation of the fire protection system.
   b. On-Site Presence: The Qualified Individual shall be on-site as necessary to ensure quality control of the installation, but no less than as required by this specification under the Field Quality Control Section. Where issues arise with the quality of the installation, the government can require the Qualified Individual to be onsite until the issues have been resolved. The Qualified Individual shall be onsite for final acceptance testing and prepare all NFPA certificates for the project.

4. Engineering Responsibility: Contract Drawings shall be designed and approved by a qualified professional engineer. Preparation of working plans, calculations, and field test reports shall be by a qualified professional engineer and/or an individual with a minimum of NICET III certification in water based fire protection systems layout.

E. Welding Qualifications: Qualify procedures and operators according to 2010 ASME Boiler and Pressure Vessel Code.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Upon delivery, place equipment and components in storage in a manner to preclude damage from weather, humidity and temperature variations, dirt and dust, or other contaminates. All pipes shall either be capped or plugged until installed.

1.9 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Sprinkler Cabinets: Finished, wall-mounted, steel cabinet with hinged cover, and with space for minimum of six spare sprinklers plus sprinkler wrench. Include at least two sprinklers of each type and temperature used on the project. Include sprinkler wrench for each type of sprinkler requiring a special wrench.

1.10 WARRANTY

A. Contractor's Warranty: Submit a written warranty agreeing to repair or replace any portion of the automatic sprinkler system that fails in materials or workmanship within a period of one year after the latter of substantial completion or sprinkler system final acceptance testing, which is witnessed by OBO/OPS/FIRE.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTIONS

A. Combined System: A standpipe system that supplies both hose connections and automatic sprinklers.

B. Automatic Wet-Type, Class I Standpipe System: Includes DN 65 (NPS 2-1/2) hose connections. Has open water-supply valve with pressure maintained and is capable of supplying water demand.

C. Automatic Dry-Type, Class I Standpipe System: Includes DN 65 (NPS 2-1/2) hose connections. Has open water-supply valve and dry-pipe valve with standpipes containing compressed air or nitrogen. Opening fire-hose valve releases compressed air and permits water pressure to open dry-pipe valve. Water then flows into standpipes.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer or NICET designer to design Class I standpipe systems.

1. Standpipe system design shall be approved by OBO/OPS/FIRE/FPE. Standpipe systems shall meet the pressure and flow requirements of the local fire department and the following:

a. Minimum residual pressure at each hose-connection outlet shall be 450 kPa (65 psig).
b. Flow Rate:

1) Minimum flow rate for the hydraulically most remote standpipe shall be 1893 L/min (500 gpm).
2) Minimum flow rate for each additional standpipe shall be 946 L/min (250 gpm).
3) The maximum flow rate shall be 3785 L/min (1000 gpm) for buildings that are sprinklered throughout, in accordance with NFPA 13, and 4731 L/min (1250 gpm) for buildings that are not sprinklered throughout.

2. Hydraulic calculations shall be prepared according to NFPA 14 criteria.

B. Standard-Pressure Piping System Component: Listed for 1200-kPa (175-psig) minimum working pressure.

C. High-Pressure Piping System Component: Listed for **[1725-kPa (250-psig) minimum] [2070-kPa (300-psig)]** working pressure.

D. Delegated Design: Engage a qualified professional engineer or NICET designer to design sprinkler systems.

1. Sprinkler system design shall be approved by OBO/OPS/FIRE/FPE.

a. Margin of Safety for Available Water Flow and Pressure: 10 percent, including losses through water-service piping, valves, and backflow preventers, etc.
b. Sprinkler Occupancy Hazard Classifications:

1) Automobile Parking Areas: Ordinary Hazard, Group 1.
2) Building Service Areas: Ordinary Hazard, Group 1.
3) Electrical Equipment Rooms: Ordinary Hazard, Group 1.

4) General Storage Areas: Ordinary Hazard, Group 1.
5) Mechanical Equipment Rooms: Ordinary Hazard, Group 1.
6) Office and Public Areas: Light Hazard.
7) Residential Living Areas: Light Hazard.
8) Food Preparation/Service Areas: Ordinary Hazard, Group 1.
9) Warehouse: Type IV commodity unless higher hazard is expected.

2. Minimum Density for Automatic-Sprinkler Piping Design:

a. Light-Hazard Occupancy: 4.1 mm/min. over 139-sq. m (0.10 gpm over 1500-sq. ft**.)** area.
b. Ordinary-Hazard, Group 1 Occupancy: 6.1 mm/min. over 139-sq. m (0.15 gpm over 1500-sq. ft**.)** area.
c. Ordinary-Hazard, Group 2 Occupancy: 8.1 mm/min. over 139-sq. m (0.20 gpm over 1500-sq. ft.**)** area.
d. Extra-Hazard, Group 1 Occupancy: 12.2 mm/min. over 232-sq. m (0.30 gpm over 2500-sq. ft.**)** area.
e. Extra-Hazard, Group 2 Occupancy: 16.3 mm/min. over 232-sq. m (0.40 gpm over 2500-sq. ft.**)** area.

3. Maximum Protection Area per Sprinkler: According to UL listing of the sprinkler, but not greater than:

a. Office Spaces: 20.9 sq. m (225 sq. ft.).
b. Storage Areas: 12.1 sq. m (130 sq. ft.).
c. Mechanical Equipment Rooms: 12.1 sq. m (130 sq. ft.**)**.
d. Electrical Equipment Rooms: 12.1 sq. m (130 sq. ft.).
e. Generator Rooms: 9.2 sq. m (100 sq. ft.).
f. Other Areas: According to NFPA 13 recommendations unless otherwise indicated.

4. Total Combined Hose-Stream Demand Requirement: According to NFPA 13 unless otherwise indicated:

a. Light-Hazard Occupancies: 6.3 L/s (100 gpm) for 30 minutes.
b. Ordinary-Hazard Occupancies: 15.75 L/s (250 gpm) for 60 to 90 minutes.
c. Extra-Hazard Occupancies: 31.5 L/s (500 gpm) for 90 to 120 minutes.

5. Hydraulic calculations shall be prepared according to NFPA 13 criteria for Area/Density method. The use of quick response reductions are not permitted.

E. Water Supply: Base hydraulic calculations on results of pump test when supply takes suction from compound fire protection water tank; in the uncommon case where fire protection water is supplied directly from the municipal system, which is indicated on Construction Drawings if applicable, base calculations on the result of the flow test associated with that system.

F. Seismic Performance: Fire-suppression piping shall withstand the effects of earthquake motions determined according to OBO-ICS IBC Chapter 16, NFPA 13 and ASCE/SEI 7, "Minimum Design Loads for Buildings and Other Structures," Section 9, "Earthquake Loads".

2.3 MANUFACTURERS

A. In other Part 2 Articles, where titles introduce lists of available manufacturers, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to, the manufacturers specified.

2.4 STEEL PIPE AND FITTINGS

A. Standard-Weight, Black-Steel Pipe: ASTM A 53/A 53M, ASTM A 135, or ASTM A795. Pipe ends may be factory or field formed to match joining method.

B. Schedule 10, Black-Steel Pipe: ASTM A 135/A 135M or ASTM A 795/A 795M, Schedule 10 in DN 125 (NPS 5) to DN65 (NPS 2 1/2); and NFPA 13-specified wall thickness in DN 150 to DN 250 (NPS 6 to NPS 10), plain end.

C. Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, standard-weight, seamless steel pipe with ends matching joining method.

D. Uncoated-Steel Couplings: ASTM A 865/A 865M, threaded.

E. Uncoated, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.

F. Uncoated, Malleable-Iron Threaded Fittings: ASME B16.3.

G. Malleable- or Ductile-Iron Unions: UL 860.

H. Cast-Iron Flanges: ASME B16.1, Class 125.

I. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.

1. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 3.2 mm (1/8 inch) thick, ASME B16.21, nonmetallic and asbestos free or EPDM rubber gasket.

   a. Class 125 and Class 250, Cast-Iron, Flat-Face Flanges: Full-face gaskets.
   b. Class 150 and Class 300, Ductile-Iron or -Steel, Raised-Face Flanges: Ring-type gaskets.

2. Metal, Pipe-Flange Bolts and Nuts: Carbon steel unless otherwise indicated.

J. Steel Welding Fittings: ASTM A 234/A 234M and ASME B16.9.

1. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

K. Grooved-Joint, Steel-Pipe Appurtenances:

1. Available Manufacturers:

a. Anvil International, Inc.
b. Central Sprinkler Corp.
c. Ductile, Inc.
d. JDH Pacific, Inc.
e. National Fittings, Inc.
f. Shurjoint Piping Products, Inc.
g. Southwestern Pipe, Inc.
h. Star Pipe Products; Star Fittings Div.
i. Victaulic Co. of America.
j. Ward Manufacturing

2. Pressure Rating: 1200-kPa (175-psig) minimum.
3. Grooved-End Fittings for Steel Piping: ASTM A 536, ductile-iron casting, with dimensions matching steel pipe.
4. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213 rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts.

2.5 DIELECTRIC FITTINGS

A. Where dielectric fittings are required due to connection of dissimilar metals, all system piping shall be flushed to clear all systems of any debris within the piping before connections with the dielectric fittings.

B. Assembly shall be copper alloy, ferrous, and insulating materials with ends matching piping system.

C. Dielectric Unions: Factory-fabricated assembly, designed for 1725 kPa (250 psig) minimum working pressure at 82 deg C (180 deg F). Including insulating material that isolates dissimilar materials and ends with inside threads according to ASME B1.20.1.

1. Available Manufacturers:

a. Capitol Manufacturing Co.
b. Central Plastic Company.
c. Epco Sales, Inc.
d. Hart Industries International, Inc.

e. Watts Industries, Inc.; Water Products Div.
f. Zurn Industries, Inc.; Wilkins Div.

D. Dielectric Flanges: Factory-fabricated companion-flange assemblies, for 1200 kPa (175 psig) minimum working-pressure rating as required for piping system.

1. Available Manufacturers:

a. Capitol Manufacturing Co.
b. Central Plastics Company
c. Epco Sales, Inc.
d. Watts Industries, Inc.; Water Products Div.

E. Dielectric Flange Insulation Kits: Components for Field assembly shall include CR or phenolic gasket, PE or phenolic bolt sleeves, phenolic washers, and steel backing washers.

1. Available Manufacturers:

a. Advanced Products and Systems, Inc.
b. Calpico, Inc.
c. Central Plastic Company.
d. Pipeline Seal and Insulator, Inc.

F. Dielectric Couplings: Galvanized steel with inert and noncorrosive thermoplastic lining and threaded ends and 2070 kPa (300 psig) working-pressure rating at 107 deg C (225 deg F).

1. Available Manufacturers:

a. Calpico, Inc.
b. Lochinvar Corp.

G. Dielectric Nipples: Electroplated steel with inert and noncorrosive thermoplastic lining, with combination of plain, threaded, or grooved ends and 2070 kPa (300 psig) working-pressure rating at 107 deg C (225 deg F).

1. Available Manufacturers:

a. Perfection Corporation.
b. Precision Plumbing Products, Inc.
c. Victaulic Co. of America

2.6 SPECIALTY VALVES

A. Listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."

B. Pressure Rating:

1. Standard-Pressure Piping Specialty Valves: 1200-kPa (175-psig) minimum.
2. High-Pressure Piping Specialty Valves: 1725-kPa (250-psig) minimum.

C. Body Material: Cast or ductile iron.

D. Size: Same as connected piping.

E. End Connections: Grooved.

F. Dry-Pipe Valves:

1. Standard: UL 260.
2. Design: Differential-pressure type. Low differential pressure vales and accelerators are not permitted. Valve must be a positive latching style.
3. Include UL 1486, trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gages, priming chamber attachment, and fill-line attachment.

G. Air-Pressure Maintenance Device:

1. Standard: UL 260.
2. Type: Automatic device to maintain minimum air pressure in piping.
3. Include shutoff valves to permit servicing without shutting down sprinkler piping, bypass valve for quick filling, pressure regulator or switch to maintain pressure, strainer, pressure ratings with 95- to 410-kPa (14- to 60-psig) adjustable range, and 1200-kPa **(**175-psig**)** outlet pressure.

H. Air Compressor:

1. Standard: UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."
2. Motor Horsepower: Fractional.
3. Power: 120-V ac, 60 Hz, single phase.

I. Main System Check Valves:

1. Standard: UL 193
2. Pressure Rating: 1200-kPa (175-psig) minimum.
3. Installation: Designed for vertical installation.
4. Body Material: Cast iron, ductile iron, or bronze with bronze grooved seat with O-ring seals, single-hinge pin, and latch design
5. Trim: Include trim sets for drain, electrical sprinkler alarm switch, and pressure gages.

J. Automatic (Ball Drip) Drain Valves:

1. Available Manufacturers:

a. AFAC Inc.
b. Grinnell Fire Protection.

2. Standard: UL 1726.
3. Pressure Rating: 1200-kPa (175-psig) minimum.
4. Type: Automatic draining, ball check.
5. Size: DN 20 (NPS 3/4).
6. End Connections: Threaded.

2.7 SPRINKLER PIPING SPECIALTIES

A. Branch Outlet Fittings:

1. Available Manufacturers:

   a. Anvil International, Inc.
   b. Central Sprinkler Corp.
   c. Ductile, Inc.
   d. JDH Pacific, Inc.
   e. National Fittings, Inc.
   f. Shurjoint Piping Products, Inc.
   g. Southwestern Pipe, Inc.
   h. Star Pipe Products; Star Fittings Div.
   i. Victaulic Co. of America.
   j. Ward Manufacturing

2. Standard: UL 213.
3. Pressure Rating: 1200-kPa (175-psig) minimum.
4. Body Material: Ductile-iron housing with EPDM seals and bolts and nuts.
5. Type: Mechanical-tee and -cross fittings.
6. Configurations: Snap-on and strapless, ductile-iron housing with branch outlets.
7. Size: Of dimension to fit onto sprinkler main and with outlet connections as required to match connected branch piping.
8. Branch Outlets: Grooved or threaded.
9. Mechanical-tee and –cross fittings are not permitted for new construction.

B. Flow Detection and Test Assemblies:

1. Standard: UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."
2. Pressure Rating: 1200-kPa (175-psig) minimum.
3. Body Material: Cast- or ductile-iron housing with orifice, sight glass, and integral test valve.
4. Size: Same as connected piping.
5. Inlet and Outlet: Threaded or grooved.

C. Branch Line Testers:

1. Standard: UL 199.
2. Pressure Rating: 175 psig (1200 kPa) (175 psig).

3. Body Material: Brass.
4. Size: Same as connected piping.
5. Inlet: Threaded.
6. Drain Outlet: Threaded and capped.
7. Branch Outlet: Threaded, for sprinkler.

D. Sprinkler Inspector's Test Fittings:

1. Standard: UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."
2. Pressure Rating: [**1200-kPa (175-psig) minimum**] [**2070 kPa (300 psig)**].
3. Body Material: Cast- or ductile-iron housing with sight glass.
4. Size: Same as connected piping.
5. Inlet and Outlet: Threaded.

E. Adjustable Drop Nipples:

1. Available Manufacturers:

   a. CECA, LLC.
   b. Merit

2. Standard: UL 1474.
3. Pressure Rating: 1725-kPa (250-psig) minimum.
4. Body Material: Steel pipe with EPDM-rubber O-ring seals.
5. Size: Same as connected piping.
6. Length: Adjustable.
7. Inlet and Outlet: Threaded.

F. Flexible Sprinkler Hose Fittings:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Victaulic Company; Vic-Flex, or comparable product by one of the following:

   a. Flex Head Corp.
   b. Viking Corp.

2. Standard: UL 2443 and FM 1637.
3. Type: Fully stainless steel AH2 flexible hose for connection to sprinkler, and with one-piece open-gate “Series AB1” bracket for connection to ceiling grid.
4. Bend Radius: The bend radius shall have a minimum of at least 53 mm (2 in.).
5. Number of Bends: The hose shall be listed for four bends at 775 mm (31 in.) length, five bends at 900 mm (36 in.) length, eight bends at 1200 mm (48 in.) length, ten bends at 1500 mm (60 in.) length, and twelve bends at 1800 mm (72 in.) length. Union joints shall be provided for ease of installation.
6. Pressure Rating: 1200-kPa (175-psig) minimum.
7. Size: Same as connected piping, for sprinkler.

8. Ceiling Grid: Integrity of ceiling grid materials inclusive of support system must meet minimum requirements of NFPA 13 and product listing.
9. Cross Listing: Both the ceiling grid assembly and the sprinkler hose must be cross listed for compatibility.

2.8 LISTED FIRE-PROTECTION VALVES

A. Valves shall be UL listed or FMG approved, with 1200 kPA (175 psig) minimum pressure ratings.

B. Two-Piece Ball Valves With Indicators

1. Available Manufacturers:

a. NIBCO.
b. Victaulic Co. of America.

2. Description:

a. UL 1091, except with ball instead of disc and FM Global standard for indicating valves (butterfly or ball type), Class Number 1112.
b. Minimum Pressure Rating: 1200 kPa (175 psig).
c. Body Design: Two piece.
d. Body Material:

1) DN40 (NPS 1-1/2) and smaller: Forged brass or bronze.
2) DN50 and DN65 (NPS 2 and NPS 2-1/2): Bronze or ductile iron.
3) DN80 (NPS 3): Ductile iron.

e. Port Size: Full or standard.
f. Seats: PTFE.
g. Stem: Bronze or stainless steel.
h. Ball: Chrome-plated brass.
i. Actuator: Worm gear or traveling nut.
j. Supervisory Switch: Internal or external.
k. End Connections for Valves DN 25 (NPS 1) through DN 50 (NPS 2): Threaded ends.
l. End Connections for Valves DN 65 (NPS 2-1/2): Grooved ends.

C. Bronze Butterfly Valves With Indicators

1. Available Manufacturers:

a. Globe Safety Products, Inc.
b. Milwaukee Valve Company.
c. Central Sprinkler Corp.
d. McWane, Inc.; Kennedy Valve Div.

e. Mueller Company.
f. NIBCO.
g. Pratt, Henry Company.
h. Victaulic Co. of America.

2. Description:

a. Standard: UL 1091 and FM Global standard for indicating valves, (butterfly or ball type), Class Number 1112.
b. Minimum: Pressure rating: 1200 kPa (175 psig).
c. Body Material:

1) DN50 (NPS 2) and smaller: Bronze.
2) DN65 (NPS 2-1/2) and larger: Bronze, cast-iron, or ductile-iron body.

d. Seat Material: EPDM.
e. Stem Material: Bronze or stainless steel.
f. Disc: Bronze or stainless steel with EPDM coating.
g. Actuator: Worm gear or traveling nut.
h. Supervisory Switch: Internal or external.
i. Ends Connections for Valves

1) DN 25 (NPS 1) through DN 50 (NPS 2): Threaded ends.
2) DN 65 (NPS 2-1/2): Grooved or flanged ends.

D. Check Valves

1. Available Manufacturers:

a. AFAC Inc.
b. American Cast Iron Pipe Co.; Waterous Co.
c. Central Sprinkler Corp.
d. Clow Valve Co.
e. Crane Co.; Crane Valve Group, Crane Valves.
f. Crane Co.; Crane Valve Group, Jenkins Valves.
g. Firematic Sprinkler Devices, Inc.
h. Globe Fire Sprinkler Corp.
i. Grinnell Fire Protection.
j. Hammmond Valve.
k. Matco-Norca, Inc.
l. McWane, Inc.; Kennedy Valve Div.
m. Mueller Company.
n. NIBCO.
o. Potter-Roemer; Fire Protection Div.
p. Reliable Automatic Sprinkler Co., Inc.
q. Star Sprinkler Inc.
r. Stockham.

s. United Brass Works, Inc.
t. Venus Fire Protection, Ltd.
u. Victaulic Co. of America.
v. Watts Industries, Inc.; Water Products Div.

2. Description:

a. Standard: UL 312 and FM Global standard for swing check valves, Class Number 1210.
b. Minimum Pressure Rating: 1200 kPa (175 psig).
c. Type: Single swing check.
d. Body Material: Cast iron, ductile iron, or bronze.
e. Clapper: Bronze, ductile iron, or stainless steel.
f. Clapper Seat: Brass, bronze, or stainless steel.
g. Hinge Shaft: Bronze or stainless steel.
h. Hinge Spring: Stainless steel.
i. End Connections: Flanged, grooved, or threaded.

E. Bronze OS&Y Gate Valves

1. Available Manufacturers:

a. Crane Co.; Crane Valve Group; Crane Valves.
b. Hammond Valve.
c. NIBCO.
d. United Brass Works, Inc.

2. Description:

a. Standard: UL 262 and FM Global standard for fire-service water control valves (OS&Y- and NRS-type gate valves).
b. Minimum Pressure Rating: 1200 kPa (175 psig).
c. Body and Bonnet Material: Bronze or brass.
d. Size: DN50 (NSP 2) and smaller
e. Wedge: One-piece bronze or brass.
f. Wedge Seat: Bronze.
g. Stem: Bronze or brass.
h. Packing: Non-asbestos PTFE.
i. Supervisory Switch: External.
j. End Connections: Threaded.

F. Iron OS&Y Gate Valves

1. Available Manufacturers:

a. Clo- Valve Co.
b. Crane Co.; Crane Valve Group; Crane Valves

c. Crane Co.; Crane Valve Group; Jenkins Valves.
d. Hammond Valve.
e. Milwaukee Valve Company.
f. Mueller Company.
g. NIBCO.
h. Victaulic Corporation of America.
i. United Brass Works, Inc.

2. Description:

a. Standard: UL 262 and FM Global standard for fire-service water control valves (OS&Y- and NRS-type gate valves).
b. Minimum Pressure Rating: 1200 kPa (175 psig).
c. Body and Bonnet Material: Cast or ductile iron.
d. Size: DN65 (NSP 2-1/2) and larger
e. Wedge: Cast or ductile iron, or bronze.
f. Wedge Seat: Cast or ductile iron, or bronze.
g. Stem: Brass or bronze.
h. Packing: Non-asbestos PTFE.
i. Supervisory Switch: External.
j. End Connections: Flanged or Grooved.

2.9 SPRINKLERS

A. Available Manufacturers:

1. AFAC Inc.
2. Central Sprinkler Corp.
3. Firematic Sprinkler Devices, Inc.
4. Globe Fire Sprinkler Corp.
5. Grinnell Fire Protection.
6. Reliable Automatic Sprinkler Co., Inc.
7. Star Sprinkler Inc.
8. Venus Fire Protection, Ltd.
9. Victaulic Co. of America.
10. Viking Corp.

B. Listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."

C. Pressure Rating for Automatic Sprinklers: 1200-kPa (175-psig) minimum.

D. Pressure Rating for High-Pressure Automatic Sprinklers: **[1725-kPa (250-psig) minimum]** [**2070 kPa (300 psig)**].

E. Automatic Sprinklers with Heat-Responsive Element:

1. Early-Suppression, Fast-Response Applications: UL 1767.
2. Nonresidential Applications: UL 199.
3. Residential Applications: UL 1626.
4. Characteristics: Nominal 12.7-mm (1/2-inch) orifice with Discharge Coefficient K of 5.6, and for "Ordinary" temperature classification rating unless otherwise indicated or required by application.

F. Thermal Sensitivity: Where permitted by NFPA 13, sprinklers shall be “quick-response”.

G. Sprinkler Finishes: Chrome plated, bronze, and white painted.

H. Special Coatings: Factory applied wax if required.

I. Sprinkler Types, Features, and Options as Follows:

1. Concealed ceiling sprinkler, including cover plate.
2. Extended-coverage sprinklers.
3. Pendent sprinklers.
4. Pendent, dry-type sprinklers.
5. Quick-response sprinklers.
6. Recessed sprinklers, including escutcheon.
7. Sidewall sprinklers.
8. Sidewall, dry-type sprinkler.
9. Upright sprinklers.
10. Early suppression/fast response sprinklers.

J. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.

1. Ceiling Mounting: Chrome-plated steel, two piece, with 25-mm (1-inch) vertical adjustment.
2. Sidewall Mounting: Chrome-plated steel, one piece, flat.

K. Sprinkler Guards:

1. Standard: UL 199.
2. Type: Wire cage with fastening device for attaching to sprinkler.

2.10 UNLISTED GENERAL-DUTY VALVES

A. Ball Valves DN50 (NSP 2) and Smaller: MSS SP-110, two-piece copper-alloy body with chrome-plated brass ball, 600-psig (4140 kPa) minimum CWP rating, blowout-proof stem, and threaded ends.

B. Check Valves DN50 (NPS 2) and Smaller: MSS SP-80, Type 4, Class 125 minimum, swing type with bronze body, nonmetallic disc, and threaded ends.

C. Gate Valves DN50 (NPS 2) and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, solid wedge, and threaded ends.

D. Globe Valves DN50 (NSP 2) and Smaller: MSS SP-80, Type 2, Class 125 minimum, with bronze body, nonmetallic disc, and threaded ends.

2.11 HOSE CONNECTIONS

A. Nonadjustable-Valve Hose Connections:

1. Available Manufacturers:

   a. AFAC Inc.
   b. Central Sprinkler Corp
   c. Elkhart Brass Mfg. Co., Inc.
   d. Fire-End and Croker Corp.
   e. Fire Protection Products, Inc.
   f. GMR International Equipment Corp.
   g. Grinnell Fire Protection.
   h. Guardian Fire Equipment Inc.
   i. McWane, Inc.; Kennedy Valve Div.
   j. Mueller Company.
   k. Potter-Roemer; Fire-Protection Div.
   l. United Brass Works, Inc.

2. Standard: UL 668 hose valve for connecting fire hose.
3. Pressure Rating: 2070 kPa (300 psig) minimum.
4. Material: Brass or bronze.
5. Size: DN 40 or DN 65 (NPS 1-1/2 or NPS 2-1/2), as indicated.
6. Inlet: Female pipe threads.
7. Outlet: Male hose threads with lugged cap, gasket, and chain. Include hose valve threads according to NFPA 1963 and matching local fire-department threads.
8. Pattern: Angle.
9. Finish: Rough brass or bronze.

2.12 FIRE-DEPARTMENT CONNECTIONS

A. Exposed-Type Fire-Department Connection

1. Available Manufacturers:

   a. AFAC Inc.

b. Central Sprinkler Corp.
c. Elkhart Brass Mfg. Co., Inc.
d. Fire-End and Croker Corp.
e. Fire Protection Products, Inc.
f. GMR International Equipment Corp.
g. Guardian Fire Equipment Inc.
h. Potter-Roemer: Fire-Protection Div.
i. Reliable Automatic Sprinkler Co., Inc.
j. United Brass Works, Inc.

2. Standard: UL 405.
3. Type: Exposed, projecting, for wall mounting.
4. Pressure Rating: 1200 kPa (175 psig) minimum.
5. Body Material: Corrosion-resistant metal.
6. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
7. Caps: Brass, lugged type, with gasket and chain.
8. Escutcheon Plate: Round, brass, wall type.
9. Outlet: Back, with pipe threads.
10. Number of Inlets: Provide one hose connection for each 946 L/min (250 gpm) of standpipe system demand.
11. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE."
12. Finish: Polished brass.
13. Outlet Size: [**DN 100 (NPS 4)**] [**DN 125 (NPS 5)**] [**DN 150 (NPS 6)**].

B. Flush-Type Fire-Department Connection

1. Available Manufacturers:

a. AFAC Inc.
b. Central Sprinkler Corp.
c. Elkhart Brass Mfg. Co., Inc.
d. Fire-End and Croker Corp.
e. Fire Protection Products, Inc.
f. GMR International Equipment Corp.
g. Guardian Fire Equipment Inc.
h. Potter-Roemer: Fire-Protection Div.
i. Reliable Automatic Sprinkler Co., Inc.
j. United Brass Works, Inc.

2. Standard: UL 405.
3. Type: Flush, for wall mounting.
4. Pressure Rating: 1200 kPa (175 psig) minimum.
5. Body Material: Corrosion-resistant metal.

6. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
7. Caps: Brass, lugged type, with gasket and chain.
8. Escutcheon Plate: Rectangular, brass, wall type.
9. Outlet: With pipe threads.
10. Body Style: **[Horizontal] [Square] [Vertical]**.
11. Number of Inlets: Provide one hose connection for each 946 L/min (250 gpm) of standpipe system demand.
12. Outlet Location: [**Back**] [**Bottom**] [**Left side**] [**Right side**] [**Top**].
13. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE."
14. Finish: Polished brass.
15. Outlet Size: [**DN 100 (NPS 4)**] [**DN 125 (NPS 5)**] [**DN 150 (NPS 6)**] [**DN 200 (NPS 8)**].

C. Yard-Type Fire-Department Connection

1. Available Manufactures:

   a. AFAC Inc.
   b. Central Sprinkler Corp.
   c. Elkhart Brass Mfg. Co., Inc.
   d. Fire-End and Croker Corp.
   e. Fire Protection Products, Inc.
   f. GMR International Equipment Corp.
   g. Guardian Fire Equipment Inc.
   h. Potter-Roemer: Fire-Protection Div.
   i. Reliable Automatic Sprinkler Co., Inc.
   j. United Brass Works, Inc.

2. Standard: UL 405.
3. Type: Exposed, freestanding.
4. Pressure Rating: **[1200 kPa (175 psig) minimum] [2070 kPa (300 psig)]**.
5. Body Material: Corrosion-resistant metal.
6. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
7. Caps: Brass, lugged type, with gasket and chain.
8. Escutcheon Plate: Round, brass, floor type.
9. Outlet: Bottom, with pipe threads.
10. Number of Inlets: Provide one hose connection for each 946 L/min (250 gpm) of standpipe system demand.
11. Sleeve: **[Brass] [Not required]**.
12. Sleeve Height: 460 mm (18 inches).
13. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE."
14. Finish **[, Including Sleeve]: [Polished chrome plated] [Rough brass or bronze] [Rough chrome plated].**
15. Outlet Size: [**DN 100 (NPS 4)**] [**DN 125 (NPS 5)**] [**DN 150 (NPS 6)**].

2.13 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections.

B. Water-Flow Indicators:

1. Available Manufacturers:

a. ADT Security Services, Inc.
b. Grinnell Fire Protection.
c. ITT McDonnell & Miller.
d. Potter Electric Signal Company.
e. System Sensor.
f. Watts industries, Inc,; Water Products Div.

2. Standard: UL 346.
3. Water-Flow Detector: Electrically supervised.
4. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals. Tamperproof cover that sends signal if removed is not permitted.
5. Type: Paddle operated.
6. Pressure Rating: 1725 kPa (250 psig).
7. Design Installation: Horizontal or vertical.

C. Pressure Switches:

1. Available Manufacturers:

a. Grinnell Fire Protection.
b. Potter Electric Signal Company
c. System Sensor.

2. Standard: UL 346.
3. Type: Electrically supervised water-flow switch with retard feature.
4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design Operation: Rising pressure signals water flow.

D. Valve Supervisory Switches:

1. Available Manufacturers:

a. Potter Electric Signal Company.
b. System Sensor.

2. Standard: UL 753.
3. Type: Electrically supervised.

4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design: Signals that controlled valve is in other than fully open position.
6. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. Tamperproof cover that sends signal if removed is not permitted.

E. Indicator-Post Supervisory Switch:

1. Available Manufacturers:

a. Potter Electric Signal Company.
b. System Sensor.

2. Standard: UL 753.
3. Type: Electrically supervised.
4. Components: Single-pole, double-throw switch with normally closed contacts.
5. Design: Signals that controlled valve is in other than fully open position.
6. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. Tamperproof cover that sends signal if removed is not permitted.

2.14 PRESSURE GAGES

A. Available Manufacturers:

1. AGF Manufacturing Co.
2. AMETEK, Inc.
3. U.S. Gauge.
4. Brecco Corporation
5. Dresser Equipment Group, Instrument Div.
6. Marsh Bellofram.
7. WIKA Instrument Corp.

B. Standard: UL 393.

C. Dial Size: 90- to 115-mm (3-1/2- to 4-1/2-inch) diameter.

D. Pressure Gage Range: 0- to 1725-kPa (0- to 250-psig) minimum.

E. Label: Include "WATER" label on dial face.

PART 3 - EXECUTION

3.1 PREPARATION

A. Where system is to have water supplied from municipal water source, Contractor shall perform or witness fire-hydrant flow test according to NFPA 291. Use results for system design calculations required in "Quality Assurance" Article. Flow test shall be recent, and in accordance with NFPA 13 standards.

B. Where system is to have water supplied by compound fire pump, Contractor shall perform or witness fire pump flow test in accordance with NFPA 20. Use results for system design calculations required in “Quality Assurance” Article. Pump test shall be recent, and in accordance with NFPA 13 standards.

C. Report test results promptly and in writing.

3.2 EXAMINATION

A. Examine roughing-in for hose connections and stations to verify actual locations of piping connections before installation.

B. Examine walls and partitions for suitable thicknesses, fire- and smoke-rate construction, frame for hose valve cabinets, and other conditions were hose connections and stations are to be installed.

C. Proceed with installation and only after unsatisfactory conditions have been corrected.

3.3 SERVICE-ENTRANCE PIPING

A. Connect sprinkler piping to water-service piping for service entrance to each building. Comply with requirements for exterior piping in Section 331414 "Fire Service Main and Appurtenances" for exterior piping. Service entrance to each building shall not be a trash room or hazardous area.

B. Install shutoff valve, pressure gage, drain, and other accessories indicated at connection to water-service piping. Install backflow preventer when connecting to a potable water supply. Do not install backflow preventer for systems supplied from fire protection water storage tank.

C. Install shutoff valve, check valve, pressure gage, and drain at connection to water service.

D. Install an OS&Y shutoff valve immediately where service enters the building.

3.4 WATER-SUPPLY CONNECTIONS

A. Connect sprinkler piping to building's interior water-distribution piping. Comply with requirements for interior piping in Division 22 Section on domestic water piping.

B. Install shutoff valve, [**backflow preventer,**] pressure gage, drain, and other accessories indicated at connection to water-distribution piping.**[Comply with requirements for backflow preventers in Division 22 Section on domestic water piping specialties.]**

C. Install shutoff valve, check valve, pressure gage, and drain at connection to water supply.

3.5 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Listed Fire-Protection Valves: UL listed and FMG approved for applications where required by NFPA 13 or NFPA 14.

   a. Shutoff: Use Butterfly or OS&Y valves.

2. Unlisted General-Duty Valves: For applications where UL-listed and FMG-approved valves are no required by NFPA 13 and NFPA 14

   a. Shutoff: Use ball, butterfly, or gate valves.
   b. Throttling: Use ball or globe valves.

3.6 PIPING INSTALLATION

A. Refer to **[Division XX]** Section for basic piping installations.

B. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated on approved working plans.

1. Deviations from approved working plans for piping require written approval from OBO/OPS/FIRE/FPE. File written approval with Architect before deviating from approved working plans.
2. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.

C. Piping Standard: Comply with NFPA 13 requirements for installation of sprinkler piping.

D. Underground piping: Install underground service-entrance piping in accordance with Section 331414 “Fire Service Main and Appurtenances” and NFPA 24.

E. Install seismic restraints on piping. Comply with NFPA 13 requirements for seismic-restraint device materials and installation.

F. Provide clearance or flexible couplings for all penetrations through all walls, floors, platforms, and foundations where required by NFPA 13.

G. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

H. Install unions adjacent to each valve in pipes DN 50 (NPS 2) and smaller. Unions are not required on flanged devices or in piping installations using grooved joints.

I. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having DN 65 (NPS 2-1/2) and larger end connections.

J. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized according to NFPA 13. Test connection shall be installed at the most remote portion of the system. All test connection shall be permanently piped to drain outside the building. Drains must discharge to an approved splash block unless drains discharge directly to concrete or asphalt.

K. Install sprinkler piping with drains for complete system drainage to an approved location outside the building. Drains must discharge to an approved splash block unless drains discharge directly to concrete or asphalt.

L. All dry-pipe sprinkler system shall be pitched to drain regardless of if the space is conditioned per NFPA 13 requirements. Branch lines and mains shall be pitched at least 4mm/m (1/2 in. per 10 ft.).

M. All dry-pipe sprinkler system test connections and drains in conditioned or finished spaces shall be piped to exterior of buildings.

N. All dry-pipe sprinkler system test connections and drains shall be identified on dry pipe riser with permanent sign indicating number and location of each test connection or drain.

O. Drains shall not terminate to interior floor drains or janitor sinks.

P. Install sprinkler control valves, test assemblies, and drain risers adjacent to standpipes when sprinkler piping is connected to standpipes.

Q. Install drain valves on standpipe and at all bulk isolation control valves.

R. Install automatic (ball drip) drain valve at each check valve for fire-department connection, to drain piping between fire-department connection and check valve. Install drain piping to outside building.

S. Install alarm devices in piping systems.

T. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13. In seismic-rated areas, refer to **[Division XX]** Section on vibration and seismic controls for fire-suppression piping and equipment.

U. Install pressure gages on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gages with connection not less than DN 8 (NPS 1/4) and with soft-metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they are not subject to freezing.

V. Pressurize and check dry-pipe sprinkler system piping and [**air-pressure maintenance devices**] [**air compressors**].

W. Fill wet standpipe system piping with water.

X. Fill wet-pipe sprinkler system with water.

Y. Install electric heating cables and pipe insulation on sprinkler piping in areas subject to freezing. Comply with requirements for heating cables in **[Division XX]** Section on heat tracing for fire-suppression piping and for piping insulation in **[Division XX]** Section on fire-suppression systems insulation.

Z. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in **[Division XX]** Section on sleeves and sleeve seals for fire-suppression piping.

AA. Install sleeve seals for piping penetrations of concrete walls and slabs below grade. Comply with requirements for sleeve seals specified in **[Division XX]** Section on sleeves and sleeve seals for fire-suppression piping.

BB. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in **[Division XX]** Section on escutcheons for fire-suppression piping.

3.7 JOINT CONSTRUCTION

A. Refer to **[Division XX]** Section for basic piping joint construction.

B. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.

C. Install unions adjacent to each valve in pipes DN 50 (NPS 2) and smaller.

D. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having DN 65 (NPS 2-1/2) and larger end connections.

E. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

F. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

G. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.

H. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape to external pipe threads. Joint compound is not permitted.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
3. Pipe Thickness: Do not thread pipe smaller than DN200 (NPS 8) with wall thickness less than Schedule 40.
4. Test every 50 field-threaded joint with calibrated thread ring test gauge and document in log.

I. Twist-Locked Joints: Not permitted.

J. Steel-Piping, Pressure-Sealed Joints: Not permitted

K. Mechanical Tee fittings or Mechanical Crosses are not permitted unless approved by OBO/OPS/FIRE/FPE in writing.

1. Where permitted by OBO/OPS/FIRE/FPE in writing, coupon/cutout shall be permanently affixed to fitting.

L. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.

1. Shop weld pipe joints where welded piping is indicated. Field welding is not permitted. Do not use welded joints for galvanized-steel pipe.

M. Steel-Piping, Cut-Grooved Joints: Cut square-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe joints.

N. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.

O. Grooved Joints: Assemble joints with listed coupling and gasket, lubricant, and bolts.

1. Ductile-Iron Pipe: Radius-cut-groove ends of piping. Use grooved end fittings and groove-end-pipe couplings.
2. Wet Steel Pipe: Cut- or roll-groove piping as indicated. Use groove end fittings and rigid grooved end-pipe couplings, unless otherwise indicated.
3. Dry Pipe Systems: Cut-groove piping only. Use groove end fittings and gaskets listed for dry-pie service.

P. Steel-Piping, Pressure-Sealed Joints: Not permitted.

Q. Dissimilar-Material Piping Joints: Construct joints using dielectric fittings compatible with both piping materials. Do not join dissimilar metals until all portions of all systems have been flushed.

1. DN50 (NPS 2) and Smaller: Use dielectric unions, couplings, or nipples.
2. DN65 to DN100 (NPS 2-1/2 to NPS4): Use dielectric flanges.
3. DN125 (NPS 5) and Larger: Use dielectric flange insulation kits.

3.8 INSTALLATION OF COVER SYSTEM FOR SPRINKLER PIPING

A. Install cover system, brackets, and cover components for sprinkler piping according to manufacturer's "Installation Manual" and NFPA 13 or NFPA 13R for supports.

3.9 VALVE AND SPECIALTIES INSTALLATION

A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13, NFPA 14, and manufacturer’s recommendations.

B. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.

C. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.

D. Specialty Valves:

1. Install valves in vertical position for proper direction of flow, in main supply to system.
2. Install **[dry-pipe][and][deluge]** valves in vertical position, in proper direction of flow, and in main supply to system. Install trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gages, priming chamber attachment, and fill-line attachment.

a. [Install air compressor and compressed-air-supply piping.]

b. **[Install air-pressure maintenance device with shutoff valves to permit servicing without shutting down sprinkler system; bypass valve for quick system filling; pressure regulator or switch to maintain system pressure; strainer; pressure ratings with [95- to 410-kPa (14- to 60-psig)] <Insert value> adjustable range; and [1200-kPa (175-psig)] <Insert value> maximum inlet pressure.]**

3.10 SPRINKLER INSTALLATION

A. Install sprinklers in suspended ceilings in center of acoustical ceiling panels.

B. Install dry-type sprinklers with water supply from heated space. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing.

C. Install sprinklers into flexible, sprinkler hose fittings, and install hose into bracket on ceiling grid.

D. Install sprinkler guards on all exposed sprinklers that are 2.3 m (7’-6”) or less above the finished floor elevation. Install sprinklers guards for all exposed sprinklers below duct work and any location subject to mechanical damage.

3.11 HOSE CONNECTION INSTALLATION

A. Install hose connections adjacent to standpipes.

B. Install freestanding hose connections for access and minimum passage restriction.

C. Hose connection shall be threaded match local fire departments hoses.

D. Provide DN65 by DN40 (NPS 2-1/2 by NPS 1-1/2) reducer adapter for all DN65 hose connections.

3.12 FIRE DEPARTMENT CONNECTION INSTALLATION

A. Install wall-type fire department connections in vertical wall.

B. Install freestanding-type, fire department connection in level surface.

C. Install protective pipe bollards on three sides of each fire department connection. Refer to Division 05 Section on metal fabrications for pipe bollards.

D. Install ball drip valve at each check valve for fire department connection. Drain to floor drain or outside building.

3.13 IDENTIFICATION

A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13, NFPA 14, and in **[Division XX]** Section. In addition, labels shall be provided in the following locations:

1. Install near each valve and control device.
2. Provide labels at 12 m (40 ft) spacing on mains.
3. Provide labels at all access doors and shafts.
4. Provide labels at 6 m (20 ft) spacing on all branch lines.

B. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section on identification for electrical systems.

3.14 FIELD QUALITY CONTROL

A. Periodic Inspections:

1. NICET Level III, NICET Level IV, or qualified Fire Protection Engineer shall perform inspection on the work performed as necessary to ensure quality control of the installation, but at intervals no greater than 60 days from previous inspection. Submit written inspection reports to OBO/OPS/FIRE/FPE for review.

B. Perform the following tests and inspections:

1. Air Tests: Prior to putting any water on the system, the contractor shall perform air pressure leakage tests at 40 psi for 24 hours for all piping and attached appurtenances. Any leakage that results in a loss of pressure shall be corrected and system retested. Testing shall occur prior to installing hard/non removable ceilings.
2. Hydrostatic Tests: After air testing has been witnessed and approved by OBO/OPS/FIRE/FPE, perform hydrostatic testing per NFPA 13. Any signs of leakage or a loss of pressure shall be corrected and system retested. Final hydrostatic testing shall be witnessed by OBO/OPS/FIRE/FPE. Testing shall occur prior to installing hard/non removable ceilings.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
4. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
5. Flush, test, and inspect standpipe system according to NFPA 14, "Systems Acceptance" Chapter.
6. Energize circuits to electrical equipment and devices.
7. Coordinate with fire-alarm tests. Operate as required.
8. Coordinate with fire-pump tests. Operate as required.

9. Verify that equipment hose threads are same as local fire department equipment.
10. OBO/OPS/FIRE may not be on site to witness flushing. If OBO/OPS/FIRE is unable to witness tests, the OBO site mechanical engineer must witness the tests and sign appropriate tests forms.

C. Sprinkler piping system will be considered defective if it does not pass tests and inspections.

D. Installed pipe and fittings that appear out of ASME B1.20.1 specifications shall be confirmed with a thread ring test gauge and plug gauge.

E. Prepare test and inspection reports.

3.15 OBO/OPS/FIRE PROGRESS INSPECTIONS AND COMMISSIONING

A. OBO/OPS/FIRE personnel conduct routine on-site inspections of fire protection systems during construction. The normally conduct three progress inspections that occur at approximately 40-50 percent, 75 percent, and 90-100 percent construction completion stages of the overall project.

B. The contractor shall keep current on file all NFPA inspections required by cited NFPA standards, and test reports for use by OBO/OPS/FIRE/FPE personnel during these inspections.

C. All deficiencies given to the contractor shall be promptly remedied. Final acceptance of the system is contingent upon all noted deficiencies being corrected to the satisfaction of OBO/OPS/FIRE/FPE in addition to all required NFPA 13 testing.

D. Scheduling of final inspection is not permitted until the building(s) are substantially completed. The General Contractor shall schedule the final inspection in accordance with Division 01 requirements, and with minimum of 30 days in advance of requested date to allow for coordination by OBO/OPS/FIRE. Parameters for substantial completion is given in a separate document titled “Appendix E Final Testing/Acceptance Requirements for Fire and Life Safety Systems.”

1. When requesting the final inspection, the general contractor shall submit with the requested inspection date the completed affidavit titled “Fire and Life Safety Systems Request for Final Acceptance Test” signed and notarized as indicated on that form. The form is attached to this specification.

3.16 PAINTING

A. All valves shall be factory painted red.

B. Clean, pretreat, and prime all pipe and fittings. Paint sprinkler piping in non-architecturally sensitive areas (above suspended ceilings, warehouse, mechanical rooms, etc.) red. In architecturally sensitive areas, the piping color can either be painted red, or to match the color of adjacent surfaces.

3.17 CLEANING AND PROTECTION

A. Clean dirt and debris from sprinklers.

B. Only sprinklers and escutcheons with their original factory finish are acceptable. Remove and replace any sprinklers or escutcheons that are painted or have any other finish than their original factory finish.

C. Protect sprinklers from damage until Substantial Completion. Remove and replace any sprinkler observed to be damaged (torqued, bent, etc.).

D. Piping shall be protected prior to and after installation. No materials shall be stored outside without protection from the elements. Any pipe, fitting, valves, or other system component observed by OBO staff to be weathered shall be removed and discarded.

3.18 TRAINING

A. Training shall not be conducted until the sprinkler systems and fire pump have been tested in accordance with NFPA 13, 14, 20, and 72, and accepted by OBO/OPS/FIRE. Sprinkler system manufacturers' field representative shall provide two 8-hours day training sessions to Government personnel, including Foreign Service National maintenance personnel on location. Training shall include classroom and practical hands-on training covering operation, adjustments, theory, and troubleshooting. Specific operation maintenance manuals, as described in this section, shall be utilized for this training. Contractor shall video the training and produce a DVD deliverable such that future staff may benefit from the class.

3.19 PIPING SCHEDULE

A. Piping between Fire Department Connections and Check Valves shall be one of the following:

1. Stainless steel pipe with cut-grooved ends, stainless steel grooved-end fittings, grooved-end-pipe couplings, and grooved joints.
2. Stainless steel pipe with stainless steel threaded fittings; and threaded joints

B. Sprinkler specialty fittings may be used, downstream of control valves, instead of specified fittings.

C. Standard-pressure, wet or dry-pipe sprinkler system, DN 50 (NPS 2) and smaller, shall be the following:

1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.

D. Standard-pressure, wet or dry-pipe sprinkler system, DN 50 (NPS 2) and smaller within 5 feet of FEBR penetrations in buildings required to be seismically braced, shall be one of the following:

1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
2. Standard-weight, black-steel pipe with cut-grooved ends; uncoated, flexible grooved-end-pipe couplings for steel piping; and grooved joints.

E. Standard-pressure, wet-pipe sprinkler system, DN 65 (NPS 2-1/2) and larger, shall be one of the following:

1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
2. Standard-weight, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
3. Schedule 10 black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.

F. Standard-pressure, dry-pipe sprinkler system, DN 65 (NPS 2-1/2) and larger, shall be one of the following:

1. Standard-weight, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
2. Standard-weight, black-steel pipe with cut-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.

3.20 SPRINKLER SCHEDULE

A. Use sprinkler types in subparagraphs below for the following applications:

1. Rooms without Ceilings: Upright sprinklers.
2. Rooms with Suspended Ceilings: Pendant, recessed, flush, and concealed sprinklers as indicated.
3. Wall Mounting: Sidewall sprinklers.
4. Spaces Subject to Freezing:

   a. Upright: Pendant - dry sprinklers.
   b. Sidewall: Dry sprinklers as indicated.

B. Provide sprinkler types in subparagraphs below with factory applied finishes indicated.

1. Concealed Sprinklers: Rough brass, with factory-painted white cover plate.
2. Flush Sprinklers: Bright chrome, with painted white escutcheon.
3. Recessed Sprinklers: Bright chrome, with bright chrome escutcheon.

4. Residential Sprinklers: Dull chrome.
5. Upright, Pendent, and Sidewall Sprinklers: Chrome plated in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view; wax coated where exposed to acids, chemicals, or other corrosive fumes.

END OF SECTION 211305

SECTION 213115 - FIRE PUMP ASSEMBLIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies fire pumps, including but not limited to requirements for system components below:

1. Drive unit (diesel engine or electric motor).
2. Fire Pump.
3. Pump controllers.
4. Fuel tank.
5. Batteries with charger.
6. Flow meter.
7. Skid assembly.
8. Piping.
9. Electrical/electronic control wiring.

B. Fire Protection Water Storage Tank: See Drawings for individual water storage tank for dedicated fire protection purposes.

C. Related Sections: Comply with applicable requirements of other Sections which interface with related work of other Sections.

1. Division 01 Sections “Start-up and Commissioning” and “Demonstration and Training.”
2. Section 033000 “Cast-in-Place Concrete.”
3. Division 09 Sections on high performance coatings.
4. Division 09 Section on painting.
5. Section 105613 “Metal Storage Shelving” for lockable cabinet for spare parts.
6. Section 211305 “Fire Sprinkler System” for sprinkler installation, and for labeling, identification, and signage requirements.
7. Division 23 Section on building fuel oil piping.
8. Division 26 Sections for electrical provisions.
9. Section 284626 "Addressable Fire Alarm Systems.
10. Section 331414 “Fire Service Mains and Appurtenances” for compound distribution of fire protection water in relation to fire pump(s).
11. Section 335005 “Underground Fuel Storage Tanks and Distribution” for source of fuel used by fuel tanks (serving as fire pump day tanks) in this Section.

1.2 CODES AND STANDARDS

A. General: Comply with the following industry standards representing the latest edition applicable to the OBO criteria version applicable to the Project. These standards contain provisions which

are explicitly applicable to work of this Section, as well as other standards identified in this Section.

1. Codes: The OBO Building Code consists of the model International Building Code and OBO amendments in the OBO International Codes Supplements (OBO-ICS) to those model codes. Codes adopted by OBO are identified in Chapter 1 of the OBO-ICS IBC (supplement to the Building Code) for the year applicable to the project.
2. "Approval Guide" by Factory Mutual (FM).
3. "Fire Protection Equipment Directory" by Underwriters Laboratories, Inc. (UL).
4. Standards by the National Fire Protection Association (NFPA), including the following:

    a. NFPA 3, “Standard for Commissioning of Fire Protection and Life Safety Systems,” 2024 edition.
    b. NFPA 4, “Standard for Integrated Fire Protection and Life Safety System Testing,” 2024 edition.
    c. NFPA 13, “Standard for the Installation of Sprinkler Systems,” 2022 edition.
    d. NFPA 20, “Standard for the Installation of Stationary Pumps for Fire Protection,” 2022 edition.
    e. NFPA 22, “Standard for Water Tanks for Private Fire Protection,” 2023 edition.
    f. NFPA 24, “Standard for the Installation of Private Fire Service Mains and Their Appurtenances,” 2022 edition.
    g. NFPA 25, “Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems,” 2023 edition.
    h. NFPA 37, “Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines.” 2024 edition.
    i. NFPA 72, “National Fire Alarm and Signaling Code,” 2022 edition.

1.3 SUBMITTALS

A. Product Data: For each fire pump prefabricated assembly, submit product data to include, but not limited to, the following prepared information. Each submittal shall include two hard copies and one electronic copy on compact disk.

1. 200 mm x 250 mm (8" x 10") colored glossy photographs of each assembly from previously produced equivalent, if not identical assemblies. Digital pictures that meet this requirement are also acceptable.
2. Specific pump certified performance curves for each fire pump. Record head developed, pump efficiency, and brake horsepower required for full range of operation.
3. In addition to quantities required by Division 01 Section “Closeout Procedures,” submit two copies of printed product literature for each of the principal component and sub-components installed in the assembly covering recommended installation, testing, operation, maintenance, troubleshooting, special tools, service, spare parts, and similar user need-to-know information. Include base price lists and ordering information for all replaceable parts. Include approved copy of factory pump curve, and drafts of field operating instructions.

B. Shop Drawings: Show installation of each fire pump assembly with overall layout of service lines and assembly location at not less than 1:20 scale, fully dimensioned, with each principal element of unit indicated. Include marked plans, elevations, sequencing, and electrical/electronic wiring diagrammatically with circuit diagrams. Include separate plan of fabricated skid framing. Include list of all part numbers and weights for the entire pump assembly.

C. Hydraulic Calculations: Calculations indicating suction supply requirements, elevations, distance, fittings, pipe material, valves, static pressure, residual pressure, velocity, hydraulic reference points, and pump size. Approval for suction line installation will be denied until calculations are submitted. Failure to comply may result in excavation, and removal of installed suction piping at Contractor's expense.

D. Seismic Design Data: Pump manufacturer shall provide documentation that fire pump package, including all piping, day tank, controller and other equipment, has been analyzed to be designed and constructed to withstand an earthquake of force identified in the Article on QUALITY ASSURANCE. Manufacturer shall document that entire package will withstand earthquake according to seismic design requirements identified in Article on QUALITY ASSURANCE.

E. Exhaust Sizing (Diesel Engines): Exhaust back pressure calculations indicating the length of the exhaust piping, fittings, pipe sizes, and silencer make and model shall be provided. Calculations shall include that back pressure is within maximum allowable backpressure limits of the engine.

F. Factory Test Procedures: Submit pump manufacturer's test procedure for approval prior to testing.

G. Field Quality Control Test Data: Following installation of work in this Section, including field testing of fire pump assembly performances, submit field test report and certified statement of compliance with requirements signed by fire pump manufacturer’s representative and installing contractor. Include markup of each previously certified pump curve sheet, recording start-up field test data for the installation. Indicate performance compliances for each primary component of the assembly in field test reports and in certified compliance statements. Comply with Project Director/COR and/or OBO/OPS/FIRE requests.

H. Operation and Maintenance Manuals: After submitted quality control data has been accepted by OBO/OPS/FIRE, prepare and submit updated operation and maintenance manuals to OBO/OPS/FIRE through the Project Director/COR for every component of installed fire pump assemblies in titled/indexed loose-leaf binders. Include product data as specified in this Article, and all final adjustments/settings, and/or changes specific to contract installation upon completion and acceptance testing. Include complete spare parts listings, including price and source information for items specified in the Article on SPARE PARTS. Identify recommended spare parts inventory by manufacturer, as well as required spare parts inventory listed by OBO/OPS/FIRE in Article on SPARE PARTS, indicating stock/quantity listing for expendable items, and every component of fire pump assemblies for Government's inventory of replacement materials and parts. Manuals shall contain one laminated set each of abbreviated and emergency instruction information placards as posted on controller(s).

I. Warranties: Properly executed product warranties from manufacturer of principal components in assembly; both as required by these Specifications, and as noted to be available by published product literature.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Manufacturer of fire pump assembly shall produce package system at their facility, and maintain ISO 9001 Quality Certification. Manufacturer must provide same-day, technical point of contact/response for inquiries by the Government from within United States and from OBO/OPS/FIRE personnel on tour of duty (TDY) around the world.

B. System Continuity: A single install shall be used for all aspects of installation, include both classified and unclassified work. Fire pump shall be installed by same contractor as installer of sprinkler system; see Section 211305 “Fire Sprinkler Systems.”

C. Manufacturer’s equipment, design, shop drawings and equipment submittals are required to be sourced from the United States.

D. Factory and field pump start-up shall be supervised by factory authorized technician(s). Technician(s) shall be certified on fire pump, driver and controller.

E. Provide permanent labels on components of equipment, recording approval stamps, recorded listings, recognized ratings, and other markings to show compliance with applicable standards by NFPA, UL, MSS, NEMA, and other trade associations.

F. Systems Testing: Manufacturer shall perform both factory testing and start-up/field testing of fire pump assembly operations in accordance with NFPA 20. Both tests are required to be witnessed by OBO/OPS/FIRE.

G. Seismic Design: Pump manufacturer shall design fire pump package, including all piping, day tank, controller and other equipment, according to the seismic design requirements in the Chapter 16 of the OBO Building Code. Brace and design package in accordance with requirements of NFPA 13 and NFPA 20. Rubber pads and springs with retaining clamps are not permitted to be used to secured skid base frame to housekeeping pad; this pertains to skinny skids, split skids, and full skid packages. Main electric/diesel driver and pump assembly shall not incorporate rubbers pads installed underneath legs or in mounting bases.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000 “Cast-in-Place Concrete.”

1.6 DELIVERY, STORAGE, AND HANDLING

A. General: Fabricate structural steel skid unit, and assemble fire pump assembly components on skid unit with sufficient strength to withstand shipping and handling stresses as well as operational stresses. Equip skid unit with suitable hoisting "eyes", and similar devices for accommodation of hoisting slings and other handling methods. Handle assembled unit in compliance with manufacturers' instructions and recommendations for rigging and hoisting.

1. Preparation of Unit: After completion of factory test procedure for assembled unit, drain water and fuel from assembly, and dry entire unit. Treat bare steel/iron surfaces, internal and external, with rust-inhibiting coating of light oil or similar easily removed harmless substances. Package all assembly components for overseas shipment in manner that will exclude moisture intrusion and prevent corrosion of metal parts. Protect equipment, piping flanges, nozzles, and other openings or connections, and protect machines against intrusion of sand and other foreign matter. Plastic inserts/flange covers into the pipe ends is not acceptable; bolted wooden flange covers are acceptable.
2. Store and ship packaged/protected fire pump assemblies in clean, airtight, moisture resistant, durable shipping container, and retain in dry location at all times.

1.7 WARRANTY

A. Manufacturer’s Special Product warranty: Manufacturer of fire pump assemblies shall provide special product warranty for period of one year after the latter of substantial completion or final acceptance testing by manufacturers' representative, which is witnessed by OBO/OPS/FIRE. Warranty must be in writing, and be presented to the Project Director/COR upon final pump acceptance by Project Director/COR and OBO/OPS/FIRE.

1.8 EXTRA MATERIALS

A. Initial Spare Parts Stock: For each required fire pump assembly and controller with an initial stock of expendable items required for two years of service, specific maintenance materials, and spare parts identified below by OBO/OPS/FIRE. In addition, supplement that stock with recommended spare parts inventory by manufacturer; where the two lists are identical provide the larger of the quantities recommended. Include not less than the following categories/quantities of materials:

1. Stock:

   a. One complete engine and pump rebuild gasket set, gasket material, seals and O-rings; for diesel only.
   b. Two complete sets of engine filter and engine filter O-rings (in addition to O-rings in rebuild kits); for diesel only.
   c. 38 L (10 gallons) engine oil as recommended by engine manufacturer. One set of drive belts; for diesel only.

d. Two engine cooling loop solenoid drain valves.
e. Two complete sets of all fuses for fire pump and jockey pump controller.
f. Two 0-2500 KPa (0-300 psi) liquid filled gauges.
g. One each jockey pump pressure transducer and fire pump pressure transducer.
h. Fire pump controller I/O board.

2. Storage: Store spare parts inventory in separate, designated lockable storage cabinet specified in Section 105613 “Metal Storage Shelving;” this cabinet shall be attached to, or located adjacent to, fire pump assembly, which is located in fire pump room. Manufacturer shall determine size of cabinet necessary to store initial spare parts. Parts shall be individually labeled and packaged to resist environment in extended storage. Place laminated parts list, with corresponding manufacturers' part numbers as well as manufacturers' telephone and fax numbers and ordering information permanently attached inside of same cabinet. Fire pump package will not be accepted unless this requirement is complete.

1.9 MAINTENANCE AND OPERATION

A. General: Following completion of installation, start-up, field testing, and acceptance of fire pump assemblies on project site, and through remainder of project construction time, provide continued maintenance, and scheduled weekly automatic testing and/or emergency operational readiness of units; comply with instructions and recommendations of the manufacturer. Operate units weekly in accordance with NFPA 25.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General: Provide a United States sourced, skid-mounted, prefabricated, horizontally mounted fire pump assembly which is arranged and performs operationally in accordance with provisions of this Section, including each “Fire Pump Assembly Data Sheet.”

B. Maximum Output Pressure (Churn): Under no conditions, unless prior written approval by OBO/OPS/FIRE is obtained, shall the churn pressure of the fire pump measured at its output flange, be above 1200 kPA/sq. m (175 psi).

C. **[Low Speed Diesel: Diesel drivers shall be limited to a maximum of 2,400 RPM.]**

2.2 CENTRIFUGAL FIRE PUMPS

A. Description, General: UL 448, factory-assembled and -tested, **[diesel-][electric-]**drive, centrifugal fire pumps capable of furnishing not less than 150 percent of rated capacity at not

less than 65 percent of total rated head and with shutoff head limited to 140 percent of total rated head.

1. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
2. Nameplate: Complete with capacities, characteristics, and other pertinent data.

B. Fabricate base and attachment to fire pumps, pressure-maintenance pumps, and controllers with reinforcement to resist movement of pumps and controllers during a seismic event when their bases are anchored to building structure. No “diamond” type or other metal plating shall be installed or welded onto top of skid frame during fabrication or field installation.

C. Single-Stage, Horizontally Mounted, Split-Case Fire Pumps: Single-suction type with pump and driver mounted on same base and connected with coupling.

1. Pump: Axially split cast-iron casing with suction and discharge flanges machined to ASME B16.1, Class 125 dimensions, unless otherwise indicated.

   a. Impeller: Cast bronze of construction to match fire pump, statically and dynamically balanced, and keyed to shaft.
   b. Wear Rings: Replaceable, bronze.
   c. Shaft and Sleeve: Steel shaft with bronze sleeve.

      1) Shaft Bearings: Grease-lubricated ball bearings in cast-iron housing.
      2) Seals: Stuffing box with minimum of four rings of graphite-impregnated braided yarn and bronze packing gland.

2. Coupling: Flexible and capable of absorbing tensional vibration and shaft misalignment. Include metal coupling guard.
3. Driver: Diesel Engine or UL-listed, NEMA MG 1, open drip proof, squirrel-cage, induction motor complying with NFPA 20 and NFPA 70. Include wiring compatible with controller used.

D. Fire-Pump Characteristics and Specialty Data:

1. Fire-Pump Plan No.: **<Insert designation used on Drawings.>**

   a. Rated Capacity: **<Insert value – as required by fire sprinkler system demand.>**
   b. Churn Pressure: **<Insert value.>**
   c. Outlet Flange Class: 125.

2. Skid: No greater than 4450mm x 2300mm (175-inches x 90-inches).
3. Speed: Same as driver.
4. Churn pressure shall not exceed 1,200 kPa/sq. m (175 psi). Do not use high pressure pumps without written approval from OBO/OPS/FIRE through the Project Director/COR.
5. Maximum speed is 2,400 RPM.

2.3 FIRE PUMP CONTROLLERS

A. Fire-Pump Controllers, General: UL 218 and NFPA 20; listed for pump driver, fire-pump service and service entrance; combined automatic and manual operation; factory assembled and wired; and factory tested for capacities and electrical characteristics. Equip controller with capability/means to download event history onto easily removable media without use of laptop or serial port.

1. Rate controllers for scheduled fire-pump horsepower and short-circuit withstand rating at least equal to short-circuit current available at controller location. Take into account cable size and distance from substation or supply transformers.
2. Enclosure: UL 50, NEMA Type 4 (minimum), drip proof, indoor, unless special-purpose enclosure is indicated. Include manufacturer's standard red paint applied to factory-assembled and -tested unit before shipping.
3. Controls, devices, alarms, functions, and operations listed in NFPA 20 as required for drivers and controller types used, and specific items listed.

a. Isolating means and circuit breaker.
b. "Power on" indicating LED.
c. Visual and Audio Alarms: Provide the following:

1) Critically low oil pressure in lubrication system. Controller shall provide means for testing position of pressure switch contacts without causing trouble alarms.
2) High engine jacket coolant temperature.
3) Failure of engine to start automatically.
4) Shutdown from over speed.
5) Battery failure or missing battery. Provide each controller with separate visible indicator for each battery.
6) Battery Charger Failure: Provide each controller separate visible indicator for battery charger failure; they shall not require audible alarm for battery charger failure.
7) Low Fuel Level: Alarm at two-thirds tank capacity.
8) Switch not in automatic.
9) High/Low Fire Water Tank Level (two inputs).
10) Fuel spill.
11) Low Water Flow Alarm.
12) High water Temperature Alarm.
13) High Fuel Level Alarm: Alarm at 95 percent tank capacity.

d. Automatic and manual operation, with minimum run-time relay to prevent short cycling.
e. Water-pressure-actuated transducer responsive to water pressure in fire-suppression piping.
f. Automatic and manual shutdown.
g. System pressure recorder.
h. Remote alarms: Provide the following:

1) Engine is running (separate signal).
2) Controller main switch has been turned to off or manual position (separate signal).
3) Trouble on controller or engine.
4) Water Level Monitoring: Low water level in fire protection water supply tank.
5) Diesel Fuel Oil Tank Monitoring: Low fuel oil level in fire pump fuel oil storage tank.

4. Nameplate: Complete with capacity, characteristics, approvals and listings, and other pertinent data.
5. Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with nonferrous metal sensing piping, NPS 1/2 (DN 15), with globe valves for testing controller mechanism from system to pump controller as indicated. Include bronze check valve with 3/32-inch (2.4-mm) orifice in clapper or ground-face union with noncorrosive diaphragm having 3/32-inch (2.4-mm) orifice.

2.4 PRESSURE GAGES – OIL FILLED

A. Description: Oil-filled only permitted. 90 to 115 mm (3-1/2 to 4-1/2-inch) diameter dial. For gauge ranges, see Paragraph on “Suction and Discharge Gauges” in Article on COMPONENTS below. Include caption "WATER" on dial face.

2.5 COMPONENTS

A. Include the following, in addition to primary components (i.e., fire pump, drive unit, skid assembly, and internal-to-package piping and electrical/electronic control wiring as applicable for each unit as required):

1. Jockey Pump Relief Valve: Equip jockey pump with pressure relief valve on discharge side. Install pressure relief valves after discharge side of pump and before system check valve. It shall be UL listed and/or FM rated, and no smaller than 20 mm (3/4 inch). It shall be visibly piped to open floor drain so flow can be regulated and adjusted. Drain line shall be piped of non-corrosive material.
2. Air Relief Valve: Equip top of pump case with APCO automatic air vent valve.
3. Suction and Discharge Gauges: Provide suction and discharge gauges, Ashcroft Mfg., or approved equal with 90 mm (3-1/2 inch) dials on fire pump and having -100 to 250 KPa (−15 to 35 psi) suction and 0 to 2500 KPa (0-300 psi) discharge. Suction and pressure gauges shall be liquid filled and piped so they can be readily viewed by operator from fire pump controller. Gauges shall have brass ballcock to facilitate gauge maintenance. Adjust suction gauge rating if municipal bypass is provided.
4. Controller Sensing Line Gauge: Fire pump and jockey pump controller sensing lines shall have one each 0-2500 KPa (0-300 psi) liquid filled gauge, Ashcroft mfg. or approved equal, piped with brass ballcock 300 mm (12 inches) above the piping entrance to their respective enclosures.

5. Discharge Piping Drain Valve: Fire pump discharge piping shall have 25 mm (1 inch) drain valve with 25 mm (1 inch) plug, located at furthest point of fire pump manufacturers' discharge piping.
6. Drain Lines: Drains located on fire pump package (including, but not limited to, fire pump packing bowls, fire pump and jockey pump controller sensing line drains, and 25 mm (1 inch) drain line on furthest point of fire pump discharge piping) shall be piped to common 40 mm (1-1/2 inch) galvanized pipe header, piped to edge of skid, and ready for Contractor's piping to floor drain (except for fire pump packing bowls). Diesel engine heat exchanger piping shall be piped separately with its own sight glass and flex connector. Each drain branch line shall have union for maintenance, and shall be piped above level of properly grouted skid, and substantially supported. Galvanized piping from fire pump packing bowls shall be 20 mm or 25 mm (3/4 inch or 1 inch). All drain lines shall be of non-corrosive material.
7. Discharge Outlet and Suction Inlet: Provide tapered concentric increaser at discharge outlet and tapered eccentric reducer at suction inlet. Both shall be flanged or grooved with straight tapers; weld reducers/increasers are not acceptable.
8. Main Relief Valve Piping: Main relief valve, when diesel driven unit, shall begin operation at 1,200 kPa (175psi) and be piped back to reservoir unless otherwise approved by OBO/OPS/FIRE. If reservoir is potable water source, main relief shall be piped to alternative non-potable reservoir in accordance with the OBO Mechanical Code, or provide drain that is sized to accept full flow from main relief valve. Piping shall have sight glass of type with removable window. Relief valve discharge piping shall have check valve installed if piping is returned below expected reservoir water level. If trapped water is present, install 25 mm (1 inch) drain valve after relief valve and before check valve (to facilitate maintenance) on sight glass or relief valve. If 25-mm (1 inch) drain is installed, it shall be piped to common skid drain header. If pump drivers are electric, pipe typical 20-mm (3/4 inch) relief valve to drain header, and equip with sight glass.
9. Name Plates: Nameplates on fire pump skid package and components shall be permanent and legible throughout life of the equipment. If component name plates are not easily accessible, or subcontracted component labels of fire pump manufacturer are not of permanent stamped steel type, then fire pump skid package manufacturer shall construct permanent label and place it in conspicuous location near referenced equipment. If fire pump manufacturer utilizes "in-house" reference number, number shall appear on permanent metal placard, attached to skid in conspicuous location.
10. Flow Meter: Flow meter shall be Gerand Mfg. or approved equal.
11. Pump Valves: Provide OS&Y valve with SPDT tamper switch on suction side of pump. Provide butterfly valve equipped with SPDT tamper switch on discharge side of pump.
12. Check Valves: Provide wafer type check valve or swing check valves on discharge side of fire pump. All system control valves and system check valves must be UL listed and/or FM approved. They shall be rated not less than 1400 kPa (175 psi). Check valves shall have Rubber Faced Clapper Assemblies.
13. Fuel Tank: Fuel tank shall be double-wall with integral leak detection for space between walls, and with mechanism to drain sediment from tank bottom. Provide ball valve with locking feature and with design to maintain integrity against diesel fuel. Fuel capacity shall be in accordance with minimum NFPA 20 requirements. Provide High/Low fuel level switch.

14. Fuel Tank Water Separator: Provide fuel tank with water separator, in-line to diesel driver if provided integral to the driver.
15. Jockey Pump: Grundfos mfg. or equivalent.
16. Jockey Pump Controller: Jockey pump controller shall be programed to use minimum run timer.
17. Fire Pump Controller: Provide fire pump controller with minimum run timer. Controller shall be timed for self-starting weekly pump runs. Through Project Director/COR, contractor shall coordinate timing of weekly pump runs with Post Facility Manager for preferred time. Self-starting weekly pump runs shall not be programed for weekends. Only "manual" pressure switch test starts are allowed.
18. Batteries: Dual acid starting type; provide charger.
19. Tamper Resistance for Valves: All control valves controlling water supply to fire suppression system shall be tamper equipped/supervised.
20. Sensing Lines: Equip controller sensing lines with brass check valves, with 2.4 mm (3/32 inch) orifices or 2.4 mm (3/32 inch) restricting unions, installed per NFPA 20 guidelines for pressure switch protection against surges. All related piping for sensing lines shall be brass piping and no smaller than 15 mm (1/2 inch) in size.
21. Jockey Pump Piping: Equip jockey pump with brass suction strainer with clean-out. Suction side of jockey pump shall be tied-in before OS&Y valve on suction side of main fire pump. Pipe jockey pump discharge to system side of OS&Y valve.
22. Miscellaneous Assembly Requirements:

    a. Provide red factory finish for (virtually) entire assembly.
    b. Provide fire pump suction and discharge piping, flow meter return piping, heat exchanger discharge piping, combination drain header (at contractor's connection point), and pressure relief piping (for diesels), provided with flanged, braided, stainless steel type vibration isolation devices (grooved or flanged).
    c. Connect diesel exhaust piping to engine with flanged strain relief, rated for diesel exhaust use. Locate flanged, braided stainless steel vibration isolation devices between fire pump package and building piping.
    d. Firmly anchor piping, pressure sensing lines, by-pass with check valves (when applicable), shut-off valve drains, meters, controllers, and pumps to steel skid by means of structural steel supports.
    e. All electrical wiring between controllers, motors, and engine shall be completed and tested at factory. Entire package shall require just one power connection by electrical subcontractor. Connect fire pump, jockey pump and jockey pump controller, and all accessories/equipment which supports fire pump installation to essential bus.

B. Component Description: Design packaged fire pump system in accordance with requirements of NFPA 20. Fire pump shall be listed by Underwriters Laboratories and/or approved by Factory Mutual for fire pump services. Pump manufacturer shall assume unit responsibility for proper operation of entire system as specified herein.

1. Fire Pump Design: Fire pump basis of design is horizontal split case type and shall be U.L. listed and/or F.M. approved. The responsible fire protection subcontractor/designer shall identify: 1) RPM, 2) rotation, and 3) rated capacity in LPM (GPM) as dictated by sprinkler

demand calculations, and maximum churn pressure in KPa (psi). Pump shall deliver minimum of 150 percent of rated capacity at 65 percent of total rated head pressure. Fire pump shall be manufactured by Peerless, Fairbanks-Morse, Patterson, AC Fire, or approved equal.

2. Pump Drive Unit: Fire pump shall be driven by diesel engine or electric motor specifically listed by Underwriters Laboratories and approved by Factory Mutual for fire pump service. Engine horsepower shall be de-rated for elevation and temperature as required by NFPA 20. Engine shall have sufficient horsepower to operate fire pump under any condition of pump load. Engine shall be wired for 12 Volt operations. Maximum speed of driver is 2,400 RPM.
3. Diesel Engine Controller: Provide UL and FM approved automatic diesel engine controller by Metron Firetrol Mfg. or approved equal. House in National Electrical Manufacturers Association (NEMA) type 4 enclosure. Required voltage is (project specific) volts. Equip controller with means to electronically record event history, automatic starting; provide with minimum run timer, having minimum run time of ten minutes. Controller shall sense pressure on system by way of pressure transducer. Equip controller with digital, programmable time clock. Omit devices designed to stop pump in event of low suction pressure. Provide UL and FM approved automatic electric engine controller by Metron Firetrol Mfg., or approved equal, housed in NEMA type 4 enclosures.

4. [Electric Motor Controller: Fire pump controller shall have transfer switch suitable for available short-circuit at line terminals of controller, and transfer switch shall be marked "Suitable for use on a circuit capable of delivering not more than <insert value> amperes r.m.s. symmetrical at <insert value>." Controller shall provide automatic starting and be provided with minimum run timer having minimum run time of ten minutes. Controller shall sense pressure on system by way of pressure transducer. Controller shall be capable of signaling a remote panel of: AC Availability, AC Failure, Pump Operation, Loss of Phase, or Phase Reversal and low voltage. Phase reversal shall be alarmed through separate set of dry contacts. If reduced voltage is required, provide Wye Delta closed transition controller. If controller is equipped with selector switch, the switch shall be monitored.]

5. Jockey Pump Design: Jockey pump shall be manufactured by Grundfos Mfg. or approved equal. Provide installation with fusible disconnect. Equip pre-piped sensing lines with brass check valves with 2.4 mm (3/32 inch) orifices; restricted unions are not acceptable. Mount jockey pump controller in NEMA Type 4 minimum enclosure, with front mounted HAND-OFF-AUTO selector switch and overload relays. Provide jockey pump with emergency AC power circuit.

   a. For jockey pump, the responsible fire protection subcontractor/designer shall identify:

      1) Delivered LPM (GPM).
      2) Total dynamic head in kPa (psi).
      3) Operating HP, RPM, voltage, phase, and hertz.

   b. Sizing:

1) Volume: 40 LPM (10 GPM) maximum.
2) Churn Pressure (Maximum): 140 kPa (20 psi) maximum above fire pump churn.

6. Protection: Enclosures for controllers shall be NEMA type 4 minimum. **[Tropicalization is required via humidistat and a thermostat, wired in parallel to heater. Tropicalization devices shall be adjustable to protect controls from effects of humidity.]** Install equipment at factory by controller manufacturer.
7. Power Distribution: Provide power distribution system to accept incoming feeder and distribute power to the items below. Distribution shall have disconnect from main power supply. Each item referenced shall have independent breaker or approved disconnect, properly labeled with permanent signage. Enclosure shall be NEMA 4 rated.

   a. Engine controller.
   b. Engine jacket water heater.
   c. Jockey pump.

2.6 FACTORY TESTING

A. Factory Testing: Fire pump's initial commissioning shall be by manufacturer's licensed representative. Testing shall be in accordance with NFPA 20. The fire pump package shall be hydrostatically tested at factory at 1600 KPa (200psi) for two hours. Test system as a unit at manufacturer's facility prior to shipment. Energize system through power distribution system panel; all system failures shall be demonstrated. After successful completion of the hydrostatic test, conduct the NFPA 20 performance acceptance tests to include a flow test. Tests shall be witnessed and approved by OBO/OPS/FIRE, with notification of Project Director/COR. Refer to Article on SUBMITTALS for requirements prior to testing.

   1. Pump drive unit engine shall be tested prior to shipment from the manufacturer's factory. Provide test header, flow meter, and related components as required by NFPA 20.

PART 3 - EXECUTION

3.1 FIRE PUMP PACKAGE ASSEMBLY INSTALLATION

A. General: Comply with manufacturers' and OBO/OPS/FIRE instructions/recommendations for installation, alignment of equipment, and connected piping. Comply with industry standards identified in Part 1 of this Section. Support connected pipelines independently from support of fire pump components. Include flowmeter and heat exchanger discharge return lines to water source, unless otherwise approved by OBO/OPS/FIRE. Locate lines to avoid interfering with access to components for service and maintenance, including for removal of driver units, couplings, pump impellers, seals, and accessories. Proceed as follows:

1. Disconnect driver-to-pump couplings during setting, leveling, anchoring, and grouting of structural skid on foundation. Contractor shall assure qualified personnel perform this function correctly.
2. Support structural skid at required elevation on steel plate wedge shims at each anchor bolt location, nominally at 25 mm (1 inch) above concrete foundation. Adjust level of skid so that pump shaft and driver are level. Ensure coupling face and suction/discharge flanges are plumb when anchor bolts are nominally tightened.
3. Install forms at edges of foundation to retain grout, and to form edges of grout into a 25 mm (1 inch) chamfer.
4. Pour skid grout to depth of approximately 40 mm (1-1/2 inches), inside skid and strike to level of skid bottom for exposure outside skid. Ensure grout is substantially under skid frame members to inhibit voids under the skid. Allow initial pour to harden and cure.
5. Nominally retighten anchor bolt nuts and recheck level/plumb of main components.
6. Align pump and driver shafts and reconnect driver to pump couplings. Ensure with dial indicator, precision straight edge and taper gauge (if applicable), alignment is correct.
7. Fill skid frame to top flange with skid grout, allow hardening and curing. Tighten anchor bolts and nuts. Recheck pump/driver alignment, and correct as necessary, complying with manufacturer's recommendations. Repeat coupling alignment checks after making pipe connections.

B. Connections, General: Reinstall any components, connections, or accessories that might have been temporarily removed or disassembled for fire pump assembly installation. Exercise care to remove temporary fluids, coating and closures. Replace with operational fluids, coatings, and lubricants as specified by manufacturer. Proceed with final pipe sizes and connections as shown, with suction piping elevations and configurations fully complying with standards referenced in Part 1 of this Section and manufacturers' recommendations and OBO/OPS/FIRE direction. Keep pipe and equipment clean internally by use of plugs and temporary closure plates. Comply with applicable Divisions 21, 22 and 23 Sections for extension of pipelines to fire pump assemblies, and for connections thereto, including installation of flanges, unions, valves, and other pipeline devices indicated. Refer to Division 26 Sections for extension of electrical/electronic services to fire pump assemblies and for connections thereto for supplying power, controlling equipment, operating connecting alarms, devices, and other systems; these are not work of this Section, except as otherwise indicated.

1. Exhaust System: Fabricate engine exhaust piping as required to remove exhaust gas from pump room, and/or building. Connect flexible piping units to engine, and mount muffler units as indicated near shield/cage units to protect personnel from accidental contact and resulting burns. Install exhaust piping system with vibration dampeners and supported independently from fire pump assembly. Insulate extended piping system except where shown to be non-insulated; apply indicated thickness of exhaust piping insulation in compliance with insulation manufacturer's instructions and recommendations.
2. Welding: Comply with ASME "Boiler and Pressure Vessel Code", Section IX, "Welding and Brazing Qualifications" for qualification of welding processes and operators used in the fabrication of exhaust piping systems.

C. System Finishes, General: Refer to Division 09 section on "Painting" for cleaning/priming/painting exposed surfaces of any work of this section to include touch-up of

abraded factory finishes on fire pump assemblies, and extensions of red enamel finishes, and other finishes as indicated on connected service piping, conduits, and similar work not in this Section. The Project Director/COR will determine extent of specific paint color applications.

3.2 INSTALLATION AND INSTALLATION MATERIALS

A. Except as otherwise indicated, provide materials for completing connections for mechanical and electrical service lines to installed fire pump assemblies to match materials of those service lines, either as specified in other Sections hereof, or as existing on previously installed lines. This requirement is applicable to piping, conduit, wiring and other lines for materials, finishes, operational equipment and devices, including valves and switches.

1. Pump Foundation Materials: Comply with applicable provisions of Section 033000 "Cast-in-Place Concrete" for concrete and reinforcing materials as required to form/pour/reinforce, pump foundations as indicated; using 30 MPa (4000 psi) Portland cement mix. Comply with fire pump manufacturers' printed directions/recommendations for selection of materials.
2. Skid Grout: Provide non-shrinking and non-metallic grout mix, complying with ASTM 1107, Grade B, with design-mix strength of 35 MPa (5000 psi) for 28-day compression. Fill assembly level to top of skid without covering drain, power, control, or sensing line of any type.
3. Engine Exhaust Piping: ASTM A 53 Type E/S, Schedule 40 butt-welded black carbon pipe and fittings. Flange gaskets shall be non-asbestos, surface temperature rating of up to 1,100 deg C (2,000 deg F). Exhaust gasses shall not be discharged where they will affect persons, disrupt occupants, or endanger buildings.
4. Exhaust Piping Insulation: Insulation, reusable/removable thermal blankets; standard construction; high density 175 kg/cu. m (9 lbs/cu. ft.) flexible fibrous glass; standard 25 mm (1 inch) thick; silicone coated outer jacket, stainless steel mesh inner surface liner; stainless steel seaming materials; custom fitted for muffler, pipe fittings, and flanges located inside building; 550 deg C (1,000 deg F) operating temperature; installed with stainless steel lacing wire; Basis of Design is GT Exhaust Systems Series 100.
5. Exhaust Sound Suppression: Pump manufacturer shall provide muffler and flexible connection between engine and muffler. Engines exhausting from normally occupied buildings. Package shall utilize residential grade mufflers. Provide muffler inside of building. Install muffler horizontally and provide with vibration isolators.
6. Engine Exhaust Installation: Connect exhaust piping to engine with flanged, strain relief, rated for diesel exhaust use. Suspend exhaust piping by approved devices that allow limited movement of pipe to prevent stress cracks from developing. Piping that must pass through walls shall utilize steel sleeves, with minimum of 25 mm (1 inch) clearance. Fill exhaust piping-to-sleeve clearance with non-hardening, fireproofing.

    a. Roof/Wall Penetrations: Thimble, factory fabricated, aluminized steel with thermal insulation. Provide with rain guard when penetration is through exterior wall or roof. Basis of Design is GT Exhaust Systems Series 20.
    b. Rain cap (if roof discharge): Hinged, black steel with stainless bushing and hinge. Basis of Design is GT Exhaust Systems Series 22.

7. Heat Exchanger Discharge: Manufacturer of fire pump assembly shall provide stainless steel, flexible hose connection at discharge of heat exchanger for installing contractor to begin piping back to drain. Provide sight glass for heat exchanger discharge line with spring-loaded "ball" to indicate water flow. Heat exchanger discharge gauge shall be liquid filled, isolated from destructive engine vibration, and equipped with brass ballcock to facilitate maintenance. Return heat exchanger water to fire-protection water tank where reasonably feasible. Install temperature gauge on return line to tank.
8. Fuel Supply System: Provide fire pump engine fuel tank fill with operator-presence-control-switch and connect to facility fuel oil system. Coordinate with requirements in Division 23 Section on building fuel oil piping.
9. Water Tank Piping: All piping, fittings, hanger assemblies, vortex plats, and other components within tank shall be stainless steel. All piping and fittings from tank to fire pump suction control valve shall be stainless steel.

3.3 FIELD QUALITY CONTROL:

A. General: Perform each fire pump assembly installation, field start up, and field testing procedure under direct supervision, at project site, of manufacturer's authorized technical representative who is acceptable to OBO/OPS/FIRE. Record in writing, and deliver copy promptly to Project Director/COR, running record on each installation activity, with observed/measured/tested results of such activities. Begin and maintain fire pump logbook, starting with first operational test/date, including any faults, or corrections made. Logbook, or similar hard cover logbook with identical information, shall be left in controller for maintenance personnel to track weekly tests, problems, and maintenance performed. Logbook will be used to assist OBO/OPS/FIRE Technicians, and Fire Marshal inspections and tests. Advise Project Director/COR in advance of scheduled test times and provide OBO/OPS/FIRE a minimum of 30 days advance notice.

1. Piping Tests: Prior to proceeding with fire pump operating tests, complete hydrostatic tests to confirm watertight installation of pressurized piping systems at 1600 kPa (200 psi) for two hours. Test suction piping at minus one-half atmosphere to confirm absence of negative pressure (air) leakage into system during operation. A two-hour 1600 KPa (200 psi) hydrostatic test is also acceptable. Test shall be witnessed by Project Director/COR or their representative before any suction piping is covered in any manner. Failure to comply may result in excavation of the piping. Comply with applicable standards for hydrostatic testing. Document tests of all underground and above ground piping on "Contractors Material and Test Certificate for Aboveground Piping" and "Contractors Material and Test Certificate for Underground Piping".
2. Preparations for Equipment Start-up: Prior to field start-up of installed fire pump assemblies, check installations and make the following preparations comply with manufacturer's instructions and recommendations:

   a. Test and adjust controls and safeties. Pressure transducers shall be set with certified, liquid filled gauges. Pressure differentials shall be recorded in fire pump logbook.
   b. Check motor/engine for proper direction of rotation, and check pump impeller for unimpeded rotation.

c. Check engine coolant fluid level, and adjust to manufacturer's recommended anti-freeze mixture percentages, with minimum of 50 percent anti-freeze/water.
d. Ensure engine oil level is correct.
e. Verify all valves are in their normal position for testing fire pump.
f. Ensure pump casing is primed.
g. Adjust stuffing boxes/mechanical seals, and open supply lines.
h. Verify hot-start operation.

3. Assembly Field Tests: Promptly upon nominal completion of installation work, proceed with operating tests on fire pump assembly(s); comply with NFPA 20. Prior to starting of field acceptance testing, all diesel fire pumps shall be run continuously for a minimum of 60 minutes at 100 percent. Engine RPM and temperature shall be recorded at least every 15 minutes. Perform direct on-site operation and testing in coordination with manufacturer's representative. Comply with manufacturer's operating instruction, and demonstrate to Project Director/COR, OBO/OPS/FIRE, and the Government's operating personnel every operational feature and capability of installed equipment, including accessory elements which make up systems. All field start-up, testing, final acceptance, and commissioning of water reservoir, suction piping, and fire pump assembly shall be performed by installing contractor and pump manufacturer's representative in presence of OBO/OPS/FIRE personnel. The manufacturer’s representative shall complete "Pump Acceptance Test Data" form.

3.4 DEMONSTRATION

A. Training: Training shall not be conducted until fire pump installation, including fire alarm system monitoring, has been tested in accordance with NFPA 20 and 72, and accepted by OBO/OPS/FIRE. Pump manufacturers' field representative shall provide two 8-assembly and component training sessions to Government personnel, including Foreign Service National (FSN) maintenance personnel, on location. Training shall include classroom and practical hands-on training covering operation, adjustments, theory, and troubleshooting. Specific operation maintenance manuals, as described under Article on SUBMITTALS in paragraph on Operation and Maintenance Manuals, shall be utilized for this training. Contractor shall video the training and produce a DVD deliverable such that future staff may benefit from the class.

END OF SECTION 213115

SECTION 223230 – POTABLE WATER TREATMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes equipment, piping, and specialties, along with water testing and monitoring to provide potable water system.

B. Related Sections include the following:

1. Refer to Section 105613 “Metal Storage Shelving” for four-post metal storage shelving and for storage cabinets used for water treatment equipment and for storage of associated manuals and operational logbooks.
2. Refer to Division 12 Section for work bench and cabinets used for testing water and supplies.
3. Refer to Division 22 Section for general plumbing system requirements, including sink (required in Potable Water Treatment Room), meters and gages for plumbing piping for pressure gages, piping installation, fittings, specialties, and similar system components.
4. Refer to Division 22 or 23 Section for dielectric fittings.
5. Refer to Division 22 Section on Domestic Booster Pumps.
6. Refer to Section 230905 “Instrumentation and Controls for HVAC” for point list schedule related to Building Automation System (BAS) connection.
7. Refer to Division 26 Sections for installation of electrical connections for power, controls, and devices.
8. Refer to Section 331416 “Site Water Distribution.”

1.2 REFERENCE STANDARDS

A. American Society of Mechanical Engineers (ASME) Standards:

1. ASME Boiler and Pressure Vessel Code, BPVC-X-2023: "Fiber-Reinforced Plastic Pressure Vessels."

B. American Water Works Association (AWWA) Standards:

1. AWWA B100, “Granular Filter Material.”
2. AWWA B114, “Reverse Osmosis and Nanofiltration Systems for Water Treatment.”
3. AWWA B116, “Electrodialysis and Ion-Exchange Membrane Systems.”
4. AWWA B604, “Granular Activated Carbon.”
5. AWWA C652, “Disinfection of Water Storage Facilities.”
6. AWWA C653, “Disinfection of Water Treatment Plants.”

C. National Sanitary Foundation (NSF) Standards:

1. NSF/ANSI 14, “Plastics Piping System Components and Related Materials.”

2. NSF/ANSI 58, “Reverse Osmosis Drinking Water Treatment Systems.”
3. NSF/ANSI 60, “Drinking Water Treatment Chemicals - Health Effects."
4. NSF/ANSI/CAN 61, “Drinking Water System Components – Health Effects.”
5. NSF/ANSI 419, “Public Drinking Water Equipment Performance – Filtration.”

1.3 SYSTEM DESCRIPTION

A. Provide multi-barrier potable water system capable of providing the design volume and flow rate of water with minimum of operations and maintenance. Each treatment unit within the system must have parallel modules with isolation valves to allow each module to be isolated for maintenance while allowing second module to remain operating. As such, all maintenance should be capable of being accomplished without shutting down the treatment system. System must include the following treatment units:

1. Pretreatment: System must include at a minimum:

   a. Initial filtration.
   b. pH and corrosion monitoring.
   c. Langelier Saturation Index (LSI) monitoring and adjustment.
   d. Temperature monitoring.
   e. Turbidity monitoring.
   f. Total Dissolved Solids (TDS) monitoring.
   g. Alkalinity (HCO3-) monitoring.
   h. Hardness (Ca+2) monitoring.
   i. Disinfectant (Cl-) dosing and monitoring.

2. Raw water storage, including:

   a. Temperature monitoring.

   b. Mixing/stirring to eliminate dead zones and control horizontal and vertical thermal striation within +/- 2 degrees C.
   c. Disinfectant (Cl-) dosing and monitoring.

3. Secondary Filtration: Filtration with multimedia filters to **[XX]** micron.
4. Granular Activated Carbon (GAC) Filtration: GAC filters for removal of organics and Total Trihalomethane (TTHM) and Disinfection By-Products (DBP) contaminants.
5. Ion Exchange Media or Cartridge Filtration (if needed): For removal of site-specific inorganic contaminants.

6. [Reverse Osmosis: Use special care in disposing of reverse osmosis reject concentrate.]

7. [Tertiary Filtration: Filtration with sub-micron cartridge filters to remove cysts and spores.]

8. Potable Water Storage including:

   a. Continuous mixing/stirring.

b. Temperature monitoring and control to maintain temperature at 21 deg C/ 70 deg F or below).
c. Chlorine and pH monitoring and control.
d. Potable Water Storage Tank must be a split tank.

9. System monitoring of treatment unit flow rates and pressures, automated filter backwashing, and indication of other required maintenance.
10. System accessories including spill containment pallets for chemicals, OSHA Hazard Communications Standards (HAZCOM), and spill response kit with operating procedures.
11. Water quality testing and monitoring equipment necessary for daily testing with dedicated space and appropriate storage in the water treatment room to perform said tests.

B. Water treatment must conform to requirements of the OBO Plumbing Code OBO-ICS IPC Section 611. Disinfection must be based on use of **[sodium hypochlorite][calcium hypochlorite]** solutions.

C. Water treatment systems must be tailored to specific source water quality. However, in no case must untreated source water be conveyed directly to Department of State facilities served by system without written approval from Project Director/COR based on input from OBO/PDCS/DE mechanical engineer. Systems must be passive and self-correcting with chemical feed systems minimized to the extent practicable.

D. Provide automatic treatment capable of complying with National Primary and Secondary Drinking Water Regulations 40 CFR Parts 141 – 143 and Safe Drinking Water Act (PL 93-523, PL 104-182, and other applicable Public laws). Source water compliance testing must be conducted quarterly (three-month intervals) for one full year during construction to validate water treatment system design.

1.4 SUBMITTALS

A. Product Data: Include system design flow; component rated capacities; water pressure drops; shipping, installed, and operating weights; and furnished products listed below:

1. Pumps.
2. Chemical solution tanks with secondary containment.
3. Chemical mixers and feeders; Provide estimate of each chemical's daily and annual usage rates.
4. Process control monitoring equipment and devices.
5. Automated water quality testing and monitoring equipment and devices.
6. Process Treatment Units including filters and media: Provide calculations for each media backwash and replacement schedules based on average contaminant load from water quality test data.
7. Water Testing Kits for required manual water quality monitoring.
8. Storage tank mixers.

B. Certifications and Approvals:

1. NSF and AWWA certifications and approvals as applicable.

2. Approvals by local Authority Having Jurisdiction or Host Country authorities if required.

C. Shop Drawings: Detail equipment assemblies and piping indicating dimensions, weights, loads, required housekeeping pads and clearances, and location and size of field connections. Shop drawings must include all components, locations of monitoring/sampling ports (both before and after treatment), valves, gauges, vibration isolators and seismic isolators and appurtenances. NSF approvals and method of field assembly must also be provided. Indicate access to floor drains and wall hydrants.

D. Wiring Diagrams: Detail power and control wiring and differentiate between manufacturer-installed and field-installed wiring.

E. Design Test Data, Calculations, and Analysis of supply water source(s) as required in Chapter 6 of the OBO-ICS IPC. Submit six final copies of report and analyses to Project Director/COR for distribution to the following: OBO/CFSM/CM (for their records), Commissioning Agent, OBO/OPS/FAC, OBO/OPS/SHEM, Post Facility Manager, and OBO/PDCS/DE mechanical engineer. Indicate and interpret test results for compliance with performance requirements. At a minimum, testing must be done by ISO 70125 accredited laboratory and include national primary drinking regulated contaminants as well as those defined as secondary water standards. In addition to regulated parameters, testing for corrosivity, sediment particles count, and size distribution analysis is also required.

F. Water treatment and environmental expert must prepare Narratives, Calculations, and associated equipment selections. Include design flows and pressures, and life-cycle costing with estimates of equipment life and labor for treatment system process (e.g., filter cartridges, media, sodium hypochlorite or other disinfectant, corrosion and pH control chemicals, etc.) and equipment selection. Calculation must be provided for each process that demonstrate sufficient contact and residence time for expected maximum contaminant concentration removal to safe levels. Provide calculations demonstrating adequacy of disinfection system including locations of feed points.

G. Operations and maintenance manuals for supplied equipment including information on normal operating parameters, when to change consumable parts, and troubleshooting guide.

H. Complete list of required NSF 61 approved filters/media, chemicals including testing reagents, disinfection agents, and cleaning chemicals. Identify local source and/or foreign source and shipping restrictions.

I. Compliance Monitoring Program: Provide quality control manual and testing schedule for process control and treatment compliance including constituents to be removed by the treatment processes. At a minimum, include testing schedules for turbidity, E. coli, Langelier Saturation Index (LSI), and chlorine residual.

J. Installation completion report including required test data as described in the execution section, adjustments and initial set-points, backwash water volumes, total and per process, and either filter run times or initial and final pressure drops.

1.5 QUALITY ASSURANCE

A. Process Monitoring: At a minimum, the parameters listed below must be monitored. Monitoring equipment must be designed for use in the water treatment system.

1. Flow rate, instantaneous.
2. Flow rate, total.
3. Operating pressures.
4. Pressure differential (across all filters).
5. Turbidity (raw and finished water).
6. Chlorine Residual, pH, TDS, alkalinity, hardness, and temperature in the raw and potable tanks and at the booster pump skid.

B. Piping materials must bear label, stamp, or other markings of specified testing agency.

C. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for the intended use.

D. NSF Compliance:

1. Comply with NSF 14, “Plastics Piping System Components and Related Materials” for plastic potable-water-service piping. Include marking "NSF-pw" on piping.
2. Comply with NSF 58, “Reverse Osmosis Drinking Water Treatment Systems” (if applicable).
3. Comply with NSF 60, “Drinking Water Treatment Chemicals - Health Effects."
4. Comply with NSF 61 “Drinking Water System Components – Health Effects” for materials for water-service piping and specialties for domestic water.

E. Conform to applicable local or Host Country codes and regulations where provisions are more stringent than cited U.S. standards. Ensure that all necessary reviews and approvals are obtained from local or Host Country officials.

F. Implement applicable provisions of the Quality Control program as established in Division 01 Section "Contractor’s Quality Control."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Ship and store water treatment components in accordance with manufacturer’s recommendations.

1.7 PROJECT CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving other occupied facilities unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Project Director/COR not less than two weeks in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Project Director/COR's written permission.

1.8 COORDINATION

A. Water service to the building must be coordinated with Site Utility Plans to comply with OBO-ICS-IZC 813.

1.9 EXTRA MATERIALS

A. Provide minimum of one year of water treatment chemicals (e.g., disinfectant, pH and corrosion control, etc.) and other consumables (e.g., filter media, cartridges, bag filters, etc.) that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.10 MAINTENANCE SERVICE

A. Commencing at the contract’s Substantial Completion date for a period of one calendar year, provide system maintenance service based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. In addition to the initial year of maintenance service, provide a proposal for a renewable option year. The option year proposal must be submitted 60 days prior to the end of the initial maintenance contract period.

B. Maintenance service must be inclusive of troubleshooting, adjusting, operating, laboratory testing, testing for the complete operation, filtration and softening equipment, chemical feeding, storage tanks, booster and recirculation pumps, and control panels, using factory-trained service personnel.

C. Maintenance service must include preventive maintenance, repair or replacement of worn or defective components, required supply of chemicals, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks must also align with the manufacturer's recommended checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 WATER TREATMENT SYSTEM

A. Pretreatment:

1. Initial filtration:

a. Filters: <**[XXX]** micron bag filters.
b. Two complete filtration units must be provided each able to filter 100 percent of the required volume with one filtration unit out of service.

2. Disinfection: Disinfect raw water with sodium hypochlorite and maintain a free chlorine residual of 0.2 – 0.5 ppm in the raw water storage tank.
3. LSI monitoring and adjustment: 0.01<LSI<0.30.
4. Water Softeners:

a. Conform to AWWA B116.
b. Softener system must be twin alternating.
c. Each softener tank must be sized for 100 percent of the system flow rate.
d. The system must be sized for a maximum of one regeneration per day.
e. Regeneration calculations and flow rates must be provided.
f. Refer to Division 22 Section on Commercial Domestic Water Softeners.

B. Raw Water Storage Processes:

1. Disinfection: Disinfect raw water with sodium hypochlorite and maintain a free chlorine residual of 0.2 – 0.5 ppm in the raw water storage tank.
2. Recirculation pumps must be installed and sized to turn over the water in the storage tank every 6 hours unless mixer with venting is deemed appropriate – then optimize both for homogenization of disinfectant residual.

3. Mixing: Raw water tank must be mixed/stirred **[with ventilation]** to eliminate dead zones and control horizontal and vertical thermal striation within +/- 2 degrees C.

C. Potable Water Treatment:

1. A complete filtration system must operate with parallel treatment modules with each parallel module able to treat 100 percent of required daily volume demand.

2. Stage 1: Multimedia filtration.

a. Multimedia Particulate Filtration – **[XX]** micron:

1) Conform to AWWA B100 and B116.
2) Each tank must be capable of processing 100 percent of flow rate.
3) Loading must not exceed 12 $m^3/hr/m^2$ (5 gpm/ft^2).

b. Install isolation valves on inlet and outlet of each filter housing.
c. Install pressure gauges on common inlet and outlet header of each of filter housings. Install flowmeters on outlet header.

3. Stage 2: Ion Exchange Modules.

a. Conform to AWWA B116.
b. Install isolation valves on inlet and outlet of each filter housing.
c. Install pressure gauges on common inlet and outlet header of each of filter housings. Install flow show meters on outlet header.

4. Stage 3: Granulated Activated Carbon (GAC) Filtration:

a. Conform to AWWA B604.

b. **[50 percent coconut and 50 percent coal-based charcoal on 12/40 sieve][XX].** Minimum bed depth 900 mm.
c. Maximum 12.0 $m^3/hr/m^3$ (1.5 gpm/ft^3) flow rate. Empty Bed Contact Time (EBCT) must be calculated for the contaminant(s) being removed.
d. Provide two filters; each filter must be sized for 100 percent of system flow rate.
e. Filters must automatically backwash sequentially.
f. Install isolation valves on inlet and outlet of each filter housing.
g. Install pressure gauges on common inlet and outlet header of each of filter housings. Install flow meters on outlet header.

5. Stage 4: Final Cartridge Filtration:

a. Conform to NSF/ANSI 419.

b. Cartridge filters must include, as necessary, a 3-stage system with a **[XX]** micron, followed by **[X]** micron, followed by 1 micron absolute.
c. Install cartridge filter housings in parallel. Each housing must be capable of treating 100 percent of the system flow rate.
d. Stainless steel filter housings.
e. Install isolation valves on inlet and outlet of each filter housing.
f. Install pressure gauges common inlet and outlet header of each of the filter housings. Install flow meters on the outlet headers.

6. Stage 5: Disinfection: Liquid or tablet chlorination, or on-site generation, such that the system maintains a free chlorine residual in all parts of the distribution system between 0.2 – 0.5 mg/l (ppm). Where sodium hypochlorite is selected, equipment must be able to provide adequate disinfection using between 4 and 12.5 percent solution.

D. Potable Water Storage Processes:

1. Disinfection: Disinfect potable water with sodium hypochlorite and maintain a free chlorine residual of 0.2 – 0.5 ppm in the potable water storage tank.
2. Recirculation Pumps: Pumps must be installed and sized to turn over the water in the storage tank every 6 hours.

3. Temperature Monitoring: Potable water storage temperatures must be monitored and reported to BAS.

E. Process Pressure FRP Tanks (if required for water treatment):

1. Construction: Fabricated and stamped to comply with ASME Boiler and Pressure Vessel Code: Section X, "Fiber-Reinforced Plastic Pressure Vessels."
2. Pressure Rating: 690 kPa minimum.
3. Wetted Components: Suitable for water temperatures from 5 to at least 49 deg C.
4. Freeboard: 50 percent minimum for backwash expansion above normal resin bed level.
5. Support Legs or Skirt: Constructed of structural steel, or similar material, bonded to tank before testing and labeling.
6. Coating: Protective coating to prevent corrosion.

F. Controls: Fully automatic; factory mounted on unit and factory wired.

1. Push-button start and complete manual or automatic operation.
2. Electric time clock and switch for fully automatic operation, adjustable to initiate regeneration or backwash at any hour of day and any day of week or at fixed time and flow intervals.
3. Sequence of Operation: Program multiport pilot-control valve to automatically pressure-actuate main operating valve through steps of regeneration and return to service.
4. Main Operating Valves: Industrial, automatic, multiport, full-port ball valves with the following features:

   a. Slow opening and closing, non-slam operation.
   b. Isolated dissimilar metals within valve.
   c. Valves must be NSF 61 certified.

5. Flow Control: Automatic flow control to control backwash and flush rates over wide variations in operating pressures. Automatic flow control must not require field adjustment.
6. Battery Backup: Provide UPS for electronic control systems such that power flashes and losses will not interrupt equipment operation.

G. Factory-Installed Accessories:

1. All accessories must be NSF 61 certified.
2. Piping, valves, tubing, and drains.
3. Sampling cocks.
4. Main-operating-valve position indicators.
5. Water Meters.

H. Water Distribution and Circulation Pumps:

1. See Division 22 Specification for triplex distribution pumps, booster pumps, recirculation pumps, and hydropneumatic tank requirements. Refer to Division 22 Section on Domestic Water Pumps.

I. [Reverse Osmosis Units:

1. Construction: In accordance with AWWA B114.

a. Provide two complete systems, each able to produce 100 percent of required volume.
b. Design system for automatic operation with minimal operator intervention.]

J. Chlorine Dosing Pumps:

1. Chlorine (Sodium Hypochlorite) feed pumps must be peristaltic or diaphragm type pumps designed specifically for purpose of chemical dosing.
2. Utilize chlorine analyzer to monitor chlorine residual in tank; it must signal chlorine feed pump to dose at rate sufficient to maintain residual of 0.2 – 0.5 ppm Cl_2. Chlorine Analyzers must utilize disposable probes (Chemtrac HydroACT or equivalent).

2.2 MONITORING AND TESTING EQUIPMENT

A. Provide complete filter testing, monitoring equipment, and incubator at location in facility identified in the Construction Documents.

1. Basis of Design: Hourly, daily, weekly water quality and compliance testing must include manual (in addition to BAS) recording: each treatment system module and pumps - flow rates, leak check, and pressures (minimum three times per day); chemical treatment flow rates, leak checks, and chemical storage tank levels (daily); water quality monitoring - manually monitor/record storage tanks daily for pH, chlorine level, turbidity, and temperature; water quality monitor/record specific contaminants of concern.
2. E. coli, total coliforms test kits must conform to one of the following:

a. Colisure.
b. Colilert.
c. Colitag.

B. Provide additional equipment, reagent, and record storage as necessary to fulfill the requirements of the monitoring plan prepared above.

C. Utility Sink and Benchtop: Provide sink and adjacent benchtop space in Potable Water Equipment Room to facilitate field water quality testing. Refer to Section 224215 “Commercial Plumbing Fixtures” for Utility Sink requirements.

D. BAS Interface: Provide a communication Interface for monitoring by the BAS.

1. The communication Interface must be ASHRAE 135 BACNET/IP protocol ready for integration into the BAS.
2. At minimum, the communication Interface must provide water treatment parameters to the BAS as listed within section 230905 Point List Schedule.
3. Potable Water Treatment manufacturer/vendor is responsible for coordinating this requirement with the BAS contractor to ensure proper interfacing.

4. Potable Water Treatment manufacturer/vendor must provide all required onsite technical support to demonstrate proper transfer of information between water treatment system and BAS.
5. Potable Water Treatment system must have no component/device with wireless (to include Wi-Fi) communication capability.

2.3 WATER PIPE, FITTINGS, AND JOINTS

A. Applies only to cold water pipe, fittings, and joints within water treatment room to address corrosive environment and connection points to water treatment equipment. Plastic piping must not be used for hot water.

B. Pipe: CPVC, Schedule 80. ASTM D2846/D2846M (Sch 80) or ASTM F441/F441M or ASTM F442/F442M (SDR-PR) or CSA B137.6.

C. Fittings: CPVC, Schedule 80, ASSE 1061 or ASTM D2846/D2846M or ASTM F437 or ASTM F439 (Sch 80) or CSA B137.6.

D. Joints: CPVC solvent cement ASTM F493.

PART 3 - EXECUTION

3.1 WATER TREATMENT EQUIPMENT INSTALLATION

A. Install water treatment equipment on concrete bases, level and plumb, according to manufacturer's written instructions, layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances but not less than one (1) meter clearance around treatment unit skids. Arrange units so controls and devices requiring service are accessible.

B. In accordance with requirements in Chapter 16 of the IBC, install seismic restraints for tanks and floor-mounting accessories and anchor to substrate.

C. Install pressure gages on all process inlet and outlets.

3.2 CONNECTIONS

A. Install piping adjacent to equipment to allow service and maintenance.

B. Install drains as indirect wastes to spill into open drains or over floor drains. Size floor drains, trench drains, or drain pits to accommodate 200 percent of the calculated backwash flow rates to prevent flooding water treatment room floor.

C. For equipment grounding, tighten electrical connectors and terminals according to manufacturer's published torque tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

D. Make piping connections to dissimilar-metal water piping with dielectric fittings. Refer to Division 22 or 23 Section for dielectric fittings.

E. CPVC solvent cement must be used to connect CPVC pipe to equipment with PVC pipe outlets / inlets. PVC solvent cement must not be used to connect to CPVC pipe.

F. Restrictions on Configuration of Connections and Associated Components:

1. Installation of sanitary drains, storm drains, hydronic piping, fuel piping, hazardous chemicals or associated pumps or equipment directly above raw, potable, or fire water tanks is not permitted.
2. Distribution piping of any system running above the tank, through the tank, or under the tank is not permitted.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field assembly of components and installation of water treatment equipment, including piping and electrical connections. Report results in writing.

1. Contamination: Keep equipment, pipes, and fittings enclosed or capped to prevent/eliminate system contamination, debris, and obstructions during startup.
2. Leak Tests: After installation, charge system modules at twice the operating pressures and test for leaks. Repair leaks and retest until no leaks exist.
3. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation. Remove malfunctioning units, replace with new units, and retest.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Clean and disinfect Water Storage Facilities and Water Treatment Plants as follows:

1. Disinfection of water storage tank(s) are required before putting into service per AWWA C652.
2. Disinfection of raw water storage tank(s) are required before putting into service.
3. Disinfection of Water Treatment Plants is required before putting into service per AWWA C653.

C. Sample water treatment plant effluent after startup and at three consecutive seven-day intervals (total of four samples). Prepare certified test reports for required water performance characteristics based on the initial water tests and the constituents the plant is intended to remove. As a minimum, the testing must include microbiologicals, chlorine residual, turbidity, and LSI (temperature, pH, TDS, alkalinity, and hardness) for corrosivity.

D. Contractor project-warranty manager must implement the compliance monitoring plan for the duration of the warranty period and submit monthly reports.

3.4 DEMONSTRATION AND TRAINING

A. Engage a factory-authorized service representative to train Government's maintenance personnel to adjust, operate, and maintain units.

1. Schedule training with Project Director/COR with at least 14 days advance notice.
2. Train Government's maintenance personnel on procedures and schedules related to start-up, normal operation, shutdown, manual operation, controls set-up and programming, and alarms for maintaining potable water treatment in coordination with complete domestic water system. Provide review of control drawings and schematics. Demonstrate interactions with other systems.
3. Review data in maintenance manuals.

4. [Reverse Osmosis: Review procedures for disposing of reverse osmosis reject concentrate and provide training on membrane cleaning and maintenance.]

B. Training must be comprised of two training sessions as follows:

1. Classroom: 8 hours minimum
2. Field Demonstration: Field Demonstration: 16 hours minimum

END OF SECTION 223230

SECTION 224105 - RESIDENTIAL PLUMBING FIXTURES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes plumbing fixtures and related components for residential buildings, such as Staff Diplomatic Apartments (SDA) and Marine Security Guard Quarters (MSGR), and for representational residences (REP) such as Chief of Mission Residence, Deputy Chief of Mission Residence, and Consular General Residence. In addition, this Section includes those fixtures and components for private executive bathrooms in office buildings.

B. Related Sections include the following:

1. **[Division 10 Section on prefabricated shower receptor and door for individual showers, including testing of floors and receptors for water tightness.]**
2. Section 113103 “Residential Appliances.”
3. Division 22 Section on drinking fountains and water coolers.
4. Section 224215 “Commercial Plumbing Fixtures” for fixtures not in this section.
5. Division 22 Section on plumbing specialties for backflow preventers and specialty fixtures not in this section.

1.2 DEFINITIONS

A. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Fitting: Device that controls flow of water into or out of plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

1.3 SUBMITTALS

A. Product Data for each plumbing fixture category and type specified. Include selected fixture, trim, fittings, accessories, appliances, appurtenances, equipment, and supports. Indicate materials and finishes, dimensions, construction details, electrical characteristics, and flow-control rates.

1. Identify WaterSense label where applicable.

B. Wiring diagrams from manufacturer for electrically operated units, including for power, signal, and controls as applicable.

C. Maintenance data for plumbing fixtures and components to include in the operation and maintenance manuals specified in Division 01.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.

1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, prior to obtaining similar products from other manufacturers specified for that category, submit findings to Project Director/COR that a single manufacturer is not available for that category (identify specific fixtures exceptions), and secure concurrence from Project Director/COR for obtaining similar products from other manufacturers specified for that category

B. If procured outside U.S., fixtures shall meet equivalent standard for performance and flow, as approved by Project Director/COR based on documentation provided to OBO/PDCS/DE mechanical engineer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to Project Director/COR, and marked for intended use.

D. Regulatory Requirements: Comply with accessibility requirements in Architectural Barriers Act (ABA) as identified in Chapter 11 of the OBO Building Code.

E. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

F. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

G. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

H. Finishes for fixtures within same rooms shall match.

I. Comply with the following applicable standards and other requirements specified for plumbing fixtures:

1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
2. Hand Sinks: NSF 2 construction.
3. Slip-Resistant Bathing Surfaces: ASTM F 462.
4. Stainless-Steel Fixtures Other Than Service Sinks: ASME A112.19.3M.
5. Vitreous-China Fixtures: ASME A112.19.2.
6. Water-Closet, Flush Valve, Tank Trim: ASME A112.19.5.

J. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:

1. Backflow Protection Devices for Faucets with Side Spray: ASME A112.18.3.
2. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3.
3. Faucet Hose: ASTM D 3901.
4. Faucets: ASME A112.18.1.
5. Hose-Connection Vacuum Breakers: ASSE 1011.
6. Hose-Coupling Threads: ASME B1.20.7.
7. Atmospheric Vacuum Breakers: ASSE 1001.
8. NSF Materials: NSF 61.
9. Pipe Threads: ASME B1.20.1.
10. Supply and Drain Fittings: ASME A112.18.1.
11. Sensor-Actuated Faucets and Electrical Devices: UL 1951.

K. Comply with the following applicable standards and other requirements specified for bathtub and shower faucets:

1. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3.
2. Automatic Compensating Valves for Individual Showers and Tub: ASSE 1016.
3. Faucets: ASME A112.18.1.
4. Backflow Prevention Devices for Hand-Held Showers: ASSE 1014.
5. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445; limit maximum setting to 49 deg C (120 deg F).
6. Hose-Coupling Threads: ASME B1.20.7.
7. Pipe Threads: ASME B1.20.1.
8. Automatic Compensating Valves for Individual Showers and Tub/Shower Combinations: ASSE 1016.
9. Standard Consumer Safety Specification for Scald-Preventing Devices and Systems in Bathing Area: ASTM F444

L. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:

1. Atmospheric Vacuum Breakers: ASSE 1001.
2. Brass and Copper Supplies: ASME A112.18.1.
3. Tubular Brass Drainage Fittings and Piping: ASME A112.18.1.

M. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1. Disposers: ASSE 1008 and UL 430.
2. Floor Drains: ASME A112.6.3.
3. Grab Bars: ASTM F 446.
4. Hose-Coupling Threads: ASME B1.20.7.
5. Off-Floor Fixture Supports: ASME A112.6.1M.
6. Pipe Threads: ASME B1.20.1.
7. Plastic Toilet Seats: ANSI Z124.5.

8. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.5 EXTRA MATERIALS

A. Furnish the following to Project Director/COR at project closeout:

1. Faucet Washers and O-Rings: 10 percent of each type.
2. Faucet Cartridge and O-Rings: 10 percent.
3. Flushometer-Tank Repair Kits: 5 percent of fixtures.

PART 2 - PRODUCTS

2.1 PLUMBING FIXTURES

A. General: All faucets and water closets shall be water conserving; provide manual devices unless specified or indicate otherwise for specific fixture type.

2.2 LAVATORY FAUCETS

A. Manual Lavatory Single-Control Faucet - SDA, MSGR-Private-Bathrooms: Single-control mixing valve. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.

1. Maximum Flow Rate: 3.0 L/min.
2. Body Material: Cast brass or copper or brass underbody with brass cover plate.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Mounting: Deck, exposed
5. Valve Handle(s): Lever.
6. Inlet(s): DN 15 male shank.
7. Spout: **[Rigid type][Rigid, gooseneck]**.
8. Spout Outlet: Aerator.
9. Operation: Compression, manual.
10. Drain: Pop-up activation; DN 32.
11. Tempering Device: Adjustable hot limit safety stop.
12. Labeling: WaterSense.

B. Manual Lavatory Single-Control Faucet, Accessible – SDA-Accessible, MSGR-Public-Bathroom, REP: Single-control mixing valve. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.

1. Maximum Flow Rate: 3.0 L/min.
2. Body Material: Cast brass or copper or brass underbody with brass cover plate.

3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Mounting: Deck, exposed
5. Valve Handle(s): Compliant with accessibility requirements of ABA.
6. Inlet(s): DN 15 male shank.
7. Spout: **[Rigid type][Rigid, gooseneck]**.
8. Spout Outlet: Aerator.
9. Operation: Compression, manual.
10. Drain: Grid type with DN 32 offset tailpiece.
11. Tempering Device: Adjustable hot limit safety stop.
12. Labeling: WaterSense.

C. **[XXX Lavatory Faucet, Accessible – Office-Executive-Bathroom: XXX**

1. Maximum Flow Rate: XXX
2. Body Material: XXX
3. Finish: XXX
4. Centers: XXX
5. Mounting: Deck, exposed.
6. Valve Handle(s): Compliant with accessibility requirements of ABA.
7. Inlet(s): DN 15 male shank.
8. Spout: XXX
9. Spout Outlet: XXX
10. Operation: XXX
11. Drain: Grid type with DN 32 offset tailpiece
12. Tempering Device: Adjustable hot limit safety stop.
13. Labeling: WaterSense.]

D. Sensor Lavatory Faucet – SDA-Public-Area: Coordinate outlet with spout and fixture receptor.

1. Maximum Flow Rate: 1.9 L/min.
2. Body Material: Cast brass or copper or brass underbody with brass cover plate.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Mounting: Deck, exposed.
5. Inlet(s): DN 15 male shank.
6. Spout: Rigid type.
7. Spout Outlet: Aerator.
8. Operation: Sensor.
9. Drain: Pop up; DN 32.
10. Tempering Device: Adjustable hot limit safety stop.
11. Labeling: WaterSense.

E. Sensor Lavatory Faucet, Accessible – MSGR-Public-Bathroom, SDA-Public-Area: Coordinate outlet with spout and fixture receptor.

1. Maximum Flow Rate: 1.9 L/min.
2. Body Material: Cast brass or copper or brass underbody with brass cover plate.

3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR].**
4. Mounting: Deck, exposed.
5. Inlet(s): DN 15 male shank.
6. Spout: Rigid type**.**
7. Spout Outlet: Aerator.
8. Operation: Sensor.
9. Drain: Grid type with DN32 offset tailpiece.
10. Tempering Device: Adjustable hot limit safety stop.
11. Labeling: WaterSense.

2.3 SHOWER FAUCETS

A. Shower Faucet - SDA, MSGR. Include hot- and cold-water indicators. Coordinate faucet inlets with supplies and outlet with wall supply.

1. Maximum Flow Rate: 6.7 L/min., unless otherwise indicated.
2. Body Material: Cast brass.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Type: Single-handle thermostatic and pressure balance valve, with provision to limit setting so that it does not exceed 49 deg C (120 deg F).
5. Mounting: Exposed.
6. Handles: Lever.
7. Operation: Compression, manual.
8. Antiscald Device: Integral with mixing valve.
9. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
10. Supply Connections: DN 15 female inlet, DN 15 male outlet.
11. Shower Head Material: Metallic with chrome-plated finish.
12. Head Type: Ball joint.
13. Spray Pattern: Adjustable.
14. Integral Volume Control: Required.
15. Shower-Arm, Flow-Control Fitting:
16. Labeling: WaterSense.

B. Shower Faucet, Accessible – SDA-Accessible, REP. Include hot- and cold-water indicators; soft hand-shower, hose, wall supply, and slide bar. Coordinate faucet inlets with supplies and outlet with wall supply.

1. Maximum Flow Rate: 6.7 L/min.
2. Body Material: Cast brass.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR].**
4. Type: Single-handle thermostatic and pressure balance valve, provision to limit setting so that it does not exceed 49 deg C (120 deg F).
5. Mounting: Exposed.

6. Handles: Lever.
7. Backflow Protection Device for Hand-Held Shower: Required.
8. Operation: Compression, manual, conforming to ABA.
9. Antiscald Device: Integral with mixing valve.
10. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
11. Supply Connections: DN 15 female inlet, DN 15 male outlet.
12. Shower Head Material: Metallic with chrome-plated finish.
13. Head Type: Handheld, slide-bar mounted.
14. Spray Pattern: Adjustable.
15. Integral Volume Control: Required.
16. Hose: 1525mm minimum.
17. Labeling: WaterSense.

C. **[Shower Faucet, Accessible – Office-Executive-Bathroom: XXX. Include hot- and cold-water indicators; soft hand-shower, hose, wall supply, and slide bar. Coordinate faucet inlets with supplies and outlet with wall supply.**

1. Maximum Flow Rate: XXX
2. Body Material: XXX
3. Finish: XXX
4. Type: Single-handle thermostatic and pressure balance valve, provision to limit setting so that it does not exceed 49 deg C (120 deg F).
5. Mounting: XXX
6. Handles: Lever.
7. Backflow Protection Device for Hand-Held Shower: Required.
8. Operation: Compression, manual, conforming to ABA.
9. Antiscald Device: Integral with mixing valve.
10. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
11. Supply Connections: DN 15 female inlet, DN 15 male outlet.
12. Shower Head Material: XXX
13. Spray Pattern: Adjustable.
14. Integral Volume Control: Required.
15. Hose: 1525mm minimum.
16. Labeling: WaterSense.]

2.4 BATHTUB/SHOWER FAUCETS

A. Bathtub/Shower Faucet - SDA: Include hot- and cold-water indicators; check stops; tub spout; and shower head, arm, and flange. Coordinate faucet inlets with supplies; coordinate outlet with diverter valve.

1. Body Material: Cast Brass.
2. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR].**
3. Type: Single-handle thermostatic/pressure-balance valve for bathtub and for shower, provision to limit setting so that it does not exceed 49 deg C (120 deg F).
4. Maximum Flow Rate: 9.5 L/min.
5. Diverter Valve: Integral with mixing valve.
6. Mounting: Concealed/exposed wall.
7. Bathtub Spout: Chrome-plated brass**[with diverter]**.
8. Operation: Compression, manual.
9. Antiscald Device: Integral with mixing valve.
10. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
11. Supply Connections: DN 15.
12. Shower Head Type: Ball joint with arm and flange.
13. Shower Head Material: Metallic with finish to match.
14. Spray Pattern: Adjustable.
15. Integral Volume Control: Required.
16. Shower-Arm Flow-Control Fitting:
17. Showerhead Labeling: WaterSense.

B. Bathtub/Shower Faucet, Accessible – SDA-Accessible, REP: Include hot- and cold-water indicators; check stops; tub spout; and shower head, arm, and flange. Coordinate faucet inlets with supplies; coordinate outlet with diverter valve.

1. Body Material: Cast Brass.
2. Finish: Polished chrome plate.
3. Type: Single-handle thermostatic/pressure-balance valve for bathtub and for shower, provision to limit setting so that it does not exceed 49 deg C (120 deg F).
4. Maximum Flow Rate: 9.5 L/min.
5. Diverter Valve: Integral with mixing valve.
6. Mounting: Concealed/exposed wall.
7. Bathtub Spout: Chrome-plated brass**[with diverter]**.
8. Operation: Compression, manual, conforming to ABA.
9. Antiscald Device: Integral with mixing valve.
10. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
11. Supply Connections: DN 15.
12. Backflow Protection Device for Hand-Held Shower: Required.
13. Shower Head Type: Handheld, slide-bar mounted.
14. Shower Head Material: Metallic with finish to match.
15. Spray Pattern: Adjustable.
16. Integral Volume Control: Required.
17. Shower-Arm Flow-Control Fitting:
18. Hose: 1525 mm minimum.
19. Showerhead Labeling: WaterSense.

2.5 SINK FAUCETS

A. Kitchen Sink Faucet - MSGR, SDA: Kitchen faucet with pull-down spray. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes, and outlet with spout and fixture receptor.

1. Maximum Flow Rate: 6.7 L/min., unless otherwise indicated.
2. Body Material: Cast brass.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Mixing Valve: Single lever-activated, washerless cartridges.
5. Backflow Protection Device for Hose Outlet: Required.
6. Centers: Adjustable.
7. Mounting: Deck, exposed.
8. Handles: Single metal lever.
9. Inlets: DN 15 male shank.
10. Spout: Swing, shaped tube.
11. Spout Outlet: Aerator.
12. Vacuum Breaker: Required.
13. Operation: Compression, manual.
14. Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.

B. Kitchen Sink Faucet, Accessible – SDA-Accessible**,** REP-Family-Kitchen: Kitchen faucet with pull-down spray. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Maximum Flow Rate: 6.7 L/min., unless otherwise indicated.
2. Body Material: Cast brass.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Mixing Valve: Single lever-activated, washerless cartridges.
5. Backflow Protection Device for Hose Outlet: Required.
6. Centers: Adjustable.
7. Mounting: Deck, exposed.
8. Handles: Single metal lever, Compliant with accessibility requirements of ABA.
9. Inlets: DN 15 male shank.
10. Spout: Swing, shaped tube.
11. Spout Outlet: Aerator.
12. Vacuum Breaker: Required.
13. Operation: Compression, manual, conforming to ABA.
14. Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.

C. Sink Faucet – MSGR Pantry (at Recreation Room), REP Bar: Bar-type, centerset sink faucet. Include hot- and cold- water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Body Material: Cast brass.
2. Maximum Flow Rate: 6.7 L/min

3. Finish: **[Polished chrome plate] [Brushed chrome if approved by Project Director/COR]**.
4. Centers: 102 mm.
5. Mounting: Deck, exposed.
6. Handles: Brass levers.
7. Inlet: DN 15 male shank.
8. Spout: Brass gooseneck swing spout.
9. Vacuum Breaker: Required.
10. Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.
11. Spout Outlet: Aerator.

D. Laundry and Utility Sink Faucet - MSGR, REP, SDA: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Body Material: Cast brass.
2. Maximum Flow Rate: 6.7 L/min., unless otherwise indicated.
3. Finish: Polished chrome plate.
4. Mixing Valve: Two-lever handle.
5. Backflow Protection Device for Hose Outlet: Required.
6. Centers: 102mm
7. Mounting: [**Deck, exposed] [Back/wall, exposed]**.
8. Handles: Knob.
9. Inlets: DN 15 male threaded inlet shanks.
10. Spout: Swing, solid brass
11. Spout Outlet: Hose thread.
12. Vacuum Breaker: Required.
13. Operation: Compression, manual.
14. Drain: Grid.

E. Service Sink Faucet - MSGR, REP, SDA-Building-Janitor's-Closet: Service sink faucet with stops in shanks, vacuum breaker, hose thread outlet, and pail hook. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Body Material: Cast brass.
2. Finish: Polished chrome plate.
3. Mixing Valve: Two-lever handle.
4. Backflow Protection Device for Hose Outlet: Required.
5. Centers: Adjustable, 152 to 254mm with offset shanks.
6. Mounting: **[Deck, exposed] [Back, wall, exposed]**.
7. Handles: Knob.
8. Inlets: DN 15 male shank.
9. Spout: Rigid, solid brass with wall brace with bucket hook.
10. Spout Outlet: Hose thread
11. Vacuum Breaker: Required.
12. Operation: Compression, manual.
13. Drain: Grid.

F. **[Kitchenette Sink Faucet – SDA-TDY: Kitchen faucet with no spray. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.**

1. **Maximum Flow Rate: 6.7 L/min., unless otherwise indicated.**
2. **Body Material: Cast brass.**
3. **Finish: Polished chrome plate.**
4. **Mixing Valve: Single lever-activated, washerless cartridge.**
5. **Centers: 203mm adjustable.**
6. **Mounting: Deck, exposed.**
7. **Handle: Single, metal lever.**
8. **Inlets: DN 15 male shank.**
9. **Spout: 200mm tubular swing.**
10. **Spout Outlet: Aerator.**
11. **Vacuum Breaker: Required.**
12. **Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.]**

G. **[Kitchenette Sink Faucet, Accessible – Accessible-SDA-TDY: Kitchen faucet with no spray. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.**

1. **Maximum Flow Rate: 6.7 L/min., unless otherwise indicated.**
2. **Body Material: Cast brass.**
3. **Finish: Polished chrome plate.**
4. **Mixing Valve: Single lever-activated, washerless cartridge.**
5. **Centers: 203mm adjustable.**
6. **Mounting: Deck, exposed.**
7. **Handle: Single, metal lever, conforming to ABA.**
8. **Inlets: DN 15 male shank.**
9. **Spout: 200mm tubular swing.**
10. **Spout Outlet: Aerator.**
11. **Vacuum Breaker: Required.**
12. **Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.]**

2.6 TOILET SEATS

A. Toilet Seat – SDA-Dwelling-Units: Solid plastic.

1. Configuration: Closed front with cover.
2. Size: Regular.
3. Class: Residential.
4. Hinge Type: SS, self-sustaining.
5. Color: White.

B. Toilet Seat – MSGR-Private-Bathrooms, SDA-Public-Area: Solid plastic.

1. Configuration: Closed front with cover.

2. Size: Regular.
3. Class: Commercial (standard).
4. Hinge Type: SS, self-sustaining.
5. Color: White.

C. Toilet Seat, Accessible – SDA-Accessible-Dwelling-Units, REP, Office-Executive-Bathroom: Solid plastic.

1. Configuration: Open front without cover.
2. Size: Elongated.
3. Class: Residential.
4. Hinge Type: SS, self-sustaining.
5. Color: White.

D. Toilet Seat, Accessible – SDA—Accessible-Public-Area, MSGR-Public-Bathrooms: Solid plastic.

1. Configuration: Open front without cover.
2. Size: Elongated.
3. Class: Commercial (standard).
4. Hinge Type: SS, self-sustaining.
5. Color: White.

2.7 PROTECTIVE SHIELDING GUARDS

A. Protective Shielding Pipe Enclosure - MSGR, REP, SDA, Office-Executive-Bathroom: High-impact, stain resistant vinyl enclosure, specifically manufactured for enclosing hot- and cold-water supplies, trap and drain piping, electronic faucet connections, and mixing valves under wall hung lavatories complying with accessibility requirements of ABA.

B. Protective Shielding Pipe Covers - MSGR, REP, SDA: Molded, closed-cell anti-microbial vinyl seamless P-trap insulation kit furnished with seamless riser tubes, supply angle stop covers, seamless drain tailpiece cover, and angle stop wheel handle covers. Comply with accessibility requirements of ABA.

2.8 FIXTURE SUPPORTS

A. Water-Closet Support - MSGR, REP, SDA: Water-closet combination carrier designed for accessible and standard mounting height. Include single or double, vertical or horizontal, hub-and-spigot or hubless waste fitting as required for piping arrangement; faceplates; couplings with gaskets; feet; and fixture bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

B. Lavatory Support - MSGR, REP, SDA: Lavatory carrier with concealed arms and tie rod. Include steel uprights with feet.

1. Accessible Fixture Support: Include rectangular steel uprights.

2.9 DISPOSERS

A. General: For pairs of sinks, provide in shallowest bowl if bowls are of different depths.

B. Disposer - MSGR-Kitchen: Batch-feed, household, food-waste disposer. Include 220-VAC, **[50Hz][60 Hz]**, 3/4 hp motor with overload protection and reset button; wall switch; corrosion-resistant chamber with jam-resistant, cutlery- or stainless-steel grinder or shredder; DN 40 outlet; quick-mounting, stainless-steel sink flange; antisplash guard; and combination cover/stopper.

C. Disposer – SDA, MSGR-Heritage-Room: Batch-feed, household, food-waste disposer. Include 220-VAC, **[50Hz][60 Hz]**, ½ hp motor with overload protection and reset button; wall switch; corrosion-resistant chamber with jam-resistant, cutlery- or stainless-steel grinder or shredder; DN 40 outlet; quick-mounting, stainless-steel sink flange; antisplash guard; and combination cover/stopper.

D. Disposer, Accessible – SDA-Accessible, REP-Family-Kitchen: Batch-feed, household, food-waste disposer. Include 220-VAC, **[50Hz][60 Hz]**, ½ hp motor with overload protection and reset button; accessible wall switch; corrosion-resistant chamber with jam-resistant, cutlery- or stainless-steel grinder or shredder; DN 40 outlet; quick-mounting, stainless-steel sink flange; antisplash guard; and combination cover/stopper.

2.10 WATER CLOSETS

A. Water Closets – SDA, MSGR-Private-Bathrooms: Floor-mounting, floor outlet vitreous-china fixture designed for gravity-type tank operation.

1. Style: Close coupled.

   a. Bowl Type: Round front with siphon-jet design. Include bolt caps matching fixture.
   b. Height: Standard.
   c. Tank: Gravity type with trim. Include cover.
   d. Trip Mechanism: Lever-handle actuator.
   e. Color: White.

2. Supply: DN 15 chrome-plated brass or copper with loose-key stop.
3. Toilet Seat: As specified for MSGR, SDA.
4. Labeling: WaterSense.

B. Water Closets, Accessible – SDA-Accessible, MSGR-Public-Bathroom, REP, Office-Executive-Bathroom: floor-mounting, floor-outlet, and vitreous-china fixture designed for gravity-type tank operation.

1. Style: Close coupled.

   a. Bowl Type: Elongated with siphon-jet design. Include bolt caps matching fixture.
   b. Height: Accessible.
   c. Design Consumption: 4.8 L/flush
   d. Tank: Gravity type with trim. Include cover.

e. Trip Mechanism: Lever-handle actuator.
f. Color: White.

2. Supply: DN 15 chrome-plated brass or copper with loose-key stop.
3. Toilet Seat: As specified for MSGR, SDA, REP.
4. Labeling: WaterSense.

C. **[Water Closets – SDA, MSGR-Private-Bathrooms: Dual-flush, floor-mounting, floor-outlet, and vitreous-china fixture designed for gravity-type tank operation.**

1. Style: Close coupled.

a. Bowl Type: Round front with siphon-jet design. Include bolt caps matching fixture.
b. Height: Standard.
c. Design Consumption: Dual flush 4.8 L/flush average volume.
d. Tank: Gravity type with trim. Include cover.
e. Trip Mechanism: Push two-button actuator.
f. Color: White.

2. Supply: DN 15 chrome-plated brass or copper with loose-key stop.
3. Toilet Seat: As specified for MSGR, SDA.
4. Labeling: WaterSense.]

D. **[Water Closets, Accessible – SDA-Accessible, MSGR-Public-Bathroom, REP: Dual-flush, floor-mounting, floor-outlet, and vitreous-china fixture designed for gravity-type tank operation.**

1. Style: Close coupled.

a. Bowl Type: Elongated front with siphon-jet design. Include bolt caps matching fixture.
b. Height: Accessible.
c. Design Consumption: Dual flush 4.8 L/flush average volume.
d. Tank: Gravity type with trim. Include cover.
e. Trip Mechanism: Push two-button actuator.
f. Color: White.

2. Supply: DN 15 chrome-plated brass or copper with loose-key stop.
3. Toilet Seat: As specified for MSGR, SDA, REP.
4. Labeling: WaterSense.]

2.11 LAVATORIES

A. Lavatories – SDA, MSGR-Private-Bathrooms: Counter-mounting, vitreous-china fixture.

1. Type: Self-rimming.
2. Oval Lavatory Size: 508 by 432 mm.

3. Faucet Hole Punching: Three, 102-mm centers, holes.
4. Faucet Hole Location: Top.
5. Color: White.
6. Faucet: Lavatory. As specified for MSGR, SDA.
7. Supplies: DN 10 chrome-plated copper with stops.
8. Drain: See faucet.
9. Drain Piping: DN 32 chrome-plated cast-brass "p" trap; DN 40 thick tubular brass waste to wall; and wall escutcheon.

B. Lavatories, Accessible – SDA-Accessible, MSGR-Public-Bathroom, REP: Wall-hanging, vitreous-china fixture.

1. Type: With contoured back.
2. Size: 508 by 432 mm rectangular.
3. Faucet Hole Punching: Three, 102-mm centers holes.
4. Faucet Hole Location: Top.
5. Color: White.
6. Faucet: As specified for accessible MSGR, REP, SDA.
7. Supplies: DN 10 chrome-plated copper with stops.
8. Drain: See faucet.
9. Drain Piping: DN 32 by DN 40 chrome-plated cast-brass "p" trap; DN 40 thick tubular brass waste to wall; and wall escutcheon.
10. Protective Shielding Guard: As specified for MSGR, REP, SDA.
11. Fixture Support: Lavatory, as specified for MSGR, REP, SDA.

C. **[Lavatories, Accessible – Office-Executive-Bathrooms: XXX**

1. Type: XXX
2. Size: XXX
3. Faucet: XXX
4. Faucet Hole Location: Top.
5. Color: XXX
6. Faucet: As specified for accessible Office Executive Bathroom.
7. Supplies: DN 10 chrome-plated copper with stops.
8. Drain: See faucet.
9. Drain Piping: DN 32 by DN 40 chrome-plated cast-brass "p" trap; DN 40 thick tubular brass waste to wall; and wall escutcheon.
10. Protective Shielding Guard: As specified for Office Executive Bathroom.
11. Fixture Support, XXX]

2.12 BATHTUBS

A. Bathtubs - SDA: PMMA (acrylic plastic) fixture.

1. Bathing Surface: Slip resistant according to ASTM F462.
2. Standard: ANSI Z124.1.2.
3. Size: 1525 by 765 mm with front apron.

4. Color: White.
5. Drain Location: **[Left] [Right]** end.
6. Faucet: As specified for SDA.
7. Supplies: DN 15 copper tubing with ball, gate, or globe valves.
8. Drain: DN 40; chrome-plated exposed parts; brass pop-up waste and overflow.
9. Drain Piping: DN 40 cast-brass "p" trap and waste.
10. Tub filler.

B. Bathtubs, Accessible – SDA-Accessible: PMMA (acrylic plastic) fixture.

1. Bathing Surface: Slip resistant according to ASTM F462.
2. Standard: ANSI Z124.1.2.
3. Size: 1525 by 765 mm with front apron.
4. Color: White.
5. Drain Location: **[Left][Right]** end.
6. Accessibility Options: Include grab bar and bench.
7. Faucet: As specified for accessible SDA.
8. Supplies: DN 15 copper tubing with ball, gate, or globe valves.
9. Drain: DN 40; chrome-plated exposed parts; brass pop-up waste and overflow.
10. Drain Piping: DN 40 cast-brass "p" trap and waste.
11. Tub filler.

C. Bathtubs, Accessible – REP: Enameled cast-iron or enameled steel fixture.

1. Bathing Surface: Slip resistant according to ASTM F462.
2. Standard: ASME A112.19.1/CSA B45.2.
3. Size: 1680 by 765 mm with front apron.
4. Color: White.
5. Drain Location: **[Left][Right]** end.
6. Accessibility Options: Include grab bar and bench.
7. Faucet: As specified for accessible REP.
8. Supplies: DN 15 copper tubing with ball, gate, or globe valves.
9. Drain: DN 40; chrome-plated exposed parts; brass pop-up waste and overflow.
10. Drain Piping: DN 40 cast-brass "p" trap and waste.
11. Tub filler.

2.13 SINKS

A. **[Kitchenette Sink – SDA-TDY: Counter-mounting, self-rimming, Type 304, 18-8 stainless steel sink.**

1. Overall Size: 559 by 432 mm.
2. Number of Compartments: One.
3. Bowl Depth: 165 mm.
4. Sink Faucet: As specified for SDA.
5. Supplies: DN 15 chrome-plated copper with stops.
6. Mounting Holes: As required by selected sink faucet.

7. Drain Opening: 89 mm, off-center - 114mm from back, outlet for disposer.
8. Drain: See faucet.
9. Drain Piping: DN 40 chrome-plated cast-brass "p" trap, 1.1-mm- thick tubular brass waste to wall, continuous waste, and wall escutcheons.
10. Disposer: As specified for SDA.
11. Underside: Fully coated to dampen sound and prevent condensation.]

B. **[Kitchenette Sink, Accessible - SDA-TDY-Accessible: Counter-mounting, self-rimming, Type 304, 18-8 stainless steel sink.**

1. Overall Size: 559 by 432 mm.
2. Number of Compartments: One.
3. Bowl Depth: 165 mm.
4. Sink Faucet: As specified for SDA.
5. Supplies: DN 15 chrome-plated copper with stops.
6. Mounting Holes: As required by selected sink faucet.
7. Drain Opening: 89 mm, off-center – 114 mm from back, outlet for disposer.
8. Drain: See faucet.
9. Drain Piping: DN 40 chrome-plated cast-brass "p" trap, 1.1-mm- thick tubular brass waste to wall, continuous waste, and wall escutcheons.
10. Disposer: As specified for SDA.
11. Protective Shielding Guard: As specified for SDA.
12. Underside: Fully coated to dampen sound and prevent condensation.]

C. Kitchen Sinks - SDA: Counter-mounting, stainless-steel fixture.

1. Overall Size: 1067 by 533 mm.
2. Number of Compartments: Two.
3. First Compartment: With 89-mm outlet for disposer.
4. First Compartment Location: Left.
5. Second Compartment: Located on opposite side of first compartment; with 89-mm crumb cup.
6. Sink Faucet: As specified for SDA.
7. Supplies: DN 15 chrome-plated copper with stops.
8. Drain Piping: DN 40 chrome-plated cast-brass "p" trap, 1.1-mm- thick tubular brass waste to wall, continuous waste, and wall escutcheons.
9. Disposer: As specified for SDA.
10. Underside: Fully coated to dampen sound and prevent condensation.

D. Kitchen Sinks, Accessible – SDA-Accessible, REP-Family-Kitchen: Counter-mounting, stainless-steel fixture.

1. Overall Size: 1067 by 533 mm.
2. Number of Compartments: Two.
3. First Compartment: With 89-mm outlet for disposer.
4. First Compartment Location: Left.
5. Second Compartment: Located on opposite side of first compartment; with 89-mm crumb cup.

6. Sink Faucet: As specified for accessible SDA**[, REP]**.
7. Supplies: DN 15 chrome-plated copper with stops.
8. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1-mm- thick tubular brass waste to wall, continuous waste, and wall escutcheons.
9. Disposer: As specified for accessible SDA**[, REP]**.
10. Protective Shielding Guard: As specified for SDA**[, REP]**.
11. Underside: Fully coated to dampen sound and prevent condensation.

E. Kitchen Sinks - MSGR: Separate pair in adjacent cabinets, undermount, stainless-steel fixture, non-accessible.

1. Basis of Design:

   a. Left Sink: Elkay ELUH2816.
   b. Righ Sink: Elkay ELUH281610.

2. Left Sink: Min. 710-mm x 405-mm, x 175- mm deep (28” x 16” x 7-12/”), with 89-mm outlet for disposer.
3. Right Sink: Min. 710-mm long by 405- mm wide by 250-mm deep (28” x 16” x 10”), with 89-mm crumb cup.
4. Sink Faucets: As specified for MSGR.
5. Installation Profile: 13-mm reveal.
6. Supplies: DN 15 chrome-plated copper with stops.
7. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1-mm- thick tubular brass waste to wall, continuous waste, and wall escutcheons.
8. Disposer: As specified for MSGR for left sink.
9. Underside: Fully coated to dampen sound and prevent condensation.
10. Accessories, One Set: Cutting board, rinsing basket, utensil caddy for rinsing basket.

F. Sinks – MSGR Heritage Room, REP Bar: Single-compartment, counter-mounting, stainless-steel bar-type fixture.

1. Size: 432 by 508 mm.
2. Sink Faucet: Bar-type, as specified for MSGR, REP.
3. Supplies: DN 15 chrome-plated copper with stops.
4. Drain: see faucet.
5. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1-mm- thick tubular brass waste to wall, and wall escutcheon.
6. Underside: Fully coated to dampen sound and prevent condensation.

2.14 DISHWASHER AIR-GAP FITTINGS

A. Fittings:

1. Standard: ASSE 1021.
2. Description: Device designed to prevent backflow of contaminated liquid into domestic dishwashers.
3. Material: Plastic body with chrome-plated-brass cover.
4. Hose Connections: 16 mm ID inlet and 22 mm ID outlet.

2.15 SERVICE BASINS

A. Service Basins - MSGR, REP**,** SDA-Building-Janitor's-Closet: Floor-mounting, pre-cast terrazzo basin with rim guard.

1. Shape: Square.
2. Size: 610 by 610 mm.
3. Height: 255 mm.
4. Rim Guard: On front.
5. Faucet: Sink as specified for MSGR, REP, SDA.
6. Drain: DN 80 outlet, see faucet.

2.16 LAUNDRY TRAYS

A. Laundry Trays - MSGR, REP, SDA: Stand-mounting, enameled cast-iron laundry tray.

1. Size: 635 by 560 mm.
2. Color: White.
3. Faucet: As specified for MSGR, REP, SDA.
4. Supplies: DN 15 chrome-plated copper with stops.
5. Drain: DN 40 outlet, see faucet.
6. Drain Piping: DN 40 chrome-plated cast-brass trap, 1.1-mm- thick tubular brass waste to wall, and wall escutcheon.
7. Stand: Manufacturer's standard metal stand; provide finish if not pre-finished.

2.17 UTILITY SINK

A. Utility Sink - MSGR, REP, SDA: Stainless steel, free-standing on legs.

1. Size: 635 mm x 560 mm.
2. Faucet: As specified.
3. Supplies: DN 15 chrome-plated copper with stops.
4. Drain Piping: DN 40 chrome-plated cast-brass "p" trap, 1.1 mm thick tubular brass waste to wall, and wall escutcheon.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water soil and for waste piping systems and supports to verify actual locations and sizes of piping connections and that locations and types of supports match those indicated, before plumbing fixture installation. Use manufacturer's roughing-in data if roughing-in data are not indicated.

B. Examine walls, floors, and cabinets for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FIXTURE INSTALLATION

A. Assemble fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. Provide adequate space around plumbing fixtures to allow for routine maintenance and repair.

C. For wall-hanging fixtures, install off-floor supports affixed to building substrate.

1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

D. Install back-outlet, wall-hanging fixtures onto waste fitting seals and attach to supports.

E. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.

F. Install wall-hanging fixtures with tubular waste piping attached to supports.

G. Install floor-mounting, back-outlet water closets attached to building floor substrate and wall bracket and onto waste fitting seals.

H. Install counter-mounting fixtures in and attached to casework.

I. Install fixtures level and plumb according to manufacturers' written instructions and roughing-in drawings.

J. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

1. Exception: Use ball, gate, or globe valve if stops are not specified with fixture. Refer to Division 22 Section on valves for general-duty valves.

K. Install "p" trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

L. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

M. Install tanks for accessible, tank-type water closets with lever handle mounted on wide side of compartment.

N. Install toilet seats on water closets.

O. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

P. Install water-supply, flow-control fittings with specified flow rates in fixture supplies at stop valves.

Q. Install faucet, flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

R. Install shower, flow-control fittings with specified maximum flow rates in shower arms.

S. Install traps on fixture outlets.

1. Exception: Omit trap on indirect wastes, unless otherwise indicated.

T. Install disposer in outlet of sinks indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

U. Install dishwasher air-gap fitting at each sink indicated to have fitting. Connect inlet hose to dishwasher and outlet hose to disposer.

V. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Refer to Division 22 Section for escutcheons.

W. Set bathtubs, shower receptors, and service basins in leveling bed of cement grout. Refer to Division 22 Section for grout.

X. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Refer to Division 07 Section on joint sealants for sealant and installation requirements.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect water supplies from water distribution piping to fixtures.

C. Connect drain piping from fixtures to drainage piping.

D. Supply and Waste Connections to Plumbing Fixtures: Connect fixtures with water supplies, stops, risers, traps, and waste piping. Use size fittings required to match fixtures. Connect to plumbing piping.

E. Supply and Waste Connections to Fixtures and Equipment Specified in Other Sections: Connect fixtures and equipment with water supplies, stops, risers, traps, and waste piping specified. Use size fittings required to match fixtures and equipment. Connect to plumbing piping.

F. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 FIELD QUALITY CONTROL

A. Verify that installed fixtures are categories and types specified for locations where installed.

B. Check that fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

F. **[Test shower floors and receptors for water tightness according to the International Plumbing Code.]**

3.5 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Operate and adjust disposers, and controls. Replace damaged and malfunctioning units and controls.

C. Adjust water pressure at faucets, shower valves, and flushometer valves to produce proper flow and stream.

D. Replace washers and seals of leaking and dripping faucets and stops.

3.6 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:

1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
2. Remove sediment and debris from drains.

3.7 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of fixtures for temporary facilities unless approved in writing by Project Director/COR.

END OF SECTION 224105

SECTION 224215 - COMMERCIAL PLUMBING FIXTURES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes plumbing fixtures and related components for office buildings (except private executive bathrooms), support buildings, recreational buildings, and public spaces in staff housing.

B. Related Sections include the following:

1. Section 114000 “Food Service Equipment” for kitchen fixtures not in this section.
2. Section 117000 “Medical Equipment” for equipment not in this section.
3. Division 22 Section on plumbing specialties for backflow preventers and specialty fixtures not in this section.
4. Section 224105 “Residential Plumbing Fixtures” for plumbing fixtures not in this section.
5. Section 224500 “Emergency Plumbing Fixtures.”
6. Division 10 Section on toilet compartments.
7. Division 22 Section on electric water coolers and drinking fountains.

1.2 DEFINITIONS

A. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Fitting: Device that controls flow of water into or out of plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

1.3 SUBMITTALS

A. Product Data for each plumbing fixture category and type specified. Include selected fixture, trim, fittings, accessories, appliances, appurtenances, equipment, and supports. Indicate materials and finishes, dimensions, construction details, and flow-control rates.

1. Identify GreenSpec or WaterSense label where applicable (e.g., faucets, toilets, urinals, shower heads).

B. Wiring diagrams from manufacturer for electrically operated units, including for power, signal, and controls as applicable.

C. Maintenance data for plumbing fixtures and components to include in the operation and maintenance manuals specified in Division 01.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.

1. Exception: If fixtures, faucets, or other components of a particular category are not available from a single manufacturer, prior to obtaining similar products from other manufacturers specified for that category, submit findings to Project Director/COR that a single manufacturer is not available for that category (identify specific fixtures exceptions) and secure concurrence from Project Director/COR for obtaining similar products from other manufacturers specified for that category.

B. If procured outside the U.S., fixtures must meet equivalent standard for performance and flow approved by Project Director/COR based on documentation provided to OBO/PDCS/DE mechanical engineer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100 by a testing agency acceptable to Project Director/COR and marked for intended use.

D. Regulatory Requirements: Comply with accessibility requirements of the Architectural Barriers Act (ABA) as identified in Chapter 11 of the OBO Building Code.

E. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

F. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

G. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

H. Finishes of fixtures within same rooms must match.

I. Comply with the following applicable standards and other requirements specified for plumbing fixtures:

1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
2. Hand Sinks: NSF 2 construction.
3. Slip-Resistant Bathing Surfaces: ASTM F 462.
4. Stainless-Steel Fixtures Other Than Service Sinks: ASME A112.19.3M.
5. Vitreous-China Fixtures: ASME A112.19.2.
6. Water Closet, Flushometer Tank Trim: ASSE 1037.
7. Water Closet Personal Hygiene Devices: ASME A112.4.2

J. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:

1. Backflow Protection Devices for Faucets with Side Spray: ASME A112.18.3.
2. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3.

3. Faucet Hose: ASTM D 3901.
4. Faucets: ASME A112.18.1.
5. Hose-Connection Vacuum Breakers: ASSE 1011.
6. Hose-Coupling Threads: ASME B1.20.7.
7. Atmospheric Vacuum Breakers: ASSE 1001.
8. NSF Materials: NSF 61.
9. Pipe Threads: ASME B1.20.1.
10. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
11. Supply and Drain Fittings: ASME A112.18.1.

K. Comply with the following applicable standards and other requirements specified for bathtub and shower faucets:

1. Automatic Compensating Valves for Individual Showers: ASSE 1016.
2. Faucets: ASME A112.18.1.
3. Backflow Prevention Devices for Hand-Held Showers: ASSE 1014.
4. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
5. Hose-Coupling Threads: ASME B1.20.7.
6. Pipe Threads: ASME B1.20.1.
7. Standard Consumer Safety Specification for Scald-Preventing Devices and Systems in Bathing Area: ASTM F444.
8. Combination Pressure Balanced and Thermostatic Valve: ASSE 1016.

L. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:

1. Atmospheric Vacuum Breakers: ASSE 1001.
2. Brass and Copper Supplies: ASME A112.18.1.
3. Manual-Operation Flushometers: ASSE 1037.
4. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.
5. Tubular Brass Drainage Fittings and Piping: ASME A112.18.1.

M. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1. Disposers: ASSE 1008 and UL 430.
2. Floor Drains: ASME A112.6.3.
3. Grab Bars: ASTM F 446.
4. Hose-Coupling Threads: ASME B1.20.7.
5. Off-Floor Fixture Supports: ASME A112.6.1M.
6. Pipe Threads: ASME B1.20.1.
7. Plastic Toilet Seats: ANSI Z124.5.
8. Supply and Drain Protective Shielding Guards: Conforming to ABA.

1.5 EXTRA MATERIALS

A. Furnish the following to the Project Director/COR at project closeout.

1. Faucet Washers and O-Rings: 10 percent of each type.
2. Faucet Cartridge and O-Rings: 10 percent.
3. Flush Valves Repair Kits: 5 percent of fixtures.
4. Toilet Seat with Integral Bidet: 20 percent of units installed, but not less than one.
5. Toilet Seat with Integral Bidet Deodorizing Filters: Two filters per unit installed.

PART 2 - PRODUCTS

2.1 PLUMBING FIXTURES

A. General: All faucets, flushometers, water closets, and urinals must be water conserving, automatic devices, unless otherwise noted.

2.2 LAVATORY FAUCETS

A. Automatic Lavatory Faucet: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Maximum Flow Rate: 1.9 L/min., with automatic 10 second shutoff.
2. Body Material: Cast brass or copper or brass underbody with brass cover plate.
3. Finish: Polished chrome plate.
4. Centers: 102 mm.
5. Mounting: Deck, exposed.
6. Handle(s): Not applicable.
7. Inlet(s): DN 15 male shank.
8. Spout: Rigid.
9. Spout Outlet: Aerator.
10. Operation: Single battery powered, sensor operated, automatic.
11. Drain: Chrome plated grid.
12. Tempering Device: Adjustable hot limit safety stop.

B. Manual Lavatory Single-Control Faucet - Accessible: Single control mixing valve. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.

1. Maximum Flow Rate: 8.3 L/min.
2. Body Material: Cast brass or copper or brass underbody with brass cover plate.
3. Finish: **[Polished chrome plate][Brush chrome if approved by Project Director/COR]**.
4. Mounting: Deck, exposed.
5. Valve Handle(s): Comply with ABA.
6. Inlet(s): DN 15 male shank.
7. Spout: **[Rigid type][Rigid, gooseneck]**.

8. Spout Outlet: Aerator.
9. Operation: Compression, manual.
10. Drain: Grid type with DN32 offset tailpiece.
11. Tempering Device: Adjustable hot limit safety stop.
12. Labeling: WaterSense.

2.3 SHOWER FAUCETS

A. Shower Faucet: Include hot- and cold-water indicators. Coordinate faucet inlets with supplies and outlet with wall supply.

1. Maximum Flow Rate: 6.8 L/min.
2. Body Material: Cast brass.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Type: Single-handle thermostatic and pressure balance valve with provision to limit setting so that it does not exceed 49 deg C (120 deg F).
5. Mounting: Exposed.
6. Handles: Lever.
7. Operation: Compression, manual.
8. Antiscald Device: Integral with mixing valve.
9. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.
10. Supply Connections: DN 15 female inlet, DN 15 male outlet.
11. Shower Head Material: Metallic with chrome-plated finish.
12. Head Type: Ball joint.
13. Spray Pattern: Adjustable.
14. Integral Volume Control: Required.
15. Shower-Arm, Flow-Control Fitting: Not required.
16. Labeling: WaterSense.

B. Shower Faucet - Accessible: Include hot- and cold-water indicators; soft handshower, hose, wall supply, and slide bar. Coordinate faucet inlets with supplies and outlet with wall supply.

1. Maximum Flow Rate: 6.8 L/min.
2. Body Material: Cast brass.
3. Finish: **[Polished chrome plate][Brushed chrome if approved by Project Director/COR]**.
4. Type: Single-handle thermostatic and pressure balance valve with provision to limit setting so that it does not exceed 49 deg C (120 deg F).
5. Mounting: Exposed.
6. Handles: Lever.
7. Backflow Protection Device for Handheld Shower: Required.
8. Operation: Compression, manual, conforming to ABA.
9. Antiscald Device: Integral with mixing valve.
10. Check Stops: Check-valve type, integral with or attached to body; on hot- and cold-water supply connections.

11. Supply Connections: DN 15 female inlet, DN 15 male outlet.
12. Shower Head Material: Metallic with chrome-plated finish.
13. Head Type: Handheld, slide-bar mounted.
14. Spray Pattern: Adjustable.
15. Integral Volume Control: Required.
16. Hose: 1500 mm.
17. Labeling: WaterSense.

2.4 SINK FAUCETS

A. Kitchenette/Pantry/Lactation Room Sink Faucet: Kitchen faucet with**[out]** pull-down sprayer. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Maximum Flow Rate: 8.3 L/min., unless otherwise indicated.
2. Body Material: Cast brass.
3. Finish: Polished chrome plate.
4. Mixing Valve: Single lever-activated, washerless cartridge.
5. Centers: 203 mm.
6. Mounting: Deck, exposed.
7. Handle: Single, metal lever.
8. Inlets: DN 15 male shank.
9. Spout: 200-217 mm tubular swing.
10. Spout Outlet: Aerator.
11. Vacuum Breaker: Required.
12. Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.

B. Kitchenette/Pantry/Lactation Room Sink Faucet - Accessible: Kitchen faucet with**[out]** pull-down sprayer. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Maximum Flow Rate: 8.3 L/min unless otherwise indicated.
2. Body Material: Cast brass.
3. Finish: Polished chrome plate.
4. Mixing Valve: Single lever-activated, washerless cartridge.
5. Centers: 203 mm adjustable.
6. Mounting: Deck, exposed.
7. Handle: Single, metal lever, conforming to ABA.
8. Inlets: DN 15 male shank.
9. Spout: 200-217 mm tubular swing.
10. Spout Outlet: Aerator.
11. Vacuum Breaker: Required.
12. Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.

C. Laboratory Sink Faucet: Two handle mixing valve. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Maximum Flow Rate: 8.3 L/min unless otherwise indicated.
2. Body Material: Cast brass.
3. Finish: Polished chrome plate.
4. Centers: 102 mm.
5. Mounting: Deck, exposed.
6. Handles: 100 mm forged Brass wrist blades.
7. Inlets: DN 15 male shank.
8. Spout: Brass gooseneck swing spout.
9. Spout Outlet: Aerator.
10. Vacuum Breaker: Required.
11. Operation: Compression, manual, by renewable unit with replaceable stainless steel seat.
12. Drain: Stainless steel crumb cup with removable stainless steel strainer basket with rubber stopper.
13. Tailpiece: DN 40 stainless steel, 102 mm long.
14. Eyewash: See faucet-mounted eyewash equipment in Section 224500 "Emergency Plumbing Fixtures."

D. Service Sink Faucet: Service sink faucet with stops in shanks, vacuum breaker, hose thread outlet, and pail hook. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Body Material: Cast brass.
2. Finish: Polished chrome plate.
3. Mixing Valve: Two-lever handle.
4. Backflow Protection Device for Hose Outlet: Required.
5. Centers: Adjustable, 152 to 254 mm with offset shanks.
6. Mounting: **[Deck, exposed][Back, wall, exposed]**.
7. Handles: Knob.
8. Inlets: DN 15 male shank.
9. Spout: Rigid, solid brass with wall brace and bucket hook.
10. Spout Outlet: Hose thread
11. Vacuum Breaker: Required.
12. Operation: Compression, manual.
13. Drain: Grid.

E. Bar Sink Faucet: Centerset. Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Body Material: Cast brass.
2. Maximum Flow Rate: 8.3 L/min.
3. Finish: **[Polished chrome plate][Brush chrome if approved by Project Director/COR]**.
4. Mixing Valve: Two-lever handle.
5. Backflow Protection Device for Hose Outlet: Required.
6. Centers: 102 mm.
7. Mounting: Deck, exposed.
8. Handles: Brass levers.
9. Inlets: DN 15 male shank.
10. Spout: Brass gooseneck swing spout.

11. Vacuum Breaker: Required.
12. Drain: Conical stainless steel strainer basket with flexible stem and rubber stopper.

F. Laundry and Utility Sink Faucet: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture holes and outlet with spout and fixture receptor.

1. Body Material: Cast brass.
2. Maximum Flow Rate: 8.3 L/min., unless otherwise indicated.
3. Finish: Polished chrome plate.
4. Mixing Valve: Two-lever handle.
5. Backflow Protection Device for Hose Outlet: Required.
6. Centers: 102 mm.
7. Mounting: **[Deck, exposed][Back, wall, exposed]**.
8. Handles: Knob.
9. Inlets: DN 15 male threaded inlet shank.
10. Spout: Swing, solid brass.
11. Spout Outlet: Hose thread
12. Vacuum Breaker: Required.
13. Operation: Compression, manual.
14. Drain: Grid.

2.5 FLUSHOMETERS

A. Flushometer for water-closet type fixture. Cast-brass body with corrosion-resistant internal components, control stop with check valve, vacuum breaker, and copper or brass tubing, and polished chrome-plated finish on exposed parts.

1. Internal Design: Diaphragm operation.
2. Style: Exposed.
3. Inlet Size: DN 25.
4. Trip Mechanism: Battery-operated sensor actuator.
5. Maximum Consumption: 4.8 L/flush
6. Tailpiece Size: DN 40 and length to top of bowl.

B. Flushometer for ultra-low flow urinal-type fixture. Cast-brass body with corrosion-resistant internal components, control stop with check valve, vacuum breaker, and copper or brass tubing, and polished chrome-plated finish on exposed parts.

1. Internal Design: Diaphragm operation.
2. Style: Exposed.
3. Inlet Size: DN 20.
4. Trip Mechanism: Battery-operated sensor actuator.
5. Maximum Consumption: 0.473 L/flush.
6. Tailpiece Size: DN 40 and length to top of bowl.
7. Labeling: GreenSpec Listed or WaterSense.

C. [Flushometer for dual-flush water-closet-type fixture. Cast-brass body with corrosion-resistant internal components, non-hold-open feature, control stop with check valve, vacuum breaker, and copper or brass tubing, and polished chrome-plated finish on exposed parts. Include metal wall plates etched with instructions.

1. Internal Design: Diaphragm operation.
2. Style: Exposed.
3. Inlet Size: DN 25.
4. Trip Mechanism: Lever-handle actuator.
5. Maximum Consumption: Dual flush, 4.8 L/flush and 4.2 L/flush.
6. Tailpiece Size: DN 40 and length to top of bowl.]

2.6 TOILET SEATS

A. Toilet Seat: Solid plastic.

1. Configuration: Open front without cover.
2. Size: Elongated.
3. Class: Heavy-duty commercial.
4. Hinge Type: SS, self-sustaining.
5. Color: White.

B. Toilet seat with integral bidet. Integral spray SS nozzle and retractable sprayer with self-cleaning feature.

1. Configuration: Open front without cover and side-arm control panel.
2. Size: Elongated.
3. Class: Heavy-duty commercial.
4. Hinge Type: SS, self-sustaining.
5. Color: White

2.7 PROTECTIVE SHIELDING GUARDS

A. Protective Shielding Pipe Enclosures: High-impact, stain resistant vinyl enclosure, specifically manufactured for enclosing hot- and cold-water supplies, trap and drain piping, electronic faucet connections, and mixing valves under wall hung lavatories complying with accessibility requirements of the ABA.

B. Protective Shielding Pipe Covers: Molded, closed-cell anti-microbial vinyl seamless P-trap insulation kit furnished with seamless riser tubes, supply angle stop covers, seamless drain tailpiece cover, and angle stop wheel handle covers. Comply with accessibility requirements of the ABA.

2.8 FIXTURE SUPPORTS

A. Water-Closet Support: Water-closet combination carrier designed for accessible and standard mounting height. Include single or double, vertical or horizontal, hub-and-spigot or hubless waste fitting as required for piping arrangement; faceplates; couplings with gaskets; feet; and fixture bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

B. Urinal Support: Urinal carrier with fixture support plates and coupling with seal and fixture bolts and hardware matching fixture. Include steel uprights with feet.

1. Accessible Fixture Support: Include rectangular steel uprights, conforming to ABA.

C. Lavatory Support: Lavatory carrier with concealed arms and tie rod. Include steel uprights with feet.

1. Accessible Fixture Support: Include rectangular steel uprights, conforming to ABA.

2.9 DISPOSERS

A. Batch-feed, household, food-waste disposer. Include 220 VAC, 559 W (0.75 HP) motor, local frequency (50 Hz or 60 Hz), with overload protection and reset button; wall switch; corrosion-resistant chamber with jam-resistant, cutlery- or stainless-steel grinder or shredder; DN 40 outlet; quick-mounting, stainless-steel sink flange; anti-splash guard; and combination cover/stopper.

2.10 [HOT-WATER DISPENSERS

A. NSF Standard: Comply with NSF/ANSI 61, "Drinking Water System Components – Health Effects," for faucet materials that will be in contact with potable water.

B. Hot-Water Dispensers:

1. Standard: ASSE 1023.
2. General: Household-type dispenser with instant on-off control; insulated, corrosion-resistant-metal storage tank that is open to atmosphere; electric heating element; chrome-plated faucet or spout; removable strainer; thermostat control for water temperature up to 88 deg C (190 deg F); and thermal-overload protection.
3. Storage Tank Capacity: 1.5 L (0.5 gal.).
4. Heating Element: 750 W minimum, 115-V ac.]

2.11 WATER CLOSETS

A. Water Closets: Wall-mounting, back-outlet, and vitreous-china fixture designed for flushometer valve operation.

1. Style: Flushometer valve.

a. Bowl Type: Elongated with siphon-jet design.
b. Maximum Consumption: 4.8 L/flush.
c. Color: White.

2. Flushometer: As specified for water closet without dual flush.
3. Toilet Seat: As specified.
4. Fixture Support: Water-closet support combination carrier.

B. Water Closets - Accessible: Accessible, wall-mounting, back-outlet, and vitreous-china fixture designed for flushometer valve operation.

1. Style: Flushometer valve.

a. Bowl Type: Elongated with siphon-jet design.
b. Maximum Consumption: 4.8 L/flush.
c. Color: White.

2. Flushometer: As specified for water closet without dual flush.
3. Toilet Seat: As specified.
4. Fixture Support: Water-closet support combination carrier, conforming to ABA.

C. [Water Closets – Dual Flush: Dual-flush, wall-mounting, back-outlet, and vitreous-china fixture designed for flushometer valve operation.

1. Style: Flushometer valve.

a. Bowl Type: Elongated with siphon-jet design.
b. Maximum Consumption: Dual flush, 4.8 L/flush and 4.2 L/flush.
c. Color: White.

2. Flushometer: As specified for water closet with dual flush.
3. Toilet Seat: As specified.
4. Fixture Support: Water-closet support combination carrier as specified.]

2.12 URINALS

A. Urinals: Ultra-low flow urinal, wall-mounting, back-outlet, vitreous-china fixture designed for flushometer valve operation.

1. Type: Siphon Jet.
2. Strainer or Trapway: Integral cast strainer.
3. Design Consumption: 0.473 L/flush.
4. Color: White.
5. Supply Spud Size: DN 20.
6. Outlet Size: DN 50.
7. Flushometer: As specified.
8. Fixture Support: As specified.
9. Labeling: GreenSpec or WaterSense.

B. Urinals - Accessible: Ultra-low flow urinal, wall-mounting, back-outlet, vitreous-china fixture designed for flushometer valve operation.

1. Type: Siphon Jet
2. Strainer or Trapway: Integral cast strainer.
3. Design Consumption: 0.473 L/flush.
4. Color: White.
5. Supply Spud Size: DN 20.
6. Outlet Size: DN 50.
7. Flushometer: As specified.
8. Fixture Support: As specified.
9. Labeling: GreenSpec or WaterSense.

2.13 LAVATORIES

A. Wall-Hanging Lavatories: Standard and accessible (conforming to ABA), vitreous-china fixture.

1. Type: With contoured back.
2. Size: 508 by 457 mm rectangular.
3. Faucet Hole Punching: Three, 102-mm centers holes.
4. Faucet Hole Location: Top.
5. Color: White.
6. Faucet: As specified.
7. Supplies: DN 10 chrome-plated copper with stops.
8. Drain: See faucet.
9. Drain Piping: DN 32 by DN 40 chrome-plated cast-brass “p” trap; DN 40 thick tubular brass waste to wall; and wall escutcheon.
10. Protective Shielding Guard: As specified.
11. Fixture Support: Lavatory, as specified.

B. Counter-Mounted Lavatories: Standard and accessible (conforming to ABA), vitreous-china fixture.

1. Type: Self-rimming.
2. Oval Lavatory Size: 508 by 432 mm.
3. Faucet Hole Punching: Three, 102-mm centers, holes.
4. Faucet Hole Location: Top.
5. Color: White.
6. Faucet: Lavatory. As specified.
7. Supplies: DN 10 chrome-plated copper with stops.
8. Drain: See faucet.
9. Drain Piping: DN 32 chrome-plated cast-brass “p” trap; DN 40 thick tubular brass waste to wall; and wall escutcheon.
10. Protective Shielding Guard: As specified.

2.14 SINKS

A. Kitchenette/Pantry/Lactation Sink: Counter-mounting, self-rimming, Type 304, 18-8 stainless steel sink.

1. Overall Size: 559 by 432 mm.
2. Number of Compartments: One.
3. Bowl Depth: 165 mm.
4. Sink Faucet: As specified.
5. Supplies: DN 15 chrome-plated copper with stops.
6. Mounting Holes: Three.
7. Drain Opening: 89 mm, off-center - 114mm from back. Position electrical outlet for disposer.
8. Drain: See faucet.
9. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1-mm- thick tubular brass waste to wall, continuous waste, and wall escutcheon(s).
10. Underside: Fully coated to dampen sound and prevent condensation.
11. Disposer: As specified.

B. Laboratory Sink: Single-compartment, counter-mounting, Type 304 18-8 stainless-steel fixture. Fixture must conform to ASME/ANSI A112.19.3M.

1. Overall Size: 483 by 534 mm.
2. Compartment: 356 by 457 mm, with straight sides and 45 mm radius corners
3. Finish: Hand-blended, with highlighted rim.
4. Rim: Self-rimming fixture with 300 series stainless steel mounting channels.
5. Sink Faucet: As specified.
6. Supplies: DN 15 chrome-plated copper with stops.
7. Drain: see faucet.
8. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1-mm- thick tubular brass waste to wall, and wall escutcheon.
9. Underside: Fully coated to dampen sound and prevent condensation.
10. Mounting Holes: Three, on 102 mm centers.

C. Bar Sink: Single-compartment, counter-mounting, stainless-steel fixture.

1. Size: 432 by 508 mm.
2. Sink Faucet: As specified.
3. Supplies: DN 15 chrome-plated copper with stops.
4. Drain: see faucet.
5. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1-mm- thick tubular brass waste to wall, and wall escutcheon.
6. Underside: Fully coated to dampen sound and prevent condensation.

2.15 SERVICE BASINS

A. Service Basins: Floor-mounting, pre-cast terrazzo basin with rim guard.

1. Shape: Square.
2. Size: 610 by 610 mm.
3. Height: 255 mm.
4. Rim Guard: On front.
5. Faucet: Sink as specified.
6. Drain: DN 80 outlet, see faucet.

2.16 INDIVIDUAL SHOWERS

A. Shower Fixtures: Refer to Division 10 for shower receptor and shower accessories.

1. Faucet/shower: As specified.
2. Drain: DN 50 outlet with chrome plated brass grate.

2.17 LAUNDRY TRAYS

A. Stand-mounting, enameled cast-iron laundry tray.

1. Size: 635 mm x 560 mm.
2. Color: White.
3. Faucet: As specified.
4. Supplies: DN 15 chrome-plated copper with stops.
5. Drain: DN 40 outlet; see faucet.
6. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1 mm thick tubular brass waste to wall, and wall escutcheon.
7. Stand: Manufacturer’s standard metal stand; provide finish if not pre-finished.

2.18 UTILITY SINK

A. Stainless steel, free-standing on legs.

1. Size: 635 mm x 560 mm.
2. Faucet: As specified.
3. Supplies: DN 15 chrome-plated copper with stops.
4. Drain Piping: DN 40 chrome-plated cast-brass “p” trap, 1.1 mm thick tubular brass waste to wall, and wall escutcheon.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water soil and for waste piping systems and supports to verify actual locations and sizes of piping connections and that locations and types of supports match those indicated, before plumbing fixture installation. Use manufacturer's roughing-in data if roughing-in data are not indicated.

B. Examine walls, floors, and cabinets for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FIXTURE INSTALLATION

A. Assemble fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. Accessible Fixtures:

1. Install accessible fixtures at mounting height required by the ABA.
2. Install protective shielding pipe covers and enclosures on exposed supplies and waste piping for accessible lavatories in accordance with the ABA.

C. Provide adequate space around plumbing fixtures to allow for routine maintenance and repair.

D. For wall-hanging fixtures, install off-floor supports affixed to building substrate.

1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

E. Install back-outlet, wall-hanging fixtures onto waste fitting seals and attach to supports.

F. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.

G. Install wall-hanging fixtures with tubular waste piping attached to supports.

H. Install floor-mounting, back-outlet water closets attached to building floor substrate and wall bracket and onto waste fitting seals.

I. Install counter-mounting fixtures in and attached to casework.

J. Install fixtures level and plumb according to manufacturers' written instructions and roughing-in drawings.

K. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

1. Exception: Use ball valve if stops are not specified with fixture. Refer to Division 22 Section on general-duty valves for plumbing piping.

L. Install "p" trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

M. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

N. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.

O. Install toilet seats on water closets.

P. **[For dual flush water closet, install instructional metal wall plate above fixture.]**

Q. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

R. Install water-supply, flow-control fittings with specified flow rates in fixture supplies at stop valves.

S. Install faucet, flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

T. Install shower, flow-control fittings with specified maximum flow rates in shower arms.

U. Install traps on fixture outlets.

1. Exception: Omit trap on indirect wastes, unless otherwise indicated.

V. Install disposer in outlet of sinks indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

W. **[Install hot-water dispensers in back top surface of sink or in counter with spout over sink.]**

X. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Refer to Division 22 Section for escutcheons.

Y. Set bathtubs, shower receptors, and service basins in leveling bed of cement grout. Refer to Division 22 Section for grout.

Z. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Refer to Division 07 Section on joint sealants for product and installation requirements.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect water supplies from water distribution piping to fixtures.

C. Connect cold water supply from water distribution to toilet seat with integrated bidet.

D. Connect drain piping from fixtures to drainage piping.

E. Supply and Waste Connections to Plumbing Fixtures: Connect fixtures with water supplies, stops, risers, traps, and waste piping. Use size fittings required to match fixtures. Connect to plumbing piping.

F. Supply and Waste Connections to Fixtures and Equipment Specified in Other Sections: Connect fixtures and equipment with water supplies, stops, risers, traps, and waste piping specified. Use size fittings required to match fixtures and equipment. Connect to plumbing piping.

G. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 FIELD QUALITY CONTROL

A. Verify that installed fixtures are categories and types specified for locations where installed.

B. Check that fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

F. Test shower floors and receptors for water tightness according to provisions in Chapter 3 of the model International Plumbing Code.

3.5 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Operate and adjust disposers**[, hot-water dispensers,]** and associated controls. Replace damaged and malfunctioning units and controls.

C. Adjust water pressure at faucets, shower valves, and flushometer valves to produce proper flow and stream.

D. Replace washers and seals of leaking and dripping faucets and stops.

3.6 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:

1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
2. Remove sediment and debris from drains.

3.7 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of fixtures for temporary facilities unless approved in writing by Project Director/COR.

END OF SECTION 224215

SECTION 224500 - EMERGENCY PLUMBING FIXTURES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following emergency plumbing fixtures:

1. Plumbed eyewash equipment.
2. Self-contained eyewash equipment.
3. Combination eyewash and emergency shower or safety station.
4. Deck-mounted equipment.

B. Related Sections include the following:

1. Division 22 Section "Plumbing Specialties" for backflow preventers and floor drains.

1.2 PERFORMANCE REQUIREMENTS

A. Provide emergency plumbing fixtures in accordance with requirements in Chapter 4 of the OBO Plumbing Code for location and travel distance.

1.3 DEFINITIONS

A. Accessible Fixture: Emergency plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Plumbed Emergency Plumbing Fixture: Fixture with fixed, potable-water supply.

C. Self-Contained Emergency Plumbing Fixture: Fixture with flushing-fluid-solution supply.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include flow rates and capacities, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Product Certificates: Submit certificates of performance testing specified in the Part 2 Article on SOURCE QUALITY CONTROL.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For emergency plumbing fixtures to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. ANSI Standard: Comply with ANSI Z358.1, "Emergency Eyewash and Shower Equipment."

B. Regulatory Requirements: Comply with accessibility provisions in Chapter 11 of the Building Code of Overseas Buildings Operations.

C. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Flushing-Fluid Solution for Self-Contained Eyewash Equipment: Separate lot and equal to at least 200 percent of amount of solution installed for each self-contained unit.

PART 2 - PRODUCTS

2.1 PLUMBED EYEWASH AND EMERGENCY SHOWER EQUIPMENT

A. Basis of Design: The following products represent models conforming to requirements. The list is not intended to indicate a requirement for sole-source acquisition.

1. Plumbed eyewash equipment

a. Guardian G1891
b. Guardian G1892
c. Guardian G1825
d. Guardian G1825P
e. Guardian G1894
f. Guardian G1896

2. Combination eyewash and emergency shower or safety station

a. Haws 8200
b. Haws 8300.158

3. Deck-mounted eyewash equipment

a. Bradley - S19-270HDSpeakman - SE-573
b. Guardian G1849

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Bradley Corporation.
2. Chicago Faucets.
3. Encon Safety Products.
4. Guardian Equipment Co.
5. Haws Corporation.
6. Lab Safety Supply Inc.
7. Sellstrom Manufacturing Co.
8. Speakman Company.
9. WaterSaver Faucet Co.
10. Western Emergency Equipment.

C. Description: Plumbed, accessible equipment.

1. General:

a. Supply Piping: DN 15 chrome-plated brass or stainless steel with flow regulator and stay-open control valve.
b. Control-Valve Actuator: Paddle.
c. Receptor: Chrome-plated brass, stainless-steel bowl, or ABS plastic.
d. Drain Piping: DN 32 minimum, chrome-plated brass, receptor drain, P-trap, waste to wall, and wall flange complying with ASME A112.18.2.
e. Mixing Valve: Thermostatic mixing valve (TMV) complying with ASSE 1071, leaving water temperature setpoint adjustable throughout the range of 16 to 35 degrees C (60 to 95 degrees F).

2. Plumbed eyewash equipment: Wall-mounted, pedestal, or deck-mounted equipment.

2.2 SELF-CONTAINED EYEWASH EQUIPMENT

A. Basis of Design: The following products represent models conforming to requirements. The list is not intended to indicate a requirement for sole-source acquisition.

1. Self-contained eyewash equipment

a. Bradley S19-921
b. Bradley S19-921H (heated model)

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Bradley Corporation.
2. Encon Safety Products.

3. Guardian Equipment Co.
4. Haws Corporation.
5. Lab Safety Supply Inc.
6. Sellstrom Manufacturing Co.
7. Speakman Company.
8. WaterSaver Faucet Co.
9. Western Emergency Equipment.

C. Description: Portable, pressurized, self-contained eyewash equipment.

1. Capacity: Deliver flushing fluid at rate not less than 1.5 L/min. (for at least 15 minutes.
2. Flushing Fluid: Medically acceptable solution manufactured and labeled according to applicable regulations.
3. Provide heated unit where required to prevent freezing.

2.3 SOURCE QUALITY CONTROL

A. Certify performance of plumbed and self-contained emergency plumbing fixtures by independent testing agency acceptable to authorities having jurisdiction.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before plumbed emergency plumbing fixture installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EMERGENCY PLUMBING FIXTURE INSTALLATION

A. Assemble emergency plumbing fixture piping, fittings, control valves, and other components.

B. Install fixtures level and plumb.

C. Fasten fixtures to substrate.

D. Install shutoff valves in water-supply piping to fixtures. Use ball, gate, or globe valve if specific type valve is not indicated. Install valves chained or locked in open position if permitted. Install valves in locations where they can easily be reached for operation. Valves are specified in Division 22 Section on general-duty valves for plumbing piping.

1. Exception: Omit shutoff valve on supply to group of plumbing fixtures that includes emergency plumbing fixture.

E. Install shutoff valve and strainer in steam piping and shutoff valve in condensate return piping.

F. Install dielectric fitting in supply piping to fixture if piping and fixture connections are made of different metals. Dielectric fittings are specified in Section on common work results for plumbing.

G. Install trap and waste to wall on drain outlet of fixture receptors that are indicated to be directly connected to drainage system.

H. Install indirect waste piping to wall on drain outlet of fixture receptors that are indicated to be indirectly connected to drainage system. Drainage piping is specified in Division 22 Section on sanitary waste and vent piping.

I. Install escutcheons on piping wall and ceiling penetrations in exposed, finished locations. Escutcheons are specified in Section on common work results for plumbing.

J. Fill self-contained fixtures with flushing fluid.

K. Install equipment nameplates or equipment markers on fixtures and equipment signs on water-tempering equipment. Identification materials are specified in Division 22 Section on identification for plumbing piping and equipment.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect hot- and cold-water supplies to emergency showers and plumbed emergency eyewash stations. Comply with manufacturer's installation instructions. The temperature of the water supply must be controlled by a thermostatic mixing valve (TMV) complying with ASSE 1071.

C. Directly connect emergency plumbing fixture receptors with trapped drain outlet to sanitary drainage and vent piping.

D. Indirectly connect emergency plumbing fixture receptors without trapped drain outlet to sanitary or storm drainage piping.

1. P-trapped drain is required when receptors drain outlet connected to sanitary drainage and vent piping.

3.4 FIELD QUALITY CONTROL

A. Mechanical-Component Testing: After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve indicated capacities and temperatures.

B. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

C. Report test results in writing.

3.5 ADJUSTING

A. Adjust or replace fixture flow regulators for proper flow.

END OF SECTION 224500

SECTION 230593 - TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes testing, adjusting, and balancing HVAC systems to produce design objectives, including the following:

1. Balancing airflow and water flow within distribution systems, including submains, branches, and terminals, to indicated quantities according to specified tolerances.
2. Adjusting total HVAC systems to provide indicated quantities.
3. Measuring electrical performance of HVAC equipment.
4. Setting quantitative performance of HVAC equipment.
5. Verifying that automatic control devices are functioning properly.
6. Measuring sound and vibration.
7. Reporting results of the activities and procedures specified in this Section.
8. Measuring and making adjustments necessary to maintain building pressurization levels in buildings in accordance with system design.

B. Related Sections include the following:

1. Those testing and adjusting requirements which are unique to particular systems and equipment are included in the associated Sections that specify those systems and equipment.
2. Field quality-control testing to verify that workmanship quality for systems and equipment installation are specified in the associated Sections for those systems and equipment.

1.2 DEFINITIONS

A. AABC: Associated Air Balance Council.

B. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

C. Balance: To proportion flows within the distribution system, including submains, branches, and terminals, according to design quantities.

D. CxA: Commissioning Agent. Refer to Division 01 Section “Commissioning.”

E. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated.

F. Functional Performance Testing (FPT): Refer to Division 01 Section “Commissioning.”

G. NEBB: National Environmental Balancing Bureau.

H. Procedure: An approach to and execution of a sequence of work operations to yield repeatable results.

I. Report Forms: Test data sheets for recording test data in logical order.

J. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

K. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

L. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

M. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

N. TAB: Testing, adjusting, and balancing.

O. TAB Specialist: An independent entity meeting qualifications to perform TAB work.

P. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

Q. Test: A procedure to determine quantitative performance of a system or equipment.

1.3 SUBMITTALS

A. Qualification Data: Within 30 days from Contractor's Notice to Proceed with construction, submit four copies of evidence that testing, adjusting, and balancing agent meets the qualifications specified in the Part 1 Article on QUALITY ASSURANCE.

B. Contract Documents Examination Report: Within 45 days from Contractor's Notice to Proceed with construction, submit four copies of Contract Documents review report as specific in Part 3.

C. Strategies and Procedures Plan: Within 90 days from Contractor's Notice to Proceed, submit four copies of testing, adjusting, and balancing strategies and step-by-step procedures as specified in the Part 3 Article on PREPARATION. Include a complete set of report forms intended for use on this Project.

D. Certified Testing, Adjusting, and Balancing Reports: Submit two copies of reports prepared, as specified in this Section, on forms conforming to requirements of the Part 1 Article on QUALITY ASSURANCE.

E. Instrument calibration reports, including the following:

1. Instrument type and make.
2. Serial number.
3. Application.
4. Dates of use.
5. Dates of calibration.

1.4 QUALITY ASSURANCE

A. TAB Specialist Qualifications: Engage a testing, adjusting, and balancing specialist certified by either Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB).

1. TAB Field Supervisor: Employee of TAB Specialist and certified by AABC or NEBB.
2. TAB Technician: Employee of TAB Specialist and certified by AABC or NEBB as TAB technician.

B. Perform testing, adjusting and balancing in accordance with ANSI/ASHRAE Standard 111-2008 (RA 2017) “Testing, Adjusting, and Balancing of Building HVAC Systems.”

C. Testing, Adjusting, and Balancing Conference: TAB Specialist shall meet with the Project Director/COR and the project Commissioning Agent upon approval of the testing, adjusting, and balancing strategies and procedures plan to develop a mutual understanding of the details. Ensure the participation of testing, adjusting, and balancing team members, equipment manufacturers' authorized service representatives, HVAC controls Installer, and other support personnel. Provide 7 days' advance notice of scheduled meeting time and location.

1. Agenda Items: Include at least the following:

a. Submittal distribution requirements.
b. Contract Documents examination report.
c. Testing, adjusting, and balancing plan.
d. Work schedule and Project site access requirements.
e. Coordination and cooperation of trades and subcontractors.
f. Coordination of documentation and communication flow.

D. Certification of Testing, Adjusting, and Balancing Reports: Certify the testing, adjusting, and balancing field data reports. This certification includes the following:

1. Review field data reports to validate accuracy of data and to prepare certified testing, adjusting, and balancing reports.
2. Certify that the testing, adjusting, and balancing team complied with the approved testing, adjusting, and balancing plan and the procedures specified and referenced in this Specification.
3. TAB Specialist shall review, backcheck, verify, and demonstrate all tests results after the Functional Performance Testing (FPT) is complete and prior to CxA Warranty Review.
4. Operate, demonstrate, and verify all the air systems to 100 percent design rated duty for air flows, with all systems in operation (not just individual systems) as designed for full

occupation of each building and as necessary to maintain the applicable pressurization requirements.

E. Testing, Adjusting, and Balancing Reports: Use standard forms from AABC's "National Standards for Testing, Adjusting, and Balancing" or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" each time a testing, adjusting, and balancing report is created.

F. Instrumentation Type, Quantity, and Accuracy: As described in AABC national standards if AABC report form is used or as described in NEBB's "Procedural Standard for Testing, Adjusting, and Balancing of Environmental Systems," Section II, "Required Instrumentation for NEBB Certification" if NEBB report form is used.

G. Instrumentation Calibration: Calibrate instruments at least every 6 months or more frequently if required by the instrument manufacturer.

1.5 COORDINATION

A. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist testing, adjusting, and balancing activities.

B. Obtain all Division 23 shop drawings of systems to be tested, adjusted, and balanced to become familiar with installation prior to the day when testing, adjusting, and balancing is performed.

C. Notice: Provide 7 days' advance notice for each test. Include scheduled test dates and times.

D. Perform testing, adjusting, and balancing after leakage, pressure tests, and specified flushing, and cleaning and chemical treatment on air and water distribution systems have been satisfactorily completed.

E. Initial TAB verification activity shall be performed prior to Functional Performance Testing (FPT).

F. TAB Specialist shall revalidate all TAB results after FPTs are complete since conditions may have been affected by adjustments to issues found and corrected in the FPT process. In addition, revalidation is necessary at two peak seasons. Refer to the Part 3 Article on ADDITIONAL TESTS.

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine Contract Documents to become familiar with project requirements and to discover conditions in systems' designs that may preclude proper testing, adjusting, and balancing of systems and equipment.

1. Verify that balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are provided as required by the design in the Contract Documents. Verify that quantities and locations of these balancing devices are accessible and appropriate for effective balancing and for efficient system and equipment operation.

B. Examine approved submittal data of HVAC systems and equipment.

C. Examine project record documents described in Division 01 Section "Closeout Procedures."

D. Examine design data, including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.

E. Examine equipment performance data, including fan and pump curves. Relate performance data to project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system. Calculate system effect factors to reduce the performance ratings of HVAC equipment when installed under conditions different from those presented when the equipment was performance tested at the factory. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," Sections 7 through 10 from Air Movement and Control Association International, Inc. (AMCA); or in SMACNA's "HVAC Systems Duct Design," Sections 5 and 6 by Sheet Metal and Air Conditioning Contractors' National Association (SMACNA). Compare this data with the design data and installed conditions.

F. Examine system and equipment installations to verify that they are complete and that testing, cleaning, adjusting, and prefunctional checklist specified in individual Specification Sections have been performed.

G. Examine system and equipment test reports.

H. Examine HVAC system and equipment installations to verify that indicated balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are properly installed, and their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation.

I. Examine systems for functional deficiencies that cannot be corrected by adjusting and balancing.

J. Examine air-handling equipment to ensure clean filters have been installed, bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

K. Examine terminal units, such as variable-air-volume boxes and mixing boxes, to verify that these items are accessible and associated controls are connected and functioning.

L. Examine plenum ceilings utilized for supply air to verify air tightness. Verify that pipe penetrations and other holes are sealed.

M. Examine strainers for clean screens and proper perforations.

N. Examine 3-way valves for proper installation for their intended function of diverting or mixing fluid flows and design fail-safe positions.

O. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

P. Examine open-piping-system pumps to ensure absence of entrained air in the suction piping.

Q. Examine equipment for installation and for properly operating safety interlocks and controls.

R. Examine automatic temperature system components to verify the following:

1. Dampers, valves, and other controlled devices operate by the intended controller.
2. Dampers and valves are in the position indicated by the controller.
3. Integrity of valves and dampers for free and full operation and for tightness of fully closed and fully open positions. This includes dampers in multizone units, mixing boxes, and variable-air-volume terminals.
4. Automatic modulating and shutoff valves, including 2-way valves and 3-way mixing and diverting valves, are properly connected.
5. Thermostats and humidistats are located to avoid adverse effects of sunlight, drafts, and cold walls.
6. Sensors are located to sense only the intended conditions.
7. Sequence of operation for control modes is according to the Contract Documents.
8. Controller set points are set at design values. Observe and record system reactions to changes in conditions. Record default set points if different from design values.
9. Interlocked systems are operating.
10. Changeover from heating to cooling mode occurs according to design values.

S. Report deficiencies discovered before and during performance of testing, adjusting, and balancing procedures.

T. Examine signed pre-functional and start-up checklists pertaining to applicable system/equipment. Ensure these documents have been submitted by installing contractor and verify that system/equipment is functioning in accordance with design intent prior to beginning any TAB fieldwork.

3.2 PREPARATION

A. Prepare a testing, adjusting, and balancing plan that includes strategies and step-by-step procedures.

B. Complete system readiness checks and prepare system readiness reports. Verify the following:

1. Permanent electrical power wiring is complete.
2. Hydronic systems are filled, clean, chemically treated as specified, and free of air.
3. Automatic temperature-control systems are operational.
4. Equipment and duct access doors are securely closed.
5. Balancing, smoke, and fire dampers are fully open.
6. Isolating and balancing valves are open and control valves are operational.
7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
8. Windows and doors can be closed so design conditions for system operations can be met.

3.3 GENERAL PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in Associated Air Balance Council (AABC) national standards or National Environmental Balancing Bureau (NEBB) "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems," and the requirements of this Section.

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to the Division 23 insulation Specifications for this Project.

C. Mark equipment settings with paint or other suitable, permanent identification material, including damper-control positions, valve indicators, fan-speed-control levers, and similar controls and devices, to show final settings.

3.4 FUNDAMENTAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Determine the best locations in main and branch ducts for accurate duct airflow measurements.

E. Check the airflow patterns from the outside-air louvers and dampers and the return- and exhaust-air dampers, through the supply-fan discharge and mixing dampers.

F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

G. Verify that motor starters are equipped with properly sized thermal protection.

H. Check dampers for proper position to achieve desired airflow path.

I. Check for airflow blockages.

J. Check condensate drains for proper connections and functioning.

K. Check for proper sealing of air-handling unit components.

L. Demonstrate operation of each pressure zone to Project Director/COR during installation and at commissioning for compliance with requirements and conformance to system design in Construction Documents.

M. Demonstrate that pressure settings do not affect opening and closing of FE/BR doors.

N. Consular Teller Window Air Flow: Demonstrate that system design provides required airflow from Consular Affairs suite to Consular Waiting Area through consular window deal trays when one or more deal trays are opened.

3.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. The procedures in this Article apply to constant-volume supply-, return-, and exhaust-air systems. Additional procedures are required for variable-air-volume supply-air systems. These additional procedures are specified in other articles in this Section.

B. Adjust fans to deliver total design airflows within the maximum allowable rpm listed by the fan manufacturer.

1. Measure fan static pressures to determine actual static pressure as follows:

   a. Measure outlet static pressure as far downstream from the fan as practicable and upstream from restrictions in ducts such as elbows and transitions.
   b. Measure static pressure directly at the fan outlet or through the flexible connection.
   c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from flexible connection and downstream from duct restrictions.
   d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.

2. Measure static pressure across each air-handling unit component.

   a. Simulate dirty filter operation and record the point at which maintenance personnel must change filters.

3. Measure static pressures entering and leaving other devices such as sound traps under final balanced conditions.

4. Compare design data with installed conditions to determine variations in design static pressures versus actual static pressures. Compare actual system effect factors with calculated system effect factors to identify where variations occur. Recommend corrective action to align design and actual conditions.
5. Adjust fan speed higher or lower than design with the approval of the Project Director/COR with input from OBO/PDCS/DE/ME and project designer. Make required adjustments to pulley sizes, motor sizes, and electrical connections to accommodate fan-speed changes.
6. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure no overload will occur. Measure amperage in full cooling, full heating, and economizer modes to determine the maximum required brake horsepower.

C. Adjust volume dampers for main duct, submain ducts, and major branch ducts to design airflows within specified tolerances.

1. Measure static pressure at a point downstream from the balancing damper and adjust volume dampers until the proper static pressure is achieved.

a. Where sufficient space in submains and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.

2. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submains and branch ducts to design airflows within specified tolerances.

D. Measure terminal outlets and inlets without making adjustments.

1. Measure terminal outlets using a direct-reading hood or the outlet manufacturer's written instructions and calculating factors.

E. Adjust terminal outlets and inlets for each space to design airflows within specified tolerances of design values. Make adjustments using volume dampers rather than extractors and the dampers at the air terminals.

1. Adjust each outlet in the same room or space to within specified tolerances of design quantities without generating noise levels above the limitations prescribed by the Contract Documents.
2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.6 ADDITIONAL PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the fan design airflow volume, place a selected number of terminal units at a maximum set-point airflow condition until the total airflow of the terminal units equals the design airflow of the fan. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set outside-air dampers at minimum, and return- and exhaust-air dampers at a position that simulates full-cooling load.
2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of the terminal unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge duct losses.
3. Measure total design system airflow.

    a. Adjust total design supply air from 100 percent to +/-5 percent (i.e., range from 95 percent to 105 percent).
    b. Adjust total design return air from 100 percent to -5 percent (i.e., range 95 percent to 100 percent).
    c. Exhaust air to be balanced to achieve the designed pressure differential for the associated areas.

4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use the terminal unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.

    a. If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.

6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.
7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure adequate static pressure is maintained at the most critical unit.
8. Record the final fan performance data.

3.7 FUNDAMENTAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Prepare test reports with pertinent design data and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against approved pump flow rate. Correct variations that exceed plus-or-minus 5 percent.

B. Prepare schematic diagrams of systems' "as-built" piping layouts.

C. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:

1. Open all manual valves for maximum flow.
2. Check expansion tank liquid level.
3. Check makeup-water-station pressure gage for adequate pressure for highest vent.
4. Check flow-control valves for specified sequence of operation and set at design flow.
5. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
6. Set system controls so automatic valves are wide open to heat exchangers.
7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
8. Check air vents for a forceful liquid flow exiting from vents when manually operated.
9. TAB Specialist must provide assistance to the Cx team to measure and document water flow using portable ultrasonic liquid flow meter capable of measuring liquid flow in various size and compositions of materials (e.g., copper, PVC, carbon steel). Examples of typical measurements include flows for chilled water bypass lines, chiller evaporator flow rates, coil flows, totals system flows for chilled water, and heat exchanger flow rates.
10. TAB Specialist shall verify accuracy of readings from hydronic system flow meters used by BAS Systems.

3.8 PROCEDURES FOR HYDRONIC SYSTEMS

A. Determine water flow at pumps. Use the following procedures, except for positive-displacement pumps:

1. Verify impeller size by operating the pump with the discharge valve closed. Verify with the pump manufacturer that this will not damage pump. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on the manufacturer's pump curve at zero flow and confirm that the pump has the intended impeller size.

    a. Check system resistance. With all valves open, read pressure differential across the pump and mark the pump manufacturer's head-capacity curve. Adjust pump discharge valve until design water flow is achieved.
    b. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on the pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.
    c. Report flow rates that are not within plus-or-minus 5 percent of design.

B. Set calibrated balancing valves, if installed, at calculated presettings.

C. Measure flow at all stations and adjust, where necessary, to obtain first balance.

1. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.

D. Measure flow at main balancing station and set main balancing device to achieve flow that is 5 percent greater than design flow.

E. Adjust balancing stations to within specified tolerances of design flow rate as follows:

1. Determine the balancing station with the highest percentage over design flow.
2. Adjust each station in turn, beginning with the station with the highest percentage over design flow and proceeding to the station with the lowest percentage over design flow.
3. Record settings and mark balancing devices.

F. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures, including outdoor-air temperature.

G. Measure the differential-pressure control valve settings existing at the conclusions of balancing.

3.9 ADDITIONAL PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

3.10 ADDITIONAL PROCEDURES FOR PRIMARY-SECONDARY-FLOW HYDRONIC SYSTEMS

A. Balance the primary system crossover flow first, then balance the secondary system.

3.11 PROCEDURES FOR HEAT EXCHANGERS

A. Measure water flow through all circuits.

B. Adjust water flow to within specified tolerances.

C. Measure inlet and outlet water temperatures.

D. Record safety valve settings.

E. Verify operation of steam traps.

3.12 PROCEDURES FOR MOTORS

A. Motors, 373 W (0.5 HP) and Larger: Test at final balanced conditions and record the following data:

1. Manufacturer, model, and serial numbers.
2. Motor horsepower rating.
3. Motor rpm.
4. Efficiency rating if high-efficiency motor.
5. Nameplate and measured voltage, each phase.
6. Nameplate and measured amperage, each phase.
7. Starter thermal-protection-element rating.

B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass for the controller to prove proper operation. Record observations, including controller manufacturer, model and serial numbers, and nameplate data. Verify that minimum frequency (Hz) set points do not allow fans or pumps to operate within "surge portion" of their respective submitted curves.

C. Vibration Testing:

1. TAB Specialist shall perform vibration measurements on all motors 5 HP and greater in size. Typically, for HVAC these motors are associated with pumps and fan systems.
2. Perform measurements at a fixed repeatable speed.
3. Perform measurements at each end of motor and bearing point.
4. Perform measurement on clean dry flat surfaces; if flat surfaces are not available, use curved surface sensor.
5. Measurement shall include both accelerations measured in 10 to 1000 Hz range, and velocity measured in 200 to 16k Hz range. Velocity measurement is used to gauge general motor condition, and velocity is used to gauge bearing condition.
6. Measurements will form a baseline for future condition monitoring.
7. TAB Specialist shall document each individual motor being tested (make, model, name), accelerometer/sensor location on motor, and maximum vibration measurements observed, along with corresponding RPM or motor load. Measurements from all vibration tests shall be incorporated in a consolidated report. This report will serve as the baseline for future comparison and troubleshooting by Facilities staff.

3.13 PROCEDURES FOR CHILLERS

A. Balance water flow through each evaporator and condenser to within specified tolerances of design flow with all pumps operating. With only one chiller operating in a multiple chiller installation, do not exceed the flow for the maximum tube velocity recommended by the chiller manufacturer. Measure and record the following data with each chiller operating at design conditions:

1. Evaporator water entering and leaving temperatures, pressure drop, and water flow.
2. Condenser water entering and leaving temperatures, pressure drop, and water flow.
3. Evaporator and condenser refrigerant temperatures and pressures, using instruments furnished by the chiller manufacturer.
4. Power factor if factory-installed instrumentation is furnished for measuring kW.
5. The kW input if factory-installed instrumentation is furnished for measuring kW.
6. Capacity: Calculate in tons of cooling.

7. Air-Cooled Chillers: Verify condenser-fan rotation and record fan data, including number of fans and entering- and leaving-air temperatures.

8. Chillers shall be commissioned on-site by the manufacturer and accepted by Project Director/COR based on input from OBO/PDCS/DE mechanical engineer.

3.14 [PROCEDURES FOR COOLING TOWERS

A. Shut off makeup water for the duration of the test, and then ensure the makeup and blow-down systems are fully operational after tests and before leaving the equipment. Perform the following tests and record the results:

1. Measure condenser water flow to each cell of the cooling tower.
2. Measure entering- and leaving-water temperatures.
3. Measure wet- and dry-bulb temperatures of entering air.
4. Measure wet- and dry-bulb temperatures of leaving air.
5. Measure condenser water flow rate recirculating through the cooling tower.
6. Measure cooling tower pump discharge pressure.
7. Adjust water level and feed rate of makeup-water system.]

3.15 PROCEDURES FOR CONDENSING UNITS

A. Verify proper rotation of fans and measure entering- and leaving-air temperatures. Record compressor data.

3.16 PROCEDURES FOR BOILERS

A. Measure entering- and leaving-water temperatures and water flow.

3.17 PROCEDURES FOR HEAT-TRANSFER COILS

A. Water Coils: Measure the following data for each coil:

1. Entering- and leaving-water temperatures.
2. Water flow rate.
3. Water pressure drop.
4. Dry-bulb temperatures of entering and leaving air.
5. Wet-bulb temperatures of entering and leaving air for cooling coils designed for less than 3540 L/s.
6. Airflow.
7. Air pressure drop.

3.18 PROCEDURES FOR TEMPERATURE TESTING

A. During testing, adjusting, and balancing, report need for adjustment in temperature regulation within the automatic temperature-control system.

B. Measure indoor wet- and dry-bulb temperatures every other hour for a period of two successive 8-hour days, in each separately controlled zone, to prove correctness of final temperature settings. Measure when the building or zone is occupied.

C. Measure outside-air, wet- and dry-bulb temperatures.

3.19 PROCEDURES FOR TEMPERATURE-CONTROL VERIFICATION

A. Verify that controllers are calibrated and commissioned.

B. Check transmitter and controller locations and note conditions that would adversely affect control functions.

C. Record controller settings and note variances between set points and actual measurements.

D. Verify operation of limiting controllers (i.e., high- and low-temperature controllers).

E. Verify free travel and proper operation of control devices such as damper and valve operators.

F. Verify sequence of operation of control devices. Note air pressures and device positions and correlate with airflow and water-flow measurements. Note the speed of response to input changes.

G. Confirm interaction of electrically operated switch transducers.

H. Confirm interaction of interlock and lockout systems.

I. Verify main control supply-air pressure and observe compressor and dryer operations.

J. Record voltages of power supply and controller output. Determine if the system operates on a grounded or ungrounded power supply.

K. Note operation of electric actuators using spring return for proper fail-safe operations.

3.20 PROCEDURES FOR HVAC SOUND LEVEL TESTING

A. TAB Specialist shall measure, verify compliance, and demonstrate to the Project Director/COR and Cx Agent that internal noise levels for HVAC systems in associated spaces conform to OBO-ICS IBC 1206.4 Noise restrictions for equipment.

3.21 TOLERANCES

A. Set HVAC system airflow and water flow rates within the following tolerances:

1. Supply, Return, Exhaust Fans, and Equipment with Fans: 0 to plus 10 percent.
2. Air Outlets and Inlets: 0 to minus 10 percent.
3. Heating-Water Flow Rate: 0 to minus 10 percent.
4. Chilled-Water Flow Rate: 0 to minus 5 percent.
5. Condenser-Water Flow Rate: 0 to minus 10 percent.

3.22 REPORTING

A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in the Part 3 Article on EXAMINATION, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.

B. Status Reports: As Work progresses, prepare reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

C. Deliver to Project Director/COR a field copy of TAB results for equipment/systems, for Government review, one week prior to functional performance testing.

3.23 FINAL REPORT

A. Submit final test reports to Project Director/COR for forwarding to the OBO/OPS/FAC for inclusion in the Maintenance Database.

B. General: Typewritten, or computer printout in letter-quality font, on standard bond paper, in 3-ring binder, tabulated and divided into sections by tested and balanced systems.

C. Include a certification sheet in front of binder signed and sealed by the certified testing and balancing engineer.

1. Include a list of the instruments used for procedures, along with proof of calibration.

D. Final Report Contents: In addition to the certified field report data, include the following:

1. Pump curves.
2. Fan curves.
3. Manufacturers' test data.
4. Field test reports prepared by system and equipment installers.

5. Other information relative to equipment performance, but do not include approved Shop Drawings and Product Data.

E. General Report Data: In addition to the form titles and entries, include the following data in the final report, as applicable:

1. Title page.
2. Name and address of testing, adjusting, and balancing Agent.
3. Project name.
4. Project location.
5. Architect's name and address.
6. Engineer's name and address.
7. Contractor's name and address.
8. Report date.
9. Signature of testing, adjusting, and balancing Agent who certifies the report.
10. Summary of contents, including the following:

    a. Design versus final performance.
    b. Notable characteristics of systems.
    c. Description of system operation sequence if it varies from the Contract Documents.

11. Nomenclature sheets for each item of equipment.
12. Data for terminal units, including manufacturer, type size, and fittings.
13. Notes to explain why certain final data in the body of reports vary from design values.
14. Test conditions for fans and pump performance forms, including the following:

    a. Settings for outside-, return-, and exhaust-air dampers.
    b. Conditions of filters.
    c. Cooling coil, wet- and dry-bulb conditions.
    d. Face and bypass damper settings at coils.
    e. Fan drive settings, including settings and percentage of maximum pitch diameter.
    f. Inlet vane settings for variable-air-volume systems.
    g. Settings for supply-air, static-pressure controller.
    h. Other system operating conditions that affect performance.

F. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present with single-line diagrams and include the following:

1. Quantities of outside, supply, return, and exhaust airflows.
2. Water and steam flow rates.
3. Duct, outlet, and inlet sizes.
4. Pipe and valve sizes and locations.
5. Terminal units.
6. Balancing stations.
7. Tag identification numbers for major equipment, valve and damper components,

G. Air-Handling Unit Test Reports: For air-handling units with coils, include the following:

1. Unit Data: Include the following:

   a. Unit identification.
   b. Location.
   c. Make and type.
   d. Model number and unit size.
   e. Manufacturer's serial number.
   f. Unit arrangement and class.
   g. Discharge arrangement.
   h. Sheave make, size in mm, and bore.
   i. Sheave dimensions, center-to-center and amount of adjustments in mm.
   j. Number of belts, make, and size.
   k. Number of filters, type, and size.

2. Motor Data: Include the following:

   a. Make and frame type and size.
   b. Horsepower and rpm.
   c. Volts, phase, and hertz.
   d. Full-load amperage and service factor.
   e. Sheave make, size in mm, and bore.
   f. Sheave dimensions, center-to-center and amount of adjustments in mm.

3. Test Data: Include design and actual values for the following:

   a. Total airflow rate in L/s.
   b. Total system static pressure in Pa.
   c. Fan rpm.
   d. Discharge static pressure in Pa.
   e. Filter static-pressure differential in Pa.
   f. Preheat coil static-pressure differential in Pa.
   g. Cooling coil static-pressure differential in Pa.
   h. Heating coil static-pressure differential in Pa.
   i. Outside airflow in L/s.
   j. Return airflow in L/s.
   k. Outside-air damper position.
   l. Return-air damper position.
   m. Vortex damper position.

H. Apparatus-Coil Test Reports: For apparatus coils, include the following:

1. Coil Data: Include the following:

   a. System identification.
   b. Location.
   c. Coil type.
   d. Number of rows.
   e. Fin spacing in mm o.c.

f. Make and model number.
g. Face area in sq. m.
h. Tube size in DN.
i. Tube and fin materials.
j. Circuiting arrangement.

2. Test Data: Include design and actual values for the following:

a. Airflow rate in L/s.
b. Average face velocity in m/s.
c. Air pressure drop in Pa.
d. Outside-air, wet- and dry-bulb temperatures in deg C.
e. Return-air, wet- and dry-bulb temperatures in deg C.
f. Entering-air, wet- and dry-bulb temperatures in deg C.
g. Leaving-air, wet- and dry-bulb temperatures in deg C.
h. Water flow rate in L/s.
i. Water pressure differential in kPa.
j. Entering-water temperature in deg C.
k. Leaving-water temperature in deg C.
l. Refrigerant expansion valve and refrigerant types.
m. Refrigerant suction pressure in kPa.
n. Refrigerant suction temperature in deg C.

I. Fan Test Reports: For supply, return, and exhaust fans, include the following:

1. Fan Data: Include the following:

a. System identification.
b. Location.
c. Make and type.
d. Model number and size.
e. Manufacturer's serial number.
f. Arrangement and class.
g. Sheave make, size in mm, and bore.
h. Sheave dimensions, center-to-center and amount of adjustments in mm.

2. Motor Data: Include the following:

a. Make and frame type and size.
b. Horsepower and rpm.
c. Volts, phase, and hertz.
d. Full-load amperage and service factor.
e. Sheave make, size in mm, and bore.
f. Sheave dimensions, center-to-center and amount of adjustments in mm.
g. Number of belts, make, and size.

3. Test Data: Include design and actual values for the following:

a. Total airflow rate in L/s.
b. Total system static pressure in Pa.
c. Fan rpm.
d. Discharge static pressure in Pa.
e. Suction static pressure in Pa.

J. Round and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:

1. Report Data: Include the following:

a. System and air-handling unit number.
b. Location and zone.
c. Traverse air temperature in deg C.
d. Duct static pressure in Pa.
e. Duct size in mm.
f. Duct area in sq. m.
g. Design airflow rate in L/s.
h. Design velocity in m/s.
i. Actual airflow rate in L/s.
j. Actual average velocity in m/s.
k. Barometric pressure in Pa.

K. Air-Terminal-Device Reports: For terminal units, include the following:

1. Unit Data: Include the following:

a. System and air-handling unit identification.
b. Location and zone.
c. Test apparatus used.
d. Area served.
e. Air-terminal-device make.
f. Air-terminal-device number from system diagram.
g. Air-terminal-device type and model number.
h. Air-terminal-device size.
i. Air-terminal-device effective area in sq. m.

2. Test Data: Include design and actual values for the following:

a. Airflow rate in L/s.
b. Air velocity in m/s.
c. Preliminary airflow rate as needed in L/s.
d. Preliminary velocity as needed in m/s.
e. Final airflow rate in L/s.
f. Final velocity in m/s.
g. Space temperature in deg C.

L. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:

1. Unit Data: Include the following:

   a. System and air-handling unit identification.
   b. Location and zone.
   c. Room or riser served.
   d. Coil make and size.
   e. Flowmeter type.

2. Test Data: Include design and actual values for the following:

   a. Airflow rate in L/s.
   b. Entering-water temperature in deg C.
   c. Leaving-water temperature in deg C.
   d. Water pressure drop in kPa.
   e. Entering-air temperature in deg C.
   f. Leaving-air temperature in deg C.

M. Packaged Chiller Reports: For each chiller, include the following:

1. Unit Data: Include the following:

   a. Unit identification.
   b. Make and model number.
   c. Manufacturer's serial number.
   d. Refrigerant type and capacity in L.
   e. Starter type and size.
   f. Starter thermal protection size.

2. Condenser Test Data: Include design and actual values for the following:

   a. Refrigerant pressure in kPa.
   b. Refrigerant temperature in deg C.
   c. Entering-water temperature in deg C.
   d. Leaving-water temperature in deg C.
   e. Entering-water pressure in kPa.
   f. Water pressure differential in kPa.

3. Evaporator Test Reports: Include design and actual values for the following:

   a. Refrigerant pressure in kPa.
   b. Refrigerant temperature in deg C.
   c. Entering-water temperature in deg C.
   d. Leaving-water temperature in deg C.
   e. Entering-water pressure in kPa.
   f. Water pressure differential in kPa.

4. Compressor Test Data: Include design and actual values for the following:

   a. Make and model number.

b. Manufacturer's serial number.
c. Suction pressure in kPa.
d. Suction temperature in deg C.
e. Discharge pressure in kPa.
f. Discharge temperature in deg C.
g. Oil pressure in kPa.
h. Oil temperature in deg C.
i. Voltage at each connection.
j. Amperage for each phase.
k. The kW input.
l. Crankcase heater kW.
m. Chilled water control set point in deg C.
n. Condenser water control set point in deg C.
o. Refrigerant low-pressure-cutoff set point in kPa.
p. Refrigerant high-pressure-cutoff set point in kPa.

5. Refrigerant Test Data: Include design and actual values for the following:

a. Oil level.
b. Refrigerant level.
c. Relief valve setting in kPa.
d. Unloader set points in kPa.
e. Percentage of cylinders unloaded.
f. Bearing temperatures in deg C.
g. Vane position.
h. Low-temperature-cutoff set point in deg C.

N. Compressor and Condenser Reports: For refrigerant side of unitary systems, stand-alone refrigerant compressors, air-cooled condensing units, or water-cooled condensing units, include the following:

1. Unit Data: Include the following:

a. Unit identification.
b. Location.
c. Unit make and model number.
d. Manufacturer's compressor serial numbers.
e. Compressor make.
f. Compressor model and serial numbers.
g. Refrigerant weight in kg.
h. Low ambient temperature cutoff in deg C.

2. Test Data: Include design and actual values for the following:

a. Inlet-duct static pressure in Pa.
b. Outlet-duct static pressure in Pa.
c. Entering-air, dry-bulb temperature in deg C.
d. Leaving-air, dry-bulb temperature in deg C.

e. Condenser entering-water temperature in deg C.
f. Condenser leaving-water temperature in deg C.
g. Condenser water temperature differential in deg C.
h. Condenser entering-water pressure in kPa.
i. Condenser leaving-water pressure in kPa.
j. Condenser water pressure differential in kPa.
k. Control settings.
l. Unloader set points.
m. Low-pressure-cutout set point in kPa.
n. High-pressure-cutout set point in kPa.
o. Suction pressure in kPa.
p. Suction temperature in deg C.
q. Condenser refrigerant pressure in kPa.
r. Condenser refrigerant temperature in deg C.
s. Oil pressure in kPa.
t. Oil temperature in deg C.
u. Voltage at each connection.
v. Amperage for each phase.
w. The kW input.
x. Crankcase heater kW.
y. Number of fans.
z. Condenser fan rpm.
aa. Condenser fan airflow rate in L/s.
bb. Condenser fan motor make, frame size, rpm, and horsepower.
cc. Condenser fan motor voltage at each connection.
dd. Condenser fan motor amperage for each phase.

O. Cooling Tower or Condenser Test Reports: For cooling towers or condensers, include the following:

1. Unit Data: Include the following:

a. Unit identification.
b. Make and type.
c. Model and serial numbers.
d. Nominal cooling capacity in kW.
e. Refrigerant type and weight in kg.
f. Water-treatment chemical feeder and chemical.
g. Number and type of fans.
h. Fan motor make, frame size, rpm, and horsepower.
i. Fan motor voltage at each connection.
j. Sheave make, size in mm, and bore.
k. Sheave dimensions, center-to-center and amount of adjustments in mm.
l. Number of belts, make, and size.

2. Pump Test Data: Include design and actual values for the following:

a. Make and model number.

b. Manufacturer's serial number.
c. Motor make and frame size.
d. Motor horsepower and rpm.
e. Voltage at each connection.
f. Amperage for each phase.
g. Water flow rate in L/s.

3. Water Test Data: Include design and actual values for the following:

a. Entering-water temperature in deg C.
b. Leaving-water temperature in deg C.
c. Water temperature differential in deg C.
d. Entering-water pressure in kPa.
e. Leaving-water pressure in kPa.
f. Water pressure differential in kPa.
g. Water flow rate in L/s.
h. Bleed water flow rate in L/s.

4. Air Data: Include design and actual values for the following:

a. Duct airflow rate in L/s.
b. Inlet-duct static pressure in Pa.
c. Outlet-duct static pressure in Pa.
d. Average entering-air, wet-bulb temperature in deg C.
e. Average leaving-air, wet-bulb temperature in deg C.
f. Ambient wet-bulb temperature in deg C.

P. Heat-Exchanger Test Reports: For hot-water heat exchangers, include the following:

1. Unit Data: Include the following:

a. Unit identification.
b. Location.
c. Service.
d. Make and type.
e. Model and serial numbers.
f. Ratings.

2. Primary Water Test Data: Include design and actual values for the following:

a. Entering-water temperature in deg C.
b. Leaving-water temperature in deg C.
c. Entering-water pressure in kPa.
d. Water pressure differential in kPa.
e. Water flow rate in L/s.

3. Secondary Water Test Data: Include design and actual values for the following:

a. Entering-water temperature in deg C.

b. Leaving-water temperature in deg C.
c. Entering-water pressure in kPa.
d. Water pressure differential in kPa.
e. Water flow rate in L/s.

4. Pump Unit Data: Include the following:

a. Unit identification.
b. Location.
c. Service.
d. Make and size.
e. Model and serial numbers.
f. Water flow rate in L/s.
g. Water pressure differential in kPa.
h. Required net positive suction head (NPSHR) in kPa.
i. Pump rpm.
j. Impeller diameter in mm.
k. Motor make and frame size.
l. Motor horsepower and rpm.
m. Voltage at each connection.
n. Amperage for each phase.
o. Full-load amperage and service factor.
p. Seal type.

5. Pump Test Data: Include design and actual values for the following:

a. Static head in kPa.
b. Pump shutoff pressure in kPa.
c. Actual impeller size in mm.
d. Full-open flow rate in L/s.
e. Full-open pressure in kPa.
f. Final discharge pressure in kPa.
g. Final suction pressure in kPa.
h. Final total pressure in kPa.
i. Final water flow rate in L/s.
j. Voltage at each connection.
k. Amperage for each phase.
l. Net Positive Suction Head.

Q. Boiler Test Reports: For boilers, include the following:

1. Unit Data: Include the following:

a. Unit identification.
b. Location.
c. Service.
d. Make and type.
e. Model and serial numbers.

f. Fuel type and input in kW.
g. Number of passes.
h. Ignition type.
i. Burner-control types.
j. Voltage at each connection.
k. Amperage for each phase.

2. Test Data: Include design and actual values for the following:

a. Operating pressure in kPa.
b. Operating temperature in deg C.
c. Entering-water temperature in deg C.
d. Leaving-water temperature in deg C.
e. Number of safety valves and sizes in DN.
f. Safety valve settings in kPa.
g. High-limit setting in kPa.
h. Operating-control setting.
i. High-fire set point.
j. Low-fire set point.
k. Voltage at each connection.
l. Amperage for each phase.
m. Draft fan voltage at each connection.
n. Draft fan amperage for each phase.
o. Manifold pressure in kPa.

R. Instrument Calibration Reports: For instrument calibration, include the following:

1. Report Data: Include the following:

a. Instrument type and make.
b. Serial number.
c. Application.
d. Dates of use.
e. Dates of calibration.

3.24 ADDITIONAL TESTS

A. Perform within 90 days of completing testing, adjusting, and balancing, perform additional testing and balancing as an initial verification that balanced conditions are being maintained throughout and to correct unusual conditions. If this testing and balancing occurs at near-peak summer conditions or near-peak winter conditions, then the associated additional seasonal inspections, testing, and adjusting for that season may be performed at the same time.

B. Additional Seasonal Visits:

1. TAB Specialist shall visit site and perform seasonal inspections, testing, and adjusting for HVAC equipment for the following conditions which were not included in the initial verification testing:

a. Near-Peak Summer Conditions: If initial testing, adjusting, and balancing procedures for cooling systems were not performed during near-peak summer conditions, perform additional inspections, testing, and adjusting during near-peak summer conditions.
b. Near-Peak Winter Conditions: If initial testing, adjusting, and balancing procedures for heating systems were not performed during near-peak winter conditions, perform additional inspections, testing, and adjusting during near-peak winter conditions.

C. Notice: Provide notice to Project Director/COR 14 days in advance of each test. Include scheduled test dates and time in notice.

END OF SECTION 230593

SECTION 230719 – HVAC PIPING INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes insulation for the following HVAC piping systems:

1. Condensate drain piping, indoors and outdoors.
2. Chilled-water and brine piping, indoors and outdoors.
3. Condenser-water piping, indoors when used for water-side economizer or for condensate control and outdoors.
4. Heating hot-water piping, indoors and outdoors.
5. Steam and steam condensate piping, indoors and outdoors.
6. Refrigerant suction and hot-gas piping, indoors and outdoors.
7. Dual-service heating and cooling piping, indoors and outdoors.
8. Heat-recovery piping, indoors and outdoors.
9. Heated fuel-oil piping, indoors and outdoors.
10. Boiler feedwater piping, indoors and outdoors.
11. Flash steam piping, indoors and outdoors.
12. Hot overflow piping, indoors and outdoors.
13. Hot drain piping, indoors and outdoors.

B. Related Sections include the following:

1. Division 07 Section on penetration firestopping for firestopping materials and requirements for penetrations through fire and smoke barriers.
2. Division 21 Sections related to fire-suppression systems insulation.
3. Division 22 Section on plumbing piping insulation.
4. Division 23 Section on duct insulation for insulation for ducts and plenums.
5. Division 23 Section on HVAC equipment insulation for insulation materials and application for pumps, tanks, hydronic specialties, and other equipment.
6. Division 23 Section on hangers and supports for HVAC piping and equipment for pipe insulation shields and protection saddles.

1.2 SUBMITTALS

A. Product Data: Identify thermal conductivity, thickness, vapor barrier, and jackets (both factory and field applied, if any), for each type of product indicated.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
2. Detail attachment and covering of heat tracing inside insulation.
3. Detail insulation application at pipe expansion joints for each type of insulation.

4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
5. Detail removable insulation at piping specialties.
6. Detail application of field-applied jackets.
7. Detail application at linkages of control devices.

C. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use.

1. Preformed Pipe Insulation Materials: 300 mm (12 inches) long by DN 50 (NPS 2).
2. Sheet Form Insulation Materials: 300 mm (12 inches) square.
3. Jacket Materials for Pipe: 300 mm (12 inches) long by DN 50 (NPS 2).
4. Sheet Jacket Materials: 300 mm (12 inches) square.

D. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.

E. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets with requirements indicated. Include dates of tests.

1.3 QUALITY ASSURANCE

A. Installer Qualification: Qualified installers shall have successfully completed three or more similar type jobs within the last 5 years.

B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products listed and labeled in accordance with UL 723 or in accordance with ASTM E84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.

1. Insulation and/or Jackets Installed Indoors: Flame-spread rating of 25 or less, and smoke-developed rating of 50 or less.
2. Insulation and/or Jackets Installed Outdoors: Flame-spread rating of 75 or less, and smoke-developed rating of 150 or less.

C. Mockups: Before installing insulation, build mockups for each type of insulation and finish listed below to demonstrate quality of insulation application and finishes. Build mockups in the location indicated or, if not indicated, as directed by Project Director. Use materials indicated for the completed Work.

1. Piping Mockups:

a. One 3-m (10 foot) section of DN 50 (NPS 2) straight pipe.
b. One each of a 90-degree threaded, welded, and flanged elbow.
c. One each of a threaded, welded, and flanged tee fitting.
d. One DN 50 (NPS 2) or smaller valve, and one DN 65 (NPS 2-1/2) or larger valve.

e. Four support hangers including hanger shield and insert.
f. One threaded strainer and one flanged strainer with removable portion of insulation.
g. One threaded reducer and one welded reducer.
h. One pressure temperature tap.
i. One mechanical coupling.
j. One Outside Air pick-up points
k. One water meter

2. For each mockup, fabricate cutaway sections to allow observation of application details for insulation materials, adhesives, mastics, attachments, and jackets.
3. Notify Project Director/COR 14 days in advance of dates and times when mockups will be constructed.
4. Obtain Project Director/COR approval of mockups before starting insulation application.
5. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Project Director/COR specifically approves such deviations in writing.
6. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
7. Demolish and remove mockups when directed.

D. Insulation work is subject to inspection by the Project Director/COR during installation and at commissioning for compliance with drawing and specifications. Deficiencies shall be corrected before acceptance by the government.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Materials shall be delivered in the manufacturer's unopened containers. Materials delivered and placed in storage shall be provided with protection from weather, humidity, dirt, dust and other contaminants. The Project Director may reject insulation material and supplies that become dirty, dusty, wet, or contaminated by some other means.

B. Packages or standard containers of insulation, jacket material, cements, adhesives, and coatings delivered for use, and samples required for approval shall have manufacturer's stamp or label attached giving the name of the manufacturer and brand, and a description of the material, date codes, and approximate shelf life (if applicable).

C. Insulation packages and containers shall be asbestos free.

1.5 COORDINATION

A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Division 23 Section on "Hangers and Supports for HVAC Piping and Equipment."

B. Coordinate clearance requirements with piping Installer for piping insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

1.6 SCHEDULING

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in the Part 3 Schedules for "Piping Insulation Schedule, General," "Indoor Piping Insulation Schedule," "Outdoor, Aboveground Piping Insulation Schedule," and "Outdoor, Underground Piping Insulation Schedule" for locations where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process. Comply with requirements in Part 3 Articles on SCHEDULE for locations where insulating materials shall be applied.

F. Calcium Silicate:

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

a. Johns Manville

2. Preformed Pipe Sections: Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C533, Type I.

3. Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C533, Type I.
4. Prefabricated Fitting Covers: Comply with ASTM C450 and ASTM C585 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.

G. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Factory-applied jacket requirements are specified in the Part 2 Article on FACTORY-APPLIED JACKETS.

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Pittsburgh-Corning (as FOAMGLAS) with PITTCOTE 300 coating

2. Block Insulation: ASTM C552, Type I.
3. Special-Shaped Insulation: ASTM C552, Type III.
4. Board Insulation: ASTM C552, Type IV.

5. Preformed Pipe Insulation without Jacket: Comply with ASTM C552, Type II, Class 1.
6. Preformed Pipe Insulation with Factory-Applied **ASJ-SSL**: Comply with ASTM C552, Type II, Class 2.
7. Factory fabricate shapes according to ASTM C450 and ASTM C585.

H. Flexible Elastomeric Cellular Insulation Closed-cell, foam- or expanded-rubber materials containing anti-microbial additive, complying with ASTM C534/C534M, Grade 1, Type I or II. Type I, Grade 1 for tubular materials. Type II, Grade 1, for sheet materials.

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Aeroflex USA
   b. Armacell LLC
   c. K-Flex USA

2. Type I and II shall have vapor retarder/vapor barrier skin on one or both sides of the insulation and require an additional exterior vapor retarder covering for high relative humidity and below ambient temperature applications.
3. Contact Adhesive: Provide Contact Adhesive per insulation manufacturer's requirements. Apply Contact adhesive for all end seams and longitudinal seam.
4. Ultraviolet-Protective Coating: Apply to exterior locations. Provide UV Coating recommended by insulation manufacturer.
5. Flexible Elastomeric and Polyolefin Adhesive: Comply with MIL-A-24179A, Type II, Class I.
6. Flexible Elastomeric and Polyolefin Adhesive: Comply with SCAQMD Rule 1168.

7. Flexible Elastomeric Fittings: Fittings are factory prefabricated fittings for flexible elastomeric pipe insulation systems in accordance with ASTM C1710. Together with the flexible elastomeric tubes, they provide complete system integrity for retarding heat gain and controlling condensation drip from chilled-water and refrigeration systems. Flexible

elastomeric, fabricated fittings provide thermal protection (0.25 k) and condensation resistance (0.05 Water Vapor Transmission factor). For satisfactory performance, properly installed protective vapor retarder/barriers and vapor stops shall be used on high relative humidity and below ambient temperature applications to reduce movement of moisture through or around the insulation to the colder interior surface.

I. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C553, Type II and ASTM C1290, Type **[I] [II with factory-applied vinyl jacket] [III with factory-applied FSK jacket] [III with factory-applied FSP jacket]**. Factory-applied jacket requirements are specified in the Part 2 Article on FACTORY-APPLIED JACKETS."

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Johns Manville
   b. CertainTeed Corporation
   c. Knauf Insulation
   d. Owens Corning
   e. Manson Insulation

J. Mineral-Fiber, Preformed Pipe Insulation:

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Johns Manville
   b. Manson Insulation
   c. Knauf Insulation
   d. Owens Corning

2. Type I, 454 deg C (850 deg F) Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C547, Type I, Grade A,. Factory-applied jacket requirements are specified in the Part 2 Article on FACTORY-APPLIED JACKETS.
3. Type II, 649 deg C (1200 deg F) Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C547, Type II, Grade A,. Factory-applied jacket requirements are specified in the Part 2 Article on FACTORY-APPLIED JACKETS.

K. Mineral-Fiber, Pipe Insulation Wicking System: Preformed pipe insulation complying with ASTM C547, Type I, Grade A, with absorbent cloth factory-applied to the entire inside surface of preformed pipe insulation and extended through the longitudinal joint to outside surface of insulation under insulation jacket. Factory apply a white, polymer, vapor-retarder jacket with self-sealing adhesive tape seam and evaporation holes running continuously along the longitudinal seam, exposing the absorbent cloth.

L. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ-SSL complying with ASTM C1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C612, Type IB. Nominal density is 40

kg/cu. m (2.5 lb/cu. ft.) or more. Thermal conductivity (k-value) at 55 deg C (100 deg F) is 0.042 W/m x K (0.29 Btu x in./h x sq. ft. x deg F) or less. Factory-applied jacket requirements are specified in the Part 2 Article on FACTORY-APPLIED JACKETS.

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Johns Manville
   b. Manson Insulation
   c. Knauf Insulation
   d. Owens Corning

M. Polyisocyanurate: Unfaced, preformed, rigid cellular polyisocyanurate material intended for use as thermal insulation.

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Johns Manville
   b. Dow

2. Comply with ASTM C591, Type I or Type IV, except thermal conductivity (k-value) shall not exceed 0.027 W/m x K (0.19 Btu x in./h x sq. ft. x deg F) at 75 deg F (24 deg C) after 180 days of aging.
3. Fabricate shapes according to ASTM C450 and ASTM C585.
4. Factory-Applied Jacket: Requirements are specified in the Part 2 Article on FACTORY-APPLIED JACKETS.

   a. Pipe Applications: **[ASJ][ASJ-SSL][PVDC][PVDC-SSL]**.

N. Polyolefin: Unicellular, polyethylene thermal plastic insulation. Comply with ASTM C534 or ASTM C1427, Type I, Grade 1 for tubular materials and Type II, Grade 1 for sheet materials.

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. Armacell

O. Polystyrene: Rigid, extruded cellular polystyrene intended for use as thermal insulation. Comply with ASTM C578, Type IV or Type XIII, except thermal conductivity (k-value) shall not exceed 0.038 W/m x K (0.26 Btu x in./h x sq. ft. x deg F) after 180 days of aging. Fabricate shapes according to ASTM C450 and ASTM C585.

1. Available manufacturers: Subject to conformance with requirements, manufacturer offerings products that may be incorporated into this work include but are not limited to:

   a. DuPont

2.2 INSULATING CEMENTS

A. Materials shall be approved for use by cement manufacturer.

B. Mineral-Fiber Insulating Cement: Comply with ASTM C195.

C. Expanded or Exfoliated Vermiculite Insulating Cement: Comply with ASTM C196.

D. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C449.

2.3 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.

B. Materials shall be approved for use by adhesive manufacturer.

C. Calcium Silicate Adhesive: Fibrous, sodium-silicate-based adhesive with a service temperature range of 10 to 427 deg C (50 to 800 deg F).

D. Cellular-Glass Adhesive: Two-component, thermosetting urethane adhesive containing no flammable solvents, with a service temperature range of minus 73 to plus 93 deg C (minus 100 to plus 200 deg F).

E. Phenolic and Polyisocyanurate Adhesive: Solvent-based resin adhesive, with a service temperature range of minus 59 to plus 149 deg C (minus 75 to plus 300 deg F).

F. Flexible Elastomeric and Polyolefin Adhesive: Comply with MIL-A-24179A, Type II, Class I.

G. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

H. Polystyrene Adhesive: Solvent- or water-based, synthetic resin adhesive with a service temperature range of 29 to plus 60 deg C (minus 20 to plus 140 deg F).

I. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

J. PVC Jacket Adhesive: Compatible with PVC jacket.

2.4 MASTICS AND COATINGS

A. Materials shall be compatible with insulation materials, jackets, and substrates.

B. Materials shall be approved for use by mastics and coating manufacturer.

C. Vapor-Retarder Mastic: Water based; suitable for indoor use on below-ambient services.

1. Water-Vapor Permeance: Comply with ASTM C755, Section 7.2.2, Table 2, for insulation type and service conditions.
2. Service Temperature Range: Minus 29 to plus 82 deg C (Minus 20 to plus 180 deg F)

3. Comply with MIL-PRF-19565C, Type II, for permeance requirements with supplier listing on DOD QPD (Qualified Products Database).
4. Color: White

D. Vapor-Retarder Mastic: Solvent based; suitable for indoor use on below-ambient services.

1. Water-Vapor Permeance: Comply with ASTM C755, Section 7.2.2, Table 2, for insulation type and service conditions.
2. Service Temperature Range: Minus 18 to plus 82 deg C (0 to 180 deg F).
3. Color: White

E. Vapor-Retarder Mastic: Solvent based; suitable for outdoor use on below-ambient services.

1. Water-Vapor Permeance: Comply with ASTM C755, Section 7.2.2, Table 2, for insulation type and service conditions.
2. Service Temperature Range: Minus 46 to plus 104 deg C (Minus 50 to plus 220 deg F).
3. Color: White

F. Breather Mastic: Water based; suitable for indoor and outdoor use on above-ambient services.

1. Water-Vapor Permeance: ASTM E96, greater than 0.66 metric perms (1.0 perm) at manufacturer's recommended dry film thickness.
2. Service Temperature Range: Minus 29 to plus 82 deg C (Minus 20 to plus 180 deg F).
3. Color: White

2.5 LAGGING ADHESIVES

A. Materials shall be approved for use by adhesives manufacturer.

B. Description: Comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.

1. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over pipe insulation.
2. Service Temperature Range: Minus 18 to plus 82 deg C (0 to plus 180 deg F).
3. Color: White.

2.6 SEALANTS

A. Materials shall be approved for use by sealant manufacturer.

B. Cellular-Glass, Phenolic, and Polyisocyanurate Joint Sealants:

C. Polystyrene Joint Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Permanently flexible, elastomeric sealant.
3. Service Temperature Range: Minus 73 to plus 149 deg C (Minus 100 to plus 300 deg F).
4. Color: White

D. FSK and Metal Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 121 deg C (Minus 40 to plus 250 deg F).
4. Color: Aluminum.

E. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 121 deg C (Minus 40 to plus 250 deg F).
4. Color: White.

2.7 FACTORY-APPLIED JACKETS

A. Materials shall be approved for use by jacket manufacturer.

B. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.
2. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C1136, Type II.

3. PVDC Jacket for Indoor Applications: 0.10 mm (4 mil) thick, white PVDC biaxially oriented barrier film with a permeance at 0.013 metric perm (0.02 perm) when tested according to ASTM E96/E96M.
4. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.
5. Vinyl Jacket: White vinyl with a permeance of 0.86 metric perms (1.3 perms) when tested according to ASTM E96/E96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.8 FIELD-APPLIED FABRIC-REINFORCING MESH

A. Woven Glass-Fiber Fabric: Approximately 68 g/sq. m (2 oz./sq. yd.) with a thread count of 4 strands by 4 strands/sq. mm (10 strands by 10 strands/sq. in.) for covering pipe and pipe fittings.

B. Woven Polyester Fabric: Approximately 34 g/sq. m (1 oz./sq. yd.) with a thread count of 4 strands by 4 strands/sq. mm (10 strands by 10 strands/sq. in.), in a Leno weave, for pipe.

2.9 FIELD-APPLIED CLOTHS

A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and presized a minimum of 271 g/sq. m (8 oz./sq. yd.).

2.10 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C921, Type I, unless otherwise indicated.

B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.

C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.

1. Adhesive: As recommended by jacket material manufacturer.

2. Color: White
3. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.

a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.

D. Metal Jacket:

1. Aluminum Jacket: Comply with ASTM B209M, Alloy 3003, 3005, 3105, or 5005, Temper H-14.

a. Factory cut and rolled to size.
b. Finish and thickness are indicated in field-applied jacket schedules.

c. Moisture Barrier for Indoor Applications**: [0.025 mm (1 mil) thick, heat-bonded polyethylene and kraft paper] [0.075 mm (3 mil) thick, heat-bonded polyethylene and kraft paper] [0.063 mm (2.5 mil) thick polysurlyn]**.
d. Moisture Barrier for Outdoor Applications: **0.075 mm (3 mil)** thick polysurlyn.
e. Factory-Fabricated Fitting Covers:

1) Same material, finish, and thickness as jacket.
2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
3) Tee covers.
4) Flange and union covers.
5) End caps.
6) Beveled collars.

7) Valve covers.
8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

2. Stainless-Steel Jacket: ASTM A167 or ASTM A240/A240M.

a. Factory cut and rolled to size.
b. Material, finish, and thickness are indicated in field-applied jacket schedules.

c. Moisture Barrier for Indoor Applications: **[0.025 mm (1 mil) thick, heat-bonded polyethylene and kraft paper][0.075 mm (3 mil) thick, heat-bonded polyethylene and kraft paper][0.063 mm (2.5 mil) thick polysurlyn]**.
d. Moisture Barrier for Outdoor Applications: **0.075 mm (3 mil)** thick polysurlyn.
e. Factory-Fabricated Fitting Covers:

1) Same material, finish, and thickness as jacket.
2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
3) Tee covers.
4) Flange and union covers.
5) End caps.
6) Beveled collars.
7) Valve covers.
8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

E. Underground Direct-Buried Jacket: 3.2 mm (125 mil) thick vapor barrier and waterproofing membrane consisting of a rubberized bituminous resin reinforced with a woven-glass fiber or polyester scrim and laminated aluminum foil.

F. PVDC Jacket for Indoor Applications: 0.10 mm (4 mil) thick, white PVDC biaxially oriented barrier film with a permeance at 0.013 metric perms (0.02 perms) when tested according to ASTM E96/E96M.

G. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.

2.11 TAPES

A. Materials shall be approved for use by tape manufacturer.

B. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C1136.

1. Width: 75 mm (3 inches).
2. Thickness: 0.29 mm (11.5 mil).
3. Adhesion: 1.0 N/mm (90 ounces force/inch) in width.
4. Elongation: 2 percent.
5. Tensile Strength: 7.2 N/mm (40 lbf/inch) in width.

6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

C. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.

1. Width: 75 mm (3 inches).
2. Thickness: 0.16 mm (6.5 mil).
3. Adhesion: 1.0 N/mm (90 ounces force/inch) in width.
4. Elongation: 2 percent.
5. Tensile Strength: 7.2 N/mm (40 lbf/inch) in width.
6. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

D. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.

1. Width: 50 mm (2 inches).
2. Thickness: 0.15 mm (6 mil).
3. Adhesion: 0.7 N/mm (64 ounces force/inch) in width.
4. Elongation: 500 percent.
5. Tensile Strength: 3.3 N/mm (18 lbf/inch) in width.

E. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.

1. Width: 50 mm (2 inches).
2. Thickness: 0.093 mm (3.7 mil).
3. Adhesion: 1.1 N/mm (100 ounces force/inch) in width.
4. Elongation: 5 percent.
5. Tensile Strength: 6.2 N/mm (34 lbf/inch) in width.

F. PVDC Tape for Indoor Applications: White vapor-retarder PVDC tape with acrylic adhesive.

1. Width: 75 mm (3 inches).
2. Film Thickness: 0.10 mm (4 mil).
3. Adhesive Thickness: 0.04 mm (1.5 mil).
4. Elongation at Break: 145 percent.
5. Tensile Strength: 10.1 N/mm (55 lbf/inch) in width.

2.12 SECUREMENTS

A. Bands:

1. Stainless Steel: ASTM A167 or ASTM A240/A240M, **[Type 304][Type 316]**; 0.38 mm (0.015 inch) thick, **19 mm (3/4 inch)** wide with **[wing seal][or][closed seal]**.
2. Aluminum: ASTM B209M, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.51 mm (0.020 inch) thick, **19 mm (3/4 inch)** wide with **[wing seal][or][closed seal]**.

B. Wire: 1.6 mm (0.062 inch) soft-annealed, stainless steel.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry pipe and fitting surfaces. Remove materials that will adversely affect insulation and/or adhesive application.

B. For Chilled Water Piping installed below grade and at exterior locations prepare surface of pipe to remove rust and contaminants. Apply two-part epoxy coating recommended by manufacturer.

3.3 GENERAL APPLICATION REQUIREMENTS

A. Requirements in this Article generally apply to all insulation materials except where more specific requirements are specified in various Part 3 Articles on pipe insulation material installation.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:

1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.

6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
9. Stencil or label the outside insulation jacket of each union with the word "union." Match size and color of pipe labels.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:

1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.
4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 50 mm (2 inches) over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.4 INSTALLATION OF CALCIUM SILICATE INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure single-layer insulation with stainless-steel bands at 300 mm (12 inch) intervals and tighten bands without deforming insulation materials.

2. Install two-layer insulation with joints tightly butted and staggered at least 75 mm (3 inches). Secure inner layer with wire spaced at 300 mm (12 inch) intervals. Secure outer layer with stainless-steel bands at 300 mm (12 inch) intervals.
3. Apply a skim coat of mineral-fiber, hydraulic-setting cement to insulation surface. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth or tape. Overlap edges at least 25 mm (1 inch). Apply finish coat of lagging adhesive over glass cloth or tape. Thin finish coat to achieve smooth, uniform finish.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of same material and thickness as pipe insulation.
4. Finish flange insulation same as pipe insulation.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed insulation sections of insulation are not available, install mitered sections of calcium silicate insulation. Secure insulation materials with wire or bands.
3. Finish fittings insulation same as pipe insulation.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install mitered segments of calcium silicate insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
2. Install insulation to flanges as specified for flange insulation application.
3. Finish valve and specialty insulation same as pipe insulation.

3.5 INSTALLATION OF CELLULAR-GLASS INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward-clinched staples at 150 mm (6 inches) on center
4. For insulation with factory-applied jackets on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as pipe insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 25 mm (1 inch), and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of cellular-glass insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.6 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION

A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:

1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install mitered sections of pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed valve covers manufactured of same material as pipe insulation when available.
2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.7 INSTALLATION OF MINERAL-FIBER INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward-clinched staples at 150 mm (6 inches) on center.
4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 25 mm (1 inch), and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.

3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

3.8 INSTALLATION OF POLYISOCYANURATE INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with tape or bands and tighten without deforming insulation materials. Orient longitudinal joints between half sections in 3- and 9-o'clock positions on the pipe.
2. For insulation with factory-applied jackets with vapor barriers, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive or tape as recommended by insulation material manufacturer and seal with vapor-barrier mastic.
3. All insulation shall be tightly butted and free of voids and gaps at all joints. Vapor barrier must be continuous. Before installing jacket material, install vapor-barrier system.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, same thickness of adjacent pipe insulation, not to exceed 38 mm (1½-inch) thickness.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polyisocyanurate block insulation of same thickness as pipe insulation.

C. Insulation Installation on Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of polyisocyanurate insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.9 INSTALLATION OF POLYOLEFIN INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Seal split-tube longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:

1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polyolefin sheet insulation of same thickness as pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install mitered sections of polyolefin pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install cut sections of polyolefin pipe and sheet insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties, and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.10 INSTALLATION OF POLYSTYRENE INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation with tape or bands and tighten bands without deforming insulation materials. Orient longitudinal joints between half sections in 3- and 9-o'clock positions on the pipe.
2. For insulation with factory-applied jackets with vapor barriers, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive or tape as recommended by insulation material manufacturer and seal with vapor-barrier mastic.
3. All insulation shall be tightly butted and free of voids and gaps at all joints. Vapor barrier must be continuous. Before installing jacket material, install vapor-barrier system.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, and make thickness same as adjacent pipe insulation, not to exceed 38 mm (1½ inch).
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polystyrene block insulation of same thickness as pipe insulation.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed insulation sections of same material as straight segments of pipe insulation. Secure according to manufacturer's written instructions.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed section of polystyrene insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.11 FIELD-APPLIED JACKET INSTALLATION

A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

1. Draw jacket smooth and tight to surface with 50 mm (2-inch) overlap at seams and joints.
2. Embed glass cloth between two 1.6 mm (0.062 inch) thick coats of lagging adhesive.
3. Completely encapsulate insulation with coating, leaving no exposed insulation.

B. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.
2. Install lap or joint strips with same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Install jacket with 38 mm (1½ inch) laps at longitudinal seams and 75 mm (3 inch) wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

C. Where PVC jackets are indicated, install with 25 mm (1 inch) overlap at longitudinal seams and end joints; for horizontal applications. Seal with manufacturer's recommended adhesive.

1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

D. Where metal jackets are indicated, install with 50 mm (2 inch) overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 300 mm (12 inches) on center and at end joints.

E. Where PVDC jackets are indicated, install as follows:

1. Apply three separate wraps of filament tape per insulation section to secure pipe insulation to pipe prior to installation of PVDC jacket.

2. Wrap factory-presized jackets around individual pipe insulation sections with one end overlapping the previously installed sheet. Install presized jacket with an approximate overlap at butt joint of 50 mm (2 inches) over the previous section. Adhere lap seal using adhesive or SSL, and then apply 1-1/4 circumferences of appropriate PVDC tape around overlapped butt joint.
3. Continuous jacket can be spiral-wrapped around a length of pipe insulation. Apply adhesive or PVDC tape at overlapped spiral edge. When electing to use adhesives, refer to manufacturer's written instructions for application of adhesives along this spiral edge to maintain a permanent bond.
4. Jacket can be wrapped in cigarette fashion along length of roll for insulation systems with an outer circumference of 850 mm (33-1/2 inches) or less. The 850 mm (33-1/2 inch) circumference limit allows for 50 mm (2 inch) overlap seal. Using the length of roll allows for longer sections of jacket to be installed at one time. Use adhesive on the lap seal. Visually inspect lap seal for "fishmouthing," and use PVDC tape along lap seal to secure joint.
5. Repair holes or tears in PVDC jacket by placing PVDC tape over the hole or tear and wrapping a minimum of 1-1/4 circumferences to avoid damage to tape edges.

3.12 INSTALLATION OF FIELD-APPLIED JACKET

A. Install PVC at minimum in all mechanical room and exposed ceilings with 50 mm (2 inch) overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal longitudinal and butt end joints as indicated in the Part 3 schedule tables, or with weatherproof sealant recommended by jacket manufacturer. Secure metal jackets with stainless-steel bands 300 mm (1 foot) on center and at end joints.

B. Install metal jackets at minimum in all outdoor application including areas under canopies, parking garages, and any other areas indirectly exposed to outdoor with 50 mm (2 inches) overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal longitudinal and butt end joints as indicated in the Part 3 schedule tables, or with weatherproof sealant recommended by jacket manufacturer. Secure metal jackets with stainless-steel bands 300 mm (1 foot) on center and at end joints.

3.13 FINISHES

A. Pipe Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Division 09 Sections on "Exterior Painting" and "Interior Painting."

1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.

   a. Finish Coat Material: Interior, flat, latex-emulsion size.

2. Refer to Division 09 Section on “Exterior Painting” for exterior applications.

B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of the insulation manufacturer's recommended protective coating.

C. Color: Final color as selected by Project Director/COR. Vary first and second coats to allow visual inspection of the completed Work.

D. Do not field paint aluminum or stainless-steel jackets.

3.14 PIPING SYSTEM APPLICATIONS

A. Insulation materials and thicknesses are specified in schedules at the end of this Section.

B. Items Not Insulated: Unless otherwise indicated, do not apply insulation to the following systems, materials, and equipment:

1. Flexible connectors.
2. Vibration-control devices.
3. Fire-suppression piping.
4. Drainage piping located in crawl spaces, unless otherwise indicated.
5. Chrome-plated pipes and fittings, unless potential for personnel injury.
6. Air chambers, unions, strainers, check valves, plug valves, and flow regulators.

3.15 FIELD QUALITY CONTROL

A. Inspection: Perform the following field quality-control inspections, after installing insulation materials, jackets, and finishes, to determine compliance with requirements:

1. Inspect fittings and valves randomly selected by Project Director/COR
2. Remove fitting covers from 20 elbows or 1 percent of elbows, whichever is less, for various pipe sizes.
3. Remove fitting covers from 20 valves or 1 percent of valves, whichever is less, for various pipe sizes.

B. Insulation applications will be considered defective if sample inspection reveals noncompliance with requirements. Remove defective Work identified during these inspections and replace with new materials according to these Specifications.

C. Reinstall insulation and covers on fittings and valves uncovered for inspection according to these Specifications.

3.16 ACCEPTANCE

A. Following a minimum of 90 days operation (or installation), but no later than one year (and prior to project warranty expiration date), the Project Director/COR may inspect installation. This inspection may involve the use of advanced monitoring technologies such as Infrared Imaging or Ultrasonic mapping. Deficiencies identified during these inspections shall be corrected by Contractor prior to acceptance of facility by the Government, and prior to project warranty expiration.

3.17 INSULATION APPLICATION SCHEDULE, GENERAL

A. Refer to Table 3.17-1 and Table 3.17-2 insulation application schedules for required insulation materials, vapor retarders, and field-applied jackets.

B. Application schedules identify piping system and indicate pipe size ranges and material, thickness, and jacket requirements.

SCHEDULES OF PIPE INSULATION, VAPOR RETARDERS, AND JACKETS FOR HVAC PIPING

TABLE 3.17-1 - HVAC PIPE INSULATION SCHEDULE

(See Notes 1 and 6)

PIPING SYSTEM & OPERATING TEMPERATURE	NOM. PIPE SIZE	INSULATION CHARACTERISTICS		VAPOR RETARDER (See Note 2)
		MATERIALS	MINIMUM THICKNESS	
CHILLED WATER, 4 -24°C (40-75°F)	Under DN38 (<1½")	Closed-Cell Cellular Glass (see note 8) Polyolefin, Polystyrene, or Elastomeric (See Notes 3 and 4)	12mm (1/2")	None. See Table 230719-2
	DN38 (1½") and larger		38 mm (1½")	
HEATING WATER & STEAM CONDENSATE (INDOOR) Up to 93°C (200°F)	Under DN38 (<1½")	Cellular Glass (see note 8), or Elastomeric	38 mm (1½")	FSK or ASJ With Taped Joints (See Note 5)
	DN 38 (1½") and larger		50 mm (2")	
DUAL TEMP. WATER SYSTEMS 4-93°C (40-200°F)	Same as Heating Hot Water	Same as Chilled Water	Same as Heating Hot Water	Same as Chilled Water
REFRIGERANT SUCTION AND HOT-GAS PIPING (INDOOR)	Under DN38 (<1½")	Closed-Cell Plastic Foams: Polyolefin, Polystyrene, Or Elastomeric (See Notes 3 and 4)	12 mm (1/2")	None. See Table 230719-2
	DN38 (1½") and larger		38 mm (1½")	

PIPING SYSTEM & OPERATING TEMPERATURE	NOM. PIPE SIZE	INSULATION CHARACTERISTICS		VAPOR RETARDER (See Note 2)
		MATERIALS	MINIMUM THICKNESS	
REFRIGERANT SUCTION AND HOT-GAS PIPING (OUTDOOR),	DN15-DN38 (½" - <1½")	Closed-Cell Plastic Foams: Polyolefin, Polystyrene, or Elastomeric (See Notes 3 and 4)	12mm (1/2")	None. See Table 230719-2
	DN38 (1½")		38 mm (1½")	
CONDENSER WATER -SUPPLY AND RETURN (free cooling applications)	ALL	Cellular Glass (see note 8) or Elastomeric	25 mm (1")	None
CONDENSER WATER – SUPPLY AND RETURN (OUTDOOR) (Free cooling applications)	ALL	Cellular Glass (see note 8) or Elastomeric	50mm (2")	None
STEAM 100 kPa (15 psig). Up to 177°C (350°F)	* DN20 (3/4")	Calcium Silicate or Cellular Glass (see note 8)	50 mm (2")	FSK or ASJ with Taped Joints (See Note 5)
	≥DN25 (1")		75 mm (3")	
MP STEAM 340 kPa (50 psig). above 177°C (350°F)	< DN20 (3/4")	Calcium Silicate Or Cellular Glass (see note 8)	75 mm (3")	FSK or ASJ with Taped Joints (See Note 5)
	>DN25(1")		100 mm (4")	
	] DN37 (1½")		114 mm (4½")	
EQUIPMENT DRAINS, ROOF DRAINS, & PLUMBING VENTS (See Note 7)	ALL	Elastomeric	19mm (3/4")	None
A/C CONDENSATE DRAINS 4 - 24°C (40 - 75°F)	ALL	Cellular Glass (see note 8) or Elastomeric	19mm (3/4")	None

PIPING SYSTEM & OPERATING TEMPERATURE	NOM. PIPE SIZE	INSULATION CHARACTERISTICS		VAPOR RETARDER (See Note 2)
		MATERIALS	MINIMUM THICKNESS	
UNDERGROUND PIPING, ALL SYSTEMS 4 - 140°C (40 - 300°F)	ALL	Pre-Manufactured, Pre-Insulated pipe and fittings, including injection polyurethanes w/ external non-metallic jacket	Refer to specific service above for insulation thickness	None
ENGINE EXHAUST PIPE, > 60º C (140ºF) ALL INTERIOR, and EXTERIOR less than 2.1m (7 ft) above ground.	ALL	Mineral fiber, fiberglass, high-temperature insulation wools (HTIW), refractories aluminum and calcium silicate.	As required for max outer surface temperature of 60ºC (140ºF) (ref ASTM C-1055)	None

Notes to Table 3.17 – 1

(1) For piping or conditions not included in this table, insulation thickness shall comply with 10 CFR 433 (ASHRAE Std. 90.1), this Specification Section, OSHA regulations, or common U.S. practice.
(2) Vapor Retarder does not include exterior jacketing; see Table 230719 – 3.12-2 for jacket requirements.
(3) Polyisocyanurate insulations are approved only for factory-injected pre-insulated piping.
(4) For all extruded foams, seal butt and longitudinal seams with adhesive, factory applied pressure sensitive adhesive (PSA), or other methods specified by the insulation manufacturer.
(5) FSK means foil, scrim, kraft paper facing; ASJ means foil-backed all-service jacket.
(6) The table does not apply to fire systems piping.
(7) As necessary in local conditions, insulate equipment drains, roof drains, drain bodies, drain overflows, and plumbing vents to control condensation in finished spaces. Separate Division 22 Section addresses pipe insulation in plumbing systems.
(8) Minimum thickness recommended for cellular glass insulation is 40 mm (1.5 inches). The reason is that the breakage rate during shipment of 25 mm (1inch) thick cellular insulation is too high to be economical.

TABLE 3.17 -2 - HVAC PIPE JACKETING SCHEDULE

PIPE SYSTEM	SERVICE LOCATION	NOM. PIPE SIZE	VAPOR RETARDER	INSULATION JACKET
ENGINE EXHAUST	All Interior; and all Exterior < 2.1m (7 ft) above ground or pavement.	ALL	NONE	Same as "Exterior, Including Rooftop"
EQUIP DRAINS, ROOF DRAINS, & PLUMBING VENTS	ALL	ALL	NONE	NONE
ALL EXCEPT ABOVE	Interior – Exposed, including Mechanical Rooms and raised accessible floors (See Note 1)	ALL	See Table 230719-1 above	0.5 mm (20-Mil) PVC with Molded Fittings, White In Color, Joints Glued Or Solvent Welded Joints
ALL EXCEPT ABOVE	Interior – Concealed by Wall, Ceiling, Soffit, Chase, etc.	ALL	See Table 230719-1 above	None
ALL EXCEPT ABOVE	Exterior, Including Rooftop (See Note 2 & 3)	ALL	See Table 230719-1 above	0.5 mm (20-Mil) Stainless Steel with Molded Fittings and 0.5 mm x 19 mm (0.020" x 0.75") SS Bands; Joints Sealed Watertight w/ 25-Year RTV Silicone, Clear or Silver in Color, No Tapes **[or 3003 H-14 Aluminum,0.4 mm (0.016") Thick, w/ Pre-formed Fittings, and 0.5 mm x 19 mm (0.020" x 0.75") Alum Bands; Joints Sealed Watertight with 25-Year RTV Silicone, Clear or Silver in Color, No Tapes]**

PIPE SYSTEM	SERVICE LOCATION	NOM. PIPE SIZE	VAPOR RETARDER	INSULATION JACKET
ALL	Underground	ALL	Only Pre-Insulated and Pre-Jacketed Pipe and Fittings Manufactured Specifically for Underground use. Exceptions by Approval Only	

Notes to Table 3.17 – 2

(1) "Interior" means any piping within the envelope of building or structure.
(2) "Exterior" means any piping outside envelope of building or otherwise exposed to weather; exterior piping which is concealed or under cover is Exterior pipe.
(3) Tapes shall not be used on exterior piping, including rooftop locations.

END OF SECTION 230719

SECTION 230805 – COMMISSIONING OF HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes commissioning process requirements for HVAC&R systems, assemblies, and equipment, which may include but not limited to the following:

1. Energy supply systems, including oil supply, central-plant hot-water supply, and solar-energy supply.
2. Heat generation systems, including hot-water boilers and auxiliary equipment.
3. Cooling generation systems, including chilled-water systems direct-expansion systems.
4. Distribution systems, including air distribution (heating and cooling) systems, hot-water distribution systems, glycol distribution systems, chilled-water distribution systems, exhaust systems, and air-handling units.
5. Terminal and packaged units, including unit ventilators, unit heaters, fan-coil units, finned-tube radiation, and electric heating.
6. Split systems, heat pumps, and variable refrigerant flow systems.
7. Vibration and sound systems, including sound attenuation, sound masking, vibration isolation devices and seismic restraints.
8. Controls and instrumentation, including building automation systems (BAS), energy monitoring and control system.
9. Systems testing and balancing verification, including heating-water piping systems chilled-water piping systems domestic hot-water circulating systems supply-air systems return-air systems exhaust-air systems.

B. Related Sections:

1. Section 019115 “Commissioning” identifies general commissioning processes and procedures, as well as roles and responsibilities for all Commissioning Team members. Section 230805 supplements the general requirements specified in Section 019115.
2. Applicable provisions of each Division 23 Section and Division 01 apply to this Section.

1.2 REFERENCES AND STANDARDS

A. References and Standards as required by each Division 23 Section, and by Division 01 Sections in relation to commissioning activities.

B. In addition, conform to the following:

1. ASHRAE Guideline 0, The Commissioning Process.
2. ASHRAE Guideline 1.1, HVAC&R Technical Requirements for The Commissioning Process

1.3 INFORMATIONAL SUBMITTALS

A. Certificates of readiness.

B. Certificates of completion of installation, prestart, and startup activities.

C. Qualification Data: For BAS and HVAC&R Testing Technician.

D. List of Test Equipment and Instrumentation: For each equipment or instrument, identify the information below. Include information for proprietary equipment/instrumentation in a separate list.

1. Equipment/instrument identification number. Identify equipment and instruments that are proprietary (i.e., from HVAC system/equipment manufacturer for use with associate system/equipment).
2. Planned commissioning application or use.
3. Manufacturer, make, model, and serial number.
4. Calibration history, including certificates from agencies that calibrate the equipment and instrumentation.

E. Plan and Final Report for Cleaning, Flushing, Testing, and Treating HVAC Piping: Identify the following information, and submit a copy to the Project Director/COR for inclusion in final commissioning report:

1. Sequence of testing and testing procedures for each Section of pipe to be tested, identified by pipe zone or sector identification marker. Markers keyed to Drawings for each pipe sector, showing the physical location of each designated pipe test Section. Provide drawings keyed to pipe zones or sectors formatted to allow each Section of piping to be physically located and identified when referred to in pipe system cleaning, flushing, hydrostatic testing, and chemical treatment plan.
2. Description of equipment for flushing operations.
3. Minimum flushing water velocity.
4. Provide plan for whole system flush after all zone flushes are complete. Indicate where filters are installed and how often system filters (permanent and temporary) are to be checked for contaminants.
5. Tracking checklist for managing and ensuring that pipe Sections have been cleaned, flushed, hydrostatically tested, and chemically treated.

F. Plan and Reports for HVAC Testing, Adjusting and Balancing: Refer to Section 230593.

1. Provide weekly field copy of testing and balancing results to Project Director and to CxA for review.

G. Test Results for Air Duct Testing: Refer to Div 23 Section for air duct testing.

1. Submit copy of test results to Project Director for CxA review prior to functional performance testing and for inclusion in final commissioning report.

1.4 QUALITY ASSURANCE

A. BAS Testing Technician Qualifications: Technicians supporting commissioning activities shall have the following minimum qualifications:

1. Journey-level or equivalent skill level with knowledge of BAS, HVAC&R, electrical concepts, and building operations.
2. Minimum three years' experience installing and servicing the brand/line of controls being tested
3. International Society of Automation (ISA) Certified Control Systems Technician (CCST) Level II.

B. HVAC&R Testing Technician Qualifications: Technicians supporting commissioning activities shall have the following minimum qualifications:

1. Journey-level or equivalent skill level with three years' experience in servicing HVAC&R mechanical systems or vocational school four-year program graduate with two years of experience in servicing HVAC&R mechanical systems.
2. Generally, required knowledge includes HVAC&R systems, electrical concepts, building operations, and application and use of tools and instrumentation to measure performance of HVAC&R equipment, assemblies, and systems.
3. Minimum three years' experience installing, servicing, and operating systems manufactured by approved manufacturer.

C. Testing and Balancing Technician Qualifications: Technician supporting commissioning activities shall have one of the following minimum qualifications:

1. National Environmental Balancing Bureau (NEBB) Certified Testing, Adjusting, and Balancing Technician.
2. Associated Air Balance Council (AABC) Certified Test and Balance Technician.

D. Testing Equipment and Instrumentation Quality and Calibration:

1. Test equipment and instrumentation shall conform to the following:

   a. Be capable of testing and measuring performance within the specified acceptance criteria.
   b. Be calibrated at the manufacturer's recommended intervals with current calibration tags permanently affixed to the instrument being used.
   c. Be maintained in good repair and operating condition throughout the duration of use on this Project.
   d. Be recalibrated/repaired if dropped or damaged in any way since last calibrated.

2. Equipment Manufacturer's Proprietary Instrumentation and Tools:

   a. HVAC&R proprietary test instrumentation and tools shall become the property of Government at the time of Substantial Completion.

1.5 GOVERNMENT AND CXA RESPONSIBILITIES

A. Refer to Section 019115 "Commissioning" for a description of roles during commissioning.

1. Project Director/COR: The Project Director (or COR if no PD is actively involved in a project at any given time) has overall responsibility for Government oversight of projects.
2. CxA: The Commissioning Agent is the Government representative for commissioning, working under the Project Director.

1.6 COMMISSIONING DOCUMENTATION

A. Submittals as required by each Division 23 Section and by Division 01 in relation to commissioning.

1.7 GENERAL WARRANTY PROVISIONS

A. Commissioning, inspecting, and testing shall not modify terms or time periods of warranties for mechanical equipment, systems, and controls, including warranties for related equipment, systems, and adjacent work.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 TESTING PREPARATION

A. Provide technicians, instrumentation, tools, and equipment to complete and document the following:

1. Start-up testing.
2. Prefunctional Checklist.
3. Functional Performance Testing.
4. Trending and logging test data.

B. Complete the following activities for each system/equipment prior to the start of functional performance testing:

1. Certify that HVAC&R systems, subsystems and equipment have been installed, calibrated, and started, and are operating according to the contract documents and approved Shop Drawings and submittals. Include this statement of certification on prefunctional checklist.
2. Certify that HVAC&R instruments and controls systems have been completed and calibrated, and that they are operating according to the contract documents and approved shop drawings and submittals, and that pretest set points have been recorded. Provide

control point-to-point checks and calibration records to the Project Director/COR one week prior to functional performance testing.

3. Certify that testing, adjusting and balancing procedures in Section 230593 ”Testing, Adjusting, and Balancing for HVAC” for the system and/or equipment have been completed, and that a preliminary/field copy of testing adjusting and balancing reports has been submitted to the Project Director/COR for review by the CxA one week prior to functional performance testing, discrepancies corrected and corrective work approved.
4. Certify that the following work has been completed in accordance with the Contract Documents, and that the equipment, systems, and sub-system are operating as required.

    a. Fire stopping in fire-rated construction, including installation of combination smoke/fire dampers, fire dampers, and smoke dampers, caulking, gasketing, and sealing of smoke barriers.
    b. Fire detection and smoke detection devices furnished in accordance with Section 284626 “Addressable Fire Alarm Systems.”

5. Certify that all building envelope work has been completed in accordance with the Contract Documents, including installation of permanent doors prior to functional testing.
6. Set systems, subsystems, and equipment into specific operating mode to be tested in accordance with approved test procedures (e.g., for normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
7. Inspect and verify position of each device and interlock identified on checklists.
8. Check safety cutouts, alarms, and interlocks with life safety systems during each mode of operation.
9. Testing Instrumentation: Install measuring instruments and logging devices to record test data as required.
10. Pipe System Cleaning, Flushing, Hydrostatic Tests, and Chemical Treatment: Refer to Division 23, HVAC piping Sections for test requirements.

3.2 GENERAL TESTING REQUIREMENTS

A. Commissioning will be provided in the following order:

1. Start-up testing
2. Prefunctional Checklist
3. Functional Performance Testing
4. Trending and logging test data.

B. Scope of HVAC&R testing shall include entire HVAC&R installation, from central equipment for heat generation and refrigeration through distribution systems to each conditioned space. Testing shall include measuring capacities and effectiveness of operational and control functions.

C. Measure capacities and effectiveness of systems, assemblies, subsystems, equipment, and components, including operational and control functions to verify compliance with acceptance criteria.

D. Test systems, assemblies, subsystems, equipment, and components in their normal automatic operating modes and then in stages to confirm operation of interlocks, control responses, and responses to abnormal or emergency conditions, and response according to acceptance criteria.

E. Perform tests using design conditions, whenever possible. Complete appropriate initial performance tests and documentation and schedule seasonal tests (unless seasonal tests are not required).

1. Simulated conditions may, with approval of Project Director/COR, be imposed using an artificial load when it is impractical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by Commissioning Authority, and document simulated conditions and methods of simulation. After tests, return configurations and settings to normal operating conditions.
2. Commissioning test procedures may direct that set points be altered when simulating conditions is impractical.
3. Commissioning test procedures may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are impractical.
4. When simulated conditions, set points, and and/or sensor values are approved it is the responsibility of the HVAC Contractor/Subcontractor to ensure altered values are returned to design set points. Any damage due to failure to return to design set point conditions is the responsibility of the Contractor.

F. If tests cannot be completed because of a deficiency outside the scope of the HVAC&R system, document the deficiency and report it to Project Director/COR. After deficiencies are resolved, reschedule tests.

END OF SECTION 230805

SECTION 230905 - INSTRUMENTATION AND CONTROLS FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes Building Automation System (BAS) control equipment for HVAC systems and components, including control components for terminal heating and cooling units not supplied with factory-wired controls.

B. Related Sections include the following, but not limited to:

1. Section 117000 “Medical Equipment” for equipment such as **[Laboratory Fume Hood and]** pharmaceutical refrigerator temperature alarm.
2. Section 223230 “Potable Water Treatment.”
3. Water Booster Pumps, and Water Softeners, and other water treatment are specified in Division 22 sections.
4. Section 221500 “General Service Compressed Air System.”
5. Identification is specified in Division 23 Section on identification for HVAC system.
6. Section 230593 “Testing, Adjusting, and Balancing for HVAC.”
7. Section 230805 “Commissioning of HVAC.”
8. Hydronic and refrigerant piping are specified in Division 23 sections.
9. Computer Room Air Conditioning Unit and Water Leak Detection Systems are specified in Division 23.
10. Chillers, AHUs, VAVs and other mechanical equipment are specified in Division 23 sections.
11. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
12. Raceways/boxes are specified in Division 26 sections.
13. Section 260915 “Electric Power Monitoring.”
14. Section 260924 “Lighting Control Devices.”
15. Section 260934 “Centralized Dimming Controls.”
16. Section 262417 “Panelboards.”
17. Motor control centers are specified in Division 26 Section on motor control centers.
18. Variable Frequency Drives are specified in Division 26.
19. Section 263214 “Engine Generators.”
20. Network connections and signal/communications cable are specified in Division 27.
21. Section 284626 “Addressable Fire Alarm Systems.”
22. **[Section 333700 “Wastewater Treatment Plant.”]**
23. Section 335005 “Underground Fuel Storage Tanks and Distribution” for fuel monitoring.

1.2 SYSTEM DESCRIPTION

A. General: This Section includes Building Automation System (BAS) control equipment for HVAC systems and components, including control components for terminal heating and cooling units not supplied with factory-wired controls. These control systems regulate building pressurization, temperature and humidity, CO_2 concentrations, and ventilation rates in thermostatic zones.

Additionally, control systems provide: Continuous monitoring of electric/fuel/water consumption at each building, AHU fan speeds, AHU entering and leaving air temperatures and filter pressure drops, hydronic water pressure drops as well as water flow rate, VAV and hydronic valve actual and minimum and maximum settings, equipment operations, automated starting/stopping for energy conservation and power failures. Energy consumption must be monitored and reported to end-user computer for entire compound, each individual building (e.g., office building, utility building), each AHU fan and each chiller on BAS.

1. Direct Digital Control (DDC) and/or electric/electronic controls are the OBO standard. In case of DDC network failure, redundancy requirements must permit local stand-alone operation of all HVAC systems. All digital controllers must be able to fully operate without network connectivity.
2. All I/O points specified for the control of a specific piece of equipment must be integral to a single controller. The following are examples of how this must be implemented:

    a. Provide one dedicated Digital Controller per Air Handling Unit (AHU). Use of multiple controllers to control a single AHU or multiple AHUs controlled by a single controller is not permitted.
    b. Provide one dedicated Terminal Unit Controller, designed specifically for control of that Terminal Unit (e.g., for each VAV box, for each fan coil unit). Control of multiple Terminal Units by a single controller is not permitted.
    c. Connect end of system differential pressure sensor directly to controller of system that is controlled by its signal.

3. Controllers must be stand-alone and independent of Operator’s Workstation (OW) and other controllers. Failure of an OW or an individual controller must not inhibit operation or program execution of other controllers in the BAS.

    a. All physical input and output points specified for a given piece of equipment must be terminated to a single controller.
    b. All programming specified for a given piece of equipment must reside in the respective controller, not in an OW or another unassociated controller.
    c. Primary input and output of each control loop must be resident in the same controller containing the control algorithm and must function independently of peer or mux communication links. Secondary or reset type, inputs may be received from the network, but approved default values and procedures must be substituted in the control algorithm for these secondary inputs if network communications fail or input becomes erroneous.

4. Incorporate sufficient space in control panels, conduit, and associated controls equipment for future expansion of control point capacity by up-to 25 percent. This must include space for wire, I/O modules, terminal blocks, transformers, and similar components.
5. Systems are required to operate under automatic control any time equipment status is 'On'. All Digital Controllers must be able to fully operate controlled equipment when placed in HAND or AUTO modes of operation. Digital Controllers must monitor operation of equipment for manual override and must control equipment according to sequence of operation when overridden (i.e., if an AHU supply fan is placed into ‘HAND Mode’, then

rest of AHU must operate in automatic operation). Sequence of operation must reflect this requirement.

6. Sequence of Operation must include the following modes of operation:

   a. Occupied/Normal
   b. Unoccupied/Setback/Low-Flow
   c. Lead/Lag Rotation
   d. Emergency Operation
   e. Alarms.

7. HVAC equipment and controls must automatically restart after power disruptions. BAS must automatically restart control sequences without need for manual intervention. Each VFD must be delayed five seconds as each unit comes online and must have slow ramp up. If this requires the inclusion of UPS equipment, then it must be provided, installed and tested as required by this section subcontractor.

B. Control system consists of sensors, indicators, actuators, final control elements, interface equipment, other apparatus, and accessories to control mechanical systems. Main or front-end personal computer (PC) and printers must serve only non-Controlled Access Area (non-CAA) spaces and must be located in dedicated BAS room with controlled access and must provide central control over all non-CAA HVAC equipment. Provide three portable laptop PCs complete with operating system licenses, graphics software (with developed site-specific graphics), and as-built BAS programming: one PC for non-CAA use and two identical PCs for CAA/PCC use. Both the CAA and PCC laptops must be equipped with all software necessary for either laptop to be able to service or interface with both the CAA and PCC BAS systems. Securely store laptops for CAA and PCC during construction and turn over to Project Director/COR at end of construction. Forward selected subset of alarms, as either indicated on construction documents or directed by Project Director/COR, concurrently to HMI panel at Post 1 for after-hours supervision.

C. There must be no direct inter-connectivity between control wiring and equipment located in CAA spaces and controllers in non-CAA spaces. Control circuits serving non-CAA spaces must not traverse into CAA space.

D. Do not install modems on PCs that monitor HVAC equipment. PCs that contain building monitoring software must not be accessible to Internet. Network Connections to central monitoring computer must be in accordance with Division 27. At minimum, install wiring or cables in dedicated signal conduits or telecom raceway.

E. Prohibited Technologies:

   1. The use or inclusion of wireless communication technology is not permitted.
   2. The use or inclusion of cameras and other types of image / video capture technology is not permitted.
   3. The use or inclusion of microphones and other types of sound capture technology is not permitted.

4. In situations where hardware cannot be procured without the inclusion of one or more of the prohibited technologies listed above, then the associated capabilities must be rendered inoperable.

F. Provide programming for sensors (e.g., temperature, humidity, pressure), AHUs and VAV boxes within CAA space at each component using direct digital controllers. CAA space equipment must not allow the central non-CAA BAS system to control units such as AHUs, VAV, and FCUs located in CAA space. The controllers within the CAA may be networked (with exception to core suites). However, the CAA BAS network must not traverse the CAA physical boundary. The CAA BAS network must not be connected to the non-CAA BAS systems or controllers outside of the CAA. Provide a panel mounted user-interface (in addition to the CAA laptop) in a convenient but secure location within the CAA for interfacing with the DDC controllers in CAA.

G. Control system must collect data necessary to provide detailed reports for power consumption and energy review. Obtain power consumption data from electrical power monitoring system via mapping of selected Owner approved points available via third-party interface; see Section 260915 "Electrical Power Monitoring." Data for consumption (kW) usage (kWh), voltage (V) and power factor (pf) must provide daily, monthly and annual consumption, highs, lows and averages. Reports must provide data for fuel consumption (liters), natural gas (m3), outside ambient temperatures (deg C), relative humidity (percent), and water consumption (liters) for each building on compound, and for photovoltaic system provided power (kW) when system is required in contract. Provide reports for major individual feeders for buildings. Reports must be provided on monthly basis via system software. Provide data in digital formats, capable of data mining. Maintain data in format which can provide required reports for minimum of five years (first year plus four consecutive years).

H. Graphic Display: Display graphic with minimum 20 dynamic points with current data within 10 seconds.

1. Graphic Refresh: Update graphic with minimum 20 dynamic points with current data within 10 seconds.
2. Object Command: Reaction time of less than two seconds between operator command of a binary object and device reaction.
3. Object Scan: Transmit change of state and change of analog values to control units or workstation within six seconds.
4. Alarm Response Time: Annunciate alarm at workstation within 45 seconds. Multiple workstations must receive alarms within five seconds of each other.
5. Program Execution Frequency: Run capability of applications as often as five seconds, but selected consistent with mechanical process under control.
6. Performance: Programmable controllers must execute DDC PID control loops, and scan and update process values and outputs at least once per second.
7. Reporting Accuracy and Stability of Control: Report values and maintains measured variables within tolerances identified in Part 2 of this Section.

1.3 SYSTEM PERFORMANCE

A. General: System design must conform to OBO Mechanical Code (International Mechanical Code as amended by OBO).

B. Provide a complete and functional BAS in accordance with the Issued For Construction (IFC) Documents. It is the responsibility of the controls subcontractor to create detailed DDC points list, control sequences, and control system strategy write up that will achieve stable control performance together with thorough and complete system monitoring; these must be agreed to and approved by the Engineer of Record and by the Project Director/COR with input from the OBO/PDCS/DE project team BAS Subject Matter Expert (SME) and the project Commissioning Agent.

1.4 SUBMITTALS

A. General:

1. Each submittal must be complete in every respect and must be submitted as one complete package with a traceable number. Partial submittals will be rejected without review. The following submittal packages are required by this project:

   a. Construction Submittal (BASSUB-1)
   b. Training Submittal (BASSUB-2)
   c. Field Quality Control Submittal (BASSUB-3)
   d. Record Documentation Submittal (BASSUB-4)

2. BAS submittals must be divided into three completely separate packages using different transmittal protocols as required for security, with separate packages for non-CAA, CAA, and PCC security zones. Label submittal documents in accordance with Division 01 specification sections.
3. After the initial submittal, subsequent submittal versions must each include a unique revision number. Updates in revised submittals must be clouded with the revision number. Revisions packages of each security zone must also be complete for the respective zone.
4. First submittal must be discussed in detail during Controls Integration Meeting specified in QUALITY ASSURANCE, with OBO comments on the submittal incorporated into the subsequent submittal.

B. Construction Submittal (BASSUB-1): Prior to the commencement of BAS work, both the procurement of materials and installation, a Construction Submittal must be provided for review and approval. A complete Construction Submittal must consist of all the drawings, product data and other information required below. Omission of any of these items, including work specified within this Section but performed by a contractor other than the BAS sub-contractor, will constitute an incomplete submission and will not be reviewed. Upon approval of the Construction Submittal, procurement and installation of the BAS will be permitted to commence. Any procurement or installation that occurs prior to approval of the Construction Submittal will be performed at the Contractor's own risk.

1. Product Data: Technical Literature from product manufacturers will be submitted for each unique product that is intended for use on the project.

a. General:

1) Comprehensive Bill of Materials: Product Data submitted will include a Bill of Materials in a tabular format that will act as a Table of Contents. A row will be included for each product. Columns shall be included to provide the following information: Device Name, Quantity, Complete Model / Part Number, Product Description, Manufacturer, Specification Reference, and Page Number of the associated Technical Literature.
2) Page Numbering: All pages of the submitted Product Data will be sequentially numbered. (1, 2, 3, 4…) The page numbering in the Bill of Materials will be coordinated to ensure the correct page numbers are used. Page numbers must be printed on each page of Technical Literature.
3) Marking of Products: When submitted literature refers to a series of products or multiple products rather than a specific product model, data specifically applicable to the project will be highlighted and clearly annotated. Mark literature to indicate the specific model, associated options and accessories intended for use.
4) Specification References: Each submitted piece of literature will be annotated to clearly cross reference the specification requirement that the submitted product is intended to cover. If a product is not specified, note that no specified requirement exists for the submitted product.

b. Technical Literature: Submit literature from the product manufacturer that provides a product description and technical data, that indicates dimensions, capacities, performance characteristics / curves, electrical characteristics, finishes for materials, etc., to show compliance with the specified requirements. Installation and startup instructions for each type of product will also be included. Submitted literature will be organized into the following sections.

1) Parts: Description, intended use and technical data for sensors, devices, ancillary components, wire, cable, installation materials, etc.
2) Controller Hardware: Description, intended use and technical data for BAS manufacturer's controllers, expansion modules, communication interfaces and other control system hardware. Provide a Protocol Implementation Conformance Statement (PICS) for each BACnet based control device submitted.
3) Computers & Network Hardware: Description, intended use and technical data for servers, desktop computers, laptop computers, computer peripherals, touchscreens, interfaces, switches, routers, security appliances and other network equipment. Provide a PICS for each BACnet based network device submitted.
4) Software: Description, intended use and technical data for BAS programming software, BAS operator interfaces, BAS color graphics, operating system software, productivity software and other third-party applications. Provide a PICS for each BACnet based software package submitted.
5) Licenses:

a) Submit licensing information for all software installed on servers, desktop computers, laptop computers, touchscreens and other interfaces.
b) Submit licensing information for all hardware that requires licensing. (network level controllers, managed switches, security appliances, etc.).

2. Shop Drawings:

a. Provide legend for all symbols used.
b. System Architecture Diagrams

1) Riser diagram showing IP layer and all field bus layers.

2) Show each computer, printer, router, repeater, controller, and protocol translator that is connected to either the IP layer or any of the field busses.
3) Each component that is shown must have a name that is representative of how it will be identified in completed database and manufacturer's name and model number.
4) Physical relationship of one component to another component must reflect proposed order of installation on network.
5) This diagram must not include power supplies, UPS, sensors or end devices.
6) Show separation of unclassified BAS from CAA.
7) Identify third-party interface wiring type, communications protocol and locations.
8) Field Bus must clearly show use of daisy chain wiring concept, order in which devices are connected to Field Bus, and location of end of segment termination devices.
9) Show BAS communications bus campus routing between buildings and indicate location and tagging information of terminal blocks with detail references.

c. BAS Plan Drawings: Drawings must be submitted that depict the proposed installation locations for components and infrastructure specific to the BAS.

1) General:

a) Plan drawings must be drawn to scale. Scale must be selected as appropriate to clearly depict required information. Scale must be noted on each plan drawing.
b) Building designations and room numbers must be shown on plan drawings.
c) Equipment designations must be shown on plan drawings.
d) Controllers, enclosures, sensors, network components, etc. shown on plans must be annotated with their associated designations and component types. Designations must match those used throughout submittal.

e) Where infrastructure shown crosses the bounds of a plan drawing, the continuation point must be clearly annotated to indicate the drawing and detail where the continuation can be found.
f) Plans to be submitted are in addition and complimentary to coordination drawings that are to be submitted under other specification sections. The purpose of these plans is to provide specific information related to the installation of BAS components and infrastructure. This information is required to provide a complete picture of the proposed BAS installation and is necessary to ensure a complete, fully functional and issue free BAS will be provided that meets the requirements of this specification section.
g) Site and floor plan drawings must be continually updated and maintained accurately throughout the construction period. These drawings must be an active record that accurately reflects installed conditions as the project progresses and must be available upon request by anyone inspecting the BAS installation on behalf of OBO.

2) Building Floor Plan Drawings (Network): Drawings must indicate the following information.

a) Proposed routing of network cable and associated conduit, raceway and duct-bank. For each network segment identify:

i. Network Type (RS-485, Ethernet, etc.)
ii. Communication Protocol (BACnet MS/TP, BACnet IP, etc.)
iii. Physical Medium (multi-mode optical fiber, Cat 6, shielded twisted pair, etc.)
iv. Transmission Speed (baud rate)
v. Designation Assigned to Network

b) Locations of building entry points.
c) Locations of controllers and enclosures.
d) Locations of network components. (routers, switches, gateways, optical isolators, repeaters, security appliances, end-of-line resistors, junctions, grounding locations, building termination blocks, etc.)
e) Locations of Operator Work Stations, Servers, Touch Screen Interfaces and similar equipment.
f) Locations of equipment monitored / controlled by the BAS. (AHUs, FCUs, Terminal Units, etc.)
g) Locations of dampers. (Control, Smoke and Combination Fire/Smoke)
h) Locations of outdoor and space mounted sensors. (Temperature, Humidity, CO2, etc.)
i) Locations of control valves not co-located with controlled equipment.
j) Locations of meters and flow measurement sensors not co-located with controlled equipment.

3) Campus Site Plan Drawings (Network): Drawings must indicate the following information.

a) Proposed routing of network cable and associated conduit, raceway and duct-bank. For each network segment identify:

vi. Network Type (RS-485, Ethernet, etc.)
vii. Communication Protocol (BACnet MS/TP, BACnet IP, etc.)
viii. Physical Medium (multi-mode optical fiber, Cat 6, shielded twisted pair, etc.)
ix. Transmission Speed (baud rate)
x. Designation Assigned to Network

b) Locations of building entry points and duct-bank access points.
c) Locations of controllers and enclosures not identified on building floor plans.
d) Locations of network components not identified on building floor plans. (routers, switches, gateways, optical isolators, repeaters, security appliances, end-of-line resistors, junctions, grounding locations, building termination blocks, etc.)
e) Locations of meters and flow measurement sensors not identified on building floor plans.

4) Building Floor Plan Drawings (Pneumatic): Drawings must indicate the following information.

a) Proposed routing of pneumatic tubing and associated conduit, raceway and duct-bank. For each tubing section identify:

xi. Tubing type (copper, poly, etc.)
xii. Tubing size
xiii. Designation of Associated Sensor
xiv. Associated HVAC System (AHU, Relief Fan, etc.)

b) Locations of pressure sensors and associated pressure probes. Information associated with space pressure control, duct static pressure control and liquid differential pressure control must be shown.
c) Locations of controllers and enclosures associated with pressure sensors and pneumatic tubing.
d) Identify pressure zones and pressure differentials to be maintained between zones.
e) Identify set points being maintained by the BAS at each pressure sensor.

d. Layout Drawings for each control panel:

1) Layout drawing must be to scale with all devices shown in their proposed positions.
2) Identify all control devices by tag number.
3) Show all terminal strips and wire channels and fiber optic to copper cable converters.

4) Show all control transformers.
5) Show all power receptacles and power supplies (including panel and breaker numbers) coordinated with Division 26.
6) Show all IP connection points.
7) Identify designated allowance for future 25 percent expansion capacity.

e. Wiring Diagrams for each control panel.

1) Control voltage wiring diagram must clearly designate devices powered by each control transformer. If control devices use half wave power, diagram must clearly show consistent grounding of appropriate power connection. Annotate all wire identification numbers on diagram. When more than one controller is powered from single circuit, provide separate power fuses for each controller at respective control panel. Provide separation for control voltage wiring (24V AC or DC) from Power Voltage (110V or higher).
2) Annotate all wire identification numbers on diagram.
3) If shielded communication wiring is used, show grounding of shield.
4) Terminal strip wiring diagram must identify all connections on both sides of terminal strip. Annotate wiring label numbers for all wiring leaving control panel on diagram.

f. Wiring Diagrams for individual components (controllers, protocol translators, etc.): Wiring diagram for each component must identify all I/O, power, and communication wiring, and locations on terminal blocks to which wires are landed (e.g., Fan Status sensor is wired from terminals 5/6 on controller to terminals 17 and 18 on terminal strip).

g. Sensor / End Device Wiring Details:

1) Provide typical wiring details for each sensor and end device (including third party sensors, end devices and equipment) which shows the wiring terminated at the sensor / end device.
2) For sensors and end devices which can be wired up in multiple configurations, a unique detail must be provided for each configuration used.
3) Each detail must be complete, showing and identifying all terminals / wire leads.
4) Both used and unused terminals / wire leads must be shown to clearly depict how wiring will be installed at the sensor / end device.
5) Each detail must be provided with a unique ID. These IDs must be referenced in the wiring diagrams where the sensor / end device is used. Each ID must incorporate the drawing number of the Sensor / End Device Wiring Detail drawing where the detail is located.
6) Incorporate sensor / end device part numbers into detail titles.

h. Instrumentation List for each controlled system.

1) List must be in table format.

2) Include name, type of device, manufacturer, model number, and product data sheet number. Description to include if device is intended for plenum rating, indoor or outdoor installation, as well as fail-safe position.

i. System Flow Diagrams for each controlled system.

1) Two-dimensional cross-sectional diagram showing key components such as fans, coils, dampers, valves, and pumps.
2) Identify locations and names of all sensors and end devices associated with control system. Label panel name and terminal numbers where connections are landed.

j. Point Lists: Point lists must be provided for each unique system controlled / monitored.

1) A separate point list must be provided for each controller used. Only the points physically connected to the controller along with its associated expansion modules and points which are physically incorporated into the controller itself shall be included in the point list.
2) A separate point list must be provided for each communication interface used. Only the points provided over the communication interface shall be included in the point list.
3) Each line item included in a point list must represent only one point.
4) Point tags and point names used in a point list must be unique within that point list.
5) Point names and expanded point descriptions must incorporate the associated point tags used.
6) At a minimum, the following columns and information must be included in each point list:

a) Point Tag
b) Point Name
c) Expanded Point Description
d) I/O Type (AO, AI, BO, BI, etc.)
e) Point Address
f) Terminations at Controller
g) Control Signal (4-20mA, 0-10VDC, on/off, pulsed, etc.)
h) Range (with Units)
i) Alarm Required
j) Alarm Limits / Criteria
k) Alarm Priority (Maintenance, General, Critical)
l) Alarm to Post 1
m) Trend Required
n) Trend Type
o) Trend Interval
p) Device Type (Relay, Temperature Sensor, CO2 Sensor, Actuator, VFD, etc.)
q) Part Number

r) Part Manufacturer

k. Sequences of Operation: Provide sequence of operation for each system or piece of equipment being controlled. Include the following as a minimum.

1) Process control sequence for each end device.
2) Supervisory logic sequence of operation for each system.
3) Impact of each global application program on sequence of operation (e.g., Demand Control).
4) List of all physical inputs and outputs associated with each sequence.
5) Within sequence of operation, annotate all application parameters that are to be user-adjustable from Operator's Workstation (OW) with (adj) after name of parameter. This must include information such as set points, including upper/lower set point limits where applicable, reset schedule parameters, calibration offsets, timer settings, control loop parameters such as gain, integral time constant, sample rates, and differentials.
6) Within sequence of operation, annotate all calculated values that are to be viewable at the OWS with (rpt) after name.
7) All points subject to override from an operator workstation, including set point adjustments, start/stop, enable/disable, open/close.
8) List of all alarm points, description of alarm, and description of alarm criteria.
9) List of all variables for which historical trending will be applied, sample rates, and any criteria used to start and stop historical trending.

l. Pneumatic Tubing Riser Diagrams

1) Riser diagram showing pressure sensor locations, pressure probe locations, and pneumatic tubing.
2) Clearly identify rooms where components are located. Include tagging of sensor and probes. For each probe identify negative and positive probes.
3) Show and identify each unique pressure zone and indicate pressure being maintained in the zone based on the actual locations of the pressure probes for the associated sensor.

m. Valve Schedule: Provide valve schedule in a tabular format with a row for each valve used on the project. Columns shall be included to provide the following information:

1) Valve Service Tag
2) System Served (Designation of associated AHU, FCU, CHWS, HWS, etc.)
3) Installed Location (Building & Room)
4) Medium (CHW, HW, Steam, Glycol, etc.)
5) Valve Manufacturer
6) Valve Model / Part Number
7) Valve Style (2-way, 3-way, etc.)
8) Valve Type (ball, characterized control ball, globe, butterfly, etc.)
9) End Connection Type (threaded, flanged, soldered, welded, etc.)
10) Pipe Size (mm)
11) Valve Size (mm)

12) Design Flow Rate (l/s)
13) Design Pressure Drop (kPa)
14) Design Flow Coefficient (Kv)
15) Valve Pressure Drop (kPa)
16) Valve Flow Coefficient (Kv)
17) Close Off Pressure Rating (kPa)
18) Actuator Manufacturer
19) Actuator Model / Part Number
20) Control Signal (0-10 VDC, 4-20 mA, on/off, etc.)
21) Voltage (24 VAC, 120 VAC, etc.)
22) Control Action (2-Position, Modulating, etc.)
23) Torque (Nm)
24) Number of Actuators
25) Run Time (in seconds)
26) Failure Position (Loss of Power – Normally Closed, Normally Open or Last Commanded State)
27) Failure Position (Loss of Control Signal – Normally Closed, Normally Open or Last Commanded State)

n. Damper Schedule: Provide damper schedule in a tabular format with a row for each damper used on the project. Columns shall be included to provide the following information:

1) Damper Service Tag
2) System Served (Designation of associated AHU, FCU, CHWS, HWS, etc.)
3) Installed Location (Building & Room)
4) Service (Supply, Return, Outdoor, etc.)
5) Damper Manufacturer
6) Damper Model / Part Number
7) Blade Type (Airfoil / Opposed, V-groove / Parallel, etc.)
8) Damper Construction (Aluminum, Galvanized Steel, etc.)
9) Duct Size (mm)
10) Damper Size (mm)
11) Number of Damper Sections
12) Damper Section Size (mm)
13) Damper Free Area (mm2)
14) Maximum Air Flow (l/s)
15) Maximum Air Velocity (m/s)
16) Actuator Manufacturer
17) Actuator Model / Part Number
18) Control Signal (0-10 VDC, 4-20 mA, on/off, etc.)
19) Voltage (24 VAC, 120 VAC, etc.)
20) Control Action (2-Position, Modulating, etc.)
21) Torque Required (Nm)
22) Torque Provided (Nm)
23) Number of Actuators
24) Fully Loaded Run Time (in seconds)

25) Failure Position (Loss of Power – Normally Closed, Normally Open or Last Commanded State)
26) Failure Position (Loss of Control Signal – Normally Closed, Normally Open or Last Commanded State)

3. Certifications:

a. Compliance Certification: The Contractor and installing subcontractors must certify that the BAS, as installed, complies with the following restrictions:

1) The BAS does not utilize or include any prohibited technologies. Where hardware cannot be procured without the inclusion of a prohibited technology, indicate the following:

a) Product Name, Part Number & Part Description.
b) Manner in which product is being used.
c) Prohibited technology included.
d) Means & methods by which the capability has been rendered inoperable.
e) Attestation that product was tested after modification and base functionality has not been impacted.

2) The BAS has not been interconnected with any non-BAS networks.
3) The BAS has not been provided with remote connectivity.
4) The non-CAA, CAA-Restricted and CAA-Core BAS are not interconnected.
5) No BAS wiring crosses the non-CAA, CAA-Restricted or CAA-Core boundaries.

b. Compatibility Certification: Submit manufacturer's certification that seats, gaskets and seals are compatible with design operating fluid(s).
c. Expandability Certification: Subcontractor must certify conformance with requirement for 25 percent future expansion panel space and conduit fill ratio space in accordance with the Part 1 Article on SUMMARY.

4. Graphic Pages: Submit sample graphics page for each type of page described in Part 2 Article on GRAPHICS PAGES.

C. Training Submittal (BASSUB-2) - Training Manuals for each Training Course:

1. Submit the following six weeks in advance of the scheduled training approved by site team and Project Director/COR:

a. List of training objectives.
b. Outline of the course with time allocations per topic.
c. Training presentation material (slides, word documents, etc.).
d. Copy of training reference material (product manuals to be used, etc.).
e. Description of measurement devices to measure training effectiveness (quizzes, programming exercises, course exam).

f. Instructor's name and resume, with emphasis on experience in presenting training programs.
g. Plan for specified video training documentation (e.g. site security approval for camera on site, who will take video, who will edit video onto DVD, Table of Contents of training to be recorded, and other requirements of Division 01 Section "Demonstration and Training"), and sample attendees sign-in sheet for record purposes.

2. Submit the following within three weeks after training has been completed:

a. List of attendees.
b. Performance scores on assessment devices.

D. Field Quality Control Submittal (BASSUB-3): Submit for review and approval test plans and reports associated with executing requirements described in Part 3 Articles on FIELD QUALITY CONTROL and ADJUSTING.

1. Submit the following testing plans at least four weeks prior to scheduled execution of testing:

a. DDC Verification Testing Plans
b. Operator Interface Verification Testing Plans
c. DDC Validation Testing Plans

2. Submit the following reports, documenting results of executed testing:

a. DDC Verification Testing Reports
b. Calibration Reports
c. Loop Tuning Reports
d. Operator Interface Verification Testing Reports
e. DDC Validation Testing Reports

3. Submit separate testing plans for each unique system tested.
4. Prepare and submit reports on a per system basis.
5. For each task in a testing plan, technician must enter their initials, date test was completed, and any recorded data (e.g., voltages, offsets, or tuning parameters). Each report must also record any deviations from submitted installation plan, issues encountered during testing and corrective measures taken.
6. Calibration reports must document measured value, reported value, and calculated offset for each sensor calibrated.
7. Loop tuning reports must document sample rate, gain and integral time constant for each control loop at completion of tuning.

E. Record Documentation Submittal (BASSUB-4): Record Documentation must include the Construction "As-Built" Manual, the Operation and Maintenance Manual and the Licenses in a single and complete package.

1. Construction "As-Built" Manual: Update of Construction Submittal, revised to reflect "As-Built" conditions. The following is a list of post construction submittals that must be updated to reflect any changes during construction and re-submitted as "As-Built".

    a. System architecture drawing including room numbers for the PC, printers, and each controller.
    b. Floor plans of each building and compound plan drawings showing BAS network routing (including conduit), pressure sensor tubing routing (including conduit), BAS panel locations, BAS network hardware locations, pressure sensor and sensing probe locations, HVAC equipment locations, room numbers, space sensor locations (temperature, CO2, occupancy, etc.), and controller addresses.
    c. Layout drawing for each control panel.
    d. Wiring diagram for each control panel.
    e. Wiring diagram for individual components.
    f. System flow diagram for each controlled system.
    g. Instrumentation list for each controlled system.
    h. Sequence of control for each system and piece of mechanical equipment.
    i. List of alarms and routing (PC, printer, Post 1, etc.).
    j. Building Pressurization System floor plans
    k. Soft copies of as-built programming must be posted on ProjNET, and also submitted on CDs. Refer to requirements of the Part 2 Article on DDC SOFTWARE AND FILES, and to Division 01 Section "Closeout Procedures."

2. Operation and Maintenance Manual: Operations and Maintenance Manual must consist of two parts and comply with Division 01 Section "Operation and Maintenance Data."

    a. Part I: Information common to the entire system. This must include, but not be limited to the following:

        1) Product manuals for key software tasks.

            a) Operating the system.
            b) Administering the system.
            c) Operator workstation.
            d) Application programming.
            e) Network servers and controllers.
            f) Setting up the web server.
            g) Report creation.
            h) Graphics creation.
            i) Re-installing graphics software and/or as-built programming from CD

        2) System architecture diagram.
        3) List of recommended maintenance tasks associated with system servers, operator workstations, data servers, web servers, and web clients.

            a) Define task.
            b) Recommend frequency for task.
            c) Reference product manual that includes instructions on executing task.

4) Names, addresses, and telephone numbers of installing contractors and service representatives for equipment and control systems.
5) Licenses for equipment and systems.
6) Submit three separate copies for PCC systems.

b. Part II: Information common to systems in single building.

1) System architecture diagram for components within building annotated with specific location information.
2) As-built drawing for each control panel.
3) As-built wiring design diagram for each control panel.
4) As-built wiring design diagram for all components.
5) Installation design details for each I/O device.
6) As-built system flow diagram for each system.
7) Sequence of control for each system.
8) Product data sheet for each component.
9) Installation data sheet for each component.

3. Licenses: Submit licenses from BAS manufacturer in accordance with the requirements in Part 1 Article on OWNERSHIP OF PROPRIETARY MATERIAL.

1.5 OWNERSHIP OF PROPRIETARY MATERIAL

A. Government retains all rights to software and passwords used for this project.

B. Government through the Project Director/COR will sign copy of manufacturer's standard software and firmware licensing agreement as condition of this contract. Such license must grant use of all programs and application software to Government as defined by manufacturer's license agreement but must protect manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. Licensing agreement must not preclude use of software by individuals under contract to Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to Government will be restricted to use on Government's computers, and only for purpose of commissioning, servicing, or altering installed system.

D. All hardware and software provided by Contractor for BAS must be U.S. licensed version, directly licensed to Department of State (DOS). The licensee of record must be, "The U.S. Department of State."

1. Licenses must allow post to work directly with BAS manufacturer. It must not be necessary after project warranty period for DOS to work through installing contractor to obtain parts, upgrades, and technical support from BAS manufacturer.

E. All project developed software, files and documentation must become property of Government. These include but are not limited to:

1. Server and Workstation software (including laptops)

2. Application Programming Tools
3. Configuration Tools
4. Addressing Tools
5. Application Files
6. Configuration Files
7. Graphic Files
8. Report Files
9. Graphic Symbol Libraries
10. All Documentation.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Experienced installer who is authorized representative, certified installer, and/or approved installer of automatic control system manufacturer for both installation and maintenance of units required for this Project.

1. Controls Installer must possess and maintain Secret facility clearance with Secret safeguarding capability.

B. Manufacturer Qualifications: Firm experienced in manufacturing automatic temperature-control systems indicated for this Project and with a record of successful in-service performance.

1. BAS system must be manufactured in the U.S. or must have a U.S. version of hardware/software provided for the project.
2. BAS manufacturer must have U.S. training center that provides BAS operator, system programmer, and system installer training. This US based center must provide Government ready access to facilitate personnel attendance and to enable Government oversight of training.
3. BAS manufacturer must have U.S. parts supply base to accommodate shipment of components intended for use in restricted facility spaces.

C. Procurement Restrictions: Materials must not be procured or delivered to the job site more than six months prior to the intended date of installation.

D. Comply with requirements of the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

E. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilation Systems."

F. Design and install control systems and components in accordance with ASHRAE/ANSI Standard 135 (BACnet) protocol.

G. Controls Integration Meeting: Prior to beginning field installation, meet with Project Director/COR and project Commissioning Agent on approval of controls hardware, software,

strategies and procedures plan to develop a mutual understanding of details and system requirements. Ensure participation of BAS controls team members, equipment manufacturers' authorized service representatives with who BAS controls system will interface (e.g., fuel oil, fire alarm, TAB), and other support personnel. Provide 90 days' advance notice of scheduled meeting time and location.

1. Agenda Items: Include the following at minimum:

   a. Submittal distribution requirements.
   b. Contract Documents examination report.
   c. Control system calibration, point-to-point check, startup and commissioning plan.
   d. Work schedule and Project site access requirements.
   e. Coordination and cooperation of trades and subcontractors.
   f. Coordination of documentation and communication flow.
   g. Interface with third party software (e.g., water treatment skid, wastewater treatment skid, fuel oil system panel, chillers, boilers, kitchen hood, VFDs, ATSs).
   h. Review of first submittal package.
   i. Review of miscellaneous controls details and building pressurization.
   j. Confirm type of HVAC systems to be included in BAS mockup.

1.7 COORDINATION

A. General: Refer to “Related Sections” paragraph under the Part 1 Article on SUMMARY regarding systems requiring coordination with work of this Section.

B. Coordinate location of temperature, pressure and humidity sensors, and other exposed control components with plans and room details before installation.

C. Coordinate supply of electrical circuits, grounding and bonding for control units, printers, UPS, and operator workstation.

D. Coordinate equipment with Section 262417 “Panelboards” to achieve compatibility with starter coils and annunciation devices.

E. Coordinate equipment with Division 26 Section on motor-control centers to achieve compatibility with motor starters and annunciation devices.

F. Coordinate equipment with Division 26 Section on variable frequency motor controllers to achieve compatibility.

G. Coordinate equipment with Section 284626 "Addressable Fire Alarm Systems" to achieve compatibility with equipment that interfaces with that system.

H. Compound BAS Network: Coordinate BAS network hardware and installation with Division 27 subcontractor.

   1. BAS network must be designed by the 230905 subcontractor. This design must be provided to the Division 27 subcontractor for procurement and installation.

2. BAS network between buildings must utilize fiber optic cable.
3. BAS network fiber must be terminated on completely separate blocks from compound IT communication blocks (Telecommunications, Audio/Video, OpenNet, TSS, etc.) such that no interconnectivity can exist.
4. BAS network fiber must be terminated on completely separate blocks from other Building Management System (BMS) blocks such that no interconnectivity can exist. BMS include, but are not limited to, the Power Monitoring System, Lighting Control System, Photovoltaic Control System, Fire Alarm System, etc.
5. BAS network fiber, conduit and hardware (routers, switches, media converters, etc.) must be dedicated to the BAS and must not be shared with any other BMS.
6. Spare network fibers must be provided for all BAS network fiber runs. Spare fiber must be in the form of a separate and distinct cable.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed, and that are packaged with protective covering for storage and identified with labels describing contents.

B. Replacement Materials: Provide 10 percent extra replacement sensors, relays, control transformers, actuators, VAV controllers, unitary plant controllers, network controllers, distributed I/O blocks/controllers, network interface modules, and routers of each type/model/sizes used on the project. If 10 percent is less than one, provide one. If 10 percent is greater than ten, provide ten.

1.9 MAINTENANCE SERVICE

A. Commencing at the contract’s Substantial Completion date for a period of one calendar year provide system maintenance service based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. In addition to the initial year of maintenance service, provide a proposal for a renewable option year. The option year proposal must be submitted 60 days prior to the end of the initial maintenance contract period.

B. Maintenance service must be inclusive of controls set-up and programming, troubleshooting, and alarms based on manufacturer's recommendations and the operation and maintenance information, using factory-trained service personnel.

C. Maintenance service must include preventive maintenance, repair or replacement of worn or defective components, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks must also align with the manufacturer's recommended checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS, PRODUCTS, AND INSTALLERS

A. Products: Subject to compliance with requirements; manufacturers whose products may be incorporated into the Work, and the product lines permitted, are limited to the list below. Product lines used must be of the variant sold and installed within the continental United States.

1. Delta Controls – enteliWEB
2. Honeywell – Optimizer
3. Johnson Controls Incorporated – Metasys
4. Siemens – Desigo CC
5. Trane – Tracer SC+

B. Installers: Listed below are the BAS contractors that have been vetted by OBO and are permitted to install BAS by OBO. Only the BAS contractors listed below may be used.

1. Albireo Energy; Hoover, Alabama
2. Johnson Controls Federal Systems; Gaithersburg, Maryland
3. Siemens Government Systems; Reston, Virginia
4. Temperature Control Services; Lebanon, Indiana
5. Trane Building Automation Systems; St. Paul, Minnesota

C. Common BAS Product Line:

1. Office Buildings: The same manufacturer and BAS product line must be used in CAA areas as in GWA/PAA areas.
2. Compound: All buildings that require BAS must utilize only one common manufacturer and BAS product line.

a. For projects on an existing compound, new work must be provided with the same manufacturer and BAS product line as used in previously designed or constructed buildings.
b. For Posts with multiple compounds, the BAS product line used in new construction on any one of the compounds must be the same as the predominant BAS in use on any existing compounds, as determined by OBO.
c. If the existing product line is obsolete or outdated, an updated product line from the same manufacturer must be provided.

2.2 CONTROL SYSTEM

A. Provide DDC system with distributed processing. If network LAN is corrupted, all controllers must remain in operation using most recent data received over LAN.

B. Provide complete system of automatic temperature and pressurization control of HVAC system, including all control accessories and devices necessary to accomplish desired results, whether specifically mentioned herein or not.

C. Control system must be Direct Digital Control (DDC) system. DDC system must maintain stable temperature control and all other conditions as indicated. End-to-end accuracy of system, including temperature sensor error, wiring error, A/D conversion and display must be plus-or-minus 0.6 deg C (plus-or-minus 1 deg F).

D. DDC system must consist of Operator's Workstation (OW), multiple local area networks connecting components, Digital Controllers (DC) and Terminal Unit Controllers (TUC). All software control programs must reside in local controller for each item of equipment. All alarms must be sent to OW where they must be processed according to priority and job requirements.

E. Communications between DCs and OW, and between DCs and TUCs, must be through Local Area Networks (LAN). Design LAN for high speed communication; actual rate must not be less than 100 megabits for the LAN connecting DCs. LAN must allow sharing of data such as outside air temperature and alarm reporting. LAN must allow for uploading and downloading of software to or from DCs, from either OW or Portable Operator's Terminal (POT). LAN may be multi-level network. LAN must include error detection for transmission with correction and retransmission capability.

F. Prohibited Technologies: Controllers, computers, printers, sensors, network components, communication interfaces, diagnostic tools, configuration tools and other hardware that make up a BAS must be provided without the following capabilities:

1. Wireless Communications: The use or inclusion of any type of wireless communication technology is not permitted.

    a. Prohibited wireless communication technologies include, but are not limited to the following: Wi-Fi, Bluetooth and Near-Field Communications (NFC), Infrared (IR), Cellular (GSM, 3G, 4G, LTE, 5G…), ZigBee, Low Powered Wide Area Networks (LPWAN), Li-Fi, Z-Wave, Wireless USB, WiMax, Microwave, Radio (RF), Lightwave (Laser), etc.
    b. New wireless communication technologies, which do not currently exist at the time of the writing of this specification, are also prohibited.

2. Cameras: The use or inclusion of any type of image / video capture technology is not permitted. This includes any technology which would allow for images or video to be seen, recorded or transmitted by the hardware.
3. Microphones: The use or inclusion of any type of sound capture technology is not permitted. This includes any technology which would allow for sound to be heard, recorded or transmitted by the hardware.

G. Provide materials and installation labor necessary to connect to components factory supplied under other Sections, as part of equipment controlled.

H. Unless specified otherwise, provide fully modulating output devices operating valves and dampers.

I. Where "packaged equipment" is provided with its own integral controls, connect to packaged equipment with appropriate devices to effect operation described in Contract Documents. Do not

make connections/interconnections which result in packaged equipment manufacturer voiding their warranty. Intent of Construction Documents is to allow packaged equipment, once activated, to operate under their own controls unless specifically indicated otherwise herein. Contractor is responsible for coordinating with packaged equipment manufacturer as needed to ensure this operation.

J. Password Protection:

1. Provide multiple-level password access protection to limit workstation control, display and data base manipulation appropriate to each user. Create password to conform to the following complexity rules:

    a. Contain 12 or more characters.
    b. Contain mix of at least three characters from the following categories: Uppercase (A-Z), lowercase (a-z), numeric (0-9) and special (non-alphanumeric).
    c. Not be the same as user identifier.
    d. Not contain names or words.
    e. Not be generic (e.g., admin or system passwords).

2. Each user must be prompted to change password at least once every 60 days or at next login attempt thereafter.
3. For all password-protected components, passwords on network must be propagated and updated from OW. Users must not be required to update passwords at each Digital Control Unit.
4. Minimum five levels of access must be supported:

    a. Level 1 = Data Access and Display
    b. Level 2 = Level 1 + Selected Operator Overrides
    c. Level 3 = Level 2 + Set point Adjust
    d. Level 4 = Level 3 +Database Modification
    e. Level 5 = Level 4 + Security and Password Additions/Modifications

5. All setpoints must be adjustable at OW by easily accessible on-screen dialog box, slider, or other approved man-machine interface.
6. Password Retention: For each OW and Server at Post, Contractor must set up the following:

    a. Administrator Account: Create Administrator-level user account labeled “OBO Sys Admin” in Operating System, BAS Software, and all other associated software (e.g., Encryption software). This account must be configured in such a manner that it cannot be deleted by another user account. Contractor must utilize random password generator to create initial password for this account. This password must be submitted to Project Director/COR or OBO/PDCS/DE project team Mechanical Engineer.
    b. Password Management: Create tables listing Operating System user accounts, BAS user accounts and all other associated software user accounts that exist within each OW and Server. Each table must identify associated OW and Server, Operating System User Account / BAS User Account / Encryption Software / etc., including the following information:

1) User Account Name.
2) Name of person associated with the User Account.
3) Type of user account (Administrator, Standard User, etc.).
4) Account permissions associated with User Account (if applicable).

c. The Contractor must not collect password information for individual user accounts.

7. All manufacturer default usernames and passwords must be removed, and new usernames and passwords must be created for all BAS devices using random password generator. These usernames and passwords must be submitted to Project Director/COR or to OBO/PDCS/DE Project team Mechanical Engineer.

K. Floating point control is acceptable for use at room level for VAV terminals, fan coil units, and similar equipment. All other analog devices must be true analog using 0-10 VDC or 4-20 MA signals.

L. Control system must interface with the following systems identified in "Related Sections":

1. Medical Equipment such as **[Laboratory Fume Hood and]** pharmaceutical refrigerator temperature alarm.
2. Potable Water Treatment, Water Booster Pumps, and Water Softeners.
3. Wastewater Treatment.
4. Computer Room Air Conditioning Unit and Water Leak Detection Systems.
5. Chillers, boilers, AHUs, VAVs and similar HVAC equipment.
6. Building Power Monitoring System.
7. Variable Frequency Drives.
8. Centralized Dimming Control System.
9. Engine Generators.
10. Fuel Monitoring and Management System.
11. Solar Photovoltaic and Solar Hot Water Systems.
12. Variable Refrigerant Volume/Flow (VRV/VRF) Systems using manufacturer's recommended Building Controller.

2.3 DDC SOFTWARE AND FILES

A. Software:

1. Submit copy of all software installed on servers, workstations, and laptops.
2. Submit copy of all software used to execute the project, even if software was not installed on servers, workstations, and laptops.
3. All software revisions must be as installed at time of system acceptance.

B. Firmware Files:

1. Submit copy of all firmware files downloaded to, or pre-installed on, any devices installed as part of this project.
2. This does not apply to firmware permanently burned on chip at factory which can only be replaced by replacing chip.

3. Submit copy of all application files created during execution of the project.
4. Submit copy of all graphic page files created during execution of the project.

C. Secondary Graphics Files: Submit copy of all secondary graphic files (e.g., bitmaps, jpegs) used in creation of graphic pages.

D. Application Software:

1. I/O capability from operator station.
2. System security for each operator via software password and access levels.
3. Automatic system diagnostics; monitor system and report failures.
4. Database creation and support.
5. Automatic and manual database save and restore.
6. Dynamic color graphic displays for risers, floor plans, and other system level displays.
7. Custom graphics generation and graphics library of HVAC equipment and symbols.
8. Alarm processing, messages, and reactions.
9. Trend logs retrievable in spreadsheets and database programs.
10. Alarm and event processing.
11. Object and property status and control.
12. Automatic restart of field equipment on restoration of power.
13. Data collection, reports, and logs. Include standard reports for the following:

    a. Current alarm summary.
    b. Disabled objects.
    c. Alarm lockout objects.
    d. Logs.
    e. Energy usage/operation times

14. Custom report development.
15. Utility reports.
16. Workstation application editors for controllers and schedules.
17. Maintenance management.

E. Custom Application Software:

1. English language only.
2. Full-screen character editor/programming environment.
3. Allow development of independently executing program modules with debugging/simulation capability.
4. Support conditional statements.
5. Support floating-point arithmetic with mathematic functions.
6. Contains predefined time variables.

2.4 DDC EQUIPMENT

A. Operator Workstation: Desktop computer(s) with minimum configuration as follows:

1. Motherboard: With minimum of four integrated USB 3.2 Type-A ports and 1 Type-C port; integrated 10/100/1000 Ethernet port with RJ45 connection; integrated audio, bios, and hardware monitoring; and two integrated HDMI ports.
2. Processor: Minimum 8 Core, 3.2 GHz w/10MB Cache; AMD RYZEN 3rd Gen/Intel CORE 10th Gen or newer
3. Random-Access Memory: Minimum of 32.0 GB.
4. Graphics Processor: AMD Radeon Pro WX 3200, NVIDIA Quadro P1000 or equivalent expansion card with minimum of 4 GB dedicated video memory.
5. Storage Media: Two enterprise-grade SATA hard drives in a RAID 1 (mirrored) configuration, minimum size of 1 TB each, minimum rotational speed of 7200 RPM. RAID must be configured and managed through software using the built-in Windows Operating System Disk Management utility. The drives must be hot-swappable to allow for removal and replacement while the system is still operational.
6. Removable Media: CD/DVD Read/Write Drive.
7. Keyboard: U.S. English; QWERTY, 105 keys; wired.
8. Mouse: Optical three-button mouse with scroll wheel, wired.
9. Displays: Two 686 mm (27 inch) LED monitors, resolution: 4K (3840x2160p@60Hz); Aspect Ratio: 16:9; Brightness: Minimum of 300 nt.
10. Printer: Color, laser type as follows:

    a. Printer Resolution: Minimum of 1200 x 1200 dpi -optimized color resolution.
    b. Paper Handling: Minimum of 100 sheets, duplex capable.
    c. Print Speed: Minimum of 24 ppm in black and 24 ppm in color.
    d. Print Size: 8-1/2” by 11”, A4, and 11” by 17”.
    e. Provide USB and 10/100 Ethernet ports for connectivity.

11. Operating System: Microsoft Windows Professional, most current version that is compatible with installed BAS software.
12. Productivity Software: Microsoft Office Suite (including Word and Excel); Adobe Acrobat Professional; and AutoCAD LT.
13. Security Software: Department approved encryption and antivirus software.
14. BAS Application Software: As required to interface with digital controllers over the BAS network or through direct communication interface.
15. BAS Graphical User Interface: Complete graphics software package, including utilities required to modify and create graphics.
16. Stand Alone Functionality: Software provided must not require internet connectivity or subscriptions to function.
17. Extended Warranty: Operator Workstations and the software installed on them, as described above, must be warranted for a period of 5 years from the date of turnover to the Government.

B. Portable Operator Workstation: Provide three portable, notebook-style computers, one for the unclassified BAS, one for CAA BAS use only, and one for PCC use only. Each computer must be capable of accessing system data by connecting to the associated system’s network. Provide computers with minimum configuration as follows:

1. Durability: Rugged or semi-rugged. Meet or exceed MIL-STD-810H and IP53 rating.

2. Base Hardware: Minimum of two integrated USB 3.2 Type-A ports and one Type-C port; integrated 10/100/1000 Ethernet port with RJ45 connector; integrated audio, bios, and hardware monitoring; and 1 integrated HDMI port.
3. Processor: Minimum 4 Core, 1.8 GHz w/8MB Cache; AMD RYZEN 3rd Gen/Intel CORE 10th Gen or newer.
4. Random-Access Memory: Minimum of 16.0 GB.
5. Graphic Processor: Integrated, shared memory.
6. Display: 430 mm (17 inches) LED anti-reflective screen; Resolution: 1920x1080p at 60Hz; Aspect Ratio: 16:9; Brightness: Minimum of 300 nt.
7. Storage Media: Two enterprise-grade M.2 NVMe solid state drives in RAID 1 (mirrored) configuration, minimum size of 1 TB each. RAID must be configured and managed through software using the built-in Windows Operating System Disk Management utility.
8. Removable Battery: Battery must be removable and capable of being replaced without the need to open or otherwise disassemble the computer.
9. Removable Media: CD/DVD Read/Write Drive.
10. Mouse: Touch pad or other internal device, and separate optical three-button mouse with scroll wheel, wired.
11. Operating System: Microsoft Windows Professional, most current version that is compatible with the installed BAS software.
12. Productivity Software: Microsoft Office Suite (including Word and Excel); Adobe Acrobat Professional; and AutoCAD LT.
13. Security Software: Department approved encryption and antivirus software.
14. BAS Application Software: As required to interface with digital controllers over the BAS network or through direct communication interface.
15. BAS Graphical User Interface: Complete graphics software package, including utilities required to modify and create graphics.
16. Stand Alone Functionality: Software provided must not require internet connectivity or subscriptions to function.
17. Extended Warranty: Portable Operator Workstations and the software installed on them, as described above, must be warranted for a period of 5 years from the date of turnover to the Government.

C. Critical Alarm Panel. Provide HMI panel for monitoring of critical alarms from BAS. Locate at Post 1 when Post 1 is continually occupied. Locate at CAC (guarded 24/7) for Lock and Leave Posts. Provide Siemens MTP1500 HMI or equivalent. Mount onto unitized cabinet with suitable brackets for wall or floor mounting. Fabricate of 1.5-mm (0.06-inch) thick, furniture-quality steel or extruded-aluminum alloy, with hinged doors and keyed lock and with manufacturer's standard shop-painted finish. Provide common keying for all panels.

1. Alarm Condition: Red color indication flashes on alarm message and buzzer sounds.
2. Acknowledged Alarm: Buzzer must be silent, and yellow color indication steady.
3. Second Alarm: Buzzer must sound, and red color indication steady.
4. Alarm Condition Cleared: System must be reset, and color indication extinguished.
5. Contacts in alarm panel must allow remote monitoring.

D. Digital Control Units: Modular, self-contained, stand-alone controller comprising processor board with programmable, nonvolatile, random-access memory; local operator access and display panel; integral interface equipment; and memory backup to maintain program for at least 48

hours. Backup power source is required if controller has no other means of memory backup. Provide digital controller at each air handling unit, each heating system and each cooling system as minimum.

1. Units perform the following: Monitor or control each I/O point; process information; execute commands from other control units, devices, and operator workstations; and download from or upload to operator workstations. Operation of operator workstation must only be necessary to reset digital controllers clock, and to send alarm messages or data to operator at operators workstation.
2. Units must be Ethernet capable at I/O level without need for any additional routers or gateways.
3. Stand-alone mode control functions operate regardless of network status. Functions include the following:

    a. Global communications.
    b. Discrete/digital, analog, and pulse I/O.
    c. Monitoring, controlling, or addressing data points.
    d. Software applications, scheduling, and alarm processing.
    e. Testing and developing control algorithms without disrupting field hardware and controlled environment.

4. Standard Application Programs:

    a. Electric Control Programs: Demand limiting, duty cycling, automatic time scheduling, start/stop time optimization, night setback/setup, on-off control with differential sequencing, staggered start, anti-short cycling, PID control, DDC with fine tuning, and trend logging.
    b. HVAC Control Programs: Optimal run time, supply-air reset, and enthalpy switchover.
    c. Chiller Control Programs: Control function of condenser-water reset, chilled-water reset, and equipment sequencing.
    d. Programming Application Features: Include trend point; alarm processing and messaging; weekly, monthly, and annual scheduling; energy calculations; run-time totalization; and security access.
    e. Provide tabular display of terminal unit information for each terminal unit.
    f. Units of Measure: Inch-pound and SI (metric).
    g. Identify all valve output signals as percent open to heat transfer coil
    h. Identify all damper actuator output signals as percent open

5. Local operator interface provides for download from or upload to operator workstation or diagnostic terminal unit.

E. Local Control Units: Application specific, modular controller, comprising processor board with electronically programmable, nonvolatile, read-only memory; and memory backup to maintain program for at least 48 hours. Backup power source is required if controller has no other means of memory backup.

1. Units monitor or control each I/O point, process information, and download from or upload to operator workstation or diagnostic terminal unit.
2. Stand-alone mode control functions operate regardless of network status. Functions include the following:

    a. Global communications.
    b. Discrete/digital, analog, and pulse I/O.
    c. Monitoring, controlling, or addressing data points.
    d. Self-diagnostics of internal components.
    e. Proportional and proportional plus integral control loops.

3. Local operator interface provides for download from or upload to operator workstation or diagnostic terminal unit.
4. Reside on second level LAN, with at least one communication port.
5. Provide capability to have separate heating and cooling setpoints as much as 4.5 deg C apart with “no energy band” between two setpoints.
6. Provide transformer of sufficient capacity to power controller and actuators controlled by terminal unit controller. Provide manual primary side disconnect switch meeting NEC requirements.

F. Unitary Controllers: Unitized, capable of stand-alone operation with sufficient memory to support its operating system, database, and programming requirements, and with sufficient I/O capacity for application.

1. Configuration: Local display with keypad or touch screen at each equipment control panel with unitary controllers; diagnostic LEDs for power, communication, and processor; wiring termination to terminal strip or card connected with ribbon cable; memory with BIOS; and memory backup to maintain program for at least 72 hours. Backup power source is required if controller has no other means of memory backup.
2. Operating System: Manage I/O communication to allow distributed controllers to share real and virtual object information and allow central monitoring and alarms. Perform scheduling with real-time clock. Perform automatic system diagnostics; monitor system and report failures.
3. Compliance with ASHRAE 135 is required.
4. Enclosure (Indoor): Dustproof-rated for operation at 0 to 50 deg C (32 to 120 deg F). Rated for plenum use where installed in plenum (i.e., VAV terminal boxes).
5. Enclosure (Outdoor): NEMA 4 rated for operation at 5 to 65 deg C (40 to 150 deg F).
6. At minimum, one panel within each mechanical equipment room must contain one RJ45 jack for network communications and GUI graphics via laptop for troubleshooting.

G. I/O Interface: Hardwired inputs and outputs must tie into system through digital controllers. Protect points so that shorting will cause no damage to controllers.

1. Binary Inputs: Allow monitoring of on-off signals without external power.
2. Pulse Accumulation Inputs: Accept up to 10 pulses per second.
3. Analog Inputs: Allow monitoring of low-voltage (0- to 10-V dc), current (4 to 20 mA), or resistance signals.

4. Binary Outputs: Provide on-off or pulsed low-voltage signal, selectable for normally open or normally closed operation with three-position (on-off-auto) override switches and status lights.
5. Analog Outputs: Provide modulating signal, either low voltage (0- to 10-V dc) or current (4 to 20 mA) with status lights, two-position (auto-manual) switch, and manually adjustable potentiometer.
6. Floating Point or Tri-State Outputs: Provide two coordinated binary outputs for control of three-point, floating-type electronic actuators.
7. Universal I/Os: Provide software selectable binary or analog outputs.

2.5 GRAPHICS PAGES

A. Hierarchy:

1. The organization of graphic pages must be from global level down to very detailed level through series of links.
2. Linking must allow operator to move down hierarchy, up hierarchy and laterally within hierarchy.

B. Hierarchy Outline:

1. Site Plan Page: Visual representation of site (map). One page or multiple linked pages, depending on size of site plan.

    a. Link to individual building graphic pages.
    b. Link to Utility Management page.
    c. Display outdoor weather conditions.

2. Utility Management Page: Summary of data on utility consumption for site.

    a. Link up to site plan.
    b. Display:

        1) Utility consumption data (electricity, gas, fuel oil, water).
        2) Power Monitoring data, including:

            a) Demand
            b) Voltages, currents, and power factors.
            c) Demand control actions currently in effect.

    c. Presentation of utility management data may require more than one graphic page to effectively report data from multiple meters.

3. Building Graphic Page: Typically picture of building. One page per building.

    a. Link to floor plans within building.
    b. Link to central plant graphics where plant serves entire building.
    c. Link to delivery systems if delivery system serves entire building

d. Link up to site plan.

4. Building Pressurization Page: Schematic of building showing each pressure zone and displaying all pressure values.

   a. Link up to Building Page
   b. Link to floor plans within building.
   c. Link to Delivery System page (AHU) for each floor or pressurization area.

5. Floor Plan Page: This will be a two-dimensional plan of floor area. Minimum of one page per floor, per building is required. Where floor plans are large, multiple linked pages are required. For each control zone, display values of monitored and controlled parameters. This will typically include occupancy sensors, carbon dioxide levels, temperatures, and relative humidity levels.

   a. Link up to Building page.
   b. Link up to Site Plan page.
   c. Link to any delivery system that serves floor plan area (air handling unit is typical).
   d. Link to time schedules that affect systems that serve area.
   e. Link to Terminal Unit Summary page such as VAVs or fan coil units.
   f. Identify individual control zones.
   g. Show location of terminal equipment serving each zone.
   h. Show location of sensors installed in occupied space.
   i. Show room numbers, where available.

6. Central Plant Page: Graphical representation of equipment that makes up plant (e.g., chillers, pumps, boilers). If plant is small, this graphic must display values of process variables and commands to end devices. If plant is complex this graphic must only contain links to equipment graphics. Provide page for each plant.

   a. Link up to Building page.
   b. Link up to Site Plan page.
   c. Link to Central Plant Equipment Component page (e.g., chiller, pumps, tower).
   d. Graphic representation of the equipment must be 3-dimensional.
   e. Display:

      1) Process variables.
      2) Commands to end devices.
      3) Status of end devices.
      4) Alarm points if this is only central plant graphic.
      5) Plant status (enabled/disabled).
      6) Demand control status.

   f. Link to any time schedules that affect operation of plant.
   g. Link to any pre-configured trend charts associated with performance of plant.
   h. Link to Central Plant Configuration Page.

7. Central Plant Equipment Component: Graphical representation of element of equipment (e.g., chiller, pumps, boiler, tower, or some combination of these). Provide page for each primary equipment item per plant.

    a. Link up to Central Plant page.
    b. Link up to Building page.
    c. Link up to Site Plan page.
    d. Graphic representation of the equipment must be 3-dimensional.
    e. Display:

        1) Process variables.
        2) Commands to end devices.
        3) Status of end devices.
        4) Alarm points.
        5) Equipment status (enabled/disabled).
        6) Demand control status.

    f. Link to any time schedules that affect operation of equipment component.
    g. Link to any pre-configured trend charts associated with performance of equipment component.
    h. Link to Central Plant Configuration Page.

8. Central Plant Configuration Page: On this page, operator is given access to configuration parameters for entire plant or for piece of equipment in plant. Typically, this page presents data in tabular format. Type of data on this page is not changed frequently, but operator may wish to view it frequently. Provide one page per plant for small plants, and one page per primary equipment item per plant for larger plants.

    a. Set Points.
    b. Tuning Parameters.
    c. Calibration Parameters.
    d. Timing Parameters.
    e. Application parameters.
    f. Reset Schedules.
    g. Lead Lag Information.
    h. Time Schedules.
    i. Link up to Equipment or Central Plant page.
    j. Link up to Building page.

9. Delivery System Page: Graphical representation of air or water delivery system (e.g., air handling unit, roof top air handling unit, computer room air conditioning unit). One page for each delivery system.

    a. If Delivery System serves specific floor area, link up to Floor Area page.
    b. Link up to Building page.
    c. Link up to Site Plan page.
    d. Link to Central Plant page if Delivery System is served by Central Plant.

e. If Delivery System supplies multiple terminal devices, link to Terminal Unit Summary page.
f. Link to Delivery System Configuration page.
g. Graphical representation of equipment must be 3-dimensional and represent true physical characteristics of installed system.
h. Display:

1) Process variables.
2) Commands to end devices.
3) Status of end devices.
4) Status of different modes (economizer on/off, mechanical cooling enabled/disabled, occupied/unoccupied).
5) Alarm points.

i. Link to any time schedules that affect system operation.
j. Link to any pre-configured trend charts for system.

10. Delivery System Configuration Page: On this page, operator is given access to configuration parameters for delivery system. Typically, this page presents data in tabular format. Type of data on this page is not changed frequently, but operator may wish to view it frequently. One page per delivery system is required.

a. Display:

1) Set Points.
2) Tuning Parameters.
3) Calibration Parameters.
4) Timing Parameters.
5) Application parameters.
6) Reset Schedules.
7) Lead Lag Information
8) Time Schedules.

b. Link up to Delivery System page.
c. Link up to Building page.
d. Link up to Site Plan page.

11. Terminal Unit Summary Page: On this page, dynamic data and set points associated with multiple terminal units are presented in tabular format. Objective is to present summary of terminal unit performance for an area of facility. Provide one page for each group of terminal units. In tabular data, do not use less than 12 pt font size. Multiple linked pages may be used if there are large number of terminals served by one delivery system.

a. Display the following in table:

1) Process variables.
2) Set points for each process.
3) Command to each end device.

4) Status of each end device.
5) Load factors such as terminal load for VAV terminal unit.

b. Link to page for each Terminal Unit.
c. Link up to Delivery System page.
d. Link up to Floor Plan page.
e. Link up to Building page.
f. Link up to Site Plan page.

12. Terminal Unit Page: Graphical representation of terminal unit such as VAV terminal or fan coil terminal. Provide one page for each terminal unit.

a. Link up to Terminal Summary page.
b. Link up to Floor Plan page.
c. Link up to Building page.
d. Link up to Site Plan page.
e. Graphic representation of equipment must be 3-dimensional, and must represent actual installed terminal unit (e.g., if VAV does not have fan, then fan should not be shown).
f. Display

1) Process variables.
2) Command to end devices.
3) Status of end devices.
4) Set points for each process.
5) Modes (e.g., auto, heat, cool).
6) Capacity indicators (e.g., terminal load, percent heat, percent cool).
7) Reset schedules.
8) Occupancy commands and status.
9) Alarm points.

C. For all points on graphic page that are subject to being under manual or test mode, display must indicate when test mode or manual mode has been applied to point.

D. Graphic Page Requirements:

1. Sequence of operation must define buildings, as well as all equipment items for which graphic pages are developed as described above.
2. Develop similar additional graphic pages, to be defined during construction period, as follows:

a. Up to five additional pages per building.
b. Up to twenty additional global pages.

2.6 TRANSFORMERS AND POWER SUPPLIES

A. AC Transformers:

1. Listing: UL Class 2 (current-limiting).
2. Power Rating / Transformer Size: Maximum of 100 VA.
3. Primary Protection: Provide a DIN mounted circuit breaker next to the transformer to protect against overcurrent, overload, and short circuits and to act as a means of disconnect for the transformer.
4. Secondary Protection: Circuit breaker.
5. Restrictions:

    a. Limit connected loads to 80 percent of rated capacity.
    b. Transformers with more than one secondary output are not permitted.

B. Linear DC Power Supplies:

1. Output Ripple: Maximum of 5.0 mV peak-to-peak.
2. Line Regulation: Less than 0.1 percent for a 10 percent line change.
3. Load Regulation: Less than 0.1 percent for a 50 percent load change.
4. Transient Response Time: Less than 100 milliseconds for a 50 percent load change.
5. Primary Protection: Provide a DIN mounted circuit breaker next to the power supply to protect against overcurrent, overload, and short circuits and to act as a means of disconnect for the power supply.
6. Secondary Protection: Provide secondary output with overload and overvoltage protection. Use add-on module if required by product for overvoltage protection.
7. Restrictions:

    a. Limit connected loads to 80 percent of rated capacity.
    b. Power supplies with more than one secondary output are not permitted.

C. Switching (PWM) DC Power Supplies:

1. Output Ripple: Maximum of 50.0 mV peak-to-peak.
2. Line Regulation: Less than 1 percent.
3. Load Regulation: Less than 1 percent.
4. Primary Protection: Provide a DIN mounted circuit breaker next to the power supply to protect against overcurrent, overload and short circuits and to act as a means of disconnect for the power supply.
5. Secondary Protection: Provide secondary output with overload and overvoltage protection.
6. Mounting: DIN Rail.
7. Restrictions:

    a. Limit connected loads to 80 percent of rated capacity.
    b. Power supplies with more than one secondary output are not permitted.

D. Uninterruptable Power Supplies (UPS):

1. Voltage Regulation: On-line, Double Conversion power conditioning.
2. Output Waveform: Pure Sine Wave.
3. Line to Battery Transfer Time: 0 ms.
4. Batteries: User replaceable, hot swappable, maintenance free.

5. Surge & Noise Suppression: Provide with EMI / RFI noise suppression and surge suppression. Surge suppression rating shall be a minimum of 150 Joules.
6. Fault Tolerance: Provide with automatic bypass to maintain utility output during a fault or overload condition.
7. Display / Interface: Include front panel with power switch and visual indication of power, battery, fault and temperature. Unit shall include an audible alarm of faults and front panel silence feature. UPS settings must be adjustable through the front panel.
8. Alarm Contact: Provide with a dry contact for monitoring by BAS of general alarm, including battery failure.
9. Communications: Provide with communication port for monitoring by Operator Workstations and Servers. Configure to provide an orderly shutdown of Operator Workstation / Server if power has not been restored and battery power falls below 20 percent.
10. Installation: UPS must be installed above the floor in a panel or on a raised surface to protect from foot traffic and damage.
11. Sizing: Size UPS for 15 minutes of operation of all connected loads. Calculations must be provided for each UPS to show requirement has been met.
12. The following BAS related equipment must be provided with uninterruptible power supplies:

    a. Operator Workstation and associated equipment, including printers.
    b. Servers.
    c. DDC Control Panels (excluding terminal unit controllers such as VAV controllers).
    d. Gateways.
    e. Networking Equipment.

2.7 ELECTRONIC SENSORS

A. Description: Provide wall, immersion, or duct mounting as required. Sensors must be vibration and corrosion resistant.

B. Temperature Sensors:

1. Thermistor Accuracy: Plus-or-minus 0.2 deg C (0.35 deg F) at calibration point.
2. Temperature sensors must be thermistors, and meet performance requirements
3. Duct Temperature Sensor: Operating Range: 5 to 60 deg C (40 to 140 deg F). Conformity: Plus-or-minus 1 deg C (2 deg F). Single point, 200 mm (8 inches) long; use where not affected by temperature stratification or where ducts are smaller than 0.85 sq. m (9 sq. ft.).
4. Averaging Elements in Ducts: 900 mm (36 inches) long, flexible; use where prone to temperature stratification or where ducts are larger than 0.85 sq. m (9 sq. ft.); length as required.
5. Chilled Water Temperature Sensors: Operating Range: -1 to +40 deg C (30 to 100 deg F). Conformity: Plus-or-minus 0.5 deg C (1 deg F).
6. Heating Hot Water: Operating Range: 20 to 120 deg C (70 to 250 deg F). Conformity: Plus-or-minus 1 deg C (2 deg F).

7. Insertion Elements for Liquids: Thermowells must be series 300 threaded stainless steel. Inside diameter and insertion length must be as required for the application. Fill thermowells with manufacturer recommended thermal-conducting material.
8. Outside-Air Sensors: Operating Range: -45 to +65 deg C (-50 to +150 deg F). Conformity: Plus-or-minus 1 deg C (2 deg F). Watertight inlet fitting, shielded from direct sunlight.
9. Room Sensors: Operating Range: 10 to 30 deg C (50 to 86 deg F). Conformity: Plus-or-minus 0.5 deg C (1 deg F) over specified operating range. Equip with set point adjustment, override switch and communication port.
10. Room Security Sensors (Use in Public Access Areas): Stainless-steel cover plate with insulated back and security screws.
11. Unconditioned Space Temperature Sensors: Operating Range: -7 to +65 deg C (20 to 150 deg F). Conformity: Plus-or-minus 0.5 deg C (1 deg F) between 10 to 30 deg C (50 and 86 deg F), and plus-or-minus 1 deg C (2 deg F) over remaining range.
12. Point Temperature Sensors: Series 300 stainless steel, anodized aluminum, or copper. Encapsulate in epoxy.
13. Hydronic Load Monitoring (Thermal Energy Metering): Provide matched pair temperature sensors, matched to +/- 0.05 deg C (+/- 0.1 deg F) with calibration certificate.

C. Humidity Sensors:

1. Use bulk polymer, resistive, or thin film capacitive type, with non-saturating sensing elements capable of withstanding saturated condition without permanently affecting calibration or sustaining damage.
2. Conformity: +/- 2 percent relative humidity.
3. Environmental Range: -5 to +60 deg C (25 to 140 deg F).
4. Long Term Stability: Less than 1 percent drift per year.
5. Sensors must be wall-mounted or duct-mounted type as required by application. Provide accessories for complete and functional installation.

    a. Room Sensors: With locking cover matching room temperature sensors, range of 10 to 90 percent relative humidity. For indoor installations, sensor calibration must not be altered by exposure to condensing airstream.
    b. Outside Air Sensors: With element guard and mounting plate, range of 0 to 100 percent relative humidity. For exterior installations, sensors must survive below-freezing temperatures and direct contact with moisture without affecting sensor calibration.
    c. Duct Air Sensors: With element guard and mounting plate, range of 0 to 100 percent relative humidity. Sensors used in duct high limit applications must use bulk polymer resistive sensing element. Equip duct-mounted sensors with duct probe designed to protect sensing element from dust accumulation and mechanical damage. Support sensors inside ducts as recommended by manufacturer based upon design air speed range.

6. Signal output: Match needs of BAS system (0-10V, 4-20mA).

D. Pressure Transmitters/Transducers:

1. Static-Pressure Transmitter: Nondirectional sensor with suitable range for expected input, and temperature compensated.

    a. Accuracy: +/- 0.25 percent of full scale with repeatability of 0.5 percent or less.
    b. Output: 4 to 20 mA.
    c. Building Static Pressure Range: +/- 25 Pa (+/-0.1-inch wg).
    d. Duct Static-Pressure Range: 0 to 1240 Pa (0- to 5-inch wg).

2. Water Pressure Transducers: Stainless-steel diaphragm construction, suitable for service; minimum 1034-kPa (150-psig) operating pressure; linear output 4 to 20 mA.
3. Water Differential-Pressure Transducers: Stainless-steel diaphragm construction, suitable for service; minimum 1034-kPa (150-psig) operating pressure and tested to 2070-kPa (300-psig); linear output 4 to 20 mA. Transmitter must include five-valve manifold.
4. Differential-Pressure Switch (Air or Water): SPDT Snap acting, with pilot-duty rating and with suitable scale range and differential.
5. Zone Differential-Air-Pressure Control and Monitoring:

    a. Monitor must measure bi-directional pressure differential between two spaces and send analog pressure differential signal to Building Automation System.
    b. System must consist of differential pressure sensors, pneumatic tubing and low pressure and high pressure sensing probes.
    c. Pressure range must be between minus 50 Pa (minus 0.2-inch wg) and plus 50 Pa (plus 0.2-inch wg), and user configurable to range of minus 25 Pa (minus 0.10-inch wg) and plus 25 Pa (plus 0.10-inch wg).
    d. Accuracy of measurement must be within plus/minus 0.5 percent full scale.
    e. Analog output of room pressure differential must be either 0-10V or 4-20 mA.
    f. Transducer must have a minimum of 10kPa positive and negative overpressure protection.
    g. Outdoor Static Pressure Probe.

        1) Stainless steel sensor probe with no moving parts.
        2) Operation not affected and impaired by rain and snow.
        3) The outdoor air probe shall be capable of sensing the outside atmospheric air pressure to within 2 percent of the actual value when subjected to radial wind velocities up to 40 miles per hour with approach angles up to 30 degrees to the horizontal.
        4) Installed in accordance with manufacturers recommendations.
        5) Designed specifically for outdoor applications.

6. Control and Instrumentation Tubing:

    a. Type ACR, copper tubing complying with ASTM B 280.

        1) Fittings: Cast-bronze solder fittings complying with ASME B16.18, or wrought-copper solder fittings complying with ASME B16.22, except forged-brass compression type fittings at connections to equipment
        2) Joining Method: Soldered or brazed.

3) Install copper tubing segments (approximately 1 meter long) where plastic tubing control systems penetrate fire rated floors and partitions

b. Virgin-polyethylene, flame-retardant, nonmetallic tubing complying with ASTM D638.

1) Fittings: Compression or push-on polyethylene fittings.

2.8 STATUS SENSORS

A. Status Inputs for Electric Motors: Comply with ISA 50.00.01, current-sensing fixed- or split-core transformers with self-powered transmitter, adjustable and suitable for 175 percent of rated motor current.

B. Voltage Transmitter (100- to 600-V ac): Comply with ISA 50.00.01, single-loop, self-powered transmitter, adjustable, with suitable range and 1 percent full-scale accuracy.

C. Power Monitor: 3-phase type with disconnect/shorting switch assembly, listed voltage and current transformers, with pulse kilowatt hour output and 4- to 20-mA kW output, with maximum 2 percent error at 1.0 power factor and 2.5 percent error at 0.5 power factor.

D. Current Switches: Self-powered, solid-state with adjustable trip current, selected to match current and system output requirements.

E. Electronic Valve/Damper Position Indicator: Visual scale indicating percent of travel and 2- to 10-V dc or 4-20 mA, feedback signal.

F. Water-Flow Switches: Bellows-actuated mercury or snap-acting type with pilot-duty rating, stainless-steel or bronze paddle, with appropriate range and differential adjustment, in NEMA 250, Type 1 enclosure.

G. Electric Low Limit Duct Thermostat (Freezestat): Snap acting, double pole, double throw, manual reset switch that trips if temperature sensed across any 1 foot of bulb length is equal to or below setpoint.

1. Bulb Length: Minimum of 6 meters (20 feet).
2. Quantity: One thermostat for every 2 sq. meters (20 sq. ft.) of coil surface.

H. Passive Infrared Occupancy Sensors: PIR occupancy sensors must have multi-level, multi-segmented viewing lens and conical field of view, with viewing angle of 180 degrees and detection of at least 6 meters (20 feet) unless otherwise shown or specified. PIR Sensors must provide field-adjustable background light-level adjustment, with adjustment range suitable to light level in sensed area, room, or space. PIR sensors must be immune to false triggering from RFI and EMI.

2.9 GAS DETECTION EQUIPMENT

A. Carbon Monoxide Detectors: Single or multichannel, dual-level detectors using solid-state plug-in sensors with 3-year minimum life; suitable over temperature range of 0 to 40 deg C (32 to 104 deg F); with 2 factory-calibrated alarm levels at 50 and 100 ppm or adjustable levels.

B. Carbon Dioxide Sensor and Transmitter: Single detector using solid-state infrared sensor; operating temperature range of 0 to 50 deg C (32 to 122 deg F); measurement range of 0 to 2000 ppm; accuracy, 2% of reading +/-30 ppm; repeatability, 1% of full scale; output, 4 to 20 mA or 0-10 Vdc; for wall mounting or duct installation. Provide appropriate mounting hardware for application in accordance with manufacturer's installation instructions.

C. Provide hydrogen detection system for each battery room as required to comply with the OBO Electrical Code. Each system consisting of one central control panel linked with up to three remote hydrogen sensors. Provide wall-mount system with NEMA 4X rating enclosure; system must be suitable for non-hazardous service. Basis of Design for control panel: Mine Safety Appliances Co. (MSA), Model Ultima XA, Combustible Gas Detection System. Provide panel with LCD display, manual warning and alarm reset, power failure alarm, and inhibit relays. Electrical characteristics must be 115V-1 with full circuit protection. Alarm unit must be able to activate exhaust fan as indicated in sequences of operation. Provide hydrogen sensors throughout Battery Room in accordance with manufacturer's recommendations for optimum coverage. Basis of Design for sensors: MSA Co. Ultima XA series. Locate audible alarm horn outside Battery Room. Include provision for remote alarm in each panel. Provide all wiring and conduit for sensors, panels, and alarms associated with this Section. Provide sensor calibration and test kit to calibrate at normal levels and confirm alarming at concentrations just above alarm point.

D. If included in the project, reference Division 23 Section on refrigerant monitoring and safety equipment.

2.10 FLOW MEASURING

A. Duct Airflow Station: Combination of air straightener and multiport, self-averaging pitot tube station.

1. Casing: Galvanized-steel frame.
2. Accuracy: Plus-or-minus 2 percent to 6000 fpm.
3. Flow Straightener: Aluminum honeycomb, 20-mm (3/4-inch) parallel cell, 75 mm (3 inches) deep.
4. Sensing Manifold: Copper manifold with bullet-nosed static pressure sensors positioned on equal area basis.

B. Water Flow Sensor: Water flow element/transmitter assemblies must be insertion type.

1. Accuracy: Plus-or-minus 0.5 percent at calibrated flow velocity. Provide meter with NIST factory calibration.
2. Output: Linear, two wire 4 to 20 mA or 0 to 10 V signal corresponding to the flow rate.
3. Enclosure: NEMA 4.
4. For pipe diameters DN65 (2-1/2 inches) and larger, provide dual turbine flow meter. Single turbine flow meters are acceptable for pipe sizes smaller than DN 65.

5. Locate flow meter according to manufacturer's guidelines with respect to straight pipe length. Ensure sufficient clearance around pipe for sensor.
6. Install Flow Sensor with shut-off/isolation full port ball valve to allow for adding/removing sensor while water system is in use.
7. Install Flow Meters in upper half of horizontal run pipes or in vertical pipe runs. Install meters perpendicular to pipe.

2.11 THERMOSTATS

A. Electric, solid-state, microcomputer-based room thermostat with remote sensor.

1. Automatic switching from heating to cooling.
2. Preferential rate control to minimize overshoot and deviation from set point.
3. Set up for four separate temperatures per day.
4. Instant override of set point for continuous or timed period from 1 hour to 31 days.
5. Short-cycle protection.
6. Programming based on every day of week.
7. Selection features include degree F or degree C display, 12- or 24-hour clock, keyboard disable, remote sensor, and fan on-auto.
8. Battery replacement without program loss.
9. Capability of reporting to BAS.
10. Thermostat display features include the following:

    a. Time of day.
    b. Actual room temperature.
    c. Programmed temperature.
    d. Programmed time.
    e. Duration of timed override.
    f. Day of week.
    g. System mode indications include "heating," "off," "fan auto," and "fan on."

2.12 HUMIDISTATS

A. Duct-Mounted Humidistats: Electric insertion, 2-position type with adjustable, 2 percent throttling range, 20 to 80 percent operating range, and single- or double-pole contacts.

2.13 ACTUATORS

A. Electric Motors: Size to operate with sufficient reserve power to provide smooth modulating action or two-position action. Select actuators for 150 percent of required torque. Torque provided must be as close to 150 percent as possible without falling below 150 percent.

1. Permanent Split-Capacitor or Shaded-Pole Type: Gear-trains type; Equip spring-return motors with integral spring mechanism in housing designed for easy access or adjustment of limit switches.

2. Non-spring-Return Motors for Valves Larger than DN 65: Size for running torque of 17 N x m and breakaway torque of 35 N x m.
3. Non-spring-Return Motors for Dampers Larger than 2.3 sq. m: Size for running torque of 17 N x m and breakaway torque of 35 N x m.

B. Electronic Actuators: Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque. Select actuator rating for 150 percent of required torque. Torque provided must be as close to 150 percent as possible without falling below 150 percent.

1. Valves: Size for torque required for valve close off at maximum pump differential pressure.
2. Dampers: Size for running torque calculated as follows:

a. Opposed-Blade Damper with Edge Seals: 62 kg-cm/sq. m of damper.
b. Opposed-Blade Damper without Edge Seals: 37.2 kg-cm/sq. m of damper.
c. Dampers with 500 to 750 Pa of Pressure Drop or Face Velocities of 5 to 13 m/s: Multiply minimum break away torque above by 1.5.
d. Dampers with 750 to 1000 Pa of Pressure Drop or Face Velocities of 13 to 15 m/s: Multiply minimum break away torque above by 2.0.

3. Coupling: V-bolt and V-shaped, toothed cradle. Single set screw is not sufficient.
4. Overload Protection: Electronic overload or digital rotation-sensing circuitry.
5. Fail-Safe Operation: Mechanical Spring Return mechanism. Provide external, manual gear release on non-spring-return actuators.
6. Power Requirements (Two-position Spring Return): 24VAC
7. Power Requirements (Modulating): Maximum 10 VA at 24-VAC or 8 W at 24-V dc.
8. Proportional Signal: 2- to 10-V dc or 4 to 20 mA, and 2- to 10-V dc position feedback signal.
9. Temperature Rating: Minus 30 to plus 50 deg C.
10. Temperature Rating (Smoke Dampers): -30 to +121 deg C.
11. Equip all actuators for Two-Position operation with end switches unless otherwise noted.
12. Manual Override: External manual adjustment mechanism to facilitate manual positioning when actuator is not powered.

2.14 CONTROL VALVES

A. General:

1. Valves must have stainless-steel stems and stuffing boxes with extended necks to clear piping insulation. Valve bodies must conform to ANSI/ASME B16.34 or ANSI/ASME B16.15 pressure and temperature class ratings, based upon design operating temperature and 150 percent of system design operating pressure.
2. Unless otherwise specified or shown, valve leakage must conform to ANSI/FCI 70-2 Class IV leakage rating (0.01 percent of valve Kv).
3. Unless otherwise specified or shown, valves DN50 (2 inches) or smaller must be ball valves; valves DN65 to DN100 (2- 1/2 to 4 inch) must be flanged globe valves, and any larger valves must be butterfly valves.
4. Unless otherwise specified the following applies:

a. Bodies for valves DN40 (1-1/2 inches) and smaller must be brass or bronze, with threaded or union ends.
b. Bodies for DN50 (2 inches) valves must have threaded ends.
c. Bodies for valves DN50 to DN75 (2 to 3 inches) must be of brass, bronze, or iron.
d. Bodies for valves DN65 (2-1/2 inches) and larger must be provided with flanged-end connections.
e. For modulating applications, selected valve coefficient must be within 100 to 125 percent of calculated valve coefficient. Valve coefficient must be defined and reported as complete control valve assembly pressure drop, including any and all reducers on all sides of the control valve to make it fit into the pipe size and location orientation, not simply control valve individually on lab test bench with "unlimited" same size straight pipe diameters both upstream and downstream.
f. For two position applications, where two positions are full open and full closed, valve coefficient must be largest available for valve size.
g. Valve and actuator combinations must be normally open or normally closed as shown.
h. Seats, seals and gaskets must be compatible with system working fluids (i.e. EPDM may not be best selection/manufacturer recommended material under certain conditions).
i. Sizing: Size the modulating control valves for water and glycol service for minimum pressure drop of 3-psi (21-kPa) and maximum pressure drop of 5-psi (35 kPa) at design flow rate.

5. Valves that combine the functionality of a standard control valve and a balancing valve, typically referred to as Pressure Independent Control Valves (PICV), are explicitly forbidden. Pressure independent control valves, regardless of if they have been shown on the design drawings, specified in a separate specification section, or called for in an equipment schedule, are not allowed.

B. Ball Valves:

1. Balls: Stainless steel or nickel plated brass.
2. Valves: Blow-out proof stems.
3. In steam and high temperature hot water applications, valve-to-actuator linkage must provide thermal break.

C. Globe Valves:

1. Globe valves must have iron body and bronze or stainless steel seat, stem and plug.
2. Valves: ANSI 125 Class III leakage rating.

D. Butterfly Valves:

1. Butterfly valves must be threaded lug type suitable for dead-end service and modulation to fully-closed position, with carbon-steel bodies and non-corrosive discs, stainless steel shafts supported by bearings, and EPDM seats suitable for temperatures from -30 to +120 deg C (-20 to +250 deg F) unless not recommended for certain fluid applications.

2. Rated flow coefficient for butterfly valves must be value at 70 percent (60 degrees) open position.
3. Valve Leakage: ANSI/FCI 70-2 Class VI leakage rating.

E. Two-Way Valves:

1. Two-way modulating valves used for liquids must have equal-percentage characteristic (except valves used for bypass, which must have linear characteristic).

F. Three-Way Valves:

1. Three-way modulating valves must provide equal percentage flow control with constant total flow throughout range of modulation.

G. Duct-Coil and Terminal Unit Coil Valves:

1. Provide control valves with either flare-type or solder-type ends for duct or terminal-unit coils.
2. Provide flare nuts for each flare-type end valve.

H. Valves for Chilled Water, Condenser Water, and Glycol Service:

1. Valve Internal Trim: Type 316 stainless steel.

I. Valves for High Temperature, Hot-Water, and Dual Temperature Service:

1. Valves for hot water service between 100 to 120 deg C (210 to 250 degs F) and dual-temperature service must have internal trim (including seats, seat rings, modulating plugs, and springs) of Type 316 stainless steel.
2. Internal trim for valves controlling water below 100 deg C (210 deg F) must be brass, bronze, or Type 316 stainless steel.
3. Non-metallic valve parts must be suitable for a minimum continuous operating temperature of 120 deg C (250 deg F), or 30 deg C (50 deg F) above the system design temperature, whichever is higher.

2.15 CONTROL DAMPERS

A. Dampers: AMCA-rated per 500D, parallel-blade design for 2-position dampers, opposed-blade design for modulating dampers.

1. Frames:

a. [For non-marine applications use following: Minimum of 2.8 mm (0.11-inch) thick, galvanized-steel frames with holes for duct mounting.]

b. [For dampers in moderate or extreme marine corrosion environments with exterior or indirect exposure (see OBO-ICS IBC Appendix W), use the following: Minimum of 2.4-mm thick, extruded aluminum hat channel frames with mounting flanges.]

c. [When the project is located in extreme hot or cold climates, and the application is normally closed for long periods of time (e.g. manual smoke removal): Opposed blade dampers similar to Ruskin CD40x2 insulated for energy conservation.]

d. For control dampers in locations exposed to greater than 22 degrees C (40 degrees F) difference between interior and exterior temperatures (e.g., normally closed smoke removal dampers in return air ducts), provide insulated frame.

1) Basis-of-Design: Ruskin CD40X2 or approved equal.

2. Damper blade:

a. [For non-marine applications use following: Minimum of 1.6 mm (0.063-inch) galvanized steel with maximum blade width of 203 mm (8-inch).]

b. [For dampers exposed to unconditioned outsider air in locations less than 10 km from a seacoast, use the following: Minimum of 1.61-mm thick, heavy gage extruded aluminum damper blades with maximum blade width of 203 mm.]

c. For control dampers in locations exposed to greater than 22 degrees C (40 degrees F) difference between interior and exterior temperatures (e.g., normally closed smoke removal dampers in return air ducts), provide insulated blades.

1) Basis-of-Design: Ruskin CD40X2 or approved equal.

3. Secure blades to 13-mm (1/2-inch) diameter zinc-plated axles using zinc-plated hardware, with nylon blade bearings, blade-linkage hardware of zinc-plated steel and brass, ends sealed against spring-stainless-steel blade bearings, and thrust bearings at each end of every blade.
4. Operating temperature Range: From -40 to +93 deg C (-40 to +200 deg F).
5. For standard applications, provide optional closed-cell neoprene edging.
6. Inflatable seal blade edging or replaceable rubber seals rated for leakage at less than 21 L/s per sq. m (4 cfm per sq. ft) of damper area at differential pressure of 250 Pa (1 inch wg) when tested according to AMCA 500D.

2.16 CONTROL WIRE AND CABLE

A. Category 6a copper-wire and OS2 & OM4 fiber-optic cables, for use with BAS Ethernet networks, must conform to the requirements specified in Section 271305 “Communications Backbone Cabling” and in Section 271505 "Communications Horizontal Cabling."

B. Cables for use with BAS RS-485 networks must conform to the following requirements:

1. Cable Type: Twisted, shielded with drain wire; 2, 3 or 4 conductors, as recommended by BAS Manufacturer.
2. Conductor Size: Must be a minimum of 0.326 mm2 (No. 22 AWG).
3. Conductor Type: Twisted, stranded copper
4. Rating: Minimum 300 V and 60 deg C, type PLTC.
5. Flame Resistance: Comply with UL 1685.
6. Maximum Segment Length: 1250 meters (4000 feet).

7. Characteristic Impedance: Between 100 and 130 Ohms
8. Low Capacitance:

    a. Capacitance between conductors: Less than 49 pF/m (15 pF/ft)
    b. Capacitance between conductors and shield: Less than 98 pF/m (30 pF/ft)

C. Wire and cabling for use with inputs, outputs and interlocks must meet the following requirements:

1. Wire: Single conductor control wiring above 24 V:

    a. Conductor Size: Must be a minimum of 0.823 mm^2 (No. 18 AWG).
    b. Conductor Type: Twisted, stranded copper.
    c. Rating: Minimum 600 V and 90 deg C.
    d. Conductor Colors: Conductor colors must be black (hot), white (neutral), and green (ground).

2. Single Twisted Shielded Instrumentation Cable above 24 V:

    a. Cable Type: Twisted, shielded with drain wire; 2 or 3 conductors, as required by application.
    b. Conductor Size: Must be a minimum of 0.823 mm^2 (No. 18 AWG).
    c. Conductor Type: Twisted, stranded copper.
    d. Rating: Minimum 600-V and 90-deg C; Type TC.
    e. Flame Resistance: Comply with UL 1685.
    f. Conductor Colors: For twisted pair, conductor colors must be black and white. For twisted triad, conductor colors must be black, red and white.

3. Single Twisted Shielded Instrumentation Cable 24 V and Less:

    a. Cable Type: Twisted, shielded with drain wire; 2 or 3 conductors, as required by application.
    b. Conductor Size: Must be a minimum 0.326 mm^2 (No. 22 AWG).
    c. Conductor Type: Twisted, stranded copper.
    d. Rating: Minimum 300-V and 105-deg C; Type PLTC.
    e. Flame Resistance: Comply with UL 1685.
    f. Conductor Colors: For twisted pair, conductor colors must be black and white. For twisted triad, conductor colors must be black, red and white.

D. Wire and Cable not installed within raceway must be plenum rated, non-halogenated, low smoke producing as tested in accordance with NFPA 262, “Standard Method of Test for Flame Travel and Smoke Characteristics of Wires and Cables for Use in Air-Handling Spaces.”

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that power supply is available to control units and operator workstation.

B. Coordinate availability, location and voltage of power for control panels, user workstation, and any other control devices requiring power with Division 26 sections.

C. Verify that duct-, pipe-, and equipment-mounted devices and wiring are installed in accordance with manufacturer recommendations, including clearance and maintenance access.

3.2 INSTALLATION

A. Prohibited Technologies: Hardware that contains prohibited technology must be modified to render inoperable these capabilities.

1. Modifications made to hardware to accomplish this must not negatively impact the base functionality of the product being provided.
2. Hardware must be fully tested after modification to ensure base functionality remains unaltered. When more than one of the same product will be modified, modification and testing must be performed on a sample of the hardware prior to modifying all of that product.

B. Install software in control units and operator workstation(s). Implement all features of programs to specified requirements and as appropriate to sequence of operation.

C. Connect and configure equipment and software to achieve sequence of operation specified.

D. Verify location of temperature, pressure and humidity sensors, and other exposed control sensors with Construction Drawings and room details before installation. Sensors in occupied spaces must conform to accessibility requirements in Chapter 11 of the OBO Building Code (International Building Code as amended by OBO). Coordinated to avoid conflict with interior furnishings.

1. Install averaging elements in ducts and plenums in crossing or zigzag pattern.

E. Install Room Security temperature sensors (stainless-steel cover plate) in Public Access Areas.

F. Coordinate location and sizes of automatic dampers.

G. Install damper motors on outside of duct in warm areas, not in locations exposed to outdoor temperatures. Where installed in plenum rated areas, install plenum rated motors or actuators, and identify as such in submittal equipment schedule. If damper motor is mounted outdoors, provide a NEMA 4 enclosure with heat where needed by project climate.

H. Install labels and nameplates to identify control components according to Division 23 Section on identification of HVAC piping and equipment.

I. Coordinate location and sizes of hydronic and refrigerant instrument wells, valves, and other accessories according to Division 23 Sections on hydronic piping and refrigerant piping.

J. Coordinate location and sizes of control dampers according to Division 23 Sections specifying air ducts.

K. When underground hydronic piping distribution to other buildings is included in the project design, furnish and install a flow switch in water makeup supply. If flow is detected for more than 3 minutes, program alarm annunciation at BAS head end computer, indicating necessity for Post maintenance to investigate for system leakage.

L. For third party controls interfaced with the BAS (i.e., chiller control panels), ensure their internal sequence is coordinated with the BAS control sequence when necessary.

M. Return and relief air damper actuators must be fully modulating with position end switches unless otherwise noted.

N. Wall sensors for split heat pumps or AC units in Compound Access Control (CAC) facilities, Utility Buildings, and Warehouse/Support buildings must be programmable thermostats with locking covers, capable of non-occupied mode setback per design, and to avoid tampering.

O. Install all flow meters (both air and water) in accordance with manufacturer's requirements for upstream and downstream pipe diameters to achieve specified flow accuracy.

P. Control valves larger than 63 mm (2-1/2 inches) must be installed with full-sized maintenance bypass valve and piping.

Q. Install building pressurization sensors for controlling and reporting zone pressures in occupied spaces, not in corridors.

R. Zone pressure sensing probes must not be located near mailroom exhaust, kitchen hood exhaust, AHU return ducts, medical lab exhaust hoods, or other sources of positive or negative pressure which will adversely affect the stability and accuracy of the sensor readings.

S. Install duct-mounted CO_2 sensors on sides or tops of ducts while remaining accessible.

3.3 WIRE, CABLE AND RACEWAY INSTALLATION

A. Comply with NECA 1, "Standard for Good Workmanship in Electrical Construction".

B. Wire and Cable Installation:

1. Comply with installation requirements in Section 260518, "Low-Voltage Electrical Power Conductors and Cables."
2. Comply with installation requirements in Section 271113, "Communication Entrance Protection."
3. Comply with installation requirements in Section 271305, "Communications Backbone Cabling."
4. Comply with installation requirements in Section 271505, "Communications Horizontal Cabling."

5. Conceal wire and cable, except in mechanical rooms and areas where other conduit and piping are exposed.
6. All wire and cable, located in exposed or concealed spaces, must be installed in raceway.

    a. Exception: Plenum rated cable not installed in raceway may be used in concealed plenum spaces in offices for use with wall mounted sensors.
    b. Clearly identify cables not installed in raceway through use of unique cable color.

7. Install network cabling in dedicated raceway separate from all other wires and cables used for other purposes. Splices in network cabling are not allowed.
8. For each sensor, input or output device, provide single cable from sensor or device directly to associated controller. Each cable must include quantity of conductors required for specific sensor or device. Sharing of conductors for multiple sensors is not permitted. Splices in cable between the sensor or device and controller are not allowed.
9. Use cables with shielding for wiring associated with analog signals. Ground drain wires from shielded cables (not including network cables) to controller enclosure as close as possible to point of entry.
10. Do not run control wiring within raceways containing wiring at 120 volts or above.
11. Bundle and harness multiconductor instrument cable in place of single cables where several cables follow a common path.
12. Fasten flexible conductors, bridging cabinets and doors, along hinge side; protect against abrasion. Tie and support conductors.
13. Clearly label all control wiring and cables for future identification and servicing of BAS. Label wires and cables at each end and at each junction box or enclosure they pass through with these identification labels. Label cables run outside of raceways every two meters. Labels must be vinyl, self-laminating flag type, and large enough to include four lines of text. Print the following information, as shown in BAS “As-Built” documents, on each label.

    a. Input/Output Wiring

        1) Control Panel ID
        2) Unique Point ID
        3) Controller I/O Used
        4) Unique Wire/Cable Designation

    b. Interlock Wiring

        1) From Location ID
        2) To Location ID
        3) Unique Interlock ID
        4) Unique Wire/Cable Designation

    c. Network Wiring

        1) From Controller/Equipment ID
        2) To Controller/Equipment ID
        3) Network ID

4) Unique Wire/Cable Designation

d. Power Wiring

1) Control Panel ID
2) Transformer/Power Supply ID
3) Voltage
4) Unique Wire/Cable Designation

14. Install wire and cable with sufficient slack and flexible connections to allow for vibration of piping and equipment.
15. Use fiber optic cable for all network runs between buildings.
16. Perform continuity and megger testing on wire and cable after installation.

C. Conduit Installation:

1. Comply with installation requirements in Section 260533, "Raceways and Boxes for Electrical Systems."
2. Minimum conduit size must be 20 mm (¾ inch) unless connecting to an end-of-line device with a factory connection size of smaller diameter (e.g., 12 mm (½ inch)).
3. Run BAS network between buildings in dedicated conduit with other conduits in concrete-encased conduit bank. Fiber and wiring from other BMS are not permitted to share the BAS conduits.
4. Enclosures, junction boxes and raceway associated with the BAS must be clearly identified as part of the BAS. Covers to BAS junction boxes must be painted light blue. Raceway must be labeled with five-centimeter-long light blue markings at a distance of every two meters.

D. Grounding: Provide for complete grounding of all applicable signal and communications cables, panels and equipment so as to ensure system integrity of operation. Ground cabling and conduit at the panel terminations. Avoid grounding loops.

E. Manual Reset Limit Controls: Connect manual-reset limit controls independent of manual-control switch positions. Automatic duct heater resets may be connected in interlock circuit of power controllers.

F. Hand-Off-Auto Switches: Connect hand-off-auto selector switches to override automatic controls when switch is in hand position.

3.4 TRENDING FUNCTIONALITY

A. Develop trending functionality of system.

1. Set up trends for each system per BAS Point List Tables in Part 3, Article POINT LIST SCHEDULE. The trend list may be modified based on input from OBO/PDCS/DE project team Mechanical Engineer or project Commissioning Agent. Trends will be similar to the following:

a. Building Pressurization: Graph all differential pressure readings and set points collected at 15 minute intervals.
b. Chilled Water Temperature: Graph all chilled water supply and return temperatures at 10 minute intervals.
c. Critical Room Space Temperature: Graph all space temperatures for Joint Unclassified Computer Room (JUCR), Main Telephone Equipment Room (MTER), Electrical Closet (EC), Radio Network Equipment Room (RNER), Multi-purpose room, and similar rooms at 30-minute intervals

B. Trend Data Storage:

1. Trend data must be stored at Digital Control Unit for the associated trended sensor, and uploaded to OW for archiving. Uploads must occur based on either user-defined interval, manual command, or when Digital Control Unit trend buffers becomes almost full. Uploads must be setup to execute without loss of trend data. All trend data uploaded to the OW must be kept for a minimum of five years (first year plus four consecutive years). All stored trend data must be available in format usable by Microsoft Excel.

3.5 REPORTING FUNCTIONALITY

A. Develop reporting functionality of system.

1. Set up maximum of ten reports. These reports will be identified by Project Director/COR with input from either Post Facility Manager or OBO/PDCS/DE project team Mechanical Engineer. Trends will be similar to the following:

a. Energy Usage: Create report to show electrical usage for compound and each building organized by month, with annual summary.
b. Fuel Usage: Create report to show fuel usage for compound and each building organized by month with annual summary.
c. Water Usage: Create report to show water usage for compound and each building organized by month with annual summary.

3.6 TESTING, CALIBRATION, AND ACCEPTANCE, GENERAL

A. Space Pressure Control and Monitoring Sensors:

1. Manufacturer or factory-trained representative must perform start-up, including calibration of monitors and sensors. Perform calibration only after ceiling and doors are installed and HVAC systems are properly air-balanced.
2. Install monitor panels on secure side of building hardlines.
3. Refer to Construction Drawings for additional requirements.
4. Protect all ends of tubing during construction with temporary caps or plugs to prevent contamination. Blow out all tubing with compressed air prior to connection to any equipment panels or sensors. Provide pressure test at 14 kPa (2 psig) for 2 hours to prove tubing system integrity and include report in Quality Control documentation.

3.7 FIELD QUALITY CONTROL

A. Contractor Verification and Validation: Testing described in this section is the sole responsibility of BAS subcontractor. BAS subcontractor must develop required testing plans, must perform verification and validation testing in accordance with these testing plans, and must prepare reports documenting results of testing performed. This work is to be performed in addition to and independently from the third party Commissioning process. It is BAS subcontractor's responsibility to verify and validate their own work before certifying to the Government and the Commissioning Agent that the BAS is ready for Commissioning Testing.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing.

C. DDC Verification Testing: The purpose of verification testing is to demonstrate "completeness" of physical tasks associated with installation and "error-free" performance of components.

1. At a minimum perform the following verification checks prior to energizing each control panel.

a. Verify integrity and quality of connections (loose strands and tight connections).
b. Verify bus topology, grounding of shields and installation of termination devices.
c. Verify proper controller power wiring.
d. Verify that controller power supply is from emergency power supply, if applicable.
e. Verify that controllers and computers are protected from power supply voltage surges and fluctuations.
f. Verify that wires at control panels are tagged with their service designation and approved tagging system.
g. Verify labeling on components and wiring is correct; matches the labeling used in approved submittals and matches labeling used in operator workstation graphics.
h. Verify component inventory as compared to approved submittals.
i. Verify that instruments are installed before calibration, testing, and loop or leak checks.
j. Check instruments for proper location and accessibility.
k. Check instrument installation for correct direction of flow, elevation, orientation, insertion depth, and other applicable considerations.
l. Check flow instruments. Inspect tag number and line and bore size and verify that inlet side is identified and that meters are installed correctly.
m. Check pressure instruments, piping slope, installation of valve manifold, self-contained pressure regulators, and length of pneumatic tubing runs connected to zone differential-air-pressure sensors.
n. Check temperature instruments. Verify material and length of sensing elements.
o. Check control valves:

1) Verify that valve is installed in correct direction.
2) Verify actuator is specified for fail-safe position and jumper/switch settings or mountings are not reverse acting unless necessary.

3) Verify that valve does not allow fluid flow when commanded to fully closed position under system operating pressure.

p. Check dampers:

1) Verify that proper blade alignment, either parallel or opposed, has been provided.
2) Verify that actuator is mounted properly to duct (alignment).
3) Verify that actuator is securely fastened to shaft (does not spin without shaft movement and is ranged properly for fully open/closed position).
4) Without actuator attached verify that damper operates freely, without dragging, when shaft is rotated by hand.

q. Verify that space for spare I/O capacity has been provided.

2. The following verification checks must be performed after energizing each control panel.

a. Measure voltage sources, primary and secondary.
b. Verify each I/O device is landed in accordance with submittals.
c. Verify analog sensors are properly scaled and correct value is reported.
d. Verify analog outputs have correct normal position and move full stroke when so commanded.
e. Verify digital sensors have correct normal position, and state is correctly reported.
f. Verify digital outputs have correct normal state and respond appropriately to energize/de-energize commands.

3. Replace damaged or malfunctioning controls and equipment and repeat testing procedures.

D. Operator Interface Verification Testing: Perform verification testing to confirm graphics are complete, user interface is configured, and both are fully operational on each operator workstation (desktop and laptop computers). Test elements must require verification of all operator interaction tasks including, but not limited to, the following:

1. User account access and configuration.
2. Graphics navigation.
3. Trend data collection and presentation.
4. Alarm handling, acknowledgement, and routing.
5. Time schedule editing.
6. Application parameter adjustment.
7. Manual override control.
8. Report execution.
9. Automatic backups.
10. Web Client access.

E. DDC Validation Testing: The purpose of validation testing is to ensure that the system performs in accordance with the sequences of operation. For each distinct control function include a series of step-by-step cause-and-effect tests to verify each aspect of the sequences of operation.

1. Validation testing must be witnessed by representative of the OBO/PDCS/DE project team, BAS Engineer, and project Commissioning Agent. Schedule validation testing with Project Director/COR.
2. After electrical circuitry has been energized, start units to confirm proper operation.
3. Test and adjust controls and safeties.
4. Test and adjust smoke and fire/smoke dampers.
5. Test and adjust purge system.
6. Test each point through its full operating range to verify that safety and operating control set points are as required.
7. Test each control loop to verify stable mode of operation and compliance with sequences of operation. Adjust PID actions.
8. Test each system for compliance with sequence of operation.
9. Test software and hardware interlocks.
10. Cooling and heating functionality must be tested during their applicable season of operation, winter for heating and summer for cooling.
11. Replace damaged or malfunctioning controls and equipment and repeat testing procedures.

F. Building Accreditation Testing: Prior to building accreditation testing by Diplomatic Security (DS) the BAS subcontractor must certify to the Government that all control wiring, controllers, and equipment have been installed, that entire BAS has been energized, and that BAS network is complete and functioning.

3.8 ADJUSTING

A. Calibrating and Adjusting:

1. Calibrate instruments.
2. Make three-point calibration test for both linearity and accuracy for each analog instrument.
3. Calibrate equipment and procedures using manufacturer's written recommendations and instruction manuals. Use test equipment with accuracy at least double that of instrument being calibrated.
4. Control System Inputs and Outputs:

    a. Check analog inputs at 0, 50, and 100 percent of span.
    b. Check analog outputs using milliampere meter at 0, 50, and 100 percent output.
    c. Check digital inputs using jumper wire.
    d. Check digital outputs using ohmmeter to test for contact making or breaking.
    e. Check resistance temperature inputs at 0, 50, and 100 percent of span using a precision-resistant source.

5. Flow:

    a. Set differential pressure flow transmitters for 0 and 100 percent values with 3-point calibration accomplished at 50, 90, and 100 percent of span.
    b. Manually operate flow switches to verify that they make or break contact.

6. Pressure:

   a. Calibrate pressure transmitters at 0, 50, and 100 percent of span.
   b. Calibrate pressure switches to make or break contacts, with adjustable differential set at minimum.

7. Temperature:

   a. Calibrate resistance temperature transmitters at 0, 50, and 100 percent of span using a precision-resistance source.
   b. Calibrate temperature switches to make or break contacts.

8. Stroke and adjust control valves and dampers, following manufacturer's recommended procedure, so that valve or damper is verified 100 percent open and fully closed.
9. Provide diagnostic and test instruments and gases for calibration of devices and adjustment of system.
10. Provide written description of procedures and equipment for calibrating each type of instrument. Submit procedures for review and approval before initiating startup procedures.

B. Adjust initial temperature, night/unoccupied set back temperatures, humidity, CO_2 and pressure set points.

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide an additional five-day visit to Project for this purpose.

3.9 TESTING, ADJUSTING AND BALANCING (TAB) FOR HVAC

A. BAS subcontractor must work in close cooperation with TAB subcontractor in calibrating all air flow measuring stations, water flow meters, duct and pipe mounted differential pressure sensors/transmitters and zone differential pressure sensors/transmitters.

B. BAS subcontractor must facilitate testing, adjusting and balancing process, as described in Section 230593 “Testing, Adjusting, and Balancing for HVAC”, by:

1. Providing TAB subcontractor with software and tools necessary to interface with control system to test, adjust and balance controlled HVAC systems.
2. Training TAB subcontractor on use of provided software and tools.
3. Providing qualified BAS technician to assist with testing, adjusting and balancing process. Assistance must include but not be limited to:

   a. Providing and implementing global system commands to set VAV boxes, dampers and control valves to maximum, minimum or other positions as required for balancing.
   b. Adjusting system settings such as air flow coefficients, fan speeds, static pressure set points and damper limits to set HVAC systems to design requirements.

C. Air flow coefficients for terminal boxes must be initially set by BAS subcontractor before TAB subcontractor begins work. Air flow coefficients must then be field tested, verified and adjusted by TAB subcontractor to ensure that actual air flow and monitored air flow match.

D. Pressure set points for air distribution systems and hydronic distribution systems must be initially set by BAS subcontractor before TAB subcontractor begins work. Pressure set points must then be field tested, verified and adjusted by TAB subcontractor.

3.10 COMMISSIONING

A. BAS subcontractor must fully participate in the Commissioning process. All necessary support must be provided to the Commissioning Agent to perform project commissioning as described in Section 019115, “Commissioning” and Section 230805, “Commissioning of HVAC”.

B. Section 019115 “Commissioning” identifies general commissioning processes and procedures, as well as roles and responsibilities for all Commissioning Team members. Section 230805 “Commissioning of HVAC” supplements the general requirements specified in Section 019115.

C. Commissioning requirements include but are not limited to: Pre-Functional Checks, Point-to-Point Checks, Startup, Functional Performance Tests, Integration Tests, etc.

D. The Commissioning process does not replace or substitute for BAS subcontractor’s own verification and validation testing.

1. Testing and other activities associated with the Commissioning process are in addition to verification and validation testing required by this Section.
2. Pre-Functional Checklists, Point-to-Point Checklists, Functional Performance Tests, Integration Tests and other testing documents and reports developed by Commissioning Agent and supplied to BAS subcontractor for use in Commissioning activities are in addition to BAS subcontractor developed verification and validation testing plans and reports required by this Section.

E. Pre-Functional Checklists and Point-to-Point Checklists are to be completed and provided to TAB subcontractor prior to start of field work identified in Section 230593 “Testing, Adjusting and Balancing for HVAC.”

3.11 DEMONSTRATION

A. Factory-trained service representative must train Government's maintenance personnel to adjust, operate, and maintain HVAC instrumentation and controls. 40 hours of training must be performed. Refer to Division 01 Section "Demonstration and Training."

3.12 SOFTWARE AND HARDWARE TURNOVER

A. Installation Software Turnover: All installation disks (DVDs or CDs) and licenses for software installed on each OW (BAS Software, Production Software and Operating System Software) and

controller must be turned over to the Government for use in rebuilding an OW or controller after catastrophic failure; this must occur for each BAS installed at post. In addition, perform the following:

1. Give post Facility Maintenance staff all software required to rebuild an OW or Controller from scratch in event of hardware failure.
2. Provide step-by-step instructions describing process for disk installation of each software package and/or driver.
3. Deliver second copy of software and associated licenses to OBO/OPS/FAC "BAS Support" for centralized backup by OBO.
4. Provide one year of system support.

B. BAS Backup Turnover: The BAS Contractor, after commissioning has been completed, must create a current backup of the data, programming, graphics, settings, license files, and any other files necessary to restore a controller, OW or Server. This must be done for each BAS installed at Post. In addition, perform the following:

1. Configure each backup to allow Facility Maintenance staff to recover associated BAS controller, OW, or Server in event there is BAS failure.
2. With each backup, provide step-by-step instructions on how to recover a controller, OW or Server.
3. Deliver second copy of all BAS backup to "BAS Support" for centralized backup by OBO.

C. [Recovery of Existing BAS Hardware: When BAS is replaced or renovated, Contractor must ship all functional existing Operator's Workstations and existing Controllers from Post to OBO "BAS Support". Care must be taken in the removal and packing of the BAS equipment to avoid causing damage.]

3.13 POINT LIST SCHEDULE

A. The following scheduled point lists for air handlers, chilled water (CHW) systems, hot water (HW) systems, variable air volume (VAV) terminal units, and for other miscellaneous systems presented, identify minimum requirements for the control system to the Designer of Record (DOR). The DOR is responsible for generating Issue For Construction (IFC) design documents that incorporate these minimum requirements into the drawings. Refer to the Part 1 Article on SYSTEM PERFORMANCE for requirement to supplement points based on project design. DOR must delete Part 3 Article POINT LIST SCHEDULE from the 230905 specification before IFC design documents are generated.

END OF SECTION 230905

SECTION 234105 - AIR FILTRATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes factory-fabricated air-filter devices and media used to remove particulate and gaseous matter from air for HVAC applications not served by Section 237315 Central Station Air Handling Units. (for example, Fan Coil Units filters or AHU filters for on-compound outbuildings serving spaces without offices (warehouses/shops) or residences,

B. Related Sections include the following:

1. See Section 237315 “Central-Station Air-Handling Units” for filtration requirements in areas with environmental security protection (chem/bio protection).

1.2 DEFINITIONS

A. [HEPA: High-efficiency particulate air.]

B. [HEGA: High-efficiency gas adsorption.]

C. MERV / MERV A: Minimum Efficiency Reporting Value; “A”: per ASHRAE Standard 52.2 MERV “A:” has been adopted to clarify performance degradation of filters that rely on electrostatic and similar mechanisms to achieve higher MERV rating that subsequently degrades after initial operation.

1.3 SUBMITTALS

A. Product Data: Include dimensions and weights; operating characteristics (e.g., particulate MERV / MERV A rating, gas adsorption residence time, temperature and humidity operating and storage limits); required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; collection efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.

B. Shop Drawings: Include plans, elevations, sections, and details to illustrate component assemblies and attachments.

1. Show filter rack assembly, dimensions, materials, methods of assembly of components, and appurtenances required for project conditions and design (e.g., lifts, test ports, p-traps, electronic trap primer for special conditions).

2. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages.

C. Calculations: Provide particulate and gaseous media selection and lifecycle calculations based upon local pollutants (e.g., agicn.org) and EPA IAQ standards for worst case scenario per National Air Filtration Association (NAFA) Guide to Air Filtration.

D. Operation and Maintenance Data: Provide emergency, operation, and maintenance manuals for each type of filter and filter rack. Include recommended change-out schedule and replacement procedure based upon contaminant concentration levels and local environmental conditions.

E. Reports: Final, certified test reports for field and factory testing, including HEPA and HEGA testing where applicable, must be provided to the Project Director/COR for forwarding to OBO/PDCS/DE/ME for approval and to OBO/OPS/FAC for inclusion in the Maintenance Database.

1.4 QUALITY ASSURANCE

A. [Basis of Design: Drawings indicate size, profiles, and dimensional requirements of air filters and are based on the specific system indicated. Other manufacturers systems with equal performance characteristics may be considered.]

B. Comply with NFPA 90A and 90B.

C. Comply with ASHRAE 52.2 for methods of testing and rating air-filter units.

D. Comply with ASHRAE RP-671.for critical IAQ air filtration applications.

E. [Comply with IEST-RP-CC001.3 for HEPA filters]

F. [Comply with IEST-RP-CC008 for gas phase adsorber cells.]

G. [Comply with applicable sections of ASME N509 for high efficiency air cleaning devices.]

H. [Comply with applicable ASME AG-1 for HEPA and HEGA filters.]

1.5 DELIVERY AND STORAGE

A. Delivery: Filters must not be shipped installed in air handling unit filter housing. Filters must be packaged in sealed heavy duty plastic to protect from moisture during shipping and storage, and securely placed in heavy cardboard boxes to protect filters from damage during shipping. Filter manufacturer and model number must be labeled on outer most packaging.

B. Handling and Storage: Filters must be carefully handled and stored in dry space, safe from inadvertent construction damage, until ready for installation. Filters must be stored at temperature and humidity within allowable ranges established for filter operation by manufacturer.

1.6 EXTRA MATERIALS

A. Furnish extra material described below that match the products installed that are packaged and labeled for storage as described in the Part 1 Article on DELIVERY AND STORAGE.

1. For non-custom air handling units, provide one complete set of replacement filters for each AHU. This set of filter is in addition to all filters required for construction and initial occupancy.
2. For fan coil units (FCU), provide three sets of replacement filters for each FCU - one to be installed at the end of the project and two sets of filters to be turned over to Post. These three sets of filters are in addition to all filters required during construction and for initial occupancy.

PART 2 - PRODUCTS

2.1 CONSTRUCTION FILTERS

A. ASHRAE 52.2 MERV 11/11A filter is the minimal acceptable construction filter for air handling unit. ASHRAE 52.2 MERV 8/8A filter is the minimal acceptable construction filter rating for various types of fan coil units.

2.2 EXTENDED-SURFACE, DISPOSABLE PANEL FILTERS AND BAG FILTERS

A. Description: High efficiency disposable filter in enclosing frame, sizes as [noted on Drawings].

B. Efficiency: ASHRAE 52.2 MERV 13/13A[or greater as required by contract documents].

C. Media: Fibrous material formed of moisture resistant, microfine glass formed into uniformly spaced close pleat and held by self-supporting wire grid. Filter must be capable of withstanding 2.5 kPa without failure of the media pack. Electrostatic media must not be used to achieve the required particle capture performance.

D. Media and Media-Grid Frame: The filter frame/media pack assembly must be constructed to ensure a rigid and durable filter.

2.3 [HEGA /ADSORPTION FILTERS FOR NON-AHU APPLICATIONS

A. Description: Use one or more adsorption filters as required to conform to U.S. EPA National Ambient Air Quality Standards (NAAQS) and Indoor Air Quality (IAQ) standards for removal of gaseous industrial air pollutants. Use historical data on outdoor air quality from the local area or nearest airport to determine the optimum filter selection. Filter set must be factory fabricated adsorption media trays in deep-V formation.

B. Media: Adsorption media (e.g., activated carbon, impregnated carbon) mounted in removable trays. Media must be sized based upon capacity of airflow; [W.W] kg ([X.X] lb) of activated carbon per [YYY] L/s ([ZZZ] cfm)). Comply with the media manufacturer's recommendations for the media application.

C. Media Frame: If relative humidity level in air remains below 70 percent, disposable epoxy coated frames are acceptable. If relative humidity level rises above 70 percent, install rechargeable plastic or stainless steel frame.

D. Housing: 1.6mm- (0.064 inch) thick, galvanized steel; for side servicing through gasketed access side doors. Equip housings with metal slide channel tracks to hold adsorption media trays. Where outdoor humidity exceeds 12 g water per Kg of dry air, provide provision for removing excess moisture upstream of HEGA media.

E. Post Filters: Provide minimum MERV 8 post filters downstream of adsorption media filters where recommended by manufacturer to capture adsorption media fines.

F. Mounting Frames: Provide bolted filter-sealing mechanism to mount and continuously seal each individual filter. Filter frame and housing must incorporate knife-edge fluid seal design that mates into a fluid-filled perimeter channel on mounting face of filter. Weld seams and joints that are adjacent to any portion of any gasket-sealing surface must be ground smooth and flush with adjacent metal surfaces.]

G. HEGA Filters: Fabricate and label in accordance with IEST-RP-CC008 for gas phase adsorber cells.

H. HEGA Test Canister: Replaceable, threaded 50-mm dia. test canisters, as recommended by filter manufacturer.]

2.4 [HEPA FILTERS

A. Description: Each HEPA Filter must be fabricated and labeled as 99.97 percent dust spot efficiency (ASHRAE 52.2 MERV 17 and higher) per IEST RP-CC001 for Type A performance and Grade 2 construction. The filter pack must be constructed by pleating a continuous sheet of filter media per IEST RP-CC001 for Type a performance and Grade 2 construction.

1. Fabricate and label in accordance with applicable sections of both ASME N509 High Efficiency Air Cleaning Devices, IEST-RP-CC008 for gas phase adsorber cells, and ASME AG-1 Code on Nuclear Air and Gas Treatment.

B. Media: UL 586, fibrous glass, constructed of continuous sheets with closely spaced pleats to remove 99.97 percent of all particulate matter 0.3 microns or greater.

C. Media to Frame Side Bond: Polyurethane foam.

D. Face Gasket: Self healing, non-flowing elastomeric gel sealant.

E. Filter Guard: Provide an expanded metal grille over exposed HEPA filter material that does not interfere with filter operation.

F. Mounting Frames: Provide bolted filter-sealing mechanism to mount and continuously seal each individual filter. Filter frame and housing must incorporate knife-edge fluid seal design that mates into a fluid-filled perimeter channel on the mounting face of the filter. All weld seams and joints that are adjacent to any portion of any gasket-sealing surface must be ground smooth and flush with the adjacent metal surfaces.]

2.5 REPLACEABLE TYPE FILTERS

A. Description: Replaceable type filters are to be used in fan coil units and heat pump/split systems. An ASHRAE 52.2 MERV 8 filter is the minimal acceptable filter rating.

B. Media: UL 900 fiber in fiberboard casings, thickness 25-50 mm as applicable to equipment to be installed on.

C. Media Frame: Media must be within cardboard frame.

2.6 [INERTIAL SEPARATOR FILTERS

A. Description: Inertial separators must be used to remove sand or blowing dust when environment at locale required in order to achieve required performance. Each air cleaner must consist of housing, bleed manifold, cell bodies, blade packs, bullnoses, and inlet screen.

B. Housing: Housings must be constructed of not less than 3.0 mm (11-gauge) [stainless] steel. The housing must be of all welded construction and equipment with continuous standing flanges around the periphery of both air entering and air exiting sides. Flanges must have pre-drilled bolt holes to facilitate field installation. The housing consists of one or more cells depending on airflow and resistance requirements.

C. Bleed Air Manifold: Housings must be equipped with a bleed air manifold constructed of not less than 3.0 mm (11-gauge) [stainless] steel, all welded construction. Manifold outlets must have a continuous standing flange with pre-drilled bolt holes to facilitate field connection. Manifolds must be sized to provide uniform airflow through each cell's dust bin for proper balance and dust removal.

D. Blade Packs: Blade packs must be constructed of not less than 0.91 mm (20-gauge) [stainless] steel with heli-arc welded construction. Blade pack vanes are to be individually formed and welded. Vanes must be arranged to provide a circuitous path to the airflow and redirect the air toward the clean air outlet. The air passageway between adjacent blades must have a minimum width of 4.83 mm. Blade packs must be removable to provide for inspection or service. Individual cells must include two removable blade packs and have a maximum center-to-center dimension of 127 mm and must be 610 mm in length.

E. Bullnose: The bullnose must be aerodynamically formed of 1.5 mm (16-gauge) [stainless] steel to provide proper air entry. One bullnose will be required for each two blade packs to

properly direct air to each tapered cell. Bullnose clamps must be constructed of 4.83 mm [stainless] steel and must be retained by 8 mm threaded stock welded to the center divider. The center divider must be constructed of 16-gauge [stainless] steel.

F. Bleed Slot: Bleed slots must be an integral part of each dust bin. The bleed slot/dust bin must be constructed of not less than 1.5 mm (16-gauge) [stainless] steel. The bleed slot must have a rounded entry configuration to minimize obstruction or plugging under heavy dust concentrations.

G. Inlet Screen: Inlet screens must consist of a 26-gauge, four-mesh, galvanized hardware cloth integrally supported by a double layered [1.5 mm (16-gauge) galvanized] [stainless] steel frame. Inlet screens must be bolted to the housing.

H. Finish: All finished components must be phosphatized and given a coat of zinc chromate primer and finished with a coat of grey enamel.

I. Efficiency: The air cleaner efficiency must not be less than 93 percent on Standardized Coarse Air Cleaner Test Dust, specific gravity of 2.54 and at 23.9 degrees C, at a clean airflow rate of 472 L/s per single cell using a bleed rate equaling 10 percent of inlet flow. Inlet to clean air outlet resistance must not exceed 290Paa at 472 L/s clean airflow.]

2.7 FACTORY QUALITY CONTROL

A. [Factory-Installed Test Ports: Manufacturer must provide factory-installed capped test ports in pre-filter access door. Place one in middle of each filter tier to facilitate field verification of aerosol uniformity during testing of air handling units with HEPA or HEGA filters.]

B. Test pre-filters in accordance with ASHRAE Standard 52.2.

C. Air Separator Filters: Test in accordance with general requirements outline in ISO 5011.

D. [HEPA Filters: Test in accordance with IEST RP-CC001.]

E. [HEGA Filters: Test in accordance with IEST-RP-CC008 for gas phase adsorber cells.]

F. [HEGA Test Canisters: When HEGA filters are used for air filtration, provide three accessible test canisters. Install test canisters in bypass line. Subject canisters to same airstream and approximate air flow (velocity and residence time) as primary HEGA filters. Install on AHU with bulk adsorption media filter sections.]

G. [HEPA and HEGA Filters: Test in accordance with applicable sections of both ASME N509 High Efficiency Air Cleaning Devices and ASME AG-1 Code on Nuclear Air and Gas Treatment. Minimum Testing Requirements:

1. Test filter section of AHU for filter alignment and fit, and for clamping mechanism operation.

2. Leak test sealing surfaces of filter section in accordance with ASME AG-1 before leaving factory. Record pressure readings once per minute for five minutes. Maximum leak rate must not exceed 0.0008 liters per second per cubic meter of filter housing volume.]

PART 3 - EXECUTION

3.1 INSTALLATION

A. Use construction filters during construction to protect air handling units and ductwork until all construction such as millwork, stone cutting, and painting are complete in each building.

B. Installation of any filters other than construction filters must not occur until all construction work/rework that may create dusty or volatile chemicals has ceased.

C. Clean the housing and ducts to remove all dust and particulates before installing activated carbon and HEPA filters.

D. Install filter frames according to manufacturer's written instructions.

E. Position each filter unit with clearance for normal service and maintenance.

F. Install filters in position to prevent passage of unfiltered air.

G. Filter gage static-pressure tips upstream and downstream from filters to measure pressure drop through filter are factory installed. Mount filter gages on outside of filter housing or filter plenum in an accessible position. Adjust and level inclined gages.

H. Coordinate filter installations with duct and air-handling unit installations.

I. Installation of air separator filters must be per manufacturer’s recommendations. Air separators will require material handling centrifugal fans with discharge piping to atmosphere.

3.2 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory trained representative to inspect field-assembled components, filter and filter-frame installation, and electrical wiring. Report results in writing.

B. [Field-Installed Test Ports: Manufacturer must provide two test ports capable of being installed in field ductwork for sampling of airstream required during HEPA or HEGA filter testing. Test ports must be cast aluminum or zinc alloy, capable of being screwed in over neoprene gasket and sealed with removable cap.]

C. [HEGA Filter Systems: Install sampling canister assemblies in accordance with manufacturer's installation requirements.]

D. [HEPA and HEGA Filter Systems: Locate factory installed sampling and injection ports, and install upstream and downstream sampling ports required by filter manufacturer for testing filters.

1. Downstream readings must not exceed 0.1 percent of upstream HEGA filter gas adsorbent test gas concentration, or 0.03 percent of upstream HEPA value for test particles (e.g., DOP or PAO).]

3.3 CLEANING

A. After completing system installation and testing, adjusting, and balancing air-handling and air-distribution systems, wipe down filter housings and install new pre-filter media.

3.4 DEMONSTRATION

A. Manufacturer's field service representative must train post technicians on operation and maintenance of installed **[HEPA][and] [HEGA]** filters.

END OF SECTION 234105

SECTION 236422 - HEAT RECOVERY CHILLERS AND SIMULTANEOUS HEATING-COOLING CHILLER SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes packaged, electric-motor-driven heat recovery modular chillers.

B. This Section identifies standards for heat recovery chillers when these chillers are used as part of a Contractor-selected approach to conformance with energy efficiency requirements of the Chapter 13 of the OBO Building Code (International Building Code as amended by OBO).

C. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete” where concrete base is used.
2. Section 055005 “Metal Fabrications” where steel framing and supports are used.
3. Division 07 Section on roof accessories.
4. Section 230719 “HVAC Piping Insulation.”
5. Division 23 Section on refrigerant monitoring and safety equipment for refrigerant monitors, alarms, supplemental breathing apparatus, and ventilation equipment interlocks.
6. Section 260518 “Low Voltage Electrical Power Conductors and Cables” for connecting electrical and controls wiring.
7. Section 260525 “Grounding and Bonding for Electrical Systems” for grounding water chillers.
8. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash compliance and training.

1.2 DEFINITIONS

A. EER: Energy-Efficiency Ratio. Ratio of cooling capacity given in terms of Btu/h to total power input given in terms of watts at any given set of rating conditions.

1.3 SYSTEM PERFORMANCE REQUIRMENTS

A. Chiller Power Characteristics: Suitable for voltage and frequency supplied by the local utility or Post, as applicable.

1.4 NOTE: REFER TO OBO-ICS IMC CHAPTER 11 REFRIGERATION AND EDIT SECTION ACCORDINGLY.

A. Design chiller for parallel evaporator water flow.

B. The liquid to be heated/chilled will be water containing corrosion inhibitors or isolated by means of a double wall heat exchanger.

C. [Seismic Performance: Chillers shall withstand effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."]

D. [Corrosion Resistance: Units installed in an outdoor location shall be covered or placed in a sheltered location as specified by the equipment manufacturer.]

E. Simultaneous Heating and Cooling Heat Pump: Provide a simultaneous heating and cooling heat pump with valves that allow each module to be operating in either heating, cooling, or simultaneous dedicated heat recovery mode.

1. This shall be accomplished by use of butterfly valves on headers to direct flow of water from heating, cooling and source sink loops which divert water to achieve all heating and cooling needs of a building without use of refrigerant side valves or inefficient co-current heat exchanger flow.
2. In cooling mode, chilled water is routed to chilled water header cooling loop, condenser water to hot water loop, and excess hot water from condenser water that a building does not need is routed to the sink.
3. In heating mode, chilled water loop has heat extracted from it and rejected back into a building where heating needs exist, and additional heating requirements are made up by extracting heat from source.
4. All control of modes of operation, valve positioning, staging of compressors, and safeties shall be provided by manufacturer of simultaneous heating and cooling heat pump.

1.5 SYSTEM DESCRIPTION

A. Heat Recovery Chiller shall consist of modules that each incorporate compressors in a refrigerant circuit; that circuit shall be constructed to be independent from other circuits from refrigeration and electrical standpoint.

1. Each refrigerant circuit shall consist of controls and dual compressors, including at least one variable speed compressor, feeding common condenser, evaporator, and thermal expansion valve.
2. Heat Recovery Chiller shall be able to produce hot water (i.e., 55 deg. C or higher condenser leaving water temperature) even in event of failure of one or more refrigerant circuits.
3. Circuits shall not contain more than 0.45 kg. (1 lb.) of refrigerant per nominal Ton of Refrigeration.

1.6 SUBMITTALS

A. Product Data: Include refrigerant type; oil type; rated capacities; power factor; shipping, installed, and operating weights; tagged locations of vibration/seismic supports; furnished specialties; and accessories for each model indicated. Performance data shall demonstrate conformance to simultaneous cooling and heating demand at scheduled summer/winter design conditions.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Drawings shall include plan and elevation views of equipment.

C. Design Calculations: Calculate requirements for selecting individual vibration isolators and seismic restraints.

D. Vibration**[/Seismic]** Isolation Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment.

E. Wire Diagrams detailing wiring for power and control systems and differentiating between manufacturer-installed and field-installed wiring.

F. Piping Diagrams detailing connections, including flushing bypass connection, between chiller and ancillary equipment and differentiating between manufacturer-installed and field-installed piping and accessories.

G. Coordination Drawings: Floor plans drawn to scale and coordinating the following, as appropriate:

1. Structural Supports.
2. Piping roughing-in requirements.
3. Wiring roughing-in requirements. Determine spaces reserved for electrical equipment.
4. Access requirements around other work, including working clearances to mechanical controls and electrical equipment, and any building obstructions that may reduce airflow to condenser coils.

H. Product Certificates: Certifications required in Part 1 Article on QUALITY ASSURANCE, as well as certification that chillers have been factory-started and function properly.

I. Source quality-control test reports as required in the Part 2 Article on SOURCE QUALITY CONTROL. Include copy in Operating and Maintenance Manual. Submit an extra copy for Post Facility Manager.

J. Field Report: Performance testing as required in Part 3 Article on START-UP SERVICE. Include copy in Operating and Maintenance Manual. Submit an extra copy for Post Facility Manager.

K. Operating and Maintenance Manuals: Include operating and maintenance manuals for the chiller and pump/heat exchanger/control package. Include information regarding availability of spare parts in the country where this unit is to be deployed.

L. Written Government Acceptance.

1.7 QUALITY ASSURANCE

A. Capacity Rating Certification: Signed by manufacturer certifying chiller design has been tested and rated using calibrated instrumentation in accordance with methods described in AHRI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle," for water-cooled chillers.

B. ASHRAE Certification: Signed by manufacturer certifying compliance with ASHRAE 15, “Safety Code for Mechanical Refrigeration.” Comply with ANSI/ASHRAE Guideline 147, “Reducing Release of Halogenated Refrigerants from Refrigeration and Air-Conditioning Equipment and Systems” for refrigerant leaks, recovery, and handling and storage requirements.

C. Comply with requirements of the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

D. Comply with UL 1995 “Heating and Cooling Equipment.”

E. Government Acceptance: After A/E of Record has reviewed and approved chiller submittals, contractor shall obtain mandatory written acceptance of chiller submittals from Project Director/COR based on input from OBO/PDCS/DE mechanical engineer assigned to project prior to procurement of each chiller.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Ship water chillers from the factory with modules wired and fully charged with refrigerant or nitrogen. If shipped with nitrogen, provide refrigerant canisters capable of providing full operating charge of refrigerant and oil for all modules.

1.9 COORDINATION

A. Contractor shall coordinate size and location of concrete pads with suitable adjacent maintenance area. Cast anchor-bolt inserts into pads. Concrete, reinforcement, and formwork requirements are specified in Section 033000 “Cast-in-Place Concrete.”

B. If roof installation is approved by OBO DE/ME engineer, Contractor shall coordinate installation of roof curbs/structural platforms and roof penetrations. For concrete, reinforcement, and formwork requirements refer to Section 033000 “Cast-in-Place Concrete.” For structural platforms requirements, refer to Section 055005 “Metal Fabrications.” For roof penetration assembly, refer to Division 07 Section on roof accessories.

1.10 WARRANTY

A. Refrigeration Compressor Warranty: Manufacturer's standard form signed by the manufacturer in which manufacturer agrees to repair or replace compressors that fail in materials or workmanship within specified warranty period.

1. Failure includes, but is not limited to, inability to maintain set temperature.
2. Compressor Warranty Period: Five years from date of Substantial Completion.

1.11 EXTRA MATERIALS

A. Furnish extra materials identified below. Package extra materials with protective covering for storage and identification labels describing contents.

1. One control circuit board of each type.
2. Power phase monitor.

PART 2 - PRODUCTS

2.1 HEAT RECOVERY CHILLER MODULES

A. Available manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following

1. Multistack LLC: Multistack Dedicated Heat Recovery Chiller.
2. Arctichill.

B. Description: Heat Recovery Chiller shall consist of modules that each have controls and an independent refrigerant circuit that incorporates dual rotary scroll type compressors, condenser and evaporator heat exchangers, and electronic expansion valve. Multi-circuit chiller shall be able to produce chilled water and condenser water even in event of failure in one or more refrigerant circuits.

C. Cabinet: Provide lifting base, structural frame, and housing (weatherproof if scheduled to be mounted outdoors) in accordance with Table 2.1, “Heat Recovery Chiller Requirements – Building Cooling Application.”. Coat the base, frame, and housing with a corrosion resistant coating capable of withstanding a 1000-hour salt spray test according to ASTM B 117 with a minimum ASTM 1654 rating of “6.” If base and frame are constructed of stainless or hot dip galvanized steel, then coating is not required unless noted elsewhere. Refer to Table 2.1, for inland and marine module construction requirements.

D. The Heat Recovery Chiller Modules shall be ETL listed in accordance with UL Standard 1995 and CSA certified per Standard C22.2#119, and bear ASME UM stamp on all heat exchangers.

E. [Where site conditions require it, modules shall be capable of being hoisted in elevator having 1200 kg capacity and, where site specific conditions require it, be able to fit through 0.75 x 2.0 meter door set.]

F. Provide chiller array with single point power connection. This shall include pre-engineered wiring for field installation and connection to factory mounted chiller junction box. Electrical junction box shall incorporate a through-the-door disconnect with over-current protection. Junction box shall include individual circuit breakers for each Module Set a maintenance outlet and at least one spare, and shall provide a single point of connection to building power.

TABLE 2.1
HEAT RECOVERY CHILLER REQUIREMENTS –
BUILDING COOLING APPLICATION

COMPONENTS	INLAND LOCATION AND/OR INDOOR INSTALLTION	MARINE LOCATION WITH OUTDOOR INSTALLATION
Module Configuration	N+0 (Maintain minimum scheduled building cooling/heating load)	N+0 (Maintain minimum scheduled building cooling/heating load)
Manifolds	Stainless steel inlet and inline strainer	Stainless steel inlet and inline strainer
Pumps	Cast iron housing; bronze impeller; variable frequency drive (where required by chilled water system design)	Stainless steel housing; bronze impeller; variable frequency drive (where required by chilled water system design)
Valves	Standard shut-off servicing valves on heat exchangers	Stainless shut-off servicing valves on heat exchangers
Housing	Galvanized steel or aluminum	Galvanized steel w/ factory-applied powder coat epoxy finish
Structural Frame	Powder-coated structural steel	Galvanized steel w/ factory-applied powder coat epoxy finish
Lifting Base	Painted structural steel	Hot dip galvanized steel
Control Panel	On chiller	On chiller

G. Note to Table 2.1:

1. Hot-dipped galvanized members shall have all penetrations made before the galvanization is done to minimize early rusting. Minimum coating thickness shall be 70 micrometers (1.60 oz. of zinc per sq. ft.).

2. Review project-specific requirements to address corrosion resistance for outdoor installations. Refer to the Part 1 Article on SYSTEM PERFORMANCE REQUIREMENTS.

2.2 CHILLED AND HOT WATER MAINS

A. Each module shall include supply and return mains for both chilled and hot water. Provide factory installed pressure taps on supply and return water pipes and drain line with 20-mm valve on each water system. Grooved end connections shall be provided for interconnection to DN 150 standard piping with grooved pipe type couplings.

B. Strainer: Each inlet water header shall incorporate built-in removable 30-mesh in-line strainer system to prevent heat exchanger fouling. Construct each strainer of Teflon coated stainless steel mesh with stainless steel supports, with minimum surface area of 0.37 square meters.

2.3 EVAPORATORS AND CONDENSERS

A. Each evaporator and condenser shall be brazed plate heat exchangers constructed of 316 stainless steel; designed, tested, and stamped in accordance with ASME code for 3030 kPa working pressure for refrigerant R-407C and 4500 kPa working pressure for refrigerant R-410A. Mount both condenser and evaporator heat exchanger below compressor to eliminate effect of migration of refrigerant to cold evaporator with consequent liquid slugging on start-up.

2.4 REFRIGERANT

A. Refrigerant must be one of the fluorocarbon gases with number designation and safety classification in accordance with ANSI/ASHRAE 15 & 34. CFC-based refrigerants are prohibited. Refrigerants must have an Ozone Depletion Potential (ODP) no greater than 0.0. Provide Safety Data Sheets (SDS) for all refrigerants. Refer to US EPA Significant New Alternatives Policy (SNAP) for more information.

2.5 COMPRESSOR

A. Each module shall contain two hermetic scroll compressors independently circuited and with internal spring isolation mounted to module with rubber-in-shear isolators. Each system shall include high discharge pressure and low suction pressure manual reset safety cut-outs. Refrigerant circuit charging point shall be on suction side of compressor. Provide acoustical wrap on each compressor.

2.6 INSULATION

A. Hot and Cold Surfaces: Closed-cell, flexible elastomeric, thermal insulation with thermal conductivity of 0.26k (BTU/HR-FT2-°F]/in.) maximum. Insulation shall conform to

ASTM C 534, Type II, for sheet materials. See tables in Section 230719 "HVAC Piping Insulation."

1. Thickness: 19mm minimum.
2. Adhesive: Provide adhesive recommended by insulation manufacturer.
3. Insulation: Provide Factory applied insulation over entire surfaces of water chiller components.

    a. Apply adhesive to 100 percent of insulation contact surface.
    b. Seal seams and joints.

2.7 CENTRAL CONTROL SYSTEM

A. Equip Heat Recovery Chiller with microprocessor-based return water controller. Heat Recovery Chiller shall have capability to operate in response to either entering heating water or cooling water set points. Selection of these two modes of operation shall be made automatically by Heat Recovery Chiller's Master Controller or alternatively, this mode may be set manually or through binary BAS input to controller.

B. Scheduling of the various compressors shall be performed by microprocessor based control system (Master Controller). A new lead compressor shall be selected every 24 hours to assure even distribution of compressor run time. Load limit control shall be available to limit number of compressors that can be energized at one time.

C. The Master Controller shall monitor and report the following on each refrigeration system:

1. Discharge Pressure Fault.
2. Suction Pressure Fault.
3. Compressor Winding High Temperature Fault.
4. Suction Temperature.
5. Evaporator Leaving Chilled Water Temperature Fault.

D. The Master Controller shall monitor and report the following system parameters:

1. Chilled Water Entering and Leaving Temperature.
2. Hot Water Entering and Leaving Temperature.
3. Chilled Water and Hot Water Flow Status.

E. An out of tolerance indication from these controls or sensors shall cause a "fault" indication at the Master Controller and shutdown of that compressor with the transfer of load requirements to the next available compressor circuit. In the case of a System Fault the entire Heat Recovery Chiller will be shut down. When a fault occurs, the Master Controller shall record conditions at the time of the fault and store the data for recall. This information shall be capable of being recalled through the keypad of the Master Controller and displayed on the Master Controller's LCD display. A history of faults shall be maintained including date and time of day of each fault (up to the last 20 occurrences).

F. Individual monitoring of leaving chilled water temperatures from each refrigeration system shall be programmed to protect against freeze-up.

G. The control system shall monitor entering and leaving hot and/or chilled water temperatures to determine system load and select the number of compressor circuits required to operate. Response times and set points shall be adjustable. The system shall provide for variable time between compressor sequencing and temperature sensing, so as to fine tune the Heat Recovery Chiller to different existing building conditions.

H. Interlock condenser water (heating load) pump with Master Controller on chiller, with chiller locked out until condenser water pump is verified "ON." Chilled water pump shall indicate chilled water pump load before chiller will be enabled. If entering heating water temperature exceeds safe limit, Master Controller shall lock out condenser water pump and initiate system alarm at Master Controller

2.8 BUILDING AUTOMATION SYSTEM (BAS) CONNECTION

A. Heat Recovery Chiller shall have factory-installed control panel with hardware and software, and with auxiliary contact to enable building management system to monitor and control set points and chiller control displays and alarms. Inputs/Outputs shall include:

1. Remote Start/Stop.
2. Heating/Cooling Alarm.
3. Run time accumulator.
4. Chiller Run Status Relay.
5. Chiller Failure Alarm (enacted when a preset number of compressors fail).
6. Condenser Water and Chilled Water Flow Switches.
7. Condenser and Chilled Water Entering and Leaving Water Temperatures.

B. Provide communication interface building automation system using BACNET or matching BAS protocol, which shall enable building automation system operator to remotely control and monitor the water chiller from an operator workstation. Control features and monitoring points displayed locally at water chiller control panel shall be available through building automation system

2.9 SAFETIES, CONTROLS, AND OPERATIONS

A. Provide safety controls system for Heat Recovery Chiller unit as follows:

1. Low Evaporator Refrigerant Pressure.
2. Loss of Flow thru the Evaporator or Condenser.
3. High Condenser Refrigerant Pressure.
4. High Compressor Motor Temperature.
5. Low Leaving Evaporator Water Temperature.

B. Failure of Heat Recovery Chiller to start or of Heat Recovery Chiller to shutdown due to any safety cutouts shall initiate an alarm at BAS front end, and failure shall be enunciated by display

of the appropriate diagnostic description at the unit control panel. This annunciation shall be in plain English. Alphanumeric codes shall be unacceptable.

C. The Heat Recovery Chiller shall be furnished with a Master Controller as an integral portion of the Heat Recovery Chiller control circuitry to provide the following functions:

1. Provide automatic Heat Recovery Chiller shutdown during periods when the load level decreases below the normal operating requirements of the Heat Recovery Chiller. Upon an increase in load, the Heat Recovery Chiller shall automatically restart. For loads between minimum and maximum capacity, chiller shall stop and start compressors to track load.
2. Provisions for connection to automatically enable the Heat Recovery Chiller from on-site energy management system.
3. The control panel shall provide alphanumeric display showing all system parameters in the English language with numeric data in English/Metric (selectable) units.

D. Normal Heat Recovery Chiller Operation:

1. When Heat Recovery Chiller is enabled, the factory supplied Master Controller modulates the Heat Recovery Chiller capacity from minimum to maximum as required by the simultaneous water and condenser (hot) water loads.
2. The Heat Recovery Chiller control system shall simultaneously respond to either Leaving (variable flow systems) or Entering (constant flow systems) Condenser (Hot) and Chilled Water Temperatures and will have an integral reset based on each entering or leaving water temperature to provide for efficient operation of compressors at part-load conditions.
3. **[Variable Flow Operation – Chilled and/or Condenser Water: Butterfly type isolation valves shall incorporate appropriate accessories and controls to allow the chiller to operate efficiently. Valves shall modulate via a motorized actuator for leaving water temperature control, chiller minimum flow bypass, chiller no load bypass, or head pressure control.]**

E. Power Phase Monitor: Provide Power Phase Monitor on incoming power supply to Heat Recovery Chiller; Basis of Design, SymCom. This device shall prevent Heat Recovery Chiller from operating during periods when incoming power is unsuitable for proper operation. The Power Phase Monitor shall provide protection against the following conditions:

1. Over and Under Voltage (Brown-Out).
2. Phase Rotation.
3. Loss of Phase.
4. Phase Imbalance.

2.10 ACCESSORIES

A. [Vented Hot Water Heat Exchanger for Potable Water: Hot water heat exchanger shall be double wall vented and certified for use with domestic water.]

B. Power Factor Correction: Provide power factor correction with chiller to meet or exceed a power factor of 0.95 unless contractor certifies that power factor correction shall be provided at the site level to ensure site power factor does not fall below 0.95.

C. Special Tools Kit: Chiller manufacturer shall assemble tool kit specially designed for use in serving the chiller(s) furnished that contains any special tools required to service chiller components not readily available to Government service personnel in performing routine maintenance. Place tools in lockable case with hinged cover. Provide list of each tool furnished and affix list to underside of case cover.

2.11 SOURCE QUALITY CONTROL

A. Factory test fully assembled heat recover chillers before shipping, according to a written protocol. Provide test report indicating test instrumentation, test conditions, acceptable limits for test results, and results. Testing shall, at a minimum, include the following tests performed at the voltage and frequency for the country of installation. Test instrumentation shall be selected and calibrated, and measurements made, in accordance with the "Instrumentation" Section of Appendix C of AHRI Standard 550/590.

1. Perform system measurements of entering and leaving water temperatures, flow rate, and power input. Calculate total system cooling capacity and efficiency in kW/ton and heating capacity and efficiency in Coefficient of Performance (COP).
2. Demonstrate specified compressor phasing in response to increasing and decreasing load conditions.
3. For each compressor module, record compressor RLA, discharge pressure, suction pressure.
4. Demonstrate system protection and auto-restart after the following conditions:

    a. Phase loss.
    b. Power failure.
    c. Flow loss.
    d. Over voltage.
    e. Under voltage.

5. Demonstrate system protection in case of high head pressure.

B. Facilitate witness by OBO/PDCS/DE/ME representative of source quality-control tests described above; notify Project Director/COR of testing date and location 14 days in advance. Provide written protocol to be used for testing at notification.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before water chiller installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, piping, and electrical to verify actual locations, sizes, and other conditions affecting water chiller performance, maintenance, and operations.

1. Final water chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 WATER CHILLER INSTALLATION

A. Install water chillers plumb and level on concrete housekeeping pad, or if roof mounted, on roof concrete pad or structural frame. Concrete base is specified in Division 23 Section, and concrete materials and installation requirements are specified in Section “Cast-in-Place Concrete.”

B. [Anchor chiller mounting frame to concrete base.

1. For supported equipment, install stainless steel anchor bolts that extend through concrete base and anchor into structural slab.
2. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
3. Install anchor bolts to elevations required for proper attachment to supported equipment.]

C. [Structural Roof Frame: Anchor chilled mounting frame to the structural frame.

1.
2. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be anchored.]

D. Vibration Isolation: Vibration isolation devices and installation requirements shall conform to requirements of the OBO Building Code. See Division 23 Section on vibration and seismic controls for HVAC piping and equipment for additional requirements.

E. Maintain manufacturer's recommended clearances for service and maintenance.

F. Verify satisfactory refrigerant charge in accordance with manufacturer service manual.

G. Install separate devices furnished by manufacturer.

3.3 CONNECTIONS

A. Chilled-water, condenser (hot)-water, and heat exchanger piping installation requirements are specified in Division 23 Section on hydronic piping. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install and route piping adjacent to chiller to allow service and maintenance.

C. Install unit connections to both chilled water and condenser (hot) water piping using flanged shut off valves to allow chiller isolation from each system independently for maintenance.

D. Evaporator Connections: Connect inlet to evaporator with controller-bulb well, shutoff valve, thermometer, strainer, pressure gage, and union or flange. Connect outlet to evaporator with shutoff valve, flow switch, flow meter, balancing valve, thermometer, pressure gage, and union or flange.

E. Condenser Connections: Connect inlet to condenser with shutoff valve, thermometer, plugged tee, and pressure gage. Connect outlet to condenser with shutoff valve, thermometer, drain line and shutoff valve, flow switch, flow meter, strainer, and plugged tee.

F. Refrigerant Pressure Relief Valve Connections: For indoor units, extend vent piping to outside without valves or restrictions when ASHRAE 15 requirements dictate

G. Ground water chillers in accordance with Chapter 2 of the OBO Electrical Code. Refer to Section 260525 “Grounding and Bonding for Electrical Systems.”

H. Connect wiring according to Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

I. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 PIPE SYSTEM FLUSHING PROCEDURE

A. Prior to connecting Heat Recovery Chiller to condenser and chilled water loop, flush piping loops with detergent and hot water 43-55 deg. C (110-130 deg. F) mixture to remove previously accumulated dirt and other organic. In old piping systems with heavy encrustation of inorganic materials consult a water treatment specialist for proper passivation and/or removal of these contaminants.

B. During flushing, 30 mesh (max.) Y-strainers (or acceptable equivalent) shall be in place in system piping and examined periodically as necessary to remove collected residue. Flushing process shall take no less than 6 hours or until the strainers when examined after each flushing are clean. Old systems with heavy encrustation shall be flushed for minimum of 24 hours, and may take as long as 48 hours before the filters run clean. Use detergent and acid concentrations in strict accordance with respective chemical manufacturers instructions. After flushing with detergent and/or dilute

acid concentrations, purge system loop with clean water for at least one hour to ensure that all residual cleaning chemicals have been flushed out.

C. Prior to supplying water to Heat Recovery Chiller, coordinate with Section 223230 "Potable Water Treatment" requirements regarding water quality during Heat Recovery Chiller operation. Appropriate Heat Recovery Chiller manufacturer's service literature shall be available to operator and/or service contractor and consulted for guidelines concerning preventative maintenance and off-season shutdown procedures.

3.5 WATER TREATMENT

A. Supply water for both hilled water and heating hot water (i.e. non-potable hot water) circuits shall be analyzed and treated by professional water treatment specialist who is familiar with operating conditions and materials of construction specified for the Heat Recovery Chiller's heat exchangers, headers and associated piping. Cycles of concentration shall be controlled such that recirculated water quality for modular Heat Recovery Chillers using 316 stainless steel brazed plate heat exchangers and carbon steel headers is maintained within parameters identified in Table 3.5, "Water Treatment Parameter":

TABLE 3.5
WATER TREATMENT PARAMETERS

FACTOR	PARAMETER
pH	Greater than 7 and less than 9
Total Dissolved Solids (TDS)	Less than 1000 ppm
Hardness as $CaCO_3$	30 to 500 ppm
Alkalinity as Ca CO_3	30 to 500 ppm
Chlorides	Less than 200 ppm
Sulfates	Less than 200 ppm

3.6 START-UP SERVICE

A. Engage a technician, factory-trained on equipment being installed, to inspect field-assembled components and equipment installation, including piping and electrical connections, and to perform testing and start-up service.

1. To facilitate OBO/PDCS/DE/ME representative witness of testing and start-up service, notify Project Director/COR of testing date and location 14 days in advance.

B. Complete installation and startup checks according to manufacturer's written instructions and perform the following:

1. Verify that refrigerant charge is sufficient and chiller refrigerant circuits have been leak tested.
2. Verify that pumps are installed and functional. Verify proper motor rotation.
3. Verify that chiller properly starts and stops based on system demands, testing both chilled water and heating water as starting variables.
4. Verify that thermometers and gages are installed.
5. Clean factory installed header strainers. Verify that piping systems have been flushed and system strainers cleaned. Verify water treatment added.
6. Operate water chiller for run-in period according to manufacturer's written instructions.
7. Check bearing lubrication and oil levels.
8. Verify that refrigerant pressure relief is vented outside on indoor-mounted units.
9. Verify installation and freedom of movement of vibration isolators and seismic anchors, if required for site, including deflection during water chiller startup and shutdown.
10. Verify and record performance of chilled- and condenser (hot)-water flow and low and high-temperature interlocks.
11. Verify and record performance of water chiller protection devices.
12. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.

C. Field Report: Prepare written startup report that records results of tests and inspections. Provide copy of test report to Project Director/COR before routine operation of equipment during construction.

3.7 OCCUPANCY ADJUSTMENTS

A. Occupancy Adjustments: At times requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site outside normal occupancy hours for this purpose.

3.8 DEMONSTRATION AND TRAINING

A. Factory-trained technician shall demonstrate and train Government’s maintenance personnel. Provide minimum of two sets of training sessions, recorded for future reference, with each set of session held at a distinctly different time period to accommodate personnel identified by Project Director/COR based on input from Post’s Facility Manager. Each set of sessions shall include 4 hours in classroom and 4 hours of demonstration. Schedule one additional training session during the occupancy adjustment visit to allow post personnel to address operating challenges.

1. Training topics shall include adjusting, operating, and maintaining chillers. Include procedures and schedules related to start-up, normal operation, shutdown, unoccupied operation, seasonal changeover, manual operation, controls set-up and programming for maintaining water chillers in coordination with the complete chilled-water system, instrumentation and control system. Review of control drawings and schematics, data in maintenance manuals, and interactions with other systems.

2. Refer to the Part 3 Article on ARC FLASH TRAINING in Section 260573 “Overcurrent Protective Device Coordination Study” for associated training requirements.

END OF SECTION 236422

SECTION 236427 - AIR-COOLED, ROTARY-SCREW WATER CHILLERS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes packaged, electrical-motor-driven, air-cooled, rotary-screw water chillers.

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete” where concrete base is used.
2. Section 055005 “Metal Fabrications” where steel framing and supports are used.
3. Division 07 series on Roof Accessories.
4. Division 23 Section on Common Motor Requirements for HVAC Equipment.
5. Division 23 Section on Sleeves and Sleeve Seals for HVAC Piping.
6. Division 23 Section on Meters and Gages for HVAC Piping.
7. Division 23 Section on General-Duty Valves for HVAC Piping.
8. Division 23 Section on Vibration and Seismic Controls for HVAC.
9. Division 23 Section on Identification for HVAC Piping and Equipment.
10. Section 230719 “HVAC Piping Insulation.”
11. Section 230905 “Instrumentation and Controls for HVAC.”
12. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety.”
13. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
14. Section 260525 “Grounding and Bonding for Electrical Systems.”
15. Section 260915 “Electrical Power Monitoring.”

1.2 DEFINITIONS

A. BAS: Building Automation System.

B. BPVC: Boiler Pressure and Vessel Code.

C. COP: Coefficient of Performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.

D. EER: Energy-Efficiency Ratio. Ratio of cooling capacity given in terms of Btu/h to total power input given in terms of watts at any given set of rating conditions.

E. IPLV: Integrated part-load value. Single-number part-load efficiency figure of merit calculated per method defined by AHRI 550/590 and referenced to AHRI standard rating conditions.

F. NPLV: Nonstandard part-load value. Single-number part-load efficiency figure of merit calculated per method defined by AHRI 550/590 and intended for operation other than AHRI standard rating conditions.

G. TEAO: Totally Enclosed Air Over.

H. TEFC: Totally Enclosed Fan Cooled.

I. TENV: Totally Enclosed Non-Ventilating.

1.3 SUBMITTALS

A. Product Data: Include refrigerant type with Safety Data Sheet; rated capacities; power factor; weights (shipping, installed, and operating); furnished specialties; verification of dimensions; accessories for each model indicated; and tagged locations of vibration/seismic supports. Performance data shall demonstrate conformance to AHRI standard conditions and at site conditions indicated on drawings as well as AHRI standard unloading conditions.

B. Product Certificates:

1. AHRI Certification of Product Ratings certifying that chiller has been tested and rated using calibrated instrumentation in accordance with AHRI 550/590 certification program.
2. ASHRAE Certification signed by manufacturer certifying compliance with ASHRAE 15, “Safety Code for Mechanical Refrigeration.”
3. ASME Form U-1 Manufacturer’s Data Report for Pressure Vessels as required by the provisions of the ASME BPVC Rules, Section VIII, Division 1.

C. Shop Drawings: Drawings shall be signed and sealed by qualified professional engineer and shall include both plan and elevation views of equipment. Include the following:

1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
2. Vibration Isolation Base and Seismic Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include base weights, and auxiliary motor slides and rails.
3. Wiring Diagrams: Detail wiring for power, signal, and control systems. Differentiate between manufacturer-installed and field-installed wiring.
4. Piping Diagrams: Detail connections between chiller and ancillary equipment. Differentiate between manufacturer-installed and field-installed piping and accessories.

D. Coordination Drawings: Floor plans, elevations, and sections drawn to scale that coordinate:

1. Size and location of structural platforms/supports and/or concrete bases with cast anchor-bolt inserts.
2. Roof curbs and roof penetrations.
3. Columns and beams.
4. Piping roughing-in requirements.
5. Wiring roughing-in requirements. Determine spaces reserved for electrical equipment.
6. Access requirements to include working clearances to mechanical controls and electrical equipment.

E. Operating and Maintenance Manuals: Include operating and maintenance manuals for chiller and associated equipment/accessories.

F. Source quality-control test reports as required in the Part 2 Article on SOURCE QUALITY CONTROL. Include copy in Operating and Maintenance Manual.

G. Field Report: Performance testing as required in the Part 3 Article on STARTUP SERVICE. Include copy in Operating and Maintenance Manual.

1.4 QUALITY ASSURANCE

A. UL: Comply with UL 465 "Safety Central Cooling Air Conditioners" and standard UL 1995 "Heating and Cooling Equipment."

B. OBO Electrical Code: Comply with OBO Electrical Code (NFPA 70, National Electrical Code as amended by OBO). Note that electrical components, devices, and accessories shall be listed and labeled as defined in NFPA 70 (as amended by OBO), Article 100, by a testing agency acceptable to authorities having jurisdiction.

C. ASHRAE: Comply with ANSI/ASHRAE 147 Guideline 3 for refrigerant leaks, recovery, and handling and storage requirements.

D. Government Acceptance: After A/E of Record has reviewed and approved chiller submittals, contractor shall obtain mandatory written acceptance of chiller submittals from Project Director/COR (based on input from OBO/PDCS/DE mechanical engineer assigned to project) prior to procurement of each chiller.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Transport chillers from the factory fully charged with **[refrigerant and oil][nitrogen to protect against refrigerant leaks during transport and ship oil in container separate from chiller]**. Maintain protective crating and covering to protect chillers. The unit will be covered at the factory with a PVC coated polyester tarp that is tied to the chiller base to help protect the chiller from weather and debris during shipment especially in the winter months and on shipping vessels.

B. Handle chillers according to manufacturer's written rigging and installation instructions for unloading, transporting, and setting in final location.

C. Store chillers to prevent damage. Store chillers in clean dry space to protect from weather, humidity and temperature variations, dirt and dust, fumes, water, and construction debris. Note that protection from 'weather' includes wind-driven elements such as sand and salt.

D. Any materials found damaged must be replaced at Contractor's expense.

1.6 WARRANTY

A. Refrigeration Compressor: Manufacturer's standard form in which manufacturer agrees to repair or replace compressors that fail in materials or workmanship within specified period.

1. Failure includes but is not limited to inability to maintain set temperature.
2. Warranty Period: Five years from date of Substantial Completion.

1.7 EXTRA MATERIALS

A. Furnish extra materials identified below. Package extra materials with protective covering for storage and identification labels describing contents.

1. Power phase monitor.
2. One complete set of oil filters and water filters as applicable.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Carrier Global Corporation.
2. Daikin Applied.
3. Trane Technologies.
4. York; a Johnson Controls company.

2.2 SYSTEM DESCRIPTION

A. Packaged assembly, factory-assembled, and factory-tested air-cooled, rotary-screw chiller including lifting base, mounting frame, casing, compressor (to include lubrication system), heat exchanger, condenser coils, condenser fans, integrated controls, interconnected piping, interconnected wiring, indicated accessories, and motors.

2.3 PERFORMANCE REQUIREMENTS

A. Efficiency: Chiller Full-Load Efficiency and IPLV shall meet or exceed those required by ASHRAE 90.1 for air-cooled chillers.

B. Seismic Performance: Chillers shall withstand effects of earthquake motions determined according to ASCE/SEI 7. **[Designer of Record shall insert seismic risk category requirement for project location.]**

1. Term "withstand" means "unit will remain in place without separation of any parts from device when subjected to seismic forces specified, and unit will be fully operational after seismic event."
2. Vibration isolation integral to the equipment shall be designed/selected by chiller manufacturer to meet Project seismic criteria.

C. Wind Load Rating: Unit shall be tested and rated to withstand wind speeds up to maximum design criteria for project location. **[Designer of Record shall insert wind speed requirement for project location.]** Provide engineer-stamped certificate that equipment has been evaluated and built to meet the required wind velocity.

D. Site Altitude: Chiller shall be suitable for altitude in which installed without affecting performance indicated. Adjust affected chiller components to account for site altitude of **[Designer of Record shall insert altitude requirement for project location]**.

E. Noise Rating: Provide sound power level measured according to ANSI/AHRI 370 “Sound Performance Rating of Large Air-cooled Outdoor Refrigerating and Air-conditioning Equipment.” Isolate vibrating, reciprocating, and rotating equipment mounted to roof or building structure from its associated piping and ducting and from building structure.

F. Outdoor Operating Conditions:

1. High Temperature: Unit shall have high-ambient operating capability up to **[51][XX]** deg C.
2. Low Temperature: Provide low-ambient controls for operation down to **[-15][XX]** deg C. If propylene glycol mixture is used to prevent freezing, equipment shall be sized to allow for derated capacities. Ethylene glycol and heat trace shall not be used to meet this requirement.

G. Corrosion Resistance: Chiller shall be suitable for outdoor installation indicated and capable of withstanding ASTM B117 salt spray test based on the level of corrosion risk as identified for the site in OBO IBC Appendix W. For this contract, follow the requirements for **[Low/Moderate][Extreme]** Risk.

1. Low/Moderate Risk:

   a. Base, frame, and casing: 1,000 hours
   b. Coils: 1,000 hours

2. Extreme Risk:

   a. Base, frame, and casing: 10,000 hours
   b. Coils: 5,000 hours

H. Power Factor Correction: Provide power factor correction (either at chiller level or site level) to maintain or exceed power factor of 0.95. (Note: this is often provided via VFD but corrective capacitors are equally acceptable.)

I. Automatic Restart: After power interruption, equipment and associated controls will automatically return to operating state without need for manual intervention.

2.4 REFRIGERANT

A. Refrigerant: Refrigerant must be one of the fluorocarbon gases with number designation and safety classification in accordance with ANSI/ASHRAE 15 & 34. CFC-based refrigerants are prohibited. Refrigerants must have an Ozone Depletion Potential (ODP) no greater than 0.0. Provide Safety Data Sheets (SDS) for all refrigerants. Refer to US EPA Significant New Alternatives Policy (SNAP) for more information.

B. Refrigerant circuits: Two or more independent refrigerant circuits.

C. [Refrigerant Detector and Alarm. This is only required for evaporators mounted remote from chiller. Detector must be the continuously-operating, halogen-specific type, appropriate for the refrigerant in use. Detector must have an adjustable sensitivity such that it can detect refrigerant at or above 3 parts per million (ppm). Detector must be supplied factory-calibrated for the appropriate refrigerant(s). Detector must be provided with an alarm relay output which energizes when the detector detects a refrigerant level at or above the TLV-TWA (or toxicity measurement consistent therewith) for the refrigerant(s) in use. The detector's relay must be capable of initiating corresponding alarms and ventilation systems as indicated on the drawings. Detector must be provided with a failure relay output that energizes when the monitor detects a fault in its operation. Detector must be compatible with the facility's building management system.]

2.5 EVAPORATOR

A. Either brazed-plate or shell-and-tube configuration.

1. Shell and Tube:

a. Designed, inspected, and stamped in accordance with ASME BPVC Section VIII requirements.
b. Shell Material: Rolled carbon-steel plate with welded seams.
c. Shell Heads: Removable carbon-steel heads located at each end of tube bundle.
d. Tubes: Copper.

2. Brazed Plate:

a. Designed, inspected, and stamped in accordance with ASME BPVC Section VIII requirements.
b. Direct expansion, brazed-plate.
c. Type 304 or 316 stainless steel.

2.6 CONDENSER (AIR-COOLED)

A. Coils: Copper fins bonded to seamless copper tubing. In areas subject to acid rain as approved by OBO/PDCS/DE Mechanical Engineer, provide epoxy-coated aluminum fins. See Corrosion Resistance under Article on "Performance Requirements."

B. Fans: Direct-drive propeller type, statically and dynamically balanced, with vertical air discharge for high efficiency and low sound.

C. Fan Guards: Removable steel safety guards with corrosion-resistant coating.

D. Fan Motor: TEAO or TENV with bearings permanently lubricated and having built-in current- and thermal-overload protection. Maximum 960 RPM at 60 Hz or 800 RPM at 50 Hz. High efficiency, Class F insulation, 3-phase.

E. Sound Package: Provide factory weatherproof acoustically-lined compressor enclosure.

F. Coil Protection: Provide louvers to protect coils.

G. Compressor Protection: Provide either security bars or louvers to protect compressors.

2.7 COMPRESSORS

A. Positive displacement, direct drive, oil-lubricated, rotary screw type. The compressor housing shall be of cast iron. The rotor shall be manufactured from forged steel. The compressor shall incorporate a complete anti-friction bearing design.

1. Capacity Control: Fully modulating control from 100 percent to 20 percent of full load.
2. Lubrication System:

   a. Oil delivered by positive system pressure differential.
   b. Dual oil filter.
   c. Immersion oil heater.
   d. Sight glass.
   e. Strainer.
   f. Magnetic plug or removable magnet in sump.
   g. Factory-piped, refrigerant-cooled oil cooler.
   h. Oil separator designed, tested, and stamped in accordance with ASME Boiler and Pressure Vessel Code, Section VIII, Division 1.

3. Compressor Motor:

   a. Type: TEAO or TEFC.
   b. Maximum operating speed: 3000 RPM at 50 Hz or 3600 RPM at 60 Hz.
   c. Mounting: D-flange, bolted to cast iron adaptor mounted on the compressor.

4. Vibration Isolation: Mount individual compressors on either of the following:

a. Seismic restrained-spring isolators with minimum deflection of 25 mm
b. Manufacturer recommended neoprene isolators.

2.8 INSULATION

A. Closed-cell, flexible elastomeric, ASTM C 534, Type I or II, thickness 38 mm.

2.9 PRESSURE RELIEF

A. Frangible-carbon rupture disc or single or multiple, reseating-type, spring-loaded relief valves. Routing and size of pressure-relief pipe shall be per ASHRAE 15.

2.10 ADDITIONAL ACCESSORIES

A. Provide low-ambient head pressure kit; factory-mounted and factory-wired chilled water flow switch; and individual compressor suction and discharge pressure gauges with shutoff valves for each refrigerant circuit.

2.11 ELECTRICAL

A. Wiring: Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point field-power connection to chiller. Wiring shall be numbered and color-coded to match wiring diagram. Factory wiring outside of an enclosure shall be in NFPA 70 compliant raceway.

B. Control Enclosure: House in a unit-mounted, NEMA 250, Type **[3R][4X]** enclosure with hinged access door with lock/padlock and key.

C. Main Disconnect: Field-power interface shall be to **[wire lugs][NEMA BS 31047, heavy-duty, non-fused disconnect switch][UL 489, instantaneous-trip circuit breaker with lockable handle]**. Disconnect means shall be interlocked with door operation.

D. Branch Disconnect: Provide branch power circuit to each motor and to controls with one of the following disconnecting means:

1. NEMA BS 31047, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection per IEC 60947-4-1.
2. NEMA BS 31047, heavy-duty, non-fusible switch.
3. UL 489, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit-trip set point.

E. Overcurrent Protection: Provide each motor with overcurrent protection.

F. Overload Protection: Overload relay sized according to UL 1995 or an integral component of chiller control microprocessor.

G. Phase-Failure and Undervoltage Relays: Solid-state sensing with adjustable settings.

H. Service Receptacle: **[220][XXX]** Volt duplex GFCI receptacle rated for outdoors, powered separately.

I. Control Relays: Auxiliary and adjustable time-delay relays or integral to water chiller microprocessor.

J. Power Readings: Indicate the following for chiller electrical power supply:

1. Current, phase to phase, for all three phases.
2. Voltage, phase to phase, and phase to neutral for all three phases.
3. Three-phase real power (kilowatts).
4. Three-phase reactive power (kilovolt amperes reactive).
5. Power factor.
6. Running log of total power versus time (kilowatt-hours).
7. Fault log, with time and date of each.

K. Power Phase Monitor: Provide Power Phase Monitor on incoming power supply to chiller to prevent chiller from operating during periods when incoming power is unsuitable for proper operation. Power Phase Monitor shall protect chiller against following conditions:

1. Over and under voltage (brown-out)
2. Phase rotation
3. Loss of phase
4. Phase imbalance

2.12 CONTROLS

A. Manufacturer's standard microprocessor-based chiller controls; unit mounted, and factory-wired with a single-point power connection and separate control circuit.

B. Status Display:

1. Date and time.
2. Operating or alarm status.
3. Operating hours.
4. Chilled water entering and leaving temperatures.
5. Refrigerant pressure in evaporator and condenser.
6. Saturation temperature in evaporator and condenser.
7. Temperature and pressure of operating setpoints.
8. No cooling load condition.
9. Outside air temperature if required for chilled-water reset.
10. Oil temperature and pressure.
11. Current-limit setpoint
12. Number of compressor starts.
13. Percent of motor maximum amperage.
14. Alarm history with retention of operational data before unit shutdown.

C. Control Functions:

1. Manual or automatic startup and shutdown time schedule.
2. Leaving- and entering-chilled-water temperatures, control setpoints, and motor load limit.
3. Current limit and demand limit.
4. External chiller emergency stop.
5. Automatic lead/lag switching.
6. Provide contacts for hardwiring of enable/disable, chiller status, and general alarm points.
7. Provide phase loss/reversal protection and over/under voltage protection with chiller auto-restart capability when voltage levels are restored to acceptable range.
8. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.
9. **[Control logic and factory-installed sensors to reset leaving chilled water temperature setpoint based on [return water temperature][outdoor air temperature][space temperature].]**

D. BAS Interface: Factory-installed hardware and software to enable BAS to monitor, display, and control chiller control points and alarms. All chiller control points shall be available via ASHRAE 135 BACnet protocol for BAS integration. Also, see Section 230905 "Instrumentation and Controls for HVAC" for chiller control points that are required to be hardwired to a controller on the BAS.

2.13 SOURCE QUALITY CONTROL (OBO-WITNESSED FACTORY TEST)

A. Verification of Performance: Prior to shipping, factory test fully assembled air-cooled chillers according to a written protocol. Provide test report indicating test instrumentation, test conditions, acceptable limits for test results, and results. Test instrumentation shall be selected, calibrated, and used in accordance with the "Instrumentation" Section of Appendix C of AHRI Standard 550/590. Testing shall, at a minimum, include the following tests performed at the voltage and frequency for the country of installation:

1. Perform system measurements of entering and leaving water temperatures, flow rate, and power input using site design conditions (including ambient dry bulb temperature and water temperatures). Test and rate chiller capacity, energy efficiency, water pressure drops, and NPLV including controlled ambient conditions and concurrent redundant verification of test results using two sets of calibrated instrumentation to concurrently measure water temperatures, flow rates, and power inputs.
2. Demonstrate specified compressor phasing in response to increasing and decreasing load conditions. Demonstrate the chiller runs properly for a minimum of 15 minutes at the minimum published load and record the efficiency in kW/ton at minimum load.
3. For each compressor module, record compressor RLA, discharge pressure, and suction pressure.
4. Demonstrate system protection and automatic restart after the following conditions:

a. High head pressure cut-out
b. Power failure
c. Flow loss

B. Advance Notice: Facilitate witness by OBO/PDCS/DE mechanical engineer representative of source quality-control tests described above. Notify Project Director/COR of testing date and location 14 calendar days in advance. Provide written protocol to be used for testing at notification.

C. Submit Results: Within one week of completed test, submit copy of test results indicating test procedures, instrumentation, test conditions, and results.

2.14 [PACKAGED, PORTABLE REFRIGERANT RECOVERY UNITS

A. Packaged, portable unit consisting of compressor, air-cooled condenser, recovery system, tank pressure gages, filter-dryer, and valving that allows for switching between liquid and vapor recovery mode. Refrigerant recovery unit shall be factory mounted on an ASME-constructed and -stamped refrigerant storage vessel that is sized to hold the full refrigerant charge of the largest chiller furnished.]

PART 3 - EXECUTION

3.1 EXAMINATION / VERIFICATION

A. Examine areas to receive chillers for compliance with requirements for installation tolerances and other conditions affecting chiller performance, maintenance, and operations. Final chiller locations indicated on Drawings are approximate. Prior to roughing-in piping and electrical connections, determine exact locations and verify all dimensions in the field.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Maintain manufacturer's recommended clearances for service and maintenance accounting for roof curbs, equipment supports, roof penetrations, etc.

B. Coordinate sizes and locations of concrete bases or structural steel with actual equipment provided. Install chillers level and plumb.

C. During installation, piping and similar openings must be capped to keep out dirt and other foreign matter.

D. Install electrical components, devices, and accessories furnished loose by manufacturer, including remote flow switches and remote chiller control panel.

E. Insulate evaporator, suction lines, and other surfaces where condensation might occur.

F. Manufacturer's factory-trained service personnel shall charge chiller with refrigerant and fill with oil.

G. Hydronic water system and piping shall be fully installed, flushed, and operational prior to connecting to chillers.

H. Hydronic water treatment system shall be fully functional with correct water chemistry including corrosion inhibitor and shall be demonstrated and stable prior to connecting hydronic piping system to chillers.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties. The following are specific connection requirements:

1. Piping Connections: Install piping adjacent to machine to allow service and maintenance. Connect chilled-water piping to chillers with flexible connectors.

    a. Evaporator inlet connection: Include controller-bulb well, shutoff valve, thermometer, strainer, pressure gage, and union or flange.
    b. Evaporator outlet connection: Include shutoff valve, flow switch, balancing valve, thermometer, pressure gage, union or flange, and water pressure relief valve.
    c. Condenser inlet connection: Include shutoff valve, thermometer, plugged tee, and pressure gage.
    d. Condenser outlet connection: Include shutoff valve, thermometer, drain line and shutoff valve, strainer, and plugged tee.

2. Safety-relief: Extend safety-relief valves or rupture-disc discharge piping from chiller and purge condenser receiver to exterior of building.
3. Refrigerant capture: At all times during installation and testing of refrigeration system, take steps to prevent release of refrigerants into the atmosphere. If refrigerant leak is discovered after system has been charged, the leaking portion must be immediately isolated, and refrigerant must be recovered into suitable container.
4. Electrical: Ground equipment. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A - 486B "Wire Connectors."

3.4 CLEANING

A. After completing installation, including outlet fittings and devices, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

3.5 STARTUP SERVICE

A. Verify that installation complies with the Contract Documents.

B. Engage a factory-authorized service representative to perform startup service.

1. Fill out startup checklists and attach copy with Contractor Startup Report.

C. Complete installation and startup checks according to manufacturer's written instructions and check for the following items:

1. No physical damage to unit.
2. Unit is level.
3. Chiller vibration isolation and flexible pipe connections are installed.
4. Clearances have been maintained and piping is installed for easy removal for service and tube cleaning.
5. Chilled-water pipes have been connected to correct ports.
6. Labels and safety instructions are clearly visible.
7. Oil levels are as recommended by manufacturer.
8. Refrigerant charge is sufficient, and chiller has been leak-tested.
9. Shipping materials such as skids, blocks, and straps are removed.
10. Refrigerant pressure relief is vented to outside.
11. Thermometers and pressure gages are installed.
12. Controls and safety interlocks are installed and connected.
13. Pumps are installed, connected, and operational.
14. Proper motor rotation.
15. Refrigerant detector and alarm have been installed and connected as applicable.

D. Check and record performance of chiller protection devices.

E. Check and record performance of chilled- and condenser-water flow and low-temperature interlocks.

F. Operate chiller for run-in period as recommended by manufacturer.

G. Check static deflection of vibration isolators including deflection during chiller startup and shutdown.

3.6 DEMONSTRATION AND TRAINING

A. Factory-trained technician shall demonstrate and train Government’s maintenance personnel. Provide minimum of two sets of training sessions, recorded for future reference, with each set of session held at a distinctly different time period to accommodate personnel identified by Project Director/COR based on input from Post’s Facility Manager. Each set of sessions shall include 4 hours in classroom and 4 hours of demonstration. Schedule one additional training session during the occupancy adjustment visit to allow post personnel to address operating challenges.

1. Training topics shall include adjusting, operating, and maintaining chillers. Include procedures and schedules related to start-up, normal operation, shutdown, unoccupied operation, seasonal changeover, manual operation, controls set-up and programming, and alarms for maintaining water chillers in coordination with the complete chilled-water system, instrumentation and control system. Review of control drawings and schematics, data in maintenance manuals, and interactions with other systems.
2. Refer to the Part 3 Article on ARC FLASH TRAINING in Section 260573 “Overcurrent Protective Device Coordination Study” for associated training requirements.

END OF SECTION 236427

SECTION 236434 - MODULAR AIR-COOLED WATER CHILLERS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes packaged, modular air-cooled, electric-motor-driven chillers providing critical cooling for Post Communication Centers (PCCs) and cooling for office buildings and residences.

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete” where concrete base is used
2. Section 055005 “Metal Fabrication” where steel framing and supports are used.
3. Division 07 Section on roof accessories.
4. Section 230719 “HVAC Piping Insulation.”
5. Division 23 Section on refrigerant monitoring and safety equipment.
6. Section 260518 “Low-Voltage Electrical Power Conductors and Cables” for connecting electrical and controls wiring.
7. Section 260525 “Grounding and Bonding for Electrical Systems” for grounding water chillers.
8. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash compliance and training.

1.2 DEFINITIONS

A. EER: Energy-Efficiency Ratio. Ratio of cooling capacity given in terms of Btu/h to total power input given in terms of watts at any given set of rating conditions.

B. IPLV: Integrated part-load value. Single-number part-load efficiency figure of merit calculated per method defined by ARI 550/590 and referenced to ARI standard rating conditions.

1.3 SYSTEM DESCRIPTION

A. Modular Chiller: Modular Chiller shall consist of primary chiller module with additional modules, and shall incorporate the following as identified in Construction Drawings on mechanical equipment schedule:

1. Primary controller and primary power connection.
2. One or more secondary chiller modules.
3. Matching pump module.
4. Building heat exchanger module for PCC chillers.
5. **[Glycol fill shot feeder.]**
6. **[Free cooling module.]**
7. **[Buffer tank module for thermal mass.]**

B. Each mechanical cooling chiller module shall contain:

1. Compressors, including at least one variable speed compressor feeding a condenser coil.
2. Expansion valve.
3. Evaporator heat exchanger.
4. Multiple condenser fans.
5. Quick connect grooved couplings for interconnection to supply and return manifold piping.
6. Power quick connect to allow isolation of module for maintenance and repair.
7. Factory installed controls that do not require onsite programming.

C. Modular chillers shall be sized and configured to meet the full design load plus one additional module for growth/redundancy.

1.4 SYSTEM PERFORMANCE REQUIREMENTS

A. Site Altitude: Chiller shall be suitable for altitude in which installed without affecting performance indicated. Adjust affected chiller components to account for site altitude.

B. Full-Load Efficiency (EER): Provide the following minimum EER at AHRI design of conditions:

1. 10 at 60 Hz.
2. 7 at 50 Hz.

C. IPLV: Provide standard chiller unit with the following IPLV:

1. Less than 0.85 kW/ton for 60 Hz.
2. Less than 0.79 kW/ton for 50 Hz.

D. Seismic Performance: Chillers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 and shall be provided with appropriate seismic mounting assemblies for the project site.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.5 SUBMITTALS

A. Product Data: Provide a data sheet (cut sheet) that includes: refrigerant type; oil type; rated capacities; IPLV, EER, shipping instructions; power factor, voltage, frequency, and maximum amperage; operating weights; furnished specialties; and accessories for each model indicated. Indicate breakdown points for chillers shipped in segments.

B. Shop Drawings: Signed and sealed by a qualified professional engineer.

C. When location requires seismic restraint, provide restraints and connections set forth in project Div. 23 Specifications.

D. Seismic Design Calculations: Provide calculations for selecting vibration isolators and seismic restraints, and for designing vibration isolation bases.

E. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

F. Wire Diagrams detailing wiring for power and control systems and differentiating between manufacturer-installed and field-installed wiring. Wiring diagram shall indicate operating voltage and frequency which matches power available at location.

G. Coordination Drawings: Floor plans and elevations drawn to scale and coordinating the following, as appropriate:

1. Structural Supports
2. Piping roughing-in requirements.
3. Wiring roughing-in requirements. Determine spaces reserved for electrical equipment.
4. Access requirements around other work, including working clearances to mechanical controls and electrical equipment, and to any building obstructions which may reduce airflow to condenser coils.

H. Product Certificates: Provide certifications required in the Part 1 Article on QUALITY ASSURANCE, as well as certification that chillers have been factory-tested and function properly. Submit chiller's rated and tested capacity, energy efficiency, and water pressure drop.

I. Source quality-control test reports as required in the Part 2 Article on SOURCE QUALITY CONTROL. Include copy in Operating and Maintenance Manual. Submit an extra copy for Post Facility Manager.

J. Field Report: Prepare written startup report that records results of tests and inspections. Include copy in Operating and Maintenance Manual. Submit an extra copy for Post Facility Manager.

K. Reports on Routine Maintenance Checks: Installing Contractor shall submit documentation that all normal maintenance checks have been conducted commencing with site start up and continued to substantial completion. Installing contractor shall submit completed maintenance logs at manufacturer's required periodicity. The maintenance logs shall indicated they were reviewed by the manufacturer.

L. Maintenance Data: For each chiller to include in maintenance manuals. Include information regarding availability of spare parts in the country where this unit is to be deployed.

M. Written Government Acceptance.

N. Warranty: Documentation in support of requirements in the Part 1 Article on WARRANTY. Include certification that maintenance during the warranty period has been completed in accordance with warranty provisions.

1.6 QUALITY ASSURANCE

A. AHRI Rating: Signed by manufacturer, certifying chiller has been tested and rated in accordance with the requirements of AHRI 550/590, "Water Chilling Packages Using the Vapor Compression Cycle," including concurrent redundant verification of test results on AHRI test stand using two sets of calibrated instrumentation to concurrently measure water temperatures, flow rates, and power inputs.

B. ASHRAE Certification: Signed by manufacturer, certifying compliance with ASHRAE 15 for safety code for mechanical refrigeration. Comply with ASHRAE 147 for refrigerant leaks, recovery, and handling and storage requirements.

C. Comply with the OBO Electrical Code (NFPA 70, National Electrical Code as amended by OBO).

D. Comply with UL 1995.

E. Government Acceptance: After Designer of Record has reviewed and approved chiller submittals, contractor shall obtain mandatory written acceptance of chiller submittals from Project Director/COR based on input from OBO/PDCS/DE mechanical engineer assigned to project prior to procurement of each chiller.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Ship water chillers from the factory fully charged with refrigerant or nitrogen.

1.8 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000 "Cast-in-Place Concrete."

B. Coordinate installation of roof curbs and roof penetrations. These items are specified in Division 07 Section on roof accessories.

1.9 WARRANTY

A. Refrigeration Compressor Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace compressors that fail within specified warranty period.

1. Failure includes, but is not limited to, inability to maintain set temperature.
2. Warranty Period: Five years from date of Substantial Completion.

1.10 EXTRA MATERIALS

A. Furnish extra materials identified below. Package extra materials with protective coating for storage and identification labels describing contents.

1. Primary module controller.
2. Secondary module controller.
3. Power phase monitor.

PART 2 - PRODUCTS

2.1 AVAILABLE MANUFACTURERS

A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Multistack LLC: Multistack Packaged Air-Cooled Scroll Chiller.
2. Artichill.

2.2 MODULAR CHILLERS

A. Air-Cooled Modular Chiller Description: Factory-assembled and tested water chiller complete with casing, compressor(s), heat exchanger(s), condenser coils and fans, pumps, glycol shot feeder fill system, expansion tank, buffer tank, controls integrated with compressor operation, interconnecting unit piping and wiring, indicated accessories, and mounting frame. Provide:

1. Cabinet: Provide lifting base, structural frame, and weatherproof housing constructed per the requirements of Tables 2.2-1 and 2.2-2. Coat base, frame, and housing with a corrosion-resistant coating capable of withstanding a 1000-hour salt-spray test (5500 hour salt spray test for moderate or extreme marine locations) according to ASTM B 117 with a minimum ASTM 1654 rating of “6.” If base and frame are constructed of stainless or hot dipped galvanized steel, coating is not required. Provide pitched roof on cabinet to prevent water accumulation.
2. Acoustical compressor wrap.
3. Fans: Propeller type, statically and dynamically balanced, with vertical air discharge for high efficiency and low sound; and equipped with heavy-gage, weather-protected fan guard. In moderate or extreme marine locations, fans shall be A/C type motor with FRP (Fiberglass Reinforced Plastic) type blades with corrosion treated hub and washdown duty motors.
4. Fan Motor: Direct drive, weatherproof, with bearings permanently lubricated, and having built-in current- and thermal-overload protection.

5. Modules shall be capable of being hoisted in an elevator having 1200 kg capacity and fit through a 0.75 x 2.00 meter Forced-Entry Ballistic-Resistant (FE/BR) door.
6. Each module shall include manifold supply and return mains for chilled water constructed of the material required in Tables 2.2-1 and 2.2-2. Provide cut grooved end connections

for interconnection to DN 100, 150, or 200 (4-, 6-, or 8- inch standard) piping with Victaulic type couplings.

7. Electrical connections, piping, pumps and chiller location shall be capable of accepting additional modules to incrementally increase chiller capacity for the space served. Minimum expansion capacity shall be 105 kW.
8. Provide chiller array with a single point power connection. This shall include pre-engineered wiring for field installation and connection to a factory mounted chiller junction box. The electrical junction box shall incorporate a through the door disconnect with over-current protection. Junction box shall include individual circuit breakers for each Module and two spares, and provide a single point of connection to building power.

9. Each air-cooled modular chiller include have the following: Minimum two independent refrigerant circuits; each circuit shall include expansion valve, liquid shutoff valve, filter drier, sight glass with moisture indicator, liquid line solenoid valve, and insulated suction line.
10. Provide motorized variable flow valves on each module when pumps are variable speed.

B. Air Cooled Modular Chiller Construction: Water chiller shall be constructed in accordance with the requirements of Table 2.2-1 and Table 2.2-2 based on the application (PCC or Building Cooling) and site location (Inland or Marine).

C. Fabricate water chiller mounting frame and attachment to the pressure vessel with reinforcement strong enough to resist water chiller movement during a seismic event.

TABLE 2.2-1
MODULAR CHILLER REQUIREMENTS – BUILDING COOLING APPLICATION

COMPONENTS	INLAND LOCATION	MARINE LOCATION
Module Configuration	N+1 Provide chiller with capacity sized per OBO-ICS IMC Ch. 3	N+1 Provide chiller with capacity sized per OBO-ICS IMC Ch. 3
Coil Tube & Fins	Copper & Copper	Copper & Copper
Coil Coating	None	Heresite or Electrofin
Manifolds	Stainless steel inlet and stainless steel Teflon coated inline strainer; minimum 30 mesh and minimum 550 square inches of surface area per module	Stainless steel E/L and stainless steel Teflon coated inline strainer; minimum 30 mesh and minimum 550 square inches of surface area per module
Pumps	Cast iron housing; bronze impeller; variable frequency drive	Stainless steel housing; bronze impeller; variable frequency drive
Housing	Galvanized steel or aluminum with 304 stainless steel fasteners	Galvanized steel w/ factory-applied powder coat epoxy finish with 304 stainless steel fasteners
Structural Frame	Galvanized steel or aluminum with 304 stainless steel fasteners	Galvanized steel w/ factory-applied powder coat epoxy finish with 304 stainless steel fasteners
Lifting Base	Painted structural steel	Hot dip galvanized steel
Control Panel	On chiller	On chiller
[Hydronic Buffer Tank]	160 gallon minimum	160 gallon minimum
System Strainer	Cast iron duplex or parallel isolatable strainers	Cast iron duplex or parallel isolatable strainers
Pump and Chiller Service/Isolation Valves	Carbon Steel	Stainless Steel
Glycol Feeder System	Where weather conditions require; provide minimum 190 Liter mixing tank	Where weather conditions require; provide minimum 190 Liter mixing tank
“Fail-to-Run” Controls	As described under CONTROLS Article	As described under CONTROLS Article

Control Panel	One on chiller, plus one remote, wall-mounted in PCC	One on chiller, plus one remote, wall-mounted in PCC
Hydronic Buffer Tank	Stainless; Sized to achieve system hydronic volume > 30.3 L (8 gal) per ton	Stainless; Sized to achieve system hydronic volume > 30.3 L (8 gal) per ton
Duplex Basket Strainer	Bronze	Bronze
Pump and Chiller Isolation Valves	Stainless Steel	Stainless Steel
Frame < 29” wide	Site Specific to FEBR Access	Site Specific to FEBR Access
“Fail-to-Run” Controls	As described under CONTROLS section of specification	As described under CONTROLS section of specification
Glycol Feeder System	19 L mini shot feeder required for all building locations	19 L mini shot feeder required for all building locations

Notes to Tables 2.2-1 and 2.2-2:

1. Hot-dipped galvanized members shall have all penetrations made before the galvanization is done to minimize early rusting. Minimum coating thickness shall be 70 micrometers (1.60 oz. of zinc per sq. ft.).
2. Inland Location and Marine Location relate to project-specific requirement to address corrosion resistance. Refer to the Part 1 Article on SYSTEM PERFORMANCE REQUIREMENTS.

2.3 COMPRESSORS

A. Description: Positive displacement direct drive with, crankcase oil heater and suction strainer. Provide suction and discharge service valves when modules contain multiple independent refrigeration circuits. The compressor system shall be capable of operating at part-load conditions without increased vibration over normal vibration at full-load operation and shall be capable of continuous operation at its lowest step of unloading.

B. Refrigerant: Refrigerant must be one of the fluorocarbon gases with number designation and safety classification in accordance with ANSI/ASHRAE 15 & 34. CFC-based refrigerants are prohibited. Refrigerants must have an Ozone Depletion Potential (ODP) no greater than 0.0. Provide Safety Data Sheets (SDS) for all refrigerants. Refer to US EPA Significant New Alternatives Policy (SNAP) for more information.

C. Refrigerant Compatibility: Seals, O-rings and internal water chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.

D. Rotating parts shall be statically and dynamically balanced to ISO 1940/1-1986, G16, or G6.3 as specified.

2.4 HEAT EXCHANGERS

A. Evaporator:

1. Description: Provide brazed plate design, fabricated and tested in accordance with UL 1995 code.
2. Material: 316 Stainless steel.
3. Working pressures: Refrigerant side: 3100 kPa Water-side: 1035 kPa.
4. Connections – Refrigerant: Threaded or brazed.
5. Connections – Water-side: Cut grooved.

B. Condenser Coil: Seamless copper tubes with mechanically bonded copper fins. Integral sub-cooling circuit, leak tested at 3100 kPa.

1. Fins: Provide copper fins. Fins shall be spaced at a minimum of 4.7 fins per centimeter.
2. Corrosion-Resistant Coal Coating: Provide in accordance with Tables 2.2-1 and 2.2-2. Where required, coating method and dry film thickness shall be in accordance with coating manufacturer recommendations.

3. Safety and Operating Options: For cold climates, provide low-ambient controls for operation down to –10 deg C.

2.5 BUFFER TANK

A. Provide an ASME labeled, insulated, and PVC-jacketed tank (38 mm thickness, closed coil flexible elastomeric thermal insulation), with internal baffle to maximize utilization of tank volume without mixing, pressure rated at 1035 kPa minimum. Size tank in accordance with designer's system volume calculation for a 2 minute or greater loop.

2.6 INSULATION

A. Cold Surfaces: Closed-cell, flexible elastomeric, thermal insulation with thermal conductivity of 0.26k (BTU/HR-FT^2-deg F/in.) maximum. Insulation shall conform to ASTM C 534, Type II, for sheet materials. See tables in Section 230719 "HVAC Piping Insulation."

1. Thickness: 19 mm minimum. Increase insulation thickness to 38mm in high humidity environments to prevent sweating.
2. Adhesive: Provide adhesive recommended by insulation manufacturer.
3. Insulation: Provide Factory applied insulation over entire surfaces of water chiller components.

a. Apply adhesive to 100 percent of insulation contact surface.
b. Seal seams and joints.

2.7 ACCESSORIES

A. For locations having ASHRAE 99 percent heating days below 7.0 deg. C, provide low-ambient head pressure kit.

B. Provide redundant chilled water differential pressure switches for proof of flow. Switches should be installed in parallel such that if one of the switches fails, chiller pump operation will not be disabled.

C. Provide refrigerant suction and discharge pressure gages for each independent refrigerant circuit.

D. For locations having ASHRAE 99 percent cooling days above 40 deg C provide high-ambient condenser option. **[EER may be decreased to 9.2 for 60 Hz units and 9.8 for 50 Hz units.]**

E. Power Factor Correction: Provide power factor correction with chiller to meet or exceed a power factor of 0.95 unless contractor certifies that power factor correction shall be provided at the site level to ensure site power factor does not fall below 0.95.

F. Special Tools Kit: Chiller manufacturer shall assemble a tool kit specially designed for use in serving the chiller(s) furnished that contains any special tools required to service chiller components not readily available to Owner service personnel in performing routine maintenance.

Place tools in a lockable case with hinged cover. Provide a list of each tool furnished and affix the list to underside of case cover.

G. For PCC chillers, which require critical cooling, provide refrigerant reclaim kit for selected refrigerant that includes refrigerant reclaim unit and cylinders to fully evacuate refrigerant charge, vacuum pump to evacuate refrigerant circuit after repairs are made, and spare refrigerant to fully charge a circuit, as well as refrigerant technician hose and gauge set.

2.8 MISCELLANEOUS EQUIPMENT MODULES

A. Chiller shall be completely assembled and pre-piped on a common skid with pump package module and glycol feeder system. Chiller shall be completely factory assembled and tested prior to shipment. Manufacturer designs shall be directly suitable for outside environment.

B. Pump Package Module: Module shall include dual in-line centrifugal pumps per Division 23 Section on hydronic pumps, with premium efficiency motors as specified in Division 23 Section on common motor requirements for HVAC equipment, in a primary/standby pumping arrangement piped into a common header. Pump starters and controls shall be provided to enable manual selection of lead pump. In addition, in the event of a loss-of-flow failure of the chilled water system, the Pump Module controls shall disable the lead pump and automatically start the standby pump. Pump Package shall include isolation valves to allow for servicing of the standby pump while the primary pump is operating. Include inlet and outlet pressure and temperature gauges.

C. Glycol Feeder System: System shall be connected through the common chiller header system requiring no additional water connections. System shall include the following glycol related equipment: a minimum of 190 liter storage/mixing tank with lid and cover for a main building chiller or a mini 19 liter shot feeder for a PCC chiller; pump suction hose with inlet strainer; pressure pump with thermal cut-out and integral pressure switch; pre-charged accumulator tank with EPDM diaphragm, manual diverter valve for purging and agitating contents of storage tank; adjustable 170-380 kPa pressure regulating valve with pressure gauge, fast fill level, integral replaceable strainer, built-in check valve, and built in shut-off valve. Glycol feeder systems shall be compatible with glycol solutions of up to 50 percent concentration. Pump shall be capable of running dry without damage. Provide low level sensor in shot feeder /tank that communicates an alarm to the remote control panel or Building Automation System (BAS) system. The module shall also include an expansion tank of welded steel with butyl rubber diaphragm and capable of a maximum operating temperature of 115 deg C and maximum working pressure of 690 kPa. The expansion tank shall be interconnected through the common chiller header system and require no additional water connections.

D. Free Cooling Module Option: Module shall interconnect with common chiller header system and require no additional water connections. Free Cooling Module shall include glycol cooling coil manufactured same as for condenser coil, temperature-controlled condenser fans, and an automatic 3-way bypass valve to eliminate the need for mechanical cooling under low ambient conditions. Operating controls shall be pre-wired in the equipment control panel. Free Cooling Module shall be in a completely separate assembly from the Mechanical Cooling Modules. No common condenser/free-cooling fans shall be accepted.

2.9 CONTROLS

A. Control Panel: Stand-alone, microprocessor-based control panel shall be located on the chiller.

B. Enclosure: Unit-mounted, NEMA 250, Type 1 enclosure, hinged or lockable; factory wired with a single-point power connection and a separate control circuit.

C. Phase Monitor: Provide SymCom brand or approved equal. This device shall prevent chiller from operating during periods when incoming power is unsuitable for proper operation. Power Phase Monitor shall provide protection against the following conditions:

1. Over and Under Voltage (Brown-Out)
2. Phase Rotation
3. Loss of Phase
4. Phase Imbalance

D. Status Display: Multiple-character liquid-crystal display or light-emitting diodes and keypad. Display the following conditions. Edit list below to suit Project. Verify availability; status displays may vary depending on unit size:

1. Date and time.
2. Operating or alarm status.
3. Operating hours.
4. Outside-air temperature if required for chilled-water reset.
5. Temperature and pressure of operating set points.
6. Entering and leaving temperatures of chilled water.
7. Refrigerant pressures in evaporator and condenser.
8. Saturation temperature in evaporator and condenser.
9. No cooling load condition.
10. Elapsed time meter (compressor run status).
11. Chilled water flow status.
12. Anti-recycling timer status.
13. Load-limit set point.
14. Compressor run hours.

E. Control Functions: Edit list below to suit Project. Verify availability; functions may vary depending on unit size:

1. Manual or automatic startup and shutdown.
2. Entering and leaving chilled-water temperature, control set points, and motor load limit. Chilled-water temperature shall be reset based on return-water temperature.
3. External water chiller emergency stop.
4. Anti-recycling timer.
5. Automatic lead-lag switching.

F. Manually Reset Safety Controls: The following conditions shall shut down the respective compressor module in which they occur and require manual reset. Edit list below to suit Project. Verify availability; conditions may vary depending on unit size:

1. Low evaporator pressure or high condenser pressure.
2. Low chilled-water temperature.
3. Refrigerant high pressure.
4. Controller.
5. Compressor motor current-overload.

G. Building Automation System (BAS) Interface: For building cooling chillers provide factory-installed hardware and software to enable the BAS to monitor and control chilled-water set point and chiller-control displays and alarms.

1. Provide communication interface with building automation system using BACNET protocol matching BAS protocol, which shall enable building automation system operator to remotely control and monitor the water chiller from an operator workstation. Control features and monitoring points displayed locally at water chiller control panel shall be available through building automation system.

H. Additional Remotely-Located Control Panel: When chiller is used for critical cooling of PCCs, provide a remotely-located control panel capable of operating all chiller controls, including starting and stopping the chilled water pumping system and chiller system. All information shall be available through LCD display provided on remote panel. Provide the following LED indicators on the panel:

1. System Normal
2. Chiller fault
3. Flow fault
4. Chiller Water Temperature Fault
5. Pump alarm
6. Glycol shot feeder low level alarm

I. Fail-to-Run Controls: Provide an integrated “Fail-to-Run” control system. This system shall automatically put all chilling modules in “OVERRIDE MODE” in the event of any system failure that would otherwise cause a system shut-down, such as: low leaving chilled water temperature; no chilled water flow; power phase monitor fault; communication fault.

2.10 MOTORS

A. Refer to Division 23 Section on common motor requirements for HVAC equipment for general requirements.

B. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

1. Open-drive motors shall have flanged or flexible coupling suitable for direct connection to compressor.

2.11 SOURCE QUALITY CONTROL

A. Factory test fully assembled water chillers before shipping, according to a written protocol. Provide test report indicating test instrumentation, test conditions, acceptable limits for test results, and results. Testing shall, at a minimum, include the following tests performed at the voltage and frequency for the country of installation:

1. Perform system measurements of entering and leaving water temperatures, flow rate, and power input. Calculate total system capacity and efficiency in kW/ton.
2. Demonstrate specified compressor phasing in response to increasing and decreasing load conditions.
3. For all modules, record compressor RLA, fan FLA, discharge pressure, suction pressure.
4. For the pump module, record water flow rate and the total pressure and FLA for each pump.
5. Demonstrate system protection and auto-restart after the following conditions:

    a. Phase loss
    b. Power failure
    c. Flow loss
    d. Over voltage
    e. Under voltage
    f. High head pressure cut-out

6. Demonstrate Fail-to-Run and Emergency Operation controls (for PCC chiller only).
7. Demonstrate remotely-located control panel (for PCC chiller only) operation.

B. If code evaporator pressure vessel is utilized, factory test and inspect evaporator according to UL 1995.

C. Rate sound power level for chillers located outdoors according to ARI 370 procedure. Test the chiller operating at calculated worst-case sound condition. Prepare test report indicating test procedures, instrumentation, test conditions, and results. Noise levels at the site boundary of the facility shall comply with the host country's noise laws and regulations. When local standards do not exist, noise shall not exceed 55 dB(a) (daytime) and 45 dB(a) (nighttime) using the "A-Weighted Sound Level." All vibrating, reciprocating and rotating equipment mounted to the roof or the building structure shall be isolated from its associated piping/ducting and the building structure.

D. Facilitate witness by OBO/PDCS/DE/ME representative of source quality-control tests described above; notify Project Director/COR of testing date and location 14 days in advance. Provide written protocol to be used for testing at notification.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before water chiller installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, piping, and electrical to verify actual locations, sizes, and other conditions affecting water chiller performance, maintenance, and operations.

1. Final water chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install water chillers on concrete base. Concrete base is specified in Division 23 Section, and concrete materials and installation requirements are specified in Section 033000 “Cast-in-Place Concrete.”

B. Concrete Bases: Anchor chiller mounting frame to concrete base.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 450-mm centers around the full perimeter of concrete base.
2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Cast-in-place concrete materials and placement requirements are specified in Section 033000 “Cast-in-Place Concrete.”

C. Vibration Isolation: Vibration isolation devices and installation requirements shall conform to the requirements of the OBO Building Code (International Building Code as amended by OBO). See Division 23 Section on vibration and seismic controls for HVAC piping and equipment for additional requirements.

D. Maintain manufacturer’s recommended clearances for service and maintenance.

E. Charge water chiller with refrigerant and oil if not factory charged.

F. Install separate devices furnished by manufacturer.

3.3 CONNECTIONS

A. Chilled and condenser-water piping installation requirements are specified in Division 23 Section on hydronic piping. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to chiller to allow service and maintenance.

C. Evaporator Connections: Connect inlet to evaporator with controller-bulb well, shutoff valve, thermometer, strainer, pressure gage, and union or flange. Connect outlet to evaporator with shutoff valve, flow switch, balancing valve, thermometer, pressure gage, and union or flange.

D. Provide domestic make-up water connection with back flow preventer for main building chiller applications.

E. Refrigerant Pressure Relief Valve Connections: Extend vent piping to the outside without valves or restrictions when required by ASHRAE 15.

F. Ground water chillers according to Section 260525 ”Grounding and Bonding for Electrical Systems.”

G. Chiller shall be provided with factory installed and wired main disconnect switch and a single point power connection. This includes pre-engineered wiring for field installation and connection to a factory mounted chiller junction box. Junction box shall include individual circuit breakers for each Module Set and two spares, and provide a single point of connection to building power. Connect wiring at single connection point according to Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

H. Tighten electrical connectors and terminals according to manufacturer’s published torque-tightening values. If manufacturer’s torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 START-UP SERVICE

A. Engage a technician, factory trained on equipment being installed, to inspect field-assembled components and equipment installation, including piping and electrical connections, and to perform testing startup service.

1. To facilitate OBO/PDCS/DE/ME representative witness of testing and start-up service, notify Project Director/COR of testing date and location 14 days in advance.

B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assemblies, installations, and connections.

C. Complete installation and startup checks according to manufacturer’s written instructions and perform the following:

1. Verify that refrigerant charge is sufficient and chiller has been leak tested.
2. Verify that pumps are installed and functional.
3. Verify that thermometers and gages are installed.
4. Operate chiller for run-in period according to manufacturer’s written instructions.
5. Check bearing lubrication and oil levels.
6. Verify proper motor rotation.

7. Verify static deflection of vibration isolators, including deflection during water chiller startup and shutdown.
8. Verify and record performance of water chiller protection devices.
9. Verify proper compressor phasing in response to increasing and decreasing load conditions.
10. Test and adjust factory-mounted (and if used remote panel) controls and safeties. Replace any and all damaged or malfunctioning controls and equipment.

D. Installing contractor shall submit completed maintenance logs at manufacturer's required periodicity to Project Director / COR certifying that maintenance during the warranty period has been completed. The maintenance logs shall indicated they were reviewed by the manufacturer.

3.5 DEMONSTRATION AND TRAINING

A. Factory-trained technician shall demonstrate and train Government's maintenance personnel. Provide minimum of two sets of training sessions, with each session held at a distinctly different time period to accommodate personnel identified by Project Director/COR based on input from Post's Facility Manager. Each set of sessions shall include 4 hours in classroom and 4 hours of demonstration. Schedule one additional training session during the occupancy adjustment visit to allow post personnel to address operating challenges.

1. Training topics shall include adjusting, operating, and maintaining chillers. Include procedures and schedules related to start-up, normal operation, shutdown, unoccupied operation, seasonal changeover, manual operation, controls set-up and programming, and alarms for maintaining water chillers in coordination with the complete chilled-water system, instrumentation and control system. Review of control drawings and schematics, data in maintenance manuals, and interactions with other systems.
2. If remote panel is installed, include training on PCC operators where applicable.
3. Refer to the Part 3 Article on ARC FLASH TRAINING in Section 260573 "Overcurrent Protective Device Coordination Study" for associated training requirements.

END OF SECTION 236434

SECTION 237315 – CENTRAL-STATION AIR HANDLING UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section identifies requirements for air handling units (AHU) in the construction of new and renovation of existing office buildings and on-compound housing.

B. Related Sections:

1. Filters and filter housing requirements for HVAC applications not protected by environmental security protection systems are addressed in Section 234105 "Air Filtration.
2. Section 250593 "Testing, Adjusting, and Balancing for HVAC."
3. Motor requirements are addressed in Division 23 Section on common motor requirements for HVAC equipment, except where otherwise specifically identified in this Section.

4. UL 900: Standard for Air Filter Units.

1.3 DEFINITIONS AND ABBREVIATIONS

A. AHU: Air Handling Units.

B. ASZM-TEDA: Impregnate applied to activated carbon for use in HEGA filters.

C. High Efficiency Gas Adsorption (HEGA) Filters: Filters with one or more adsorbents (e.g., activated carbon, impregnated carbon, activated alumina, zeolites, and molecular sieves) used to remove airborne toxic chemicals.

D. High Efficiency Particulate Air (HEPA) Filters: Filters typically used in industry in hospital operating rooms and manufacturing clean rooms.

E. Indoor Air Quality (IAQ): Air quality within and around buildings and structures, especially as it relates to the health and comfort of building occupants. IAQ can be affected by gases (e.g., carbon monoxide, volatile organic compounds), particulates (measured in outdoor air and reported as PM10 and PM2.5), and microbial contaminants (e.g., bacteria, mold). Outdoor (and some indoor) pollutants can be created from a variety of sources to include the decay of radioactive elements (e.g., radon), local motor vehicles (e.g., nitrogen oxides, sulfur dioxide, carbon monoxide), manufacturing plants (e.g., toxic industrial chemicals, volatile organic compounds). To provide occupant health and comfort, and to enhance productivity, contaminant levels are controlled utilizing a variety of best practices, including building pressurization and gas/particle filtration.

F. Inertial Separator: Used to extend life of particulate filters by separating heavy airborne particles as air changes direction.

G. Marine Climate: See Appendix W of the OBO Building Code.

H. MERV: Minimum Efficiency Reporting Value as defined by ASHRAE Standard 52.2.

I. Outdoor-Air Pollution Control Filter (OAPCF): Single or combination (e.g., MERV 13, HEGA, adsorption media impregnated bag filters, etc.) of various particulate and/or gas adsorption filters which control contaminants and pollutants to achieve acceptable indoor air quality. Control of humidity, dust, and rain at the pollution control filters is critical to operation and life of the Environmental Security filtration system components.

J. Sub-Arctic/Very Cold/Cold/Mixed: Climate that is sub-arctic, very cold, cold, or mixed as defined by ANSI/ASHRAE/IESNA Standard 90.1.

K. Toxic Industrial Chemicals (TIC): Chemical hazards (e.g., carcinogens, reproductive hazards, corrosives, agents that affect lungs or blood) or physical hazards (e.g., flammable, combustible, explosive, reactive).

L. Volatile Organic Compounds (VOC): Any compound of carbon (apart from carbon monoxide, carbon dioxide, carbonic acid, metallic carbides, and carbonate ammonium carbonate) that participates in atmosphere photochemical reactions, except for those designated by EPA as having negligible reactivity.

1.4 SUBMITTALS

A. Preconstruction Submittals: Copy of Export License (DOS Form DSP-83) for export-controlled ASZM-TEDA carbon, or certification that no license is required. See Article on MARKING, PACKING, SHIPMENT, AND STORAGE.

B. Shop Drawings: Submit AHU room layout drawn to scale with equipment properly configured with conformance to access (e.g., coil pull and filter change).

1. Identify all maintenance space requirements, including space reserved to facilitate coil pull.
2. Identify all ductwork and piping entering and leaving AHU room in plan and elevation.
3. Indicate hose bibb and floor drain locations in each AHU room to facilitate cleaning of coils.
4. Indicate maintenance platform around AHU as required to facilitate maintenance.

C. Product Drawings: Provide dimensioned plan and section views for each air handling unit including the following information:

1. Equipment section breaks, external components (e.g., dampers, intakes with bird/bug screens, security grills, rain/snow entrainment, deicing/icing control system, dust and sand capture devices, etc.), internal components (e.g., dampers, filter housing, filters, grates, coils, etc.), equipment pad, chilled/hot water piping connections, drain/condensate drain piping and trap/trap primer locations and sizes, and inlet and outlet duct connection locations. Indicate location of control dampers, if installed internally, with location of actuator assembly.
2. **[Humidifiers: Show minimum length of straight duct downstream of humidifier and associated condensate drip pan.]**
3. Filter Housings: Provide dimensional plans and elevations of filter.
4. Cooling and heating coils, including corrosion control systems, as applicable: Clearly show location and “pull space” for coil replacement.
5. Access Doors and Access Panels: Indicate size and location of equipment access doors and panels, latch location, and direction path of door swing.
6. Electrical and Building Automation System (BAS) Control Elements: Indicate location of fan motor power junction box, variable frequency drives, electrical door switch junction box, and Magnehelic®/reporting pressure gauges.
7. **[Electric Duct Heater: Indicate location of electric duct heater with exterior mounted power and control panel.]**

D. Product Data:

1. Motors: Motors and variable frequency drives.
2. Fans.
3. Coils.
4. Humidifiers.
5. Insulation: Submit insulation material data sheet. Indicate insulation thickness and R-value. If AHU is to be installed in non-conditioned or outdoor location, submit calculations verifying that unit will not sweat under design conditions.
6. Casing: Submit no-thru-metal design construction sheets and materials that meet corrosive conditions at the intended site.
7. Filter Housings: Submit data which confirms that internal construction components of filter housings are stainless steel or as otherwise specified in this Section.
8. Filters: Submit following data on all filters selected for each AHU:

    a. Filter media.
    b. Framework construction.
    c. Physical dimensions required for clearances and access space.
    d. Weights.
    e. Securing methods.
    f. Fire classification.
    g. Rated flow capacity.
    h. Initial and final pressure drops at scheduled air flow.
    i. Particulate MERV rating.
    j. Gas adsorption residence time.
    k. Expected lifespan and replacement schedule.
    l. Test method.
    m. Operating/storage limits regarding temperature and humidity.

E. Design Data:

1. Derating Equipment: Provide derating corrections for all AHU components as necessary for proper operation at sites with elevation greater than or equal to 500 meters above sea level. Identify necessary derating corrections for heat transfer fluid (baseline: water) and power (e.g., frequency, voltage).
2. Pressure: Static pressure profile for each AHU that shows external static pressure broken down into supply air and return air components, individual AHU component static pressure losses, fan derating for system, and AHU exit loss at design airflow. Provide separate tables for clean and dirty filter operating conditions.
3. Leakage: Leakage compliance data for opposed blade dampers as specified in this Section.
4. Coils and Fins: Identify rated flow and heat transfer data for cooling and heating coils with applicable corrosion control, both waterside and airside, at design and maximum operating points. For cooling coils, separately annotate latent heat transfer data.
5. Filters: Identify quality (at design condition) of ventilation air (temperature and humidity). Submit particulate and gaseous media selection calculations based upon ASHRAE 62.1 or 62.2 (as applicable) IAQ standards for the worst-case local microclimate conditions. Calculations must support specific recommended filter change schedule provided in O&M

manual. Analysis must include life cycle cost of OAPCF and associated impact on replacement frequency of HEGA ASZM-TEDA filters.

6. Fan Data: Fan performance curves and data table indicating system operating conditions at rated design operating points (both minimum and maximum design airflows) for both clean and dirty filters.
7. Acoustic Summary Data: Provide Sound Power Level table in dBA for inlet openings in mixing plenum and plenum fan discharge. Provide Casing Radiation Sound Level data in dBA for supply fan section. Data must be based at design airflow rate and maximum total pressure of each AHU.

F. Test Reports:

1. Testing Agency Qualifications: Submit qualifications for independent testing agency.
2. Testing Protocols: Submit testing protocols to Project Director/COR for receipt by OBO/PDCS/DE Mechanical Engineer representative.

   a. Factory Testing: Receipt must be at least seven days in advance of test.
   b. Field Testing: Receipt must be at least 14 days in advance of test.
   c. Commissioning and Startup Service: Receipt must be at least 14 days in advance of test. Itemize equipment and materials required on site; list each performance test to be conducted and describe desired outcome of each commissioning test.

3. Factory AHU Casing Pressure Test: Prior to shipping, submit data for test signed by testing official from testing performed in accordance with Article on FACTORY ACCEPTANCE TESTING.
4. Factory Filter Housing Test: Submit data for test signed by testing official from testing performed in accordance with Article on FACTORY ACCEPTANCE TESTING. Include the following:

   a. Filter Housing Test Report from manufacturer of filter frame manifold(s) in housing.
   b. HEGA media lot acceptance test data for each lot; submit when filters are shipped.

5. Field AHU Casing Pressure Test: For modular AHU assembled in field, submit data for test signed by testing official from testing performed in accordance with Article on FIELD QUALITY CONTROL.
6. Field Filter Bypass Test: Submit data for test signed by testing official from testing performed in accordance with Article on FIELD QUALITY CONTROL. Include the following:

   a. Testing Equipment: Provide list of equipment used along with current calibration certificate.
   b. Field Quality Test Report: This Report will be forwarded by Project Director/COR to OBO/OPS/FAC for inclusion in Maintenance Database.

7. Field AHU System Leakage Test: Submit data for test signed by testing official from testing performed in accordance with Article on FIELD QUALITY CONTROL.

G. Certificates: For certification as identified in Article on QUALITY ASSURANCE.

H. Operations and Maintenance Manuals.

1.5 QUALITY ASSURANCE

A. Single-Source Responsibility: Obtain all AHU assemblies from a single source, which assumes responsibility for compatibility with each HVAC system.

B. Testing Agency Qualifications: Independent agency with experience and capability to conduct testing included in this Section that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/ME.

C. Certification: Certify compliance with the following:

1. Motors: Conventional efficiency testing is performed in accordance with NEMA MG 1. Motors comply with NEMA standards and are matched to torque and horsepower requirements of load. Motors have electrical insulation in accordance with Article on MOTORS AND VARIABLE FREQUENCY DRIVES.
2. Variable Frequency Drive Controllers: Design and rating of motors for use with variable frequency drive controllers are suitable for use throughout entire speed range without overheating.
3. Electrical Components and Wiring: Testing indicated in the OBO Electrical Code (NFPA 70 as amended by OBO) for items identical to those used in other Sections of this project Construction Specification. Systems must be listed and labeled for intended use.
4. Welding Certify that manufacturer uses skilled, certified welders for this construction. Welding procedures and personnel certifications must be in accordance with AWS D1.1 and AWS D9.1 for casing joints, filter housings, and seam welding.
5. Cooling and Heating Coils: Compliance with AHRI 410.
6. Humidifiers: Compliance with AHRI 640 “Standards for Commercial Humidifiers.”
7. Filters:

    a. Compliance with NFPA 90 series for fire classifications, ASHRAE 52.2 for testing and rating air filters, and AHRI 850.
    b. HEPA Filters: Compliance with either IEST-RP-CC001.
    c. HEGA Filters: Compliance with IEST-RP-CC008, MIL-DTL-32101 for ASZM-TEDA Carbon, and Section TA of ASME AG-1 for High Efficiency Air Cleaning Devices (applicable sections). Certify filter housings and filters are designed, manufactured, and tested in accordance with quality assurance program that meets ASME NQA-1, Basic Requirements.
    d. HEGA Media Lot Acceptance Test: Testing and physical and chemical analysis of data from test performed in accordance with MIL-DTL-32101 (except Section 4.3.6.8 adsorption testing).

D. Corrosion Resistance: Provide corrosion resistance for air handling system in accordance with OBO Building Code Appendix W and OBO Mechanical Code Chapter 3.

1.6 MARKING, PACKAGING, SHIPMENT, AND STORAGE

A. Coordinate shipping to ensure all AHU components, including construction filters and inertial separator for each AHU are delivered at same time for proper field assembly or storage.

B. Packaging, shipping, and storage of filters must be done in accordance with IEST-RP-CC008 for HEGA filters, and IEST-RP-CC001 for HEPA filters. To preserve filter integrity and carbon life, ship all occupancy filters and replacement filters to arrive no earlier than 90 days before scheduled filter testing, in individual protective packaging separate from AHU housings. Ship occupancy filters so that they are on jobsite before scheduled filter testing. Carefully handle and store filters in dry location with constantly controlled temperature to protect from inadvertent construction damage. Inspect filters showing damage from shipping/handling or improper packaging to determine filter integrity; and replace damaged filters. If plastic wrapping on HEGA filters is damaged, determination will be made by Project Director/COR based upon input from OBO/PDCS/DE Mechanical Engineer as to disposition (replacement or rewrapping).

C. Each filter and filter packaging must be permanently marked in accordance with IEST-RP-CC008 for HEGA and IEST-RP-CC001 for HEPA filters. Marking must include HEGA adsorbent data (manufacturer, type, and grade), adsorbent weight, applicable warnings, and filter filled weight. Cartons or crates must be clearly marked with “This Side Up” ensure proper orientation is maintained during shipment.

D. AHU Condensate P-Trap: AHU manufacturer must ship AHU condensate P-traps with each AHU. Provide clear written instructions for proper field installation in shipment package. In extremely dry locations, trap primer may be required.

E. Contractor is responsible for submission of required documentation for export license, when such license is required, for HEGA filters to ensure HEGA filter availability in timely manner at project site for AHU commissioning.

1.7 EXTRA MATERIALS

A. Construction filters for each AHU. Prior to shipping, install one set of construction filters in each AHU, and provide additional three change-out sets of construction filters for each AHU stored in inlet plenum. Occupancy filters must not be used for initial start-up nor during construction. See Article on COMMISSIONING AND START-UP SERVICE for installation of occupancy filters.

B. Spare filters for each outdoor-air AHU. Provide four sets of primary occupancy pre-filters. Provide two sets of secondary occupancy pre-filters.

C. Spare filters for each indoor-air AHU. Provide three sets of primary occupancy pre-filters.

D. Spare gaskets for AHU access doors. Provide sufficient length of spare gasket for each size access door used on any AHU installed for project, including filter section.

E. Spare AHU Gauges. Provide one additional AHU gauge of each type and range used, including filter gauges, as spare set.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. AHU: **[For Dedicated Outdoor Air Supply or Makeup Air Unit, a different manufacturer may be used for this unit than for other AHU.]**

   a. United Technologies (Carrier).
   b. Daikin Applied (McQuay).
   c. Ingersoll Rand (Trane).
   d. Johnson Controls Incorporated (York).
   e. Haakon (USA).
   f. [Desert Aire (for Dedicated Outdoor Air Supply or Makeup Air Unit only).]

2. Filter and Filter Housing:

   a. Camfil Group (formerly Camfil Farr).
   b. AAF Flanders.
   c. P&G Manufacturing.

3. Activated Carbon:

   a. Calgon Carbon Corporation.
   b. Molecular Products Group Ltd.

4. Fans (including fan arrays with gravity dampers). Use only direct drive:

   a. AcoustiFLO.
   b. Twin City Fan and Blower (Twin City Fan Companies, Ltd.).
   c. Chicago Blower Corporation.

2.2 MANUFACTURED UNITS

A. Factory design AHU components as modular sections for field assembly on concrete housekeeping pads. Size modular sections to permit installation or removal through fire egress corridors. Modular sections include:

1. Inlet plenum with modulating interconnected dampers for ventilation and return air.
2. Filter sections include pre-filter, HEPA filter, HEGA filter and post-filter.
3. Coil section includes finned cooling coils, condensate drain pans, cleaning access, plus heating coils and humidifier as required.
4. Heat Recovery Device section.
5. Fan sections, including motors and fans.

B. Casings:

1. Wall: AHU Casing must be double-wall, insulated pressure casing with no-through-wall metal joints or fasteners.
2. Joining: Bolt modular section support frame together and join modular casing sections together with leak-proof mating surfaces.
3. Base: Units must be supplied with base rails and perimeter lifting lugs for each section. Base rails must be G90 galvanized steel painted to conform to 1000-hour salt solution (5 percent) spray test without any signs of rust when tested in accordance with ASTM B117. Rust rating must be 10 with blister rating of 10 in accordance with ASTM D714. Alternatively to painted G90 steel, Type 6061 T6 welded structural aluminum may be used.
4. AHU Installed Outdoors or in Other Unconditioned Areas: Inner and outer walls must be minimum **[1.3 mm 3003 aluminum][1.6 mm (Gauge 16) 316 stainless steel]**. Associated ductwork, dampers, actuators, and other appurtenances exposed to outdoor air or mixed airstream must be 316 stainless steel or powder-coated epoxy paint. Construct roof panel to provide drainage with 5 percent maximum pitch to side.
5. AHU Installed in Conditioned Mechanical Rooms: Sheet metal wall and roof panels forming outer wall must be minimum 1.6 mm (Gauge 16) galvanized G90 steel, lock forming quality conforming to ASTM A653. Inner wall must be minimum 1.6 mm (Gauge 16) **[galvanized G90 steel, lock forming quality conforming to ASTM A653.][316 stainless steel.]** Paint outer skin to conform to 1000-hour salt solution (5 percent) spray test without any signs of rust when tested in accordance with ASTM B117. Rust rating must be 10 with blister rating in accordance with ASTM D714. **[Associated ductwork, dampers, actuators, and other appurtenances exposed to outside air or mixed airstream must be 316 stainless steel or powder-coated epoxy paint.]**
6. Deflection: AHU housing must not deflect more than L/240, where L is major axis across largest unstiffened panel.
7. Flooring: Flooring of sections must be minimum 3.2 mm (0.125 inches) thick aluminum deck tread (diamond plate), continuously welded. Structural base frame must be epoxy-painted steel C-channels.
8. Insulation: Design unit to prevent condensation on exterior surfaces. Provide calculations showing exterior surface temperatures remain above the design dew point temperature when the air handler is in cooling mode (design dew point temperature varies depending on location, indoor/outdoor, etc.). Core insulation material in walls, floor, and ceiling must be at least 50 mm (2-in.) thick UL-listed Class-1 medium-density (32 kg/cu-mtr; 2.0 lb/cu-ft) closed-cell polyurethane foam with thermal conductivity not greater than 0.024 W/m-oK (0.014 Btu/hr-ft-°F) (ASTM C518 aged R-value R-6 per inch or greater). Submit material data sheet for the selected insulation product.
9. Penetrations: Do not make penetrations of AHU casing in field; all necessary penetrations (including for coils, controls, and traps) must be made at factory.
10. Sealant Material: Joint and Seam sealant must include tapes, adhesives, masked and open weave fabric. Flange gaskets must be butyl rubber or EPDM polymer with polyisobutane plasticizer. Flange mastics must be single-component polyurethane-based, non-sag elastomeric joint sealant complying with ASTM C920, Type S, Grade NS, Class 12.5. Water-based joint and seam sealant must be UL723 listed, complying with NFPA for Class 1 ducts, and be resistant to UV light when cured.
11. Test Ports for Field Installation: Manufacturer must provide two test ports capable of being installed in field ductwork for sampling of airstream required during filter bypass testing.

Test ports must be cast aluminum or zinc alloy, capable of being attached over neoprene gasket and sealed with removable cap.

12. Control and Electrical Power Connections: All penetrations for control and motor electrical power connections must be performed at factory such that no additional penetrations are required to be performed in field, and to ensure that installation is leak tight.
13. Lighting: Provide one vapor-tight light fixture with globe guard and screw-in style LED bulb in each AHU service compartment that has an access door capable of personnel entry (does not apply to side access filter compartments). Provide single light switch on casing exterior to control all the lights within the AHU.

C. Filter Gauges: For each AHU, provide factory-mounted 100-mm (4-inch) dial-type Magnehelic® and transmitting differential pressure gauges with brass fittings and copper tubing to indicate pressure drop across each pre-filter, secondary filter/HEPA filter, and HEGA filter. Differential pressure gauge is not required for final filter. Gauges must be diaphragm type, with dial and pointer in metal case, black figures on white background, and equipped with vent valves and front recalibration adjustment. Calibrate gauges in SI units. Filter gauge markings must be in Pascals, with pressure range within that scheduled for maximum operating pressure of AHU. Provide placard for each filter; indicate type of filter and scheduled clean/dirty filter pressure points reflecting points in approved shop drawing submittal.

D. Condensate Pan, Drain, and Trap:

1. Condensate Pan: Install drain pan beneath cooling coils**[and humidifier]**, and extend drain pan the lesser of 800 mm downstream from face of cooling coil or entire length of coil inspection area to collect condensate. Provide removable **[galvanized steel][316 stainless steel]** floor grating over drain pan downstream of cooling coil. Drain pans must be double sloped to drain and must be continuously welded 316 stainless steel with minimum 50 mm (2 inch) depth.

2. Condensate Drain: Extend drain connection out through side of casing above structural frame of AHU; see Article on INSTALLATION. Condensate drain size must be in accordance with AHU manufacturer recommendations.
3. Condensate Trap: AHU manufacturer must provide each AHU with ASTM B88 Type L copper tube condensate P-trap with inspection caps and screw-on, electronic trap primer. Condensate trap inspection caps must be removable full-pipe-size located at top of each side of the trap; this is to facilitate inspection of water level in trap and maintenance of condensate trap and condensate drain line. P-trap must be configured for suction-side operation of sufficient depth to overcome suction pressure of supply fan with fully loaded filters without being sucked dry, plus an additional 50-mm (2-inch) mm depth.

E. Inlet Plenum Wash-down Drain: Install 40 mm floor drain with removable galvanized steel floor grating (capped for normal use) to allow unit wash down in inlet plenum; drain outlet may be located within AHU structural frame.

F. Access Doors: Access doors (not including filter section) and panels must be of same construction as wall panels. Frames must be 50 mm extruded aluminum angles with thermal break for no-through metal construction. Doors must swing 180 degrees and allow easy panel removal.

Provide finished assembly with two perimeter sealing surfaces to allow double gaskets. Provide piano or butt hinges, number and size according to SMACNA's "HVAC Duct Construction Standards – Metal and Flexible." Provide minimum of two wedge-lever-type, padlockable latches, operable from inside and outside. Doors must open against air pressure (swing out on fan suction side and swing in on fan discharge side).

G. Cooling and Heating Coils: **[ElectroFin or approved equal coils][Coils]** and fins must be airside cleanable and conform to AHRI 410 and ASHRAE 33. Thread piping connections on same end.

1. Tubes: 15 mm copper with 0.9 mm wall thickness, complying with ASTM B75M.
2. Fins: Minimum 0.23 mm (.009 inches) thick copper, mechanically bonded to tubes, with minimum fin spacing of 2.3 mm, maximum fin spacing of 3.2 mm.
3. Headers: Seamless copper with brazed joints.
4. Working Pressure Rating: 1380 kPa, test to 2070 kPa.

H. Dampers: Motorized control dampers must be opposed airfoil blade design constructed with 2 mm minimum thickness and 152 mm wide blades constructed of stainless steel, Type 304 or 316, complying with ASTM A312 or ASTM A554 equipped with replaceable seals made of either EPDM or extruded silicone. Dampers frames must be at least 2 mm thick stainless steel, Type 304 or 316, complying with ASTM A312 or ASTM A554. Secure blades 13 mm diameter zinc-plated or cast zinc axles using zinc-plated hardware, with nylon blade bearings and nylon thrust bearings at the end of each axle. Leak test each damper assembly in accordance with AMCA 500-D. Maximum air leakage must not exceed amount allowed for AMCA Class 1 rating when tested at design static pressure or 1.99 kPa, whichever is greater.

I. [Humidifiers: Comply with AHRI 640. Steam or Dispersion tube humidifiers inside AHU. Humidifiers must be stainless steel, extending entire width of AHU, with maintenance access. Locate downstream of carbon filters and heating coil. Provide stainless steel drain pan of adequate length to allow complete absorption of water vapor. Absorption distance characteristic must prevent water accumulation on any induct surfaces beyond [305][460] mm. Controls must include:

1. Disconnect switch.
2. Liquid crystal display with programmable keyboard.
3. Set point adjustment.
4. Warning signal indicating end of life of replaceable cylinder.
5. Conductivity probe for water level control.
6. High water sensor to prevent overfill.
7. Back-up float to prevent overfill with remote alarm.
8. Proof of fan before humidifier is enabled (to prevent excessive moisture from being discharged into duct whenever fan is off).
9. High/low limit relative humidity sensor.]

J. AHU Filter Housing:

1. Construct filter housing section for AHU of double-walled interior stainless steel **[316 in corrosive environment][403 in non-corrosive environment]** with single side access.

Design and construct entire filter housing to withstand negative and positive pressure of 2500 Pa and still maintain filtration leakage/bypass requirements. Continuously weld pressure retaining joints and seams with no pores allowed. Visually inspect welds for workmanship acceptance criteria described in Section 5 and 6 of ANSI/AWS D9.1. Limit filter housing size to maximum of four filters wide and three filters high. Standard filter face dimensions are nominal 609 mm wide by 609 mm high.

2. Filter housings may be designed for combination of inlet air plenum access and side access installation. The exception is that one-high filter housing configuration must be provided with only side access installation. For filter decks downstream of inlet air plenum, provide at least 0.5 meters between installed filter face and top of AHU where ductwork is installed. If no ductwork is installed through top of AHU, provide at least 0.75 meters between installed filter face and rear wall of plenum or damper (if present) for maintenance accessibility. Locate damper actuator arms (if present) so as to not interfere with filter installation.
3. Filter housing section must incorporate special securing mechanisms to retain HEPA and HEGA filters in place. Each mechanism must exert an equal force on top and bottom edge of filter sufficient for knife edge on filter section housing to penetrate filter's silicone or urethane gel sealant and maintain filter firmly in place. Interlock side access doors for HEGA filter sections with securing mechanism to prevent door closure unless filters are properly sealed in housing.
4. Filter section access doors must be swing-open type with padlock-type securing latches. Fit with reliable gasket seals to prevent leakage when closed. These side access doors must enclose HEGA and final filters; label "Warning - Do not install filters, other than construction filters, until all construction work, including drywall and painting, has ceased."
5. When HEPA and/or HEGA filter housings are installed within an AHU casing, all seams between filter housing and inner wall of AHU casing where air could potentially bypass filter section must be gasketed and sealed.
6. Factory-Installed Filter Housing Test Ports: Filter Housing Manufacturer must provide factory-installed capped test ports in filter housing upstream of HEPA filter, one in middle of each filter tier, to facilitate verification of aerosol uniformity during filter bypass testing in field.
7. Factory-Installed Filter Housing Differential Pressure Sensing Points: Male pipe thread ports must be factory welded into housings for differential pressure sensing across each pre-filter, secondary filter/HEPA filter, and HEGA filter. AHU manufacturer must attach and extend pressure tubing from ports to filter gages.
8. HEGA Test Canisters: For each filter housing incorporating ASZM-TEDA HEGA filters, install three test canisters in bypass line, and subject to same airstream as primary ASZM-TEDA HEGA filters.

K. Electric Duct Heaters: Refer to Division 23 Section on duct heaters for general requirements for electric duct heaters. Electric duct heaters must be slip-in type with gasketing on electric panel for providing tight seal on AHU casing. Heater insert frame must be capable of being connected to safing dividers within AHU casing to provide airtight connection.

L. Fixed-Plate Enthalpy Heat Exchanger: Refer to Division 23 Section on fixed-plate air-to-air energy-recovery equipment for general requirements for this equipment.

1. General: Fixed-plate enthalpy exchangers must be certified through AHRI 1060 Certification program. At nominal certified airflow, enthalpy exchanger must provide at least 60 percent total effectiveness for both heating and cooling conditions and 0 percent exhaust air transfer ratio (EATR) when tested at AHRI differential pressure between airstreams. These values must be produced from official AHRI certification data, and verification may be obtained via www.ahridirectory.org website; that website has been made available to the public by AHRI to ensure proper comparison of air to air energy recovery products.
2. Heat exchanger manufacturer must provide independent testing of enthalpy exchanger core to UL standard 900 with flame spread result less than 25 and smoke generation less than 50; these results conform to NFPA 90A and 90B for component within ducted air system.
3. Enthalpic Transfer Core: Enthalpy exchanger must provide high performance sensible and latent transfer between airstreams. This transfer must be accomplished by moving energy (both sensible and latent) molecularly through enthalpy exchanger surface while keeping airstreams physically separated. Air-to-air enthalpy exchanger must be of fixed plate type and must have no moving parts, surface-adhered desiccants, or paper parts. Core unit must be capable of both summer and winter operation with no condensation buildup or condensate management; enthalpy exchanger core must operate with no frosting or condensation at outdoor conditions above -23.3 degree C and exhaust air relative humidity below 40 percent. Infrequent incursions outside these conditions must not impact function of exchanger. Drain pans are not required.
4. Heat recovery section of AHU must be provided with galvanized steel internal bypass damper controlled by two-position, spring return actuators to be controlled by an external economizer control (refer to separate Section). This will bypass intake/outdoor air directly around enthalpic transfer core. Return/exhaust air must continue normally through cores to exhaust fan.

M. Energy Recovery Coils: Provide water coil section upstream of heating and cooling coils in outdoor-air AHU for pre-heating/cooling of outdoor air from building return/exhaust air systems. Coil construction must be in accordance with requirements above for cooling and heating coils in heat exchanger. Medium must be propylene glycol/water; ratio of those two must be in accordance with manufacturer requirement for design ambient winter temperature.

N. Heat Pipe Heat Exchangers: Provide refrigerant heat pipe heat exchanger coil section with divider partition of air stream. Coil construction must be in accordance with requirements above for cooling and heating coils in heat exchangers. Refer to Division 23 Section on heat-pipe air-to-air energy-recovery equipment.

2.3 FILTERS

A. Each filter must be tested and rated either in accordance with ASHRAE Standard 52.2.

B. Construction Filters: Construction filters must be used during construction to protect AHU and ductwork until all related project work (e.g., millwork, stone cutting, and painting) is complete in each building. A 102 mm (4 inch) deep MERV 8 filter is minimal acceptable filter for air handling unit. A 51mm (2 inch) deep MERV 6 filter is minimal acceptable filter rating for fan coil units. Dimensions of filters must be coordinated with equipment.

C. False Filter Inserts: Provide 609 mm x 609 mm x 305 mm deep metal "filter" frames with adjustable air slots that may be installed with construction filters in air handling units to simulate AHU having "clean" filters, allowing AHU to be operated thru variable speed drives without damage to drives due to high airflow/low total pressure conditions.

D. Roughing Bag-Type Pre-Filter (F-1 for MERV 11) for Single-Pass Outdoor-Air AHU: Each pre-filter must be MERV 11 bag-type filter with microfiber glass media and plastic enclosing frame. Size of pre-filter must be 609 mm x 609 mm x 559 mm deep. Initial resistance to airflow must be less than 75 Pascal at airflow of 2.5 m/s (500 fpm).

E. Outdoor-Air Pollution Control Filters (OAPCF):

1. OAPCF Particulate Filter (F-2): Outdoor-Air Particulate Filters must be minimum MERV 14 pleated polyester or polypropylene thermally glued to welded wire backing. Fiberglass media is prohibited. Media filter configuration must reduce, as shown though technical analysis, particulate contaminants (e.g., PM2.5, PM10, lead) from site microclimate air pollution sources.
2. OAPCF Molecular (Activated Carbon Gas Phase) HEGA Filter (F-3):

   a. 609 mm x 609 mm x 483 mm deep with activated carbon or other OBO/PDCS/DE/ME approved adsorption media beds that must reduce, as shown though technical analysis, gas phase contaminants from air pollution sources (VOC and local TIC) to safe level for building occupants approved by OBO/PDCS/DE Mechanical Engineer through Project Director/COR. Non-cylindrical, deep-V configuration enclosed on four sides by non-perforated case that extends full depth of beds.

   b. Activated carbon, coconut shell base, 8x16 mesh and must have a minimum carbon tetrachloride activity of 60 percent when tested in accordance with ASTM D3467; or other adsorption media in configurations that will provide required removal of gaseous contaminants.
   c. Carbon or other adsorption media in these filters must meet "base" requirements for nuclear grade media with media thickness/weight, particle size distribution, and composition selected to minimize life cycle cost. Analysis must include life cycle cost of OAPCF and of associated impact on replacement frequency of HEGA ASZM-TEDA filters.

3. OAPCF Combination Particulate and Molecular Filter (F-4): Pleated V-cell filter. Coordinate filter manufacturer's space requirements with air handler manufacturer since filter manufacturer has option of providing combination embedded particulate/molecular filters or separate particulate and molecular filters. Initial resistance to airflow of the combination particulate and molecular filter must be less than 150 Pascal at airflow of 2.5 m/s (500 fpm).
4. Filter Casing: Filter case must be high impact polystyrene capable of use in high humidity applications and must have same cross-sectional size as filter. All seams and joints that are adjacent to any portion of any filter contact surface must be ground smooth and flush with adjacent surfaces.

5. Performance: Air passing through filters must have residence time (e.g., > 0.1 sec is "typical" for activated carbon) required to remove contaminants of interest to acceptable, safe concentration levels based upon calculations performed in accordance with Appendix B of IEST-RP-CC-008 with air velocity of less than 0.25 m/sec through unbordered filter bed screen area in direction perpendicular to media. Filters must have mechanical efficiency of 99.9 percent at maximum rated flow of HEGA filter. Measure mechanical efficiency using refrigerant leak test method at maximum rated flow of adsorption filter in accordance with Section 7.3.2 of IEST-RP-CC-008.

F. HEGA Post Filter (F-5): Install MERV 8 Post Filters, sized 610 mm x 610 mm x 102 mm deep, immediately downstream of HEGA filter to capture carbon fines that may discharge from HEGA filters.

G. Pre-Filter (F-6) for Recirculating AHU: Provide MERV 13. Filter media must be microfine glass formed into mini-pleat packs and arranged into V-bank configuration with plastic enclosing frame. Size of pre-filter must be 609 mm x 609 mm x 305 mm deep. Initial resistance to airflow must be less than 85 Pascal at airflow of 2.5 m/s (500 fpm).

H. HEPA Filter (F-7):

1. Fabricate and label each HEPA Filter for AHU in accordance with IEST RP-CC001.3 for Type A performance and Grade 2 construction. Filter dimensions must be 610 mm x 610 mm x 292 mm; careful sizing based on this nominal dimension is important for filter operation. Fabricate filter pack by pleating continuous sheet of filter media per IEST RP-CC001 for Type performance and Grade 2 construction. Seal filter pack with fire-retardant solid urethane sealant.
2. Media: UL 586, fibrous glass, constructed of continuous sheets with closely spaced pleats to remove 99.97 percent of all particulate matter 0.3 microns or greater.
3. Media to Frame Side Bond: Polyurethane foam.
4. Face Gasket: Self-healing, non-flowing elastomeric gel sealant.
5. Filter Guard: Provide expanded metal grille over exposed HEPA filter material that does not interfere with filter operation.
6. Mounting Frames: Provide bolted filter-sealing mechanism to mount, and continuously seal each individual filter. Filter frame and housing must incorporate knife-edge fluid seal design that mates into highly viscous silicone gel fluid-filled perimeter channel on mounting face of filter. Grind all weld seams and joints adjacent to any portion of any gasket-sealing surface smooth and flush with adjacent metal surfaces.

I. HEGA ASZM-TEDA Molecular Filter (F-8):

1. Each HEGA molecular filter must be 610 mm x 610 mm x 483 mm deep, with activated carbon beds in deep-V configuration enclosed on four sides by non-perforated case that extends full depth of beds.
2. Adsorption filters must consist of multiple flat adsorbent beds in V-cell configuration, with minimum bed depth of 25 mm of activated carbon impregnated with ASZM-TEDA in accordance with specification MIL-DTL-32101. Bind carbon media in each bed with two perforated sheets spaced uniformly apart. To prevent air bypassing sides of beds, seal internal sides of case to ends of beds with adhesive or sealant in accordance with section

4.4.2 of IEST-RP-CC008 and provide each perforated sheet with minimum of 12 mm solid margin around all four sides. Line each perforated sheet with durable scrim to prevent carbon granules from passing through larger holes in perforated sheet. Activated carbon must be 12x30 mesh, specially impregnated coal base, carbon conforming to MIL-DTL-32101.

3. Filter Casing: 3.2-mm thick, non-perforated high impact polystyrene capable of incineration. Overall case dimensional tolerances must conform to IEST-RP-CC008, Section 6.4.4. Filter case and housing must incorporate knife-edge fluid seal design that mates into silicone or urethane gel fluid-filled perimeter channel on mounting face of filter. Grind all seams and joints adjacent to any portion of any gasket-sealing surface smooth and flush with adjacent metal surfaces.
4. Performance: Air passing through filters must have residence time of 0.1 seconds or greater based upon calculations performed in accordance with Appendix B of IEST-RP-CC-008 with air velocity of less than 0.25 m/sec through un-bordered filter bed screen area in direction perpendicular to media. Filters must have mechanical efficiency of 99.9 percent at maximum rated flow of HEGA filter that maintains the residence time of 0.1 seconds at bed velocity of less than or equal to 0.25 m/sec. Measure mechanical efficiency using refrigerant leak test method at maximum rated flow of adsorption filter in accordance with Section 7.3.2 of IEST-RP-CC-008.
5. Requirements for Chemical Agent Gas Life Test identified in MIL-DTL-32101, Section 4.3.6.8 are not required. However, provide manufacturer's test data for each lot; see Article on SUBMITTALS.
6. Pressure Drop: Average pressure drop across filter must be no more than 490 Pascals at maximum allowable airflow through filter that still provides required minimum residence time of 0.1 seconds at bed velocity of less than or equal to 0.25 m/sec. When tested at filter's rated airflow, pressure drop across each filter in lot must vary by no more than 10 percent of arithmetic mean of pressure drops across all filters in lot.

J. HEGA Filter Test Canisters (F-9): Three removable, replaceable, adsorption media ASZM-TEDA activated carbon sampling devices on each AHU, with same maximum velocity and residence time characteristics as rest of adsorption filter. Sampling media canisters must be approximately 50 mm diameter, and either accessible from filter housing frame door or externally mounted and accessible from filter housing. Provide equal number of canister blanks to prevent air bypass when sampling media canisters are removed for testing.

2.4 OUTDOOR AIR INLET

A. Provide weather protection hood. Hood must be Type 316 stainless steel complying with ASTM A554.

B. Bird Screen: Corrosion-resistant 6 mm galvanized mesh bird screen that conforms to ASHRAE 62.1/62.2.

C. [Inertial Separator: Design and provide AHU with inertial separator, installed upstream of the AHU, to extend life of particulate filters by separating heavy airborne particles as air changes direction. Depending on equipment size, use a fan to either supply air through

inertial separator with 10 percent exhaust bleed air, or exhaust 10 percent bleed air of sand and heavy particles from inertial separator.]

2.5 MOTORS AND VARIABLE FREQUENCY DRIVES

A. Motors must be totally enclosed fan-cooled (TEFC) rated as premium efficiency with Class H insulation and service factor of 1.15. Conventional efficiency tests must be performed in accordance with NEMA MG 1.

B. Design and rate motors for use with variable frequency drive controllers suitable for use throughout entire speed range without overheating. Comply with NEMA MG 1 for thermal overload protection. Use electronic filters conforming to IEEE 519 for power supply. Provide remote monitor leads compatible with energy management system. Refer to Division 23 Section on motor requirements for HVAC equipment and Division 26 Section on variable frequency motor controllers for additional requirements.

C. All motor wiring must be factory installed, with leak tight penetration through AHU fan housing section. Install all necessary conduit penetrations at factory for fan, coil, and return/outdoor-air plenum to accommodate field installation of BAS wiring; penetrations must be capped internally and externally for testing.

D. Provide continuous current, voltage, and power monitoring at each AHU variable frequency drive, together with data logger for historical data retrieval.

2.6 FANS

A. Fan section must be factory fabricated, assembled, tested. Equip with direct drive centrifugal plenum fan, motor, disconnect switch, drive assembly, and housing.

B. Comply with AMCA 99 for operating limits. Factory tests must conform to AMCA 210 for fan performance data. Comply with AMCA 300 and AMCA 301 for acoustical data.

C. Fan wheel must be aluminum, and employ backward inclined blades that are welded or riveted to flange and back plate.

D. Static and dynamic balances must conform to ISO 14694. Motor vibration must conform to NEMA MG 1 Part 7 “Motor and Generators.”

E. Fan shaft must be turned, ground polished, hot rolled steel with keyway, designed to operate at no more than 70 percent of first critical speed when rotating at top of fan speed range.

F. Center fan inlet in fan wall for optimal airflow characteristics and condensation control.

G. Provide piezometer ring with digital display indicating airflow accurate to within plus/minus 5 percent.

H. Provide fan section door electrical interlock that prevents fan operation when door is open.

I. Service disconnect must be provided by the AHU manufacturer and mounted both within sight and 2 meters reach of motor access door.

J. Labels: On fan door assembly, mount placard with designation of unit, design airflow rate in L/s and M3/hr, and design pressure drop of AHU in Pascals.

K. Fan/Motor Assembly Mounting: Mount assembly structural steel frame such that fan inlet is centered over cooling coil to promote even airflow over coil surface area. Mount fan assembly on steel frame or fan floor casing as applicable, or on seismic or vibration isolators as applicable for site seismicity requirements, and anchored to section floor casing or fan mounting frame as applicable. Refer to Division 23 Section on vibration and seismic controls for HVAC.

2.7 FILTER GAUGES

A. For each filter on air handling unit, except for final filters after HEGA filter, provide factory-mounted 100 mm dial-type Magnehelic® and transmitting differential pressure gauges with brass fittings and pneumatic tubing for inside AHU and copper tubing where exposed outside of AHU or Filter Housing. Gauges must be diaphragm type with dial and pointer in metal case, with black figures on white background, and with vent valves and front recalibration adjustment. Calibrate gauges in Pascals. Gauge range must be between 0-750 Pascals for pre-filters and 0-500 Pascals for HEPA and HEGA filters. Manufacturer must provide placard beneath each gauge indicating the type filter gauged, design “clean” and “dirty” filter pressure drops in Pascals for AHU design airflow (pressure drop for maximum airflow allowed for filters at maximum filter airflow capability allowed is not acceptable).

2.8 ACCESSORIES

A. Provide foot-pedal operated hydraulic scissor lift table on push truck cart equipped with caster wheels and brakes capable of lifting and lowering HEGA filters to/from AHU filter housings.

1. Minimum Lifting Capacity: 350 kg
2. Lifting Height: 1.5 meters
3. Width x Length: 61 cm x 122 cm

2.9 FACTORY ACCEPTANCE TESTING

A. General:

1. Notify Project Director/COR of testing date and location at least 45 days in advance of testing to facilitate OBO/PDCS/DE/ME representative to witness testing and beginning of start-up service.
2. Facilitate access by OBO/PDCS/DE/ME representative to place where air-handling units are being tested for witness testing.
3. Fabrication must be fully completed and ready prior to witness testing.
4. Successful witness testing is a required quality assurance procedure prior to shipping of air-handling units.

B. HEGA Media Lot Acceptance Test: Analyze physical and chemical characteristics in accordance with applicable standard (e.g., ASTM D 3467).

C. Filter Housing Test: Housing manufacturer must test housings for filter alignment, filter fit, and for clamping mechanism operation. Leak test filter sealing surfaces and filter housing assembly pressure boundary in accordance with Section TA of ASME AG-1 before leaving factory. Record pressure readings once per minute for five minutes. Maximum leak rate must not exceed 0.008 liter/second per cubic meter of filter housing volume.

D. AHU Casing Pressure Test:

1. Assemble, install, and fill condensate drain trap with potable water prior to conducting AHU Casing Pressure Test.
2. After test preparation is completed, conduct pressure test in accordance with ANSI/AHRI 1350.
3. Leakage Test: Conduct test at design static pressure or 2.48 kPa (positive in normally positive pressure areas, negative in normally negative pressure areas), whichever is greater. Air leakage for AHU, including coil and wiring penetrations, must not exceed 1.0 percent of total design airflow.
4. Deflection Test: Air handling unit housing must not deflect more than L/240 during any part of air handling unit and filter section pressurization tests, where L is major axis across largest unstiffened section of air handling unit parallel to direction of airflow between filter housing and fan. OBO/PDCS/DE Mechanical Engineer or their designee must be present for test and will select one unit per factory visit for deflection test. If chosen unit fails to meet deflection test requirements, all remaining AHU must also be tested. If unit fails to meet test requirements, corrections must be made at Contractor's expense.

PART 3 - EXECUTION

3.1 FIELD EXAMINATION

A. Examine concrete pads for compliance with requirements for installation tolerances and other conditions affecting installation and performance of HVAC casings. Verify sufficient height exists to allow proper mounting of provided P-trap without contacting the floor.

B. Examine roughing-in of hydronic drainage piping systems and electrical services to verify actual locations of connections before installation.

C. For renovation and system replacement projects, verify that roof structure can handle load.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Concrete Bases: Install floor mounting units with sufficient height to ensure clearance for condensate trap installation above finished floor, with minimum of 100 mm high concrete bases.

See Division 23 Section on common work results for HVAC for concrete base materials and fabrication requirements.

B. **[Rooftop units: Mount rooftop units on 1000 mm high structural railing to allow for roof maintenance under the AHU. Include raised platform with railing around perimeter of rooftop unit to facilitate AHU maintenance.]**

C. Units with Internally Isolated Fans: Secure units to anchor bolts installed in concrete bases. Remove manufacturer's shipping retainers on the internal isolators supporting fan mounting frame and adjust per manufacturer's recommendations.

D. Install weather protection hood over the outdoor-air inlet. **[Bottom of weather hood must be a minimum of [XX mm] above roof to preclude impedance of airflow by snow accumulation and its resulting interference of system performance. Include heat trace on outdoor-air damper.]**

3.3 CONNECTIONS

A. Coordinate piping installations and specialty arrangements with schematics on Drawings and with requirements specified in piping systems.

B. Piping installation requirements are specified in other Division 23 Sections. Construction Drawings indicate general arrangement of piping, fittings, and specialties. Install piping adjacent to AHU to provide coil pull space, and to facilitate service and maintenance.

C. Drain Piping:

1. Condensate Drains: Install factory provided condensate trap to drain pan outlet with inlet and outlet connection locations in accordance with manufacturer's drawings. Connect condensate drain piping using hard copper tube, ASTM B88, Type **L [cast-][or][wrought-]copper [solder-joint][or][pressure-seal joint]** fittings; and **[brazed][or][soldered][or][pressure-seal]** joints. Extend to nearest equipment or floor drain. Install cleanouts at each change in direction. Install electronic trap primer system within condensate drain trap inlet above water line to prevent P-trap from drying out. Plastic "P" traps are prohibited.
2. Wash-Down Drain: Connect 40 mm Type L copper drain pipe with ball valve to drain outlet connection and route separate from condensate drain pipe to nearest equipment or floor drain.

D. Connect hot and chilled water piping to supply and return coil taps, with shutoff or balancing valve and union or flange at each connection. Hangers and supports must support piping so that no piping is supported by air handling unit.

E. Coordinate duct installations and specialty arrangements with schematics on Drawings and with requirements specified in duct and duct accessory Specifications. Make final duct connections with flexible connections.

F. Electrical: Comply with applicable requirements in Division 26 Sections for power wiring, switches, and motor controls. Ground equipment according to Division 26 Section on grounding and bonding for electrical systems. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B. Service disconnect, provided by AHU manufacturer, must be mounted both within sight of, and 2-meters reach of, fan motor access door. **[Use NEMA enclosure type 4X panels in locations where exposed to outdoor air or unconditioned outdoor airstream.][Use stainless steel wire connectors in outdoor locations.]**

G. Install HEGA filter sampling canister assemblies in accordance with manufacturer's installation requirements.

H. Injection and sampling ports: Locate on ductwork so that ports are easily accessible by maintenance personnel on upstream and downstream side of filter housing for commissioning and subsequent testing of HEPA/HEGA performance in accordance with Section TA of ASME AG-1. Locate injection ports in ductwork upstream of filter section to allow even distribution of test agent (e.g., poly-alpha-olefin (PAO), R-11) across entire filter area. Locate downstream sampling ports after fan discharge in area of ductwork that is accessible. Add warning labels to prevent damage to unit.

I. Verify pressure gauges and air flow monitor pneumatic tubing are connected to the device and gauges. Ensure proper calibration of pressure gauges and airflow monitor. Verify that all equipment labels are installed on the AHU.

J. [If site conditions require incorporation of inertial separator on an outdoor-air intake, verify that system has been installed in accordance with manufacturer's instructions and that bleed exhaust fan is operable.]

3.4 FIELD QUALITY CONTROL

A. After equipment/system installation, perform the following field tests and inspections:

1. Condensate Trap Leakage: Fill condensate trap with potable water. Verify that AHU condensate traps maintain seal with potable water at maximum design static pressure to prevent air from entering AHU through the condensate drain line.
2. AHU Casing Pressure Test: Modular AHU assembled in field must be tested again in accordance with procedure described in Article on FACTORY ACCEPTANCE TESTING.
3. Filter Bypass Test: Commissioning and subsequent testing of HEPA and adsorption filter performance must be in accordance with Section TA of ASME AG-1. Independent test agent must identify appropriate locations in ducts for test ports provided for field installation described in Article on MANUFACTURED UNITS, and must install identified test ports in those locations. After installation, permanently mark location of these test ports. If halide gas detection instrument is gas chromatograph (GC), test must include at least four readings taken at least one minute apart within ten-minute interval at rated flow. If halide gas detection instruments are detectors, detectors must continuously monitor real time of "pulse" charge of halide gas at rated flow, and plot levels using printer provided by

testing agent for inclusion with test reports. Reading may not exceed 0.1 percent of upstream value for R-11 (gas) or 0.03 percent of upstream value for particles.

B. Final field assembly must be tested as complete integral AHU and certified to meet rigid life safety requirements of enhanced filtration.

C. Demonstrate to post Facility Manager and Project Director/COR proper operation of AHU and controls.

3.5 COMMISSIONING AND START-UP SERVICE

A. Factory-trained technician must inspect field-assembled components and equipment installation, including piping and electrical connections, and perform start-up and performance testing service in accordance with this Article and AHU manufacturer's recommendations.

B. Prior to AHU startup, perform the following minimum tasks:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that spring isolators are installed and adjusted.
3. Verify that unit is secure on mountings and supporting devices.
4. Verify that connections to piping, ducts, and electrical systems are complete.
5. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
6. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.
7. Lubricate bearings and other moving parts with factory-recommended lubricants.
8. Set connected duct system variable air terminal dampers to fully open position.
9. Set outdoor-and return-air mixing dampers to minimum outdoor-air and maximum return air settings.
10. Clean packaged air-handling units internally upon completion of installation according to manufacturer's written instructions. Clean fan interiors to remove foreign material and construction dirt and dust. Vacuum-clean fan wheels, cabinets, and coils entering air face.
11. Comb coil fins for parallel orientation.
12. Coil leak test. Fill water coils with water. Test coils and connections for leaks. Repair leaks and retest until no leaks exist. Drain coils and fill with water or water and propylene glycol solution.

C. Startup: Perform the following minimum tasks:

1. Filters. Verify installation of construction filters.
2. Fans. Verify proper motor rotation direction and verify free fan wheel rotation and smooth bearing operations. After electrical circuitry has been energized, start units to confirm proper motor rotation and drive unit operation. Run fan through entire operational range using VFD controls to verify proper installation. Remove malfunctioning motors, replace with new units, and retest. Adjust fan drive to scheduled RPM for initiation of system balancing. Measure and record motor electrical values for voltage and amperage.

3. Dampers. Adjust damper linkages for proper damper operation. Manually operate dampers from fully closed to fully open position and record fan performance. Refer to Section 250593 “Testing, Adjusting, and Balancing for HVAC” for packaged air-handling system testing, adjusting, and balancing.
4. Separators. Test inertial separators per the general requirements outlined in ISO 5011.
5. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. After Successful Startup: Perform the following minimum tasks after AHU testing, welding, gypsum board installation, sanding, painting, and other dust- and/or VOC-generating activities have been performed and after all spaces are clean of construction dust and fumes, perform the following:

1. Remove construction filters.
2. Clean filter housings.
3. Install occupancy filters.
4. Perform testing, adjusting, and balancing of packaged air-handling and air-distribution system.
5. Commission air-handling and air-distribution system.

3.6 DEMONSTRATION

A. Factory-trained technician (on equipment being installed) must train post’s maintenance personnel to adjust, operate, and maintain packaged AHU.

END OF SECTION 237315

SECTION 260508 – COMMON WORK RESULTS FOR ELECTRICAL, COMMUNICATIONS AND ELECTRONIC SAFETY

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Supporting devices for electrical components.
2. Electricity-metering components.
3. Sleeves and sleeve seals.
4. Lock-out/tag-out devices.
5. Safety accessories.
6. Safety considerations for outdoor substations.
7. Concrete equipment bases.
8. Underground cable connections.
9. Touchup painting.

B. Related Sections include the following:

1. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash study.
2. Section 337105 “Underground Ducts and Raceways.”

1.2 SUBMITTALS

A. Shop Drawings: Show location of underground cable splices, including associated manhole or handhole.

B. Product Data: For each type of product indicated, including lock-out/tag-out devices and safety accessories.

C. Operational Procedures:

1. Identify procedures for equipment isolation, energizing, and de-energizing.
2. Identify procedures for use of Lock-Out/Tag-Out devices and use of safety accessories.

D. Lock-Out/Tag-Out (LOTO) Device Schedule: Identify which LOTO model is intended to be used for each applicable electrical equipment.

1.3 SYSTEM CHARACTERISTICS

A. Facility Voltages: These characteristics apply to work of all Sections for this project.

1. [Medium Voltage: In accordance with Host Country utility voltage.]

a. [50] [60] Hz.
b. [Δ] [Y].]

2. Site Distribution Voltage:

a. Three-phase.
b. **[New Construction: [400/230][208/120][480/277][600] volts.]**
c. **[Existing Facilities: [380/220][400/230][208/120][480/277][600] volts.]**
d. **[50] [60]** Hz.
e. **[Δ] [Y].**

3. Utility Voltage:

a. Single-phase.
b. **[120][220]** volts.
c. **[50][60]** Hz.

4. Control Voltage: In accordance with voltage for associated controlled equipment.

1.4 CORROSION PROTECTION

A. Corrosion protection shall conform to OBO Electrical Code Chapter 1 and OBO Building Code Appendix W.

B. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.

1.5 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.6 COORDINATION

A. Coordinate arrangement, mounting and support of electrical equipment:

1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
3. To allow right of way for piping and conduit installed at required slope.
4. So connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

B. Coordinate chases, slots, inserts, sleeves, and openings with general construction work and arrange in building structure during progress of construction to facilitate the electrical installations that follow.

1. Set inserts and sleeves in poured-in-place concrete, masonry work, and other structural components as they are constructed.

C. Sequence, coordinate, and integrate installing electrical materials and equipment for efficient flow of the Work. Coordinate installing large equipment requiring positioning before closing in the building.

D. Coordinate electrical service connections to components furnished by utility companies.

1. Coordinate installation and connection of exterior underground and overhead utilities and services, including provision for electricity-metering components.
2. Comply with requirements of authorities having jurisdiction and of utility company providing electrical power and other services.

E. Coordinate location of access panels and doors for electrical items that are concealed by finished surfaces. Access doors and panels are specified in Division 08 Section on access doors and frames.

F. Where electrical identification devices are applied to field-finished surfaces, coordinate installation of identification devices with completion of finished surface.

G. Where electrical identification markings and devices will be concealed by acoustical ceilings and similar finishes, coordinate installation of these items before ceiling installation.

H. Coordinate electrical testing of electrical, mechanical, and architectural items, so equipment and systems that are functionally interdependent are tested to demonstrate successful interoperability.

PART 2 - PRODUCTS

2.1 OUTDOOR SUBSTATIONS

A. Metal Enclosures: Use metal enclosures around all live parts.

B. Locks: Provide on gates with key interlocks on switchgear doors to prevent access to live parts.

C. Clearances: Conform to clearance requirements in the OBO Electrical Code and National Electrical Safety Code (ANSI C.2).

2.2 SUPPORTING DEVICES

A. Material: Cold-formed steel, with corrosion-resistant coating acceptable to Project Director/COR.

B. Metal Items for Use Outdoors or in Damp Locations: Hot-dip galvanized steel.

C. Slotted-Steel Channel Supports: Flange edges turned toward web, and 14-mm-diameter slotted holes at a maximum of 50 mm o.c., in webs.

D. Slotted-Steel Channel Supports: Comply with Metal Framing Manufacturers Association MFMA-4 and Division 05 Section on metal fabrications for slotted channel framing.

1. Channel Thickness: Selected to suit structural loading.
2. Fittings and Accessories: Products of the same manufacturer as channel supports.

E. Nonmetallic Channel and Angle Systems: Structural-grade, factory-formed, glass-fiber-resin channels and angles with 14-mm- diameter holes at a maximum of 200 mm o.c., in at least one surface.

1. Fittings and Accessories: Products of the same manufacturer as channels and angles.
2. Rated strength: Selected to suit specified load criteria

F. Raceway and Cable Supports: Manufactured clevis hangers, riser clamps, straps, threaded C-clamps with retainers, ceiling trapeze hangers, wall brackets, and spring-steel clamps or click-type hangers.

G. Cable Supports for Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug for nonarmored electrical cables in riser conduits. Plugs have number and size of conductor gripping holes as required to suit individual risers. Body constructed of malleable-iron casting with hot-dip galvanized finish.

H. Expansion Anchors: Carbon-steel wedge or sleeve type.

I. Toggle Bolts: All-steel springhead type.

J. Powder-Driven Threaded Studs: Heat-treated steel.

2.3 EQUIPMENT FOR UTILITY COMPANY'S ELECTRICITY METERING.

A. Current-Transformer Cabinets: Comply with requirements of electrical power utility company.

B. Meter Sockets: Comply with requirements of electrical power utility company.

C. [Modular Meter Centers: Factory-coordinated assembly of a main meter center circuit-breaker unit with wireways, tenant meter socket modules, and tenant branch circuit breakers arranged in adjacent vertical sections, complete with interconnecting buses.

1. Housing: NEMA 250, Type 3R enclosure.]

2.4 [EQUIPMENT FOR ELECTRICITY METERING FOR GOVERNMENT USE

A. [Meter: Electronic kilowatt-hour measuring to record electricity used.]

B. [Meter: Electronic kilowatt-hour/demand measuring to record electricity used and highest peak demand over a time period according to electric utility. Meter is designed for use on the type and rating of circuit indicated for its application.]

1. Kilowatt-Hour Display: Digital liquid crystal.
2. Kilowatt-Demand Display: Digital, liquid-crystal type to register highest peak demand.
3. Enclosure: NEMA 250, Type 1, minimum, with hasp for padlocking or sealing.
4. Memory Backup: Self-contained to maintain memory throughout power outages of 72 hours, minimum.
5. Sensors: Current-sensing type, with current or voltage output, selected for optimum range and accuracy for the ratings of the circuits indicated for this application.
6. Type: Solid core.
7. Accuracy: Nationally recognized testing laboratory certified to meet ANSI C12.16 specifications.
8. Demand Signal Communication Interface: Match signal to building automation system input that conveys data on instantaneous/integrated demand level measured by meter used for load switching to control demand.

C. Current-Transformer Cabinets: Listed or recommended by metering equipment manufacturer for use with sensors indicated.]

2.5 SLEEVES FOR RACEWAYS AND CABLES

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.

B. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

C. Sleeves for Rectangular Openings: Galvanized sheet steel with minimum 1.3- or 3.5-mm (0.05- or 0.14-inch) thickness as indicated and of length to suit application.

D. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section on penetration firestopping.

2.6 SLEEVE SEALS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.

1. Sealing Elements: **[EPDM][NBR]** interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.
2. Pressure Plates: Stainless steel. Include two for each sealing element.
3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 LOCK-OUT/TAG-OUT (LOTO) DEVICES

A. Provide lockout tag-out devices to securely de-energize equipment in the Sections identified below. A set of LOTO devices shall be selected by the Contractor to positively lock-out all of the models of equipment in these Sections. Provide five of each model of LOTO device for each model of LOTO device in the set.

1. Division 26 Section on secondary unit substations.
2. Section 261214 “Medium-Voltage Transformers.”
3. Division 26 Section on medium voltage switchgear.
4. Section 262300 “Low-Voltage Switchgear.”
5. Section 262313“Paralleling Switchgear.”
6. Section 262315 “Double-Ended Switchgear.”
7. Section 262325 “Power Sequence of Operation.”
8. Section 262412 “Switchboards.”
9. Section 262417 “Panelboards.”
10. Division 26 Section on motor-control centers.
11. Section 262500 “Enclosed Bus Assemblies.”
12. Division 26 Section on fused power circuit devices.

13. Division 26 Section on enclosed switches and circuit breakers.
14. Division 26 Section on enclosed controllers.
15. Division 26 Section on variable frequency motor controllers.
16. Section 263214 “Engine Generators.”
17. Section 263237 “Resistive Load Banks.”
18. Section 263535 “Power Factor Correction Equipment.”
19. **[Section 263552 “Low-Voltage Automatic Voltage Regulators.”]**
20. **[Section 263554 “Medium-Voltage Automatic Voltage Regulators.”]**
21. Section 263600 “Transfer Switches.”

2.8 SAFETY ACCESSORIES

A. Supply safety accessories identified below to assist in safely de-energizing AVR and transformer. Provide prior to system and testing and commissioning.

1. Two live–line tools conforming to ASTM F711; one 1200 mm (4 foot) and one 1800 mm (6 foot) in length.
2. Non-contact voltage proximity detector. Detector shall have both audio and visual alerts and warning indicators. Detector shall be instrument rated for AVR and transformer voltages. Detector shall be compatible with live-line tool.
3. Two pair voltage-rated (VR) gloves and leather protectors conforming to ASTM D120 Class 2 (voltage rating of 17,000 AC and 25,500 DC); one pair glove size 8.5, and one pair glove size 9.5. Provide canvas bags for glove storage.
4. Two sets VR rubber sleeves similar voltage rating as VR gloves, with canvas storage bags.
5. Two arc flash protection suits, conforming to ASTM F1506, and rated for NFPA 70E hazard class 4 (40 cal); one sized large and one sized medium.
6. Two sets safety grounds capacity rated for application conforming to ASTM F855. Ground cluster connectors shall acceptably secure clamp onto phase conductor and ground conductor.
7. Retrieval stick conforming to ASTM F711; 1800 mm (6 foot) in length.

2.9 CONCRETE BASES

A. Concrete Forms and Reinforcement Materials: As specified in Section 033000 "Cast-in-Place Concrete."

B. Concrete: As required for footings/foundations in Section 033000 "Cast-in-Place Concrete."

2.10 TOUCH-UP PAINT

A. Equipment Not Exposed to Harsh Environment: Equipment manufacturer's paint.

B. Equipment Enclosures Not Exposed to Harsh Environment: Manufacturer's standard finish for indoor installations in non-harsh environments.

C. Galvanized Surfaces: Zinc-rich paint recommended by item manufacturer.

D. Paints for Applications Exposed to Harsh Environments: For all outdoor applications and for indoor applications in harsh environment refer to Division 09 Section on high performance coatings. Metallic materials shall be protected against corrosion.

PART 3 - EXECUTION

3.1 COMMON REQUIREMENTS FOR ELECTRICAL INSTALLATION

A. Comply with NECA 1.

B. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items.

C. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.

D. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.

E. Right of Way: Give to raceways and piping systems installed at a required slope.

F. Electrical equipment shall be designed and rated to operate in project-specific unusual environmental conditions such as wind-blown sand, salt atmosphere, flooding, ultraviolet rays due to altitude, high winds such as hurricanes and tornadoes, etc. Where standard ratings are not available to match environmental conditions, equipment shall be derated as required to compensate for factors such as high altitude and ambient temperature. Equipment installed in conditioned spaces shall be designed and rated for the conditioned ambient.

3.2 ELECTRICAL SUPPORTING DEVICE APPLICATION

A. Damp Locations and Outdoors: Hot-dip galvanized materials or nonmetallic, U-channel system components.

B. Dry Locations: Steel materials.

C. Support Clamps for PVC Raceways: Click-type clamp system.

D. Selection of Supports: Comply with manufacturer's written instructions.

E. Strength of Supports: Adequate to carry present and future loads, times a safety factor of at least four; minimum of 90-kg design load.

3.3 SUPPORT INSTALLATION

A. Install support devices to securely and permanently fasten and support electrical components.

B. Install individual and multiple raceway hangers and riser clamps to support raceways. Provide U-bolts, clamps, attachments, and other hardware necessary for hanger assemblies and for securing hanger rods and conduits.

C. Support parallel runs of horizontal raceways together on trapeze- or bracket-type hangers.

D. Size supports for multiple raceway installations so capacity can be increased by a 25 percent minimum in the future.

E. Support individual horizontal raceways with separate, malleable-iron pipe hangers or clamps.

F. Install 6-mm diameter or larger threaded steel hanger rods, unless otherwise indicated.

G. Spring-steel fasteners specifically designed for supporting single conduits or tubing may be used instead of malleable-iron hangers for 40-mm and smaller raceways serving lighting and receptacle branch circuits above suspended ceilings and for fastening raceways to slotted channel and angle supports.

H. Arrange supports in vertical runs so the weight of raceways and enclosed conductors is carried entirely by raceway supports, with no weight load on raceway terminals.

I. Simultaneously install vertical conductor supports with conductors.

J. Separately support cast boxes that are threaded to raceways and used for fixture support. Support sheet-metal boxes directly from the building structure or by bar hangers. If bar hangers are used, attach bar to raceways on opposite sides of the box and support the raceway with an approved fastener not more than 600 mm from the box.

K. Install metal channel racks for mounting cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices unless components are mounted directly to structural elements of adequate strength.

L. Install sleeves for cable and raceway penetrations of concrete slabs and walls unless core-drilled holes are used. Install sleeves for cable and raceway penetrations of masonry and fire-rated gypsum walls and of all other fire-rated floor and wall assemblies. Install sleeves during erection of concrete and masonry walls.

M. Securely fasten electrical items and their supports to the building structure, unless otherwise indicated. Perform fastening according to the following unless other fastening methods are indicated:

1. Wood: Fasten with wood screws or screw-type nails.
2. **[Masonry: Toggle bolts on hollow masonry units and expansion bolts on solid masonry units.]**
3. New Concrete: Concrete inserts with machine screws and bolts.
4. **[Existing Concrete: Expansion bolts.]**
5. **[Instead of expansion bolts, threaded studs driven by a powder charge and provided with lock washers may be used in existing concrete.]**
6. Steel: Welded threaded studs or spring-tension clamps on steel.
7. Field Welding: Comply with AWS D1.1.
8. Welding to steel structure may be used only for threaded studs, not for conduits, pipe straps, or other items.
9. Light Steel: Sheet-metal screws.
10. Fasteners: Select so the load applied to each fastener does not exceed 25 percent of its proof-test load.

3.1 UNDERGROUND CABLE CONNECTIONS

A. Minimize underground cable splices.

1. Splices that are made shall be made cables inside manholes or handholes. See Division 33 Section on underground ducts and raceways for manholes and handholes.
2. Provide identification for manholes and handholes that contain splices.
3. Underground cable splices shall be made using UL-approved methods for water-exposed direct burial locations.
4. To the extent readily feasible, cable splices shall be located 300 mm (12 inches) above highest water mark inside manholes or 300 mm (12 inches) above known water table.

3.2 UTILITY COMPANY ELECTRICITY-METERING EQUIPMENT

A. Install equipment according to utility company's written requirements. Provide grounding and empty conduits as required by utility company.

3.3 FIRESTOPPING

A. Apply firestopping to cable and raceway penetrations of fire-rated floor and wall assemblies to achieve fire-resistance rating of the assembly. Firestopping materials and installation requirements are specified in Division 07 Section on penetration firestopping.

3.4 CONCRETE BASES

A. Construct concrete bases of dimensions indicated, but not less than 100 mm (4 inches) larger, in both directions, than supported unit. Follow supported equipment manufacturer's anchorage recommendations and setting templates for anchor-bolt and tie locations, unless otherwise indicated.

1. Refer to Section 271116 “Communications Cabinets and Frames” regarding constraints on usage at telecommunications equipment.

3.5 FIELD QUALITY CONTROL

A. Inspect installed components for damage and faulty work, including the following:

1. Supporting devices for electrical components.
2. Electricity-metering components.
3. Cable splices.
4. Concrete bases.
5. Cable splices.
6. Touchup painting.
7. Sleeves and Seals

B. Test the Government's electricity-metering installation for proper operation, accuracy, and usability of output data.

1. Connect a load of known kW rating, 1.5 kW minimum, to a circuit supplied by the metered feeder.
2. Turn off circuits supplied by the metered feeder and secure them in the "off" condition.
3. Run the test load continuously for eight hours, minimum, or longer to obtain a measurable meter indication. Use a test load placement and setting that ensure continuous, safe operation.
4. Check and record meter reading at end of test period and compare with actual electricity used based on test load rating, duration of test, and sample measurements of supply voltage at the test load connection. Record test results.
5. Repair or replace malfunctioning metering equipment or correct test setup; then retest. Repeat for each meter in installation until proper operation of entire system is verified.

3.6 REFINISHING AND TOUCHUP PAINTING

A. Refinish and touch up paint. Paint materials and application requirements are specified in Division 09 painting sections.

1. Clean damaged and disturbed areas and apply primer, intermediate, and finish coats to suit the degree of damage at each location.

2. Follow paint manufacturer's written instructions for surface preparation and for timing and application of successive coats.
3. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
4. Repair damage to PVC or paint finishes with matching touchup coating recommended by manufacturer.

3.7 DEMONSTRATION

A. Demonstrate, to Project Director/COR and appropriate post electrical staff, the operation of each lock-out/tag-out (LOTO) model and safety accessories. Identify which LOTO model is used for each applicable electrical equipment, referencing LOTO Schedule. Coordinate with training in Section 260573 "Overcurrent Protective Device Coordination Study." Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 260508

SECTION 260518 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes building wires and cables and associated connectors, splices, and terminations for wiring systems rated 600 V and less.

B. Related Sections include the following:

1. Division 07 Section on “Penetration Firestopping.”
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
3. Division Section 26 on “Identification for Electrical Systems.”
4. Division 27 Sections for communications cables.
5. Section 337105 "Underground Ducts and Raceways."

1.2 SUBMITTALS

A. Product Data - General: For each type of product indicated.

B. Product Data - Products Manufactured to International Standards: Identify variations from U.S. standards.

C. Qualification Data: For testing agency.

D. Field quality-control test reports.

1.3 QUALITY ASSURANCE

A. Testing Agency Qualifications: Testing agency as defined by OSHA in 29 CFR 1910.7 or a member company of the InterNational Electrical Testing Association (NETA), or is nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Article on FIELD QUALITY CONTROL.

B. Comply with the OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in the NFPA 70, Article 100 by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

C. Products Manufactured to International Standards: Variations from U.S. standards require evaluation and approval by Project Director/COR with input from OBO/PDCS/DE/EE.

PART 2 - PRODUCTS

2.1 CONDUCTORS AND CABLES

A. Conductor Material: Copper only complying with NEMA WC 70; solid conductor for 6.0 mm2 and smaller, stranded for 10.0 mm2 and larger.

B. Conductor Insulation Types: Type THHN-THWN, XHHW, SO, or XHHW-2 complying with NEMA WC 70

1. International Type Conductors and Cables: If requests are approved for international type conductors and cables, conductor and cable ampacities for applications of 600-VAC or less shall not exceed ampacities listed in National Electrical Code Table 310.16.

2.2 CONNECTORS AND SPLICES

A. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

PART 3 - EXECUTION

3.1 CONDUCTOR AND INSULATION APPLICATIONS

A. Service Entrance: Type XHHW or XHHW-2, single conductors in raceway.

B. Exposed Feeders: Type THHN-THWN, single conductors in raceway.

C. Feeders Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway.

D. Feeders Concealed in Concrete, below Slabs-on-Grade, and in Crawlspaces: Type THHN-THWN, single conductors in raceway.

E. Exposed Branch Circuits, including in Crawlspaces: Type THHN-THWN, single conductors in raceway.

F. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway.

G. Branch Circuits Concealed in Concrete and below Slabs-on-Grade: Type THHN-THWN, single conductors in raceway.

H. Underground Feeders and Branch Circuits: Type THHN-THWN, single conductors in raceway.

I. Cord Drops and Portable Appliance Connections: Type SO, hard service cord.

J. Fire Alarm Circuits: Type THHN-THWN, in raceway.

K. Class 1 Control Circuits: Type THHN-THWN, in raceway.

L. Class 2 Control Circuits: Type THHN-THWN, in raceway.

M. Class 3 Control Circuits: Type THHN-THWN, in raceway.

N. Control wiring shall be minimum of 2.5 mm2 (#14 AWG) stranded copper and shall be rated for 600-volt service.

O. Neutral Conductor: Where a secondary distribution system requires a neutral conductor, a full-sized neutral conductor shall be used throughout the system, such that neutral conductor is not shared with any other branch circuit or feeder. If the secondary distribution system supports computers or other equipment that generates harmonics, double size neutrals shall be run from the subpanel boards feeding this equipment back to the MDP or service entrance. Neutral buses shall be sized to accommodate these conductors.

P. Ground Conductor: Insulated equipment grounding conductors run with branch circuits shall be installed such that that conductor is not shared with any other branch circuit.

3.2 INSTALLATION

A. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.

B. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

C. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

D. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.

E. Support cables according to Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety."

F. Seal around cables penetrating fire-rated elements according to Division 07 Section on "Penetration Firestopping."

G. Identify and color-code conductors and cables according to Division 26 Section on “Identification for Electrical Systems.”

H. Install outdoor underground feeders in concrete encased ductbank in accordance with Section 337105 “Underground Ducts and Raceways.”

I. Each electronic equipment rack shall be fed by an individual circuit breaker protected branch circuit.

3.3 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

B. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.

C. Wiring at Outlets: Install conductor at each outlet, with at least 300 mm of slack.

3.4 FIELD QUALITY CONTROL

A. Testing: Perform the following field quality-control testing:

1. After installing conductors and cables and before electrical circuitry has been energized, test for compliance with requirements.
2. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification (ATS), Section 7.3. Certify compliance with test parameters.

B. Test Reports: Prepare a written report to record the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

END OF SECTION 260518

SECTION 260525 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes grounding of electrical systems and equipment. Grounding requirements specified in this Section may be supplemented by special requirements of systems described in other Sections.

B. Related Sections include the following:

1. Section 076205 “Sheet Metal Flashing and Trim.”
2. Section 263105 “Solar Photovoltaic Systems.”
3. Section 264115 “Lightning Protection System.”
4. Section 270526 “Grounding and Bonding for Communications Systems.”
5. Section 331416 “Site Water Distribution Piping” for water service and water meter piping.
6. Section 337105 "Underground Ducts and Raceways" for ground test wells.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Other Informational Submittals: Plans showing dimensioned as-built locations of grounding features specified in Article on FIELD QUALITY CONTROL, including the following:

1. Test wells.
2. Ground rods.
3. Ground rings.
4. Grounding arrangements and connections for separately derived systems.
5. Grounding for sensitive electronic equipment.

C. Qualification Data: For testing agency and testing agency’s field supervisor.

D. Field quality-control test reports.

E. Operation and Maintenance Data: Include the following in operation and maintenance manuals:

1. Instructions for periodic testing and inspection of grounding features at test wells based on NFPA 70B.

   a. Tests shall be to determine if ground resistance or impedance values remain within specified maximums, and instructions shall recommend corrective action if they do not.
   b. Include recommended testing intervals.

1.3 QUALITY ASSURANCE

A. Grounding & Lightning Protection System. The system shall meet the requirements as listed on the plan drawings for UL 96.

B. Testing Agency Qualifications: Testing agency as defined by OSHA in 29 CFR 1910.7 or a member company of the InterNational Electrical Testing Association (NETA) and that is acceptable to Project Director based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA to supervise on-site testing specified in Article on FIELD QUALITY CONTROL.

C. Comply with UL 467.

D. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

E. For overhead-line construction and medium-voltage underground construction, comply with IEEE C2.

F. Comply with NFPA 780 “ Standard for the Installation of Lightning Protection Systems.”

G. Comply with UL 96 when interconnecting with lightning protection system; see Section 264115 “Lightning Protection System.”

PART 2 - PRODUCTS

2.1 GROUNDING CONDUCTORS

A. For insulated copper conductors, comply with Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

B. Equipment Grounding Conductors: Insulated with green-colored insulation.

C. Isolated Ground Conductors: Insulated with green-colored insulation with yellow stripe. On feeders with isolated ground, use colored tape, alternating bands of green and yellow tape to provide a minimum of three bands of green and two bands of yellow.

D. Grounding Electrode Conductors: Stranded copper cable.

E. Underground Conductors: Bare copper, tinned, stranded, unless otherwise indicated.

F. Bare Copper Conductors: Comply with the following:

1. Solid Conductors: ASTM B 3.
2. Assembly of Stranded Conductors: ASTM B 8.
3. Tinned Conductors: ASTM B 33.

G. Copper Bonding Conductors:

1. Bonding Cable (interconnecting ground rods): copper conductor.
2. Bonding Conductor/Jumper: stranded copper conductors, sized per the National Electrical Code.

H. Grounding Bus: Bare, annealed copper bars of rectangular cross section 6 x 50 mm, with insulators as shown on drawings.

2.2 CONNECTOR PRODUCTS

A. Comply with IEEE 837 and UL 467; listed for use for specific types, sizes, and combinations of conductors and connected items.

B. Welded Connectors: Exothermic-welded type, in kit form, and selected per manufacturer's written instructions.

2.3 GROUNDING ELECTRODES

A. Ground Rods: Copper-clad steel.

B. Ground Rods

1. Size: 20 mm diameter by 3000 mm long.

C. Test Wells: Provide handholes as specified in Section 337105 "Underground Ducts and Raceways."

PART 3 - EXECUTION

3.1 APPLICATION

A. In raceways, use insulated equipment-grounding conductors.

B. Connections: Connections shall be made by one of the following methods:

1. Exothermic-Welded Connections: Use for connections to structural steel and for underground connections, except those at test wells.
2. Irreversible Mechanical Connections (IMC): Use for any connections. Mechanical connection shall be made by specialized tool for irreversible mechanical connections which shall apply permanent marking to connector to identify that connection was made.

C. Equipment Grounding Conductor Terminations: Exothermic or irreversible Mechanical connection.

D. Ground Rod Clamps at Test Wells: Use bolted pressure clamps with at least two bolts.

E. Grounding Bus: Install in electrical room and in rooms housing service equipment, and elsewhere as indicated.

1. Use insulated spacer; space 25 mm from wall and support from wall 150 mm above finished floor, unless otherwise indicated.
2. At doors, route the bus up to the top of the doorframe, across the top of the doorway, and down to the specified height above the floor.

F. Underground Grounding Conductors: Use bare-copper conductor, 95 mm^2 minimum. Bury at least 450 mm below grade or bury 300 mm above duct bank when installed as part of the duct bank.

G. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
2. Underground Connections: Welded connectors or IMC, except at test wells and as otherwise indicated.
3. Connections to Ground Rods at Test Wells: Bolted connectors.
4. Connections to Structural Steel: Welded connectors.

3.2 EQUIPMENT GROUNDING CONDUCTORS

A. Comply with Article 250 of the OBO Electrical Code for types, sizes, and quantities of equipment grounding conductors, unless more restrictive specific types, larger sizes, or more conductors are indicated on Drawings.

B. Install equipment grounding conductors in all feeders and circuits.

C. Install insulated equipment grounding conductor with circuit conductors for the following items, in addition to those required by the OBO Electrical Code:

1. Feeders and branch circuits.
2. Lighting circuits.
3. Receptacle circuits.
4. Single-phase motor and appliance branch circuits.
5. Three-phase motor and appliance branch circuits.
6. Flexible raceway runs.
7. Armored and metal-clad cable runs.
8. X-Ray equipment circuits
9. Computer outlet circuits

D. Busway Supply Circuits: Install insulated equipment grounding conductor from the grounding bus in the switchgear, switchboard, or distribution panel to equipment grounding bar terminal on busway.

E. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate grounding conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

F. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate equipment grounding conductor. Isolate equipment grounding conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

G. Nonmetallic Raceways: Install an equipment grounding conductor in nonmetallic raceways unless they are designated for communications cables.

H. Air-Duct Equipment Circuits: Install an equipment grounding conductor to duct-mounted electrical devices operating at 220 V or higher, including air cleaners and heaters. Bond conductor to each unit and to air duct.

I. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate equipment grounding conductor to each electric water heater, heat-tracing, and antifrost heating cable. Bond conductor to heater units, piping, connected equipment, and components.

J. Signal and Communication Systems: For alarm, voice, data, and other communication systems, provide insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, telecommunications rooms, and central equipment location.

1. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 6.0 mm thick by 50 mm high by 300 mm long grounding bus.
2. Terminal Cabinets: Terminate grounding conductor on cabinet grounding bus bar/terminal.

K. Metal Poles Supporting Outdoor Lighting Fixtures: Provide a grounding electrode in addition to installing a separate equipment grounding conductor with supply branch-circuit conductors.

L. Common Ground Bonding with Lightning Protection System: Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized the same as power system grounding electrode conductor, and install in conduit. See Section 264115 “Lightning Protection System.”

M. Photovoltaic Systems: For system grounding connection, use of fine stranded grounding conductor is not permitted; refer to Section 263105 “Solar Photovoltaic Systems.”

3.3 COUNTERPOISE

A. Ground the steel framework of the building with a driven ground rod at the base of every corner column and at intermediate exterior columns at distances not more than 18 m apart. Provide a grounding conductor (counterpoise), electrically connected to each ground rod and to each steel column, extending around the perimeter of the building. Use tinned-copper conductor not less than 95 mm^2 for counterpoise and for tap to building steel. Bury counterpoise not less than 450 mm below grade and 600 mm from building foundation.

3.4 INSTALLATION

A. Ground Rods: **[Install ground rods as indicated on the drawings.] [Install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes.]**

1. Drive ground rods until tops are 300 mm below finished floor or final grade, unless otherwise indicated.
2. Interconnect ground rods with grounding electrode conductors. Use exothermic welds, except at test wells and as otherwise indicated. Make connections without exposing steel or damaging copper coating.

B. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

C. Bonding Straps and Jumpers: Install so vibration by equipment mounted on vibration isolation hangers and supports is not transmitted to rigidly mounted equipment. Use exothermic-welded connectors or IMC for outdoor locations, unless a disconnect-type connection is required; then, use a bolted clamp. Bond straps directly to the basic structure taking care not to penetrate any adjacent parts. Install straps only in locations accessible for maintenance.

D. Metal Water Service Pipe: Provide insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building; see Section 331416 “Site Water Distribution Piping.” Connect grounding conductors to main metal water service pipes by grounding clamp connectors. Where a dielectric main water fitting is installed, connect grounding conductor to street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.

E. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with grounding clamp connectors. See Section 331416 “Site Water Distribution Piping.”

F. Bond roof metal materials to equipment grounding conductors or lightning protection system; see Section 076205 “Sheet Metal Flashing and Trim.”

G. Bond interior metal piping systems and metal air ducts to equipment grounding conductors of associated pumps, fans, blowers, electric heaters, and air cleaners. Use braided-type bonding straps.

H. Bond each aboveground portion of gas piping system upstream from equipment shutoff valve.

I. Install one test well for each service at the ground rod electrically closest to the service entrance. Set top of well flush with finished grade or floor.

J. [Under Ground (Concrete-Encased Grounding Electrode): Fabricate according to the OBO Electrical Code using a minimum of 6.0 m of bare copper conductor not smaller than 25 mm2. If concrete foundation is less than 6.0 m long, coil excess conductor within the base of the foundation. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building grounding grid or to a grounding electrode external to concrete.]

3.5 CONNECTIONS

A. General: Make connections so galvanic action or electrolysis possibility is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.

1. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer to order of galvanic series.
2. Make connections with clean, bare metal at points of contact.
3. Make aluminum-to-steel connections with bi-metal stainless-steel separators and mechanical clamps approved for application.
4. Make aluminum-to-galvanized steel connections with bi-metal tin-plated copper jumpers and mechanical clamps approved for application.
5. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

B. Exothermic-Welded Connections: Comply with manufacturer's written instructions. Welds that are puffed up or that show convex surface indicating improper cleaning are not acceptable.

C. Irreversible Mechanical Connection (IMC): Use hydraulic compression tools to provide correct circumferential pressure for compression connectors. Use tools and dies recommended by connector manufacturer. Provide embossing die code or other standard method to make visible indication that each connector has been adequately compressed on grounding conductor.

D. Equipment Grounding Conductor Terminations: For 10 mm^2 and larger, use pressure-type grounding lugs. 10 mm^2 and smaller grounding conductors may be terminated with winged pressure-type connectors.

E. Noncontact Metal Raceway Terminations: If metallic raceways terminate at metal housings without mechanical and electrical connection to housing, terminate each conduit with a grounding bushing. Connect grounding bushings with a bare grounding conductor to grounding bus or terminal in housing. Bond electrically noncontinuous conduits at entrances and exits with grounding bushings and bare grounding conductors, unless otherwise indicated.

F. Connections at Test Wells: Use compression-type connectors on conductors and make bolted- and clamped-type connections between conductors and ground rods.

G. Tighten screws and bolts for grounding and bonding connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

H. Moisture Protection: If insulated grounding conductors are connected to ground rods or grounding buses, insulate entire area of connection and seal against moisture penetration of insulation and cable.

3.6 UNDERGROUND DISTRIBUTION SYSTEM GROUNDING

A. Duct Banks: Install grounding conductor with at least 50 percent ampacity of largest phase conductor in duct bank. See Section 337105 "Underground Ducts and Raceways."

B. Manholes and Handholes: Install a driven ground rod close to wall and set rod depth so 100 mm will extend above finished floor. If necessary, install ground rod before manhole is placed and provide a 70 mm^2 bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive tape or heat-shrunk insulating sleeve from 50 mm above to 150 mm below concrete. Seal floor opening with waterproof, nonshrink grout.

C. Connections to Manhole Components: Connect exposed-metal parts, such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with 25 mm^2 minimum, stranded, hard-drawn copper conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields as recommended by manufacturer of splicing and termination kits.

D. Pad-Mounted Transformers and Switches: Install two ground rods and counterpoise circling pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Use tinned-copper conductor not less than 35 mm^2 for counterpoise and for taps to equipment ground pad. Bury counterpoise not less than 600 mm below grade and 150 mm from the foundation.

3.7 FIELD QUALITY CONTROL

A. Testing: Engage a qualified testing agency to perform the following field quality-control testing:

B. Testing: Perform the following field quality-control testing:

1. After installing grounding system but before permanent electrical circuitry has been energized, test for compliance with requirements.
2. Test completed grounding system at each building electric service entrance, electric/telecom rooms, generator system, buildings and lightning protection system where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, and at ground test wells. Tests at each ground rod before any conductors are connected are not required if a clamp-on ground tester is used. Measure ground resistance not less than two full days after the last trace of precipitation, and without the soil being

moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance. Perform tests, by the fall-of-potential method according to IEEE 81.

3. Provide drawings locating each ground rod and ground rod assembly and other grounding electrodes, identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results. Maximum value of acceptable system ground resistance is 10 ohms.
4. Excessive Ground Resistance: If resistance to ground exceeds specified values, drive additional ground rods until resistance meets specified values.

END OF SECTION 260525

SECTION 260573 - OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes three computer-based fault-current, overcurrent protective device coordination, and arc flash studies to determine suitability of, and settings for, overcurrent protective devices, and identification of proper personal protective equipment to be used when maintaining the studied electrical system.

B. Purpose of this overall study is to facilitate:

1. Identification of Amp Interrupting Capacity (AIC) to prevent equipment damage.
2. Identification of personal protective equipment to minimize effects of arc flash at specific device locations.
3. Improvement of system reliability and isolation of faults.

C. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety,” including lock-out/tag-out devices and other electrical safety accessories.
2. Division 23 and 26 Sections requiring personnel protection in accordance with NFPA 70E.

1.2 SUBMITTALS

A. Software Information and Data Files - General:

1. Provide technical data information describing for operating system, study software capabilities and features, applicable standards, operator interface, color graphics. Include associated third-party applications.
2. After final version of Study is performed and accepted, provide data files which contain all required information to reconstruct study and allow system modification in future when used with application software. This electronic file shall include all library type data such as that for circuit breaker curves used on this project, as well as data which represents all physical and electrical characteristics of power system that Contractor had to provide for complete and proper study. This data is likely only compatible with particular software application used to generate study.

B. Software Certificates: For coordination-study and fault-current-study computer software programs, certifying compliance with IEEE 399. For arc-flash study program, certifying compliance with IEEE 1584.

C. Qualification Data: Coordination-Study Specialist and Testing Agency.

D. Overall Study and Report Requirements – General:

1. Results of each of the three studies shall be summarized at the start of each subsection in the overall report. Each subsection shall have an executive summary, description, purpose, basis, and scope of each study
2. Submit searchable PDF versions of this Study for review during construction. Deliver five bound hardcopies of complete final report to the post Facilities Staff along with three copies on CD/DVD.
3. Reports, diagrams, and in field equipment shall follow naming conventions and contract drawings at all locations.
4. Single Line Diagrams: Include [multi-color] single-line diagrams of electrical distribution system within scope of this project. In hardcopy versions, use folded ANSI B sheets (279 mm x 432 mm (11" x 17")). Single-line diagrams shall include:

    a. Transformer rating, voltage rating, impedance, and wiring connection.
    b. Feeder cable phase, neutral, and ground sizes, length of cable, conductor materials, and conduit size and type.
    c. Switchgear, switchboards, panelboards, MCC's, fuses, circuit breakers, ATS's, and switches continuous ratings
    d. Protective relays with appropriate device numbers and current transformers (CTs) and potential transformers (PTs) with associated ratios.
    e. Busses and fault levels.
    f. Detailed legend indicating device type identification and other significant details.
    g. [Identify all locations of Neutral-Ground bonds per Engineer of Record.]

5. All studies, reports, and associated diagrams shall be submitted to Project Director/COR prior to final review of electrical distribution equipment shop drawings, and prior to release of associated electrical equipment for manufacture.

    a. If formal completion of study may cause delay in equipment manufacture, approval from Project Director/COR may be obtained for preliminary submittal of sufficient study data to ensure that selection of device ratings and characteristics will be satisfactory. Formal final study will then be provided to verify preliminary findings.

6. Prior to submitting final versions of each report to Project Director/COR, transmit these versions to Engineer of Record for their approval. Based on recommended system improvements in project design, and on submittal comments themselves from Engineer of Record and from the Government reviewers, each report may require re-submittal; if so, final versions of those reports shall be corrected and resubmitted until it is approved by the Engineer of Record.

E. Fault-Current Study Report: Shall include equipment evaluation table or spreadsheet and information required in the Part 1 Article on FAULT CURRENT STUDY below.

F. Coordination Study Report: Shall include Device Setting tables or spreadsheet, Time-Current Curves, and information required in the Part 1 Article on COORDINATION STUDY below.

G. Arc Flash Hazard Study Report: Shall include table or spreadsheet that shows arc flash energy levels in cal/cm^2, comparing both worst case and ARMS enabled conditions for major and/or main bus locations. Provide arc flash labels reproductions in hard copy submittals. See the Part 1 Article on ARC FLASH STUDY below for more detailed requirements.

1.3 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.

B. Coordination-Study Specialist Qualifications: Organization experienced in application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

C. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or the National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

D. Comply with IEEE 399 for general study procedures.

E. Comply with IEEE 242 for short-circuit currents and coordination time intervals.

F. Comply with NFPA 70E “Standard for Electrical Safety in the Workplace.”

1.5 FAULT CURRENT STUDY

A. Source Impedance: As an infinite bus on primary side of utility transformer.

B. Analyze electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project, using approved computer software program to calculate values.

1. Include studies of system-switching configurations and alternate operations that could result in maximum fault conditions.

C. Calculate momentary and interrupting duties on the basis of maximum available fault current.

D. Calculate interrupting ratings of overcurrent protective devices to verify compliance with the following:

1. Low-Voltage Circuit Breakers: IEEE 1015, IEEE C37.13, and IEEE C37.50.
2. Low-Voltage Fuses: IEEE C37.46.

E. Data Presentation: Enter calculated X/R ratios and interrupting (5-cycle) fault currents on electrical distribution system diagram of report. List other output values from computer analysis, including momentary (1/2-cycle), interrupting (5-cycle), and 30-cycle fault-current values for 3-phase, 2-phase, and phase-to-ground faults. Show Fault current calculations including a definition of terms and guide for interpretation of computer printout.

F. Equipment Evaluation: Analyze adequacy of overcurrent protective devices and conductors by comparing fault-current ratings of these devices with calculated fault-current momentary and interrupting duties. Provide tabulations of circuit breakers, any fuses, and other protective device ratings versus calculated short circuit duties and commentary regarding it.

1.6 COORDINATION STUDY

A. Gather and tabulate the following input data to support coordination study:

1. Product Data for overcurrent protective devices specified in other Division 26 Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings. Examine overcurrent protective device construction submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Construction Drawings.
2. Impedance of utility service entrance.
3. Electrical distribution system diagram showing the following:

    a. Load current that is the basis for sizing continuous ratings of circuits for cables and equipment.
    b. Circuit-breaker and fuse-current ratings and types.
    c. Relays and associated power and current transformer ratings and ratios.
    d. Transformer kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios.
    e. Generator kilovolt amperes, size, voltage, and source impedance.
    f. Cables. Indicate conduit material, sizes of conductors, conductor insulation, and length.
    g. Busway ampacity and impedance.
    h. Motor horsepower and code letter designation according to NEMA MG 1.

4. Data sheets shall supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram:

    a. Special load considerations, including starting inrush currents and frequent starting and stopping.
    b. Magnetic inrush current overload capabilities of transformers.
    c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
    d. Ratings, types, and settings of utility company's overcurrent protective devices.
    e. Special overcurrent protective device settings or types stipulated by utility company.
    f. Time-current-characteristic curves of devices indicated to be coordinated.

g. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
h. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
i. Panelboards, switchboards, motor-control center ampacity, and interrupting rating in amperes rms symmetrical.

5. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices not submitted for approval with coordination study may not be used in study.

B. Perform coordination study and prepare a written report using results of fault-current study and approved computer software program.

C. Study shall reflect compliance with the OBO Electrical Code (NFPA 700 "National Electrical Code" as amended by OBO) for overcurrent protection of circuit elements and devices.

D. Study shall reflect compliance with IEEE 242 recommendations for fault currents and time intervals.

E. Transformer Primary Overcurrent Protective Devices:

1. Study shall reflect that devices do not operate in response to the following:

a. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
b. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
c. Inrush current when first energized.

2. Study shall reflect that devices protect transformer according to IEEE C57.12.00, for fault currents.

F. Study shall reflect that motors served by voltages more than 600 V are protected according to IEEE 620.

G. Conductor Protection: Study shall reflect that cables are protected against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Verify adequacy of phase conductors at maximum three-phase bolted fault currents, equipment grounding conductors, and grounding electrode conductors at maximum ground-fault currents.

H. Coordination-Study Report: Prepare report indicating the following results of coordination study:

1. Tabular Format of Settings Selected for Overcurrent Protective Devices:

a. Device tag.
b. Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values.
c. Circuit-breaker sensor rating; and long-time, short-time, and instantaneous settings.
d. Fuse-current rating and type.
e. Ground-fault relay-pickup and time-delay settings.

2. Coordination Curves: Prepare curves to determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between series devices, including power utility company's upstream devices. Show the following specific information:

a. Device tag.
b. Voltage and current ratio for curves.
c. Three-phase and single-phase damage points for each transformer.
d. No damage, melting, and clearing curves for fuses.
e. Cable damage curves.
f. Transformer inrush points.
g. Maximum fault-current cutoff point.

3. Completed data sheets for setting of overcurrent protective devices including relay and circuit breaker trip settings, fuse selection, and commentary regarding it.

1.7 ARC FLASH STUDY

A. General: Perform study to:

1. Determine potential arc flash incident energies, arc flash boundaries, shock hazard boundaries and proper personal protective equipment (PPE) on all major equipment in distribution system (i.e., transformers, switchgears, switchboards, motor control centers (MCC), panelboards, automatic transfer switches (ATS), uninterruptible power supplies (UPS), and variable frequency devices (VFD)).
2. Calculations shall comply with NFPA-70E, and IEEE-1584.

a. Bolted short circuit calculations used in above standards shall comply with ANSI C37.010, C37.13, C37.5, IEEE-141, and IEEE-399.

3. Determine arc flash hazards in conformance with NFPA-70E, by using a comprehensive software model of the complete electrical distribution system, which provides arc flash calculations for all equipment covered by this project.

B. Arc flash study shall determine results identified below for each system mode of operation. Provide results in spreadsheet format for each mode and electrical system location to provide easy viewing and comparison. Worst-case arc flash energy levels shall be flagged, and spreadsheet comparison table shall be capable of providing its output directly to high quality label printers. Calculations shall, as a minimum, include comparison of both 100 percent and 85 percent arcing currents for low voltage equipment for each electrical system configuration or operating mode, indicating worst-case arc flash hazards. Spreadsheet results shall include:

1. Equipment name and voltage.
2. Upstream equipment device name and ANSI function (e.g., 51/50).
3. Equipment type (e.g., switchgear, MCC, Panel, VFD).
4. Equipment arc gap.
5. Bolted and estimated arcing fault current at fault point (equipment) in symmetrical amperes. Estimated arcing current shall be based on arcing current equations used.
6. Trip time, opening time, and total clearing time (total arc time) of protective device.
7. Worst-case arc flash boundary for each bus/equipment in model.
8. Worst-case arc flash hazard incident energy in cal/cm2 for each bus/equipment in model.
9. Worst-case personal protective equipment (PPE) for each bus/equipment in model.
10. Working distances for up to five different distances showing three worst-case scenarios above for each distance.
11. Indicate "Danger" designation for equipment locations where incident energy is greater than 40 cal/cm^2 and provide recommendations to reduce arc flash energy levels for these locations. Provide "Danger" labels as indicated in Attachment B below.
12. Flag results where 85 percent arcing current provided worst-case results.
13. Provide maintenance mode arc flash reduction switch to provide dual parameter sets that enable trip unit to automatically lower instantaneous setting and thereby lower available energy in fault condition (commonly referred to as "maintenance mode"), making breaker trip faster while engaged in any form of maintenance while being in proximity to energized equipment to minimize arc flash dangers. Arc flash reduction maintenance switch shall reduce to below hazard identified in NFPA 70E hazard class ratings of 3 or greater.

C. Modes of Operation: Describe in detail each mode of operation, indicating areas where incident energy calculations and PPE requirements are higher than calculated in normal operating mode.

D. Equipment with ARMS: For equipment with Arc Reduction Maintenance Switches (ARMS), arc flash study shall identify information required for both normal operating mode and maintenance (ARMS) mode.

1. ARMS mode shall reduce arc flash levels to accommodate safe worker operation and maintenance of 8 cal/cm^2. If 8 cal/cm^2 cannot be reached, steps to provide alternative means of compliance to achieve worker safety, when approved by the Project Director/COR based upon input from OBO/PDCS/DE/EE electrical engineer, shall be identified. Candidate measures to achieve alternative means of compliance, used individually or in combination, include the following:

   a. Additional isolation procedures beyond baseline procedures required for all major electrical and mechanical equipment.
   b. Physical separation during testing and operations.
   c. Remote operations and testing.
   d. Additional safety accessories; see Section 260508 "Common Work Results for Electrical, Communications, and Electronic Safety" for baseline accessories.
   e. Provide permanent ARMS Notice Labels as required in the Part 3 Article on ARC FLASH HAZARD WARNING LABEL below. Provide a table or spreadsheet in the Arc Flash Study that shows arc flash energy levels in cal/cm^2, comparing both worst case and ARMS enabled conditions at each switchgear or switchboard location where ARMS are located.

E. General Report Contents: Provide detailed arc flash analysis report including as minimum:

1. Introduction.
2. Methodology.
3. Information Sources.
4. Key Assumptions.
5. Arc flash energy and other consideration for various system modes of operation (e.g., maintenance mode using ARMS, bus-tie).
6. Arc energy at 100 percent and reduced currents.
7. IEEE 1584-2002 Considerations.
8. Overcurrent protective device changes, replacements or setting changes implemented in study to reduce arc flash hazard exposure.
9. Explanation of data in arc flash hazard report tables.
10. NFPA 70E Information.

    a. Shock hazards with covers removed.
    b. Shock Hazard Approach Boundaries: Limited Approach Boundary and Restricted Approach Boundary.
    c. Arc Flash Hazard Boundaries.

11. Results of Arc flash Hazard Analysis for high voltage, medium voltage and low voltage systems, including:

    a. Working distances.
    b. Energy Levels.
    c. PPE Requirements.
    d. Recommendations to reduce arc flash hazard energy and exposure. Identify where baseline arc flash level cannot be achieved and identify any alternative means of compliance if available.

F. Study Support: Contractor shall provide support necessary to facilitate study.

1.8 OWNERSHIP OF PROPRIETARY MATERIAL

A. The Government shall retain all rights to software and passwords used for this project.

B. The Government will sign a copy of manufacturer's standard software and firmware licensing agreement as condition of this contract. Such license shall grant use of all programs and application software to Government as defined by manufacturer's license agreement, but shall protect manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. The licensing agreement shall not preclude use of software by individuals under contract to Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to Government shall be restricted to use on Government's computers, and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation shall be compatible and operable with SKM software, and become property of Government. These include but are not limited to:

1. Single line diagram identifying buss and fault levels (pdf).
2. Server and Workstation software
3. Application Programming Tools
4. Application Files
5. Configuration Files
6. Graphic Files
7. Report Files
8. Graphic Symbol Libraries
9. All Documentation.

PART 2 - PRODUCTS

2.1 SOFTWARE FOR STUDY

A. Available Computer Software Vendors: Subject to compliance with requirements, companies offering computer software programs that may be used in the Work include, but are not limited to, the following:

1. CYME International, Inc.
2. EDSA Micro Corporation.
3. Electrical Systems Analysis, Inc.
4. SKM Systems Analysis, Inc.

B. Software shall facilitate conformance with IEEE 399, IEEE 1584, and NFPA 70E.

C. Analytical features of fault-current-study computer software program shall include "mandatory," "very desirable," and "desirable" features as listed in IEEE 399, Table 7-4.

D. Software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices.

1. Additional Reporting Capabilities:

a. Arcing faults.
b. Simultaneous faults.
c. Explicit negative sequence.
d. Mutual coupling in zero sequence.

E. Arc Flash Study Software:

1. General: Software shall provide complete integration of one-line, database, short circuit, PDC and Arc flash functions. Software using separate short circuit, PDC, TCC or arc flash programs is not permitted. Spreadsheet calculations are not permitted. Include program arc flash hazard calculations with necessary features to eliminate errors in arc flash calculations. **[Detailed software model shall be established for site electrical distribution system which documents site compliance with the OSHA and NFPA 70E**

requirements. This model will serve as an integral part of site ongoing safety program by providing ability to prepare integral work permits and arc flash calculations in compliance with NFPA-70E Article 130.1(A)(2) for each electrical equipment on compound.]

2. Software shall perform arc flash calculations with enhanced IEEE-1584 equations, which eliminate voltage discontinuities and non-conservative/average results of standard equations. This will ensure that calculated incident energies are closer to actual test results ensuring conservative calculation minimizing personnel risk.
3. Software shall perform arc flash calculations on fastest clearing upstream protective device protecting equipment for single sources and slowest upstream protective device for multiple sources. Calculations shall automatically compare all series and parallel upstream protective devices in system to determine the fastest series device or conservative parallel clearing time. Algorithm shall incorporate traversing routine that can search back unlimited number of buses/nodes and consider all series and parallel branches in comparison to ensure accurate answers and to prevent hazards associated with incorrect results. Software shall not have trace back limits (5-10 buses) that can provide incorrect answers for low voltage faults that require high voltage protective device clearing to prevent potential errors.
4. Software shall display arc flash calculations including arc flash boundary, incident energy, PPE requirements, and working distance on one-line diagram and TCC simultaneously. Software shall show visually the arc flash values as settings are incrementally changed (dragging curves) so protection can be optimized, allowing protection engineer to visually balance competing objectives of personnel protection with that of system selectivity.
5. Software shall include four calculation options for arc flash calculations to ensure that software provides flexibility required to meet any system configuration or training requirement that may be considered. Each calculation option shall comply with graphic and spreadsheet display requirements of this section. These options are as follows:

    a. Option 1: Detailed option shall provide let-through energy for each protective device in system or on selected equipment. This is energy on load side of protective device. Equipment shall be highlighted when let-through energy exceeds user defined threshold-clothing limit.
    b. Option 2: Worst-case including main protective device. This option shall provide worst-case arc-hazard energy for equipment based on let-through energy of equipment's main protective device. If equipment is not equipped with main device, program shall traverse back entire system to determine fastest series upstream protective device. Equipment shall be highlighted when let-through energy exceeds user defined threshold-clothing limit.
    c. Option 3: Worst-case excluding main protective device. This option shall provide worst-case arc-hazard energy for equipment based on let-through energy of fastest upstream series protective device in system. Program shall traverse back entire system to determine fastest upstream protective device. The equipment shall be highlighted when let-through energy exceeds user defined threshold-clothing limit.
    d. Option 4: Worst-case excluding and including main protective device. This is a combination of Options 2 and 3.

6. Software shall produce arc flash calculations that provide integral "Work Tasks" for listed equipment types. Tasks shall be derived from 70E Table 130.7(C)(9)(a), and be specific

to equipment type. Work tasks shall be user definable in software to allow customization and integral with "Work Permit" feature of software. Listed equipment types shall include:

a. Switchgear, Switchboards, Panelboards, MCC, VFD, UPS, ATS, Interrupting Switch, NEMA E2 Contactor, Conductor, Open Air for 100-200 volt equipment.
b. Switchgear, Switchboards, Panelboards, MCC, VFD, UPS, ATS, Interrupting Switch, NEMA E2 Contactor, Conductor, Open Air for 200-1000 volt equipment.
c. Switchgear, MCC, VFD, UPS, ATS, Interrupting Switch, NEMA E2 Contactor, Conductor, Open Air for 1.0-5.0 kV equipment.
d. Switchgear, MCC, VFD, ATS, Interrupting Switch, NEMA E2 Contactor, Conductor, Open Air for 5.0-15.0 kV equipment.
e. Switchgear, Interrupting Switch, Conductor, Open Air for 15.0-38.0 kV equipment.
f. Interrupting Switch, Conductor, and Open Air for 38.0-1500 kV equipment.

7. Work Tasks shall have user-defined library that provides the following customizable features for each work task:

a. Work Tasks for each specific equipment type and voltage range.
b. Working distance units English or Metric.
c. Work distance for each task.
d. Voltage-rated gloves and tool requirements.
e. Job description and procedures.
f. Safe work practices description.
g. Hazard Risk Category (HRC) reduction. HRC reduction shall only be used based on documented risk assessment as integral part of safety program.

8. [Software shall permit preparation of work tasks that are accessible from one-line diagram for any equipment through mouse click on equipment in electrical system model one-line. Dialog box shall appear listing all 70E and user definable work tasks for specific equipment selected. Work task dialog shall include user definable working distance for each work task and allow user to select tasks specific to any equipment feeder or incoming main. Work tasks for each equipment type shall be voltage specific and user definable in library. These requirements integrate 70E work tasks to one-line diagram for specific equipment types, providing basis for customized safety program and work permit process compliant with 70E mandates. Detailed requirements for "work task" software is necessary to ensure that any variation of equipment type, equipment layout, or work procedure can be handled and documented in software.

a. Software interface shall allow user to select any breaker fuse or switch on one-line and get specific work task generated for that device showing load side arc flash hazard (let-through energy) for that device. The purpose of this requirement is to detail specific feeder hazards when work tasks dictate working downstream from feeder protective device.
b. Software shall produce integral work permits from arc flash calculations to comply with NFPA-70E, 2004 Article 130.1 (A). Work permits shall be integral with system one-line diagram and arc flash calculations and shall detect and account for work between feeder and main breaker.]

9. [Software shall allow work permits to be activated by mouse click for all equipment types listed in F5. Work permits shall have the following calculated values and provide the following information specific to "work task" and equipment selected:

a. Shock hazard.
b. Shock hazard boundaries.
c. Arc flash boundary – worst-case for each equipment.
d. Arc flash hazard incident energy in cal/cm2 for the equipment.
e. Hazard Risk Category (HRC) and any applicable risk reduction.
f. Required PPE category based on calculated energy level and optional risk reduction.
g. Required PPE description based on PPE category.
h. Determination of V-rated gloves and tools.
i. Auto fill job description and procedures for each work task.
j. Auto fill safe work practices description for each work task.
k. Job briefing and planning check list.
l. Approval sign off section.
m. Working distance measurements in English or Metric units.
n. Required work distance for each task.
o. Documentation for safety program in compliance with 70E 130.1(A).]

10. [Software shall create work permits in MS Word, and have the following user customizable features:

a. Work Tasks for each specific equipment type and voltage range.
b. Restricted shock boundary.
c. Arc flash boundary – worst-case for each equipment.
d. Arc flash hazard incident energy in cal/cm^2 for the equipment.
e. Hazard Risk Category (HRC) reduction for low risk tasks.
f. Required PPE category based on risk reduction.
g. Working distance in English or Metric units.
h. Working distance for each task.
i. Voltage-rated gloves and tool requirements.
j. Arc resistant clothing requirements.
k. Job description and procedures for each work task.
l. Safe work practices description for each work task.
m. Job briefing and planning check list.
n. Approval sign-off section.]

11. [Power system software shall allow created work permits to be linked via MS Windows "hyperlinks" to each equipment on one-line diagram. This will facilitate developing data repository of work permits performed on each equipment for 70E review, as well as providing one-stop location where documents pertaining to equipment can be accessed by maintenance and job planning.]

12. Power system software shall be fully compatible with facility arc flash hazard and electrical safety implementation software that provides the following capabilities:

a. Calculates shock hazards, shock hazard boundaries, arc flash boundaries, incident energies, PPE requirements, and similar analyses for power systems modeled in EasyPower or EasyPower EasySolv or approved equal.

b. [Built in Work Permit Feature for creation of custom Energized Work Permits complying with the NFPA-70E requirements. Work permit feature shall include NFPA risk assessment categories based on task performed for all types of electrical equipment and voltage ranges. Work permit feature shall include extensive library of user definable work tasks, safety procedures and safe work practices.]

c. [Energized work permits, safety procedures, equipment instruction manuals, and similar items produced by software shall be capable of being directly linked to equipment one-line through Hyperlinks feature, providing one-stop data repository easily accessible to all plant and safety personnel, saving plant personnel and contractors significant productive time in locating applicable instruction manual, equipment safety procedure, drawing, pictures and maps for equipment. This feature will assist compliance with OSHA and NFPA 70E record keeping requirements.]

d. Additional equipment information and records such as Maintenance Records, Maintenance Manuals, Operations Manuals, Lock out / Tag out procedures shall also be capable of being Hyperlinked to equipment on graphical one-line.

e. Program shall support creation of arc flash labels.

f. Program shall also have customizable output, allowing one-line printing, text report creation, export to AutoCAD, and similar operations.

g. Program shall be a MS Windows-based operating system and shall use MS Windows conventions.

h. Program shall be capable of being installed on standalone personal computers or on networked systems and shall be compatible with all systems operating on MS Windows 2000 or later operating systems.

i. Program shall be easily operable by site Facility staff without any specialized training.

PART 3 - EXECUTION

3.1 OVERCURRENT PROTECTIVE DEVICE SETTING

A. Manufacturer's Field Service: Engage factory-authorized service representative, of electrical distribution equipment being set and adjusted, to set overcurrent protective devices within equipment. If study recommends different type of devices or equipment, provide it at no additional cost to Government.

B. Testing: Engage qualified testing agency to perform the following device setting and to prepare test reports.

3.2 ARC FLASH HAZARD WARNING LABELS

A. Required Label Information: Electrical equipment such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling units, and that are likely to require examination, adjustment, servicing, or maintenance while energized, shall be field-marked with label containing all of the following information:

1. Nominal System Voltage
2. Arc Flash Boundary
3. Available incident energy and the corresponding working distance
4. Shock hazard boundaries, Limited and Restricted Approach
5. Arc Flash PPE for calculated incident energy
6. Insulated glove class
7. Date of Study

B. Placement: Place shock and arc flash hazard warning labels, prepared using software, onto electrical components and devices as determined in arc flash study.

C. Label Types: Refer to Attachments A and B at the end of this Section for illustration of label types that shall be used for applicable warning conditions.

D. For ARMS equipment, provide a Notice Label alerting the user that the equipment is provided with ARMS capability. Mount these on the face of the equipment in prominent locations near the most upstream ARMS. The Notice Label shall say the following (unless alternate wording is approved by OBO) :

> "This equipment is provided with Arc Reduction Maintenance Switch (ARMS) capability. The switches, when enabled in 'maintenance mode', will result in less potential fault current and lower incident energy in downstream equipment. Qualified technicians must refer to the arc flash study, located with this equipment, for arc flash guidance when engaging the ARMS".

Provide a bound copy of the complete arc flash report in the O&M manual storage location for any gear where any ARMS switches are present. The bound report shall include the table or spreadsheet that compares worst case and ARMS enabled arc flash energy levels as required in the Part 1 Article on ARC FLASH STUDY above.

3.3 ARC FLASH TRAINING

A. Provide training by qualified specialist who also understands specific Arc Flash Hazard Analysis for this site. Training shall be for site qualified electrical Post Facilities personnel.

B. Training session shall address:

1. Potential arc flash hazards associated with working on energized equipment.
2. Proper use of system analysis data.
3. Interpretation of hazard labels.
4. Selection, and utilization of personal protective equipment.

5. Baseline isolation procedures for electrical and mechanical equipment.
6. Alternative means of compliance for worker safety where implemented for specific equipment; refer to the paragraph on "Equipment with ARMS" in the Part 1 Article on ARC FLASH STUDY.
7. How to safely operate the ARMS and how to interpret ARMS information and the arc flash report.
8. Preparation of Energized Work Permits.

C. Session shall be four hours minimum duration, with trainees using (at applicable portions of session) proper Personal Protective Equipment (PPE) provided by Contractor.

D. Training shall be certified for continuing education units (CEUs) by International Association for Continuing Education Training (IACET) or equivalent.

E. Coordinate with training for lock-out/tag-out devices and safety accessories in Section 260508 "Common Work Results for Electrical, Communications, and Electronic Safety."

SECTION 260815 - FIELD TESTING AND INSPECTION OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes general requirements for field testing and inspection of electrical systems. More detailed requirements are specified in each Section listed in the "Related Sections" paragraph. General requirements include the following:

1. Qualifications of testing agencies and their personnel.
2. Suitability of test equipment.
3. Calibration of test instruments.
4. Coordination requirements for testing and inspecting.
5. Reporting requirements for testing and inspecting.

B. Related Sections include the following:

1. Section 260508 "Common Work Results for Electrical, Communications, and Electronic Security," including for electrical safety accessories.
2. Division 26 Section on medium-voltage cables.
3. Section 260518 "Low-Voltage Electrical Power Conductors and Cables."
4. Section 260525 "Grounding and Bonding for Electrical Systems."
5. Section 2605073 "Overcurrent Protective Device Coordination Study."
6. Section 260915 "Electrical Power Monitoring."
7. Section 260924 "Lighting Control Devices."
8. Section 260934 "Centralized Dimming Controls."
9. **[Division 26 Section on secondary unit substations.]**
10. Section 261214 "Medium-Voltage Transformers."
11. **[Division 26 Section on medium-voltage switchgear.]**
12. Section 262214 "Low-Voltage Transformers."
13. Section 262300 "Low-Voltage Switchgear."
14. Section 262313 "Paralleling Switchgear."
15. Section 262315 "Double-Ended Switchgear."
16. Section 262325 "Power Sequence of Operation."
17. Section 262412 "Switchboards."
18. Section 262417 "Panelboards."
19. Division 26 Section on motor-control centers.
20. Section 262500 "Enclosed Bus Assemblies."
21. Division 26 Section on fused power circuit devices.
22. Division 26 Section on enclosed switches and circuit breakers.
23. Division 26 Section on enclosed controllers.
24. Division 26 Section on variable frequency motor controllers.
25. Section 263214 "Engine Generators."
26. Section 263354 "Uninterruptible Power Supply for Telecommunications."
27. Section263237 "Resistive Load banks."

28. Section 263535 “Power Factor Correction Equipment.”
29. [Section 263552 “Low-Voltage Regulators.”]
30. [Section 263554 “Medium Voltage Regulators.”]
31. Section 263600 on “Transfer Switches.”
32. Section 264115 “Lightning Protection.”
33. Section 264315 “Surge Protective Devices.”

1.2 QUALITY ASSURANCE

A. Independent Testing Agency: Provide the services of an Independent Testing Agency for field testing and inspection of each system listed in the “Related Section” paragraph of this Section.

1. Qualifications: Independent of manufacturers, suppliers, and installers of components to be tested or inspected.

a. Testing Agency's Field Supervisor for Power Component Testing: Person currently certified by the InterNational Electrical Testing Association (NETA) or the National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in Division 26 power component Sections.

B. Test Equipment Suitability: Comply with NETA ATS, Section 5.2.

C. Test Equipment Calibration: Comply with NETA ATS, Section 5.3.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL TESTING AND INSPECTION PROCEDURES

A. Testing Preparation: Prepare systems, equipment, and components for tests and inspections, and perform preliminary tests to ensure that systems, equipment, and components are ready for Independent Testing Agency testing. Include the following minimum preparations as appropriate:

1. Perform insulation-resistance tests.
2. Perform continuity tests.
3. Perform rotation test (for motors to be tested).
4. For all circuit breakers rated at 200 amperes and above, perform injection testing per NETA standards.
5. Provide a stable source of electrical power for test instrumentation at each test location.

B. Field Test and Inspection Reporting: In addition to requirements specified in Related Sections, ensure that each test and inspection report includes the following:

1. Manufacturer's written testing and inspecting instructions.
2. Calibration and adjustment settings of adjustable and interchangeable devices involved in tests.
3. Tabulation of expected measurement results made before measurements.
4. Tabulation of "as-found" and "as-left" measurement and observation results.

3.2 SAFETY DURING TESTING

A. In advance of testing and commissioning, review project-specific safety recommendations from reports prepared in accordance with Section 260573 “Overcurrent Protective Device Coordination Study.” Use safety accessories provided in Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”

END OF SECTION 260815

SECTION 260915 - ELECTRICAL POWER MONITORING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes monitoring of electrical power and lighting circuits through electronic communication links between devices in distribution system components and power monitoring units.

1. Power monitoring units include the following:

a. Local display panels.
b. Central-processing workstation personal computers.
c. Remote workstation personal computers.

B. Related Sections include the following:

1. Section 230905 “Instrumentation and Controls for HVAC” for building automation system (BAS).
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
3. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
4. Division 26 Section on raceways and boxes.
5. Division 26 Section on identification for electrical systems.
6. **[Section 262313, “Paralleling Switchgear” for load shedding.]**
7. Section 262315 “Double-Ended Switchgear.”
8. Section 262325 “Power Sequence of Operation.”

1.2 TECHNOLOGY RESTRICTIONS

A. In accordance with Chapter 1 of the OBO Electrical Code, power monitors and controls may not contain ultrasonic technology, or wireless technology, even if not implemented. This includes prohibition of Wi-Fi, Bluetooth, Near Field Communication, ZigBee, Low Power Wide Area Networks, and similar technology.

1.3 DEFINITIONS

A. BAS: Building automation system.

B. LAN: Local area network, sometimes plural as "LANs."

C. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.

D. PC: Personal computer, sometimes plural as "PCs."

E. PV: Photovoltaic.

1.4 SYSTEM DESCRIPTION

A. Distribution system components which require monitoring include the following:

1. Medium-voltage switchgear: Meters, breaker trip units.
2. Transformers: Status/alarm points.
3. Low-voltage switchgear: Meters, breaker trip units.
4. Switchboards: Meters, breaker position.
5. Panelboards: Meters if sub-metering.
6. Motor controllers: Power monitoring is required in addition to Building Automation System (BAS) monitoring.
7. Motor-control centers: Power monitoring is required in addition to BAS monitoring.
8. Generators: Electrical and mechanical real-time and status/alarm points.
9. Transfer switches: Electrical real-time points, position, sources available.
10. Paralleling switchgear: Meters, breaker trip units.
11. Joint-Unclassified Communications (JUCR) Uninterruptible Power Supply (UPS): Status/alarm points.
12. Voltage regulators: Electrical and mechanical real-time and status/alarm points.
13. Load bank: Meter.
14. Fuel system: Fuel system real-time status/alarm points.
15. Day tanks: Status/alarm points.
16. Electrical distribution system ground current: Monitor for potentially Objectionable Current as described in Article 250 of the OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO). As a minimum, grounding conductors identified below shall be monitored for objectionable current. Metering shall measure ground currents with at least 5 percent accuracy down to 50 milliamp range as required by leakage currents anticipated; damage shall not occur to any metering components during any ground fault event.

    a. Main Bonding Jumpers within Main Service Equipment or Grounding Electrode Conductors connecting Main Bonding Jumper to **[compound][counterpoise]** ground rod system.
    b. Equipment Grounding Conductors (EGC) including all EGCs installed between Service Transformer secondary and Main Service Equipment.

17. [Photovoltaic Data acquisition system.]

18. [Wind Turbine Data acquisition system.]

1.5 SUBMITTALS

A. Product Data: List of components for power monitoring, including dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes. Attach copies of Submittals for effected products (such as switchboards and switchgear) that describe power monitoring features to coordinate Product Data related to power monitoring.

B. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on this Project.

1. Outline Drawings: Indicate dimensions, weights, arrangement of components, and clearance and access requirements.
2. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.
3. Wiring Diagrams: Detail specific wiring to suit Project. Coordinate nomenclature and presentation with a block diagram and differentiate between manufacturer-installed and field-installed wiring.

C. Software and Firmware Operational Documentation: Include the following:

1. Software operating and upgrade manuals.
2. Program Software Backup: On magnetic media or compact disc, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.

D. Software Upgrade Kit: For Government to use in modifying software to suit future power system revisions, or in power monitoring revisions.

E. Qualification Data: For firms and persons specified in Article on QUALTIY ASSURANCE.

F. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

G. Maintenance Data: For power monitoring equipment components.

1.6 QUALITY ASSURANCE

A. Startup Personnel Qualifications: Engage specially trained personnel who are directly employed by a manufacturer of distribution system protective devices.

B. Installer Qualifications: Experienced installer who is an authorized representative of power monitoring equipment manufacturer for both installation and maintenance of units required for this Project.

C. Manufacturer Qualifications: Firm experienced in manufacturing power monitoring equipment similar to that indicated for this Project and with record of successful in-service performance.

D. Source Limitations: Obtain power monitoring, firmware, monitoring panels, and network components from same manufacturer as for distribution equipment circuit breakers and other protective devices.

E. Comply with the requirements of the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for indicated use and installation conditions.

F. Comply with 47 CFR 15, Subparts A and B, for Class A digital devices.

G. Comply with UL 916.

1.7 COORDINATION

A. Coordinate features of distribution equipment and power monitoring components to form an integrated interconnection of compatible components.

1. Match components and interconnections for optimum performance of specified functions.
2. Coordinate Work of this Section with BAS so that BAS PC workstations indicate and record designated alarms registered in power monitoring displays.

a. Coordinate power monitoring components so metered electrical load and demand values and associated summary and trend reports available at central-processing workstations specified in this Section are made accessible at BAS workstations.
b. Log and store data from power monitoring system to facilitate production of monthly reports associated with each building.
c. Provide capacity to maintain logged data for a minimum of ten years. Provide auto archive capability and locally accessible storage.
d. [Where photovoltaic (PV) systems are used, all data from PV data acquisition system shall be monitored and provided to compound power monitoring system. See Section 263105 "Solar Photovoltaic Systems."]
e. [Where wind turbine systems are used, all data from wind turbine data acquisition system shall be monitored and provided to compound power monitoring system. See Division 26 Section on wind turbine systems.]

B. Coordinate Work of this Section with those in Sections specifying distribution components that are monitored by power monitoring equipment.

C. Coordinate a communication link with BAS to meet input requirements of BAS integrator and gateway equipment provided as part of BAS installation.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Communication Power Supplies: One of each type installed.
2. Network Interface Cards: One of each type installed.
3. Fiber Converters: One of each type installed.
4. Ethernet Switches: One of each type installed.
5. Meters: One of each type installed.

PART 2 - PRODUCTS

2.1 WORKSTATIONS AND SOFTWARE

A. Central-Processing Workstation: Desktop PC shall be models that were released to the market no more than two years prior to when workstation is installed, and shall be commercial-off-the-shelf models. With minimum installation, workstations shall be capable of communicating with a minimum of 200 devices, and including the following minimum peripherals, accessories, and features:

1. RAM: **[16GB][X GB]**.
2. Hard-Disk Drive: **[1 TB][X TB]**.
3. CPU: minimum 3 Ghz.
4. CD-ROM Drive: 24X read/write.
5. Monitor: 532 mm Multisync with 0.25-mm mask pitch and 1024 by 768 resolutions at 100 Hz.
6. Operating System: Microsoft Windows **[XP][7][8][X]** OS.
7. Keyboard and mouse: Compatible with Microsoft Windows **[XP][7][8][X]** OS.
8. One serial and one parallel port in addition to those required for power monitoring.
9. Network Interface Card: Computer operated, with two-way communication transmitter-receiver chip.
10. Modem: External, 56 K, minimum.
11. Automatic Reboot Capability: When power is restored after an outage.
12. Printer: Laser jet. Six pages per minute minimum nominal printing rate in draft mode.
13. Backup Battery-Inverter Power Supply: Automatic, rated 650-VA output for 10 minutes. Arranged to supply computer, accessories, and peripherals, not including a printer. Include transient voltage surge suppressor and electromagnetic-interference filters.

B. Remote Workstations: Desktop PCs that include the following features:

1. RAM: **[2GB] [X GB]**.
2. Hard-Disk Drive: **[500 GB] [X GB]**.
3. CPU: Minimum 3 GHz.
4. CD-ROM Drive: 24X read/write.
5. Monitor: 532 mm Multisync with 0.25 mm dot pitch and 1024 by 768 resolutions at 100 Hz.

6. Operating System: Microsoft Windows **[XP][7][8][X]** OS.
7. Keyboard and mouse: Compatible with Microsoft Windows **[XP][7][8][X]** OS.
8. One serial and one parallel port.
9. Network Interface Card: Computer operated, with two-way communication transmitter-receiver chip.
10. Modem: External, 56 K, minimum.

C. Metering and Monitoring Software: Features and functions include the following:

1. Password Protection: Three configurable security levels, minimum.
2. Operates in multitasking, multiuser environment. Microsoft Windows **[XP][7][8][X]** compliant.
3. On-Line Help: Context sensitive.
4. Coordinates the communications of the network.
5. Provides interactive color-graphics platform with mouse-accessed menu and mouse-driven generation of distribution system graphics, including the following graphic image types:

    a. Site plan.
    b. Floor plans.
    c. Equipment elevations.
    d. Single-line diagram.

6. Provides mouse-driven interface with devices depicted in single-line diagram and equipment elevation screens.
7. Logs user-defined power monitoring and power distribution system events including log on/off; attempted log on/off; alarms; equipment operations; and out-of-limit, pickup, trip, and no-response events; with date and time stamps accurate to 0.1 second.
8. Exports and imports data to and from commonly used Microsoft Windows spreadsheet, database, tenant billing, whole building usage, and other applications; uses dynamic data exchange technology.
9. Reports Trends: Instantaneously, in a real-time or historical tabular format, bar chart, or user-defined time, trend plots of monitored parameters; unlimited as to interval, duration, or quantity of trends.
10. Manages Alarm Function: Annunciates and logs alarm messages from discrete input and monitoring outputs, according to programmable security access protocol using the communication network.

    a. Functions Requiring User Acknowledgment: Run in background during computer use for other applications and override other presentations when they occur.

11. Views and analyzes captured waveforms. Displays harmonic content through the twenty-first harmonic, minimum, and reports total harmonic distortion.
12. Defines and initiates load-shedding schemes responding to generator PLC system, or set points of metered demands, or combination of both. See Section 262313 “Paralleling Switchgear.”
13. Communicates with BAS main workstation PC.

D. Tenant or Activity Billing Software: For non-CAA areas, automatically computes and prepares activity demand and energy-use statements based on electricity metering of energy use and peak demand integrated over same interval used by electric utility.

1. Automatically imports historical metering data from memory, generated by metering and monitoring software.
2. Maintains a separate directory for each tenant's historical billing information.

a. List of Tenants is determined by project-specific Space Requirements Program (SRP).

3. Prepares summary reports.

E. Whole Building Usage: Automatically compute and prepare activity demand and energy-use statements for all buildings over 100 sm, based on electricity metering of energy use, reactive energy, and peak demand for 15-minute intervals.

1. Automatically imports historical metering data from memory, generated by metering and monitoring software.
2. Maintains separate directory for each tenant's historical billing information.
3. Prepares summary reports.
4. Stores up to 5 years of demand and usage data (kW and kWh) for each feeder serving buildings over 100 square meters.

F. Energy Usage: Automatically prepares activity report to provide whole facility energy report based on hourly inputs. This shall be identified as the 8760 report. This report shall follow National Renewable Energy Laboratory (NREL) guidance.

1. Provide annual 8760 reports from 00:00 Jan 1 to 24:00 Dec 31.
2. Provide current prior year report (current hour back 8760).

G. Communication Software: As recommended by manufacturer for high-speed communication via modem.

H. Meter Monitoring Requirements: All meters shall monitor and record the following data:

1. Monitoring of demand power (kW).
2. Energy usage (kWh).
3. Reactive Power (kVAR).
4. Harmonics.

2.2 LOCAL DISPLAY PANEL

A. Description: Microprocessor-based, self-contained device mounted in the door of switchboard or switchgear and arranged to display values of parameters metered at each of the monitored circuit breakers in the host equipment. Features include the following:

1. Communicates over power monitoring network.
2. Circuit breakers are selected for status and parameter display by programmable designations.
3. Circuit-breaker status and trip rating are displayed in addition to parameter values.
4. Nonvolatile memory retains programmed input data indefinitely during power outages.
5. Display Screen: Light-emitting diode or illuminated liquid-crystal display, or approved equivalent.

2.3 COMMUNICATION COMPONENTS AND NETWORKS

A. Surge Protective Devices (SPD) and Electromagnetic-Interference Immunity: Include in solid-state equipment. Comply with IEEE C37.90. SPD are also known as Transient Voltage Surge Suppression (TVSS).

B. Network Configuration: High speed, multi-access, open nonproprietary, industry standard communication protocol; LANs complying with EIA 485, IEEE 802.3, 100 Base-T Ethernet, Modbus TCP/IP or other approved industry standard.

C. Network Interface Modules: Provide polling time supporting 30-second maximum interval between alarm initiation from monitored devices and registration and printout of alarm messages.

2.4 COMMUNICATION FEATURES OF POWER DISTRIBUTION SYSTEM DEVICES

A. Communication Function: Microprocessor based and integral to devices indicated as having power monitoring functions.

1. Communication Address: Unique to each individual device, and changeable at device.
2. Communication Protocol: Match that of network to which connected.
3. Two-Way Communication: Send and receive values and data communication indicated. Initiate alarm on malfunction of monitored device of monitoring equipment or network.
4. At minimum, devices shall be BacNet and MODBus compatible.

B. Circuit Breakers: Provide separate circuit breakers at power panels for each equipment rack, cabinet, or piece of electronic equipment. Connect individual pieces of equipment to panelboards with wiring for dedicated circuits run in cable racks or conduits, or combination of both.

1. Circuit Breakers, 600 V and Less: Include communication capability as feature of trip unit. Trip unit shall meter amps, volts, power per phase, three phase power, energy, power factor, frequency, alarm status, and trip events.
2. Medium-Voltage Circuit Breakers: Include communication capability as feature of overcurrent relay trip unit. Trip unit shall meter amps, volts, power per phase, three phase power, energy, power factor, frequency, alarm status, and trip events.

C. Motor Controllers, 600 V and Less: Include communication capability as feature of motor protection relay, or in network interface card designed to mount on controller. Provide electrical power monitoring in addition to BAS monitoring and control.

D. Multifunction Digital Meter and Power Quality Monitor: Microprocessor-based device, flush or semi-flush mounted in the door of switchboard or switchgear. Unit shall display and communicate indicated monitoring parameters and data for circuit and inputs to which connected. Unit shall have the ability to communicate and be connected to power monitoring system as specified in "Communication Function" Paragraph above plus the following:

1. Waveform data from high-speed sampling of voltage and current values metered.
2. Status of up to three external contact-monitored alarm conditions monitored by internal meter relay functions.
3. Monitoring of minimum of three programmable threshold values of metered parameters.
4. Monitoring of demand power (kW), energy usage (kWh), Reactive Power (kVAR), and Harmonics.

E. Addressable Monitoring Relay: Continuously polled for data, via the communication network, as to state (open or closed) of dry contacts of contact-making sensing device.

1. Ability to Communicate: As specified in "Communication Function" Paragraph above.
2. Power Supply Rating: 220 or 240 V ac or 48- to 240 V dc.
3. Enclosure: NEMA 250, Type 12, unless otherwise indicated.

2.5 ADDITIONAL POWER MONITORING COMPONENTS

A. Current Transformers: For multifunction digital meter and power quality monitors and other current-monitoring equipment furnished under this Section, without integral current transformers, provide factory-mounted current-transformer units.

1. Primary Rating: Equal to or more than that of associated circuit-breaker trip rating. Equip with shorting switches.

B. Potential Transformers: If those required for indicated monitoring functions are not integral to basic switchgear, circuit breakers, or circuit-breaker trip units, provide factory-mounted units.

1. Rating: Same as distribution system phase-to-neutral voltage.
2. Protection: Current-limiting fuses.

2.6 LOW-VOLTAGE WIRING

A. Data Line Cable: Shielded, twisted-pair cable.

B. Low-Voltage Cable: Multiple conductor, color-coded, 0.5 mm^2 copper, minimum.

1. Sheath: PVC; except in plenum-type spaces, use sheath listed for plenums.
2. Ordinary Switching Circuits: Three conductors, unless otherwise indicated.
3. Switching Circuits with Pilot Lights or Locator Feature: Five conductors, unless otherwise indicated.

2.7 ACCESSORIES

A. Interfaces with Distribution Equipment Specified in Other Sections: Accessories, adapters, electronic interface units, and connections required for functional performance indicated.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install equipment level and plumb. Anchor to building structural elements and support according to requirements in Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”

B. Mounting heights indicated are to bottom of unit for suspended items and to center of unit for wall-mounting items.

3.2 WIRING INSTALLATION

A. Install wiring between power monitoring devices as specified in Section 260518 “Low-Voltage Electrical Power Conductors and Cables" for low-voltage analog connections, and for network and data line circuits.

B. Wiring Method: Install wiring in raceway as specified in Division 26 Section on raceways and boxes for electrical systems.

C. Bundle, train, and support wiring in enclosures.

D. Ground equipment.

E. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B “Standard for Wire Connectors.”

3.3 IDENTIFICATION

A. Identify components and power wiring according to Division 26 Section on identification for electrical systems.

B. Label each power monitoring module with a unique designation.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Engage a factory-authorized service representative to inspect, test, adjust, and program power monitoring equipment.

B. Schedule visual and mechanical inspections and electrical tests with at least seven days' advance notice.

C. Inspect power monitoring components for defects and physical damage, labeling of testing laboratory, and nameplate compliance with the Contract Documents.

D. Check tightness of electrical connections with torque wrench calibrated within previous six months. Use manufacturer's recommended torque values.

E. Electrical Tests: Use particular caution when testing devices containing solid-state components. Perform the following according to manufacturer's written instructions:

1. Continuity tests of circuits.

2. Operational Tests: Set and operate controls at PC workstations and at monitored devices to demonstrate their functions and capabilities. Use methodical sequence that cues and reproduces actual operating functions as recommended by manufacturer. Note response to each test command and operation. Note time intervals between initiation of alarm conditions and registration of alarms at central-processing workstation.

a. Coordinate testing required by this Section with that required by Sections specifying equipment being monitored.
b. Metering Test: Load feeders, measure loads on feeder conductor with RMS reading clamp-on ammeter, and simultaneously read indicated current on same phase at central-processing workstation. Record and compare values measured at two locations. Resolve discrepancies greater than 10 percent and record resolution method and results.
c. Integration with BAS: Verify validity of displays at BAS PC workstations that are related to electrical power monitoring functions.
d. Record metered values, operations, cues, time intervals, and functional observations.

F. Correct deficiencies, make necessary adjustments, and retest. Verify that specified requirements are met.

G. Test Labeling: After satisfactory completion of tests and inspections, apply label to tested components indicating test results, date, and responsible agency and representative.

H. Reports: Written reports of tests and observations. Record defective materials and workmanship and unsatisfactory test results. Record repairs and adjustments.

3.5 CLEANING

A. Cleaning: Clean equipment and devices internally and externally using methods and materials recommended by manufacturers, and repair damaged finishes.

3.6 DEMONSTRATION

A. Engage factory-authorized service representative to provide on-site training of Government's locally employed staff (LES) maintenance personnel and Government's maintenance management to adjust, operate, and maintain systems.

1. Training Content: Train in interpreting and using monitoring displays and in configuring and using software and reports. Train in troubleshooting, servicing, adjusting, and maintaining equipment.
2. Training Duration:

   a. LES Maintenance Personnel: Provide 40 consecutive hours (one week) of training.
   b. Government Maintenance Management: Identify 16 hours of the training provided for LES maintenance personnel which would provide management with the best overview. Through Project Director/COR, confirm this content and schedule breakout (e.g., two full days or four ½ days) for participation of Government maintenance management in training sessions.

3. Training Aids: Use approved final versions of software and maintenance manuals as training aids.
4. Schedule training through Project Director/COR, with at least 14 days advance notice.

3.7 ON-SITE ASSISTANCE

A. Occupancy Adjustments: Within one year of date of Substantial Completion, provide up to three Project site visits, when requested by Project Director/COR, to adjust and calibrate components and to assist Government personnel in making program changes and in adjusting sensors to suit actual conditions.

3.8 TELEPHONE TECHNICAL SUPPORT

A. Hardware and Software: Within two years of date of Substantial Completion, provide unlimited response to user questions regarding software use and hardware and communication link troubleshooting, reconfiguring, and adjusting.

1. Telephone Calls: Toll free.
2. Availability: Eight hours per day during Post working hours on weekdays.
3. Responder Qualifications: Engineer or technician thoroughly familiar with power monitoring equipment.

END OF SECTION 260915

SECTION 260924 - LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following lighting control devices:

1. Outdoor photoelectric switches.
2. Indoor photoelectric switches and photosensors.
3. Indoor in-wall occupancy sensors switches.
4. Outdoor motion sensors.
5. Multipole contactors.

B. Related Sections include the following:

1. Section 122413 “Roller Window Shades” for coordinated interface of window shades on exterior wall of Consular Waiting Area.
2. Section 260934 “Centralized Dimming Controls” for architectural dimming system equipment.
3. Section 262725 “Wiring Devices” for wall-box dimmers and manual light switches.
4. Section 265105 “Interior Lighting” for LED fixtures.

1.2 DEFINITIONS

A. DALI: Digital Addressable Lighting Interface

B. LED: Light-emitting diode.

C. PIR: Passive infrared.

1.3 PERFORMANCE REQUIREMENTS

A. Provide sufficient quantity, layout, and aiming of devices to facilitate conformance with lighting requirements in Chapter 12 of the OBO Building Code, achieving at least at least 90 percent coverage in each area. Do not exceed coverage limits specified in manufacturer's written instructions.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated include ratings, configurations, standard wiring diagrams, dimensions, colors, service condition requirements, and installed features.

B. Shop Drawings: Show installation details for occupancy and light-level sensors.

1. Lighting plan showing location, orientation, and coverage area of each sensor.
2. Interconnection diagrams showing field-installed wiring.
3. In relation to the Consular Waiting Area show interface of lighting controls, located in the staff side of the Consular Section, with window shades at exterior walls of the Consular Waiting Area. Refer to Section 122413 on "Roller Window Shades."

C. Qualifications:

1. Testing agency.
2. Training instructor.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For each type of product include detailed information on device programming and setup in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code, or BS EN 60079:2004 "Electrical Apparatus for Explosive Gas Atmospheres," by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

B. Manufacturer Qualifications: Company specializing in manufacturing products specified in this Section, with minimum three years documented experience.

1.6 COORDINATION

A. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies. Voltages listed shall be adjusted to match the host country voltage.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Sensors: 10 per type.
2. Relays and Control Modules: Two per type.
3. Transfer Units (Normal/Emergency): Two per type.

PART 2 - PRODUCTS

2.1 GENERAL LIGHTING CONTROL DEVICE REQUIREMENTS

A. Line-Voltage Surge Protection: Integral part of devices for 220- or 240-V solid-state equipment. For devices without integral line-voltage surge protection, field-mounting surge protection shall comply with IEEE C62.41 and with UL 1449.

B. Unless specifically indicated to be excluded, provide all required conduit, wiring, connectors, hardware, components, and related accessories necessary for complete operating system.

2.2 OUTDOOR PHOTOELECTRIC SWITCHES

A. Conform to system design requirements for exterior site lighting in OBO Zoning Code Appendix B.

B. Description: Solid state, with DPST dry contacts rated for 1800-VA tungsten or 1000-VA inductive, to operate connected relay, contactor coils, microprocessor input, and complying with UL 773A.

1. Light-Level Monitoring Range: 16 to 108 lx, with an adjustment for turn-on and turn-off levels within that range, and directional lens in front of photocell to prevent fixed light sources from causing turn-off.
2. Time Delay: 15-second minimum, to prevent false operation.
3. Surge Protection: Metal-oxide varistor type, complying with IEEE C62.41 for Category A1 locations.
4. Mounting: Twist lock complying with IEEE C136.10, with base-and-stem mounting or stem-and-swivel mounting accessories as required to direct sensor to North sky exposure in northern hemisphere or to South sky exposure in the southern hemisphere.

2.3 INDOOR PHOTOELECTRIC SWITCHES AND PHOTOSENSORS

A. Ceiling-Mounting Photoelectric Switch and Photosensors: Solid-state, light-level sensor unit, mounted in ceiling box or on luminaire if stand alone, to detect changes in lighting levels that are perceived by eye, and to provide dimming range as required by sequence of operation. Cadmium sulfide photoresistors are not acceptable.

1. Sensor Output: Contacts rated to operate associated relay or input to centralized control system, complying with UL 773A. Power sensor from relay unit, power pack, or centralized lighting control system.
2. Ceiling Mount with range and viewing angle to meet requirements of sequence of operation and as indicated in Construction Documents.
3. Relay Unit: Dry contacts rated for 20-A ballast load at 220 and 240 V ac, for 13-A tungsten at 220 or 240 V ac, and for 1 hp at 220- or 240-V ac. Power supply to sensor shall be 24-V dc, 150-mA, Class 2 power source as defined by NFPA 70 “National Electrical Code”

or BS 7671:2001 "Requirements for Electrical Installations-IEE Wiring Regulations-16th Edition."

4. Addressable Unit: DALI integrated with faceplate/finish trim and factory wiring connections.
5. Light-Level Monitoring Range: 108 to 2150 lx 1080 to 10 800 lx, with adjustment for turn-on and turn-off levels within that range.
6. Time Delay: Adjustable from five to 300 seconds to prevent cycling, with deadband adjustment.
7. Indicator: Two LEDs to indicate beginning of on and off cycles.
8. Response: Output signal shall be linear to light level. Cadmium sulfide photo-resistors are not acceptable.

B. Window/Skylight Photoelectric Sensors and Photosensors: Solid-state, light-level sensor; house in threaded, plastic fitting for mounting; under skylight, facing up at skylight, in ceiling adjacent to window, facing down; with separate relay unit mounted on luminaire, or integrated to centralized lighting control system, to detect changes in lighting levels that are perceived by eye, and to provide dimming range as required by sequence of operation. Cadmium sulfide photoresistors are not acceptable.

1. Sensor Capacity: As required to meet requirements of construction documents.
2. Sensor Output: Contacts rated to operate associated relay or input to centralized control system, complying with UL 773A. Power sensor from relay unit, or centralized lighting control system.
3. Relay Unit: Dry contacts rated for 20-A ballast load at 220 or 240 ac, for 13-A tungsten at 220 or 240 V ac, and for 1 hp at 220 or 240 V ac. Power supply to sensor shall be 24-V dc, 150-mA, Class 2 power source as defined by NFPA 70 "National Electrical Code" or BS 7671:2001 "Requirements for Electrical Installations-IEE Wiring Regulations-16th Edition."
4. Addressable Unit: DALI integrated, with faceplate/finish trim and factory wiring connections.
5. Light-Level Monitoring Range: 10 800 to 108 000 lx, with adjustment for turn-on and turn-off levels within that range.
6. Time Delay: Adjustable from 5 to 300 seconds to prevent cycling, with deadband adjustment.
7. Indicator: Two LEDs to indicate the beginning of on and off cycles.
8. Response: Output signal shall be linear to light level. Cadmium sulfide photo-resistors are not acceptable.

C. Lighting Control and Window Shade Control Interface for Consular Waiting Area:

1. Lighting and window shading system shall be controllable from common front-end system.

   a. Full functionality and integration of both systems shall be achievable without additional interfaces.
   b. Lighting and shade controllers shall communicate on same low voltage communication link for ease of installation and maintenance.
   c. At a minimum, lighting and shading control system front-end shall be able to provide cross system reporting of device status, activity history, and energy savings.

d. Window Shade Override Control: See Section 122413 “Roller Window Shades” for separate but adjacent control to facilitate override of window shade operation. The common front-end system shall permit the use of this override feature.

2.4 INDOOR IN-WALL OCCUPANCY SENSOR SWITCHES

A. General Description: Occupancy sensors designed for installation in standard wall box, at standard wall switch mounting height with field of view of 180 degrees, with integrated manual control capability, and no leakage current to load in off mode.

1. Operation - General: Factory-assembled commercial specification grade devices for indoor use capable of sensing both major motion (walking) and minor motion (small desktop level movements), according to published coverage areas, for automatic control of load indicated; with time delay for turning lights off, adjustable over minimum range of 1 to 15 minutes.

   a. Auto/Auto: Turn lights on when covered area is occupied, and off when unoccupied.
   b. Manual/Auto: Manually turn lights on in covered area, and automatically turn lights off in covered area when unoccupied.
   c. Auto to 50 Percent Auto: Turn lights on when covered area is occupied to 50 percent with occupant having ability to adjust lights to 100 percent manually. Automatically turn lights off when unoccupied.

2. Sensor Output: Contacts rated to operate connected relay, complying with UL 773A. Power sensor from relay unit or power pack.
3. Mounting:

   a. Sensor: Suitable for mounting in any position on standard outlet box.
   b. Relay: Externally mounted though 13-mm knockout in standard electrical enclosure.
   c. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.

4. Indicator: Provide fade-to-off operation to warn occupant of impending load turn-off. LED indicator shall display when motion is being detected during testing and normal operation of sensor.
5. Bypass Switch: Override on function in case of sensor failure.
6. Selectable Option Light-Level Sensor: Enable low light feature (automatic-on when ambient light is below threshold). Ambient light threshold shall be adaptive utilizing occupant feedback.
7. Suitable to dim LED loads.

B. Dual-Technology Type: Detect occupancy by using combination of passive infrared (PIR) and ultrasonic detection methods in area of coverage; microphonic technology is prohibited.

1. Sensitivity Adjustment: Adjustable for high, medium, low, and off presets.

2. Selectable Option Light-Level Sensor: Enable low light feature (automatic-on when ambient light is below threshold). Ambient light threshold shall be adaptive utilizing occupant feedback.
3. Detection Coverage (Standard Room): Coverage of 81 sq m, with mounting height of 1.2 m.
4. Dual-technology in-wall sensors are permitted only in Public Access Area (PAA) and General Work Area (GWA).

C. Sensors in CAA:

1. Provide passive infrared (PIR) sensors; ultrasonic or dual technology sensors are prohibited.
2. CAA Restricted: Provide digital control using block diagrams; floor plan configurations are not permitted.
3. CAA Core:

a. Provide basic lighting control by individual suite; control systems are not permitted to cross suite boundaries. Centralized dimming controls, in Section 260934, are not applicable or permitted in these areas.
b. Provide line voltage or analog control only.
c. Reporting of status lights to indicated load status is prohibited.
d. Interconnection to any building automation system, in Section 230905, is prohibited.

2.5 MULTIPOLE CONTACTORS

A. Description: Electrically operated and electrically held, complying with NEMA ICS 2 and UL 508.

1. Current Rating for Switching: Listing or rating consistent with type of load served.
2. Control-Coil Voltage: Match control power source.

2.6 CONDUCTORS AND CABLES

A. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than 4 mm2, complying with Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

B. Classes 2 and 3 Control Cable: Multiconductor cable with stranded copper conductors not smaller than 1.0 mm2, complying with Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

C. Class 1 Control Cable: Multiconductor cable with stranded copper conductors not smaller than 2.5 mm2, complying with Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

D. Install unshielded, twisted-pair cable for control and signal transmission conductors, complying with Section 271505 “Communications Horizontal Cabling.”

PART 3 - EXECUTION

3.1 WIRING INSTALLATION

A. Wiring Method: Comply with Section 260518 “Low-Voltage Electrical Power Conductors and Cables.” Minimum conduit size shall be 13 mm.

B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.

C. Install field-mounted surge protective devices for lighting control devices in Category A locations that do not have integral line-voltage surge protection.

D. Size conductors according to lighting control device manufacturer's written instructions, unless otherwise indicated.

E. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B “Standard for Wire Connectors” or BS 7671:2001 Requirements for Electrical Installations –IEE Wiring Regulations-16th Edition.

3.2 IDENTIFICATION

A. Identify components and power and control wiring according to Division 26 Section "Identification for Electrical Systems."

B. Label time switches and contactors with unique designation.

3.3 CONTROL LOCATIONS

A. General: Locate controls for appropriate operational controls.

B. Special Scenarios: Locate controls as follows:

1. Main Lobby: Locate in Post 1.
2. Multipurpose Room: Locate in AV Control Booth; if no Booth, contact Project Director/COR for input.
3. American Center: Locate in nearby GWA office area; preferred location in Public Affairs Office if close.
4. Consular Waiting Area: Locate lighting controls, along with integrated window shade controls, in Consular Office area.

5. Gallery/Atrium and Foodservice Area: Locate controls so as to be not readily visible and to facilitate appropriate control.

3.4 FIELD QUALITY CONTROL AND ADJUSTING

A. Perform the following field tests and inspections and prepare test reports:

1. After installing devices and sensors, and after electrical circuitry has been energized, adjust and test for compliance with requirements, including time delays and ambient light thresholds where applicable. Verify optimal coverage for entire room or area.
2. Verify that outlet boxes are installed in proper locations and at proper mounting heights and are properly signed to accommodate devices and conductors in accordance with OBO Electrical Code.
3. Complete installation and startup checks according to manufacturer’s written instructions.
4. Test for circuit continuity, open, shorts, and other tests as recommended by manufacturer.
5. Check operation of local control devices.
6. Verify that control system features are operational.
7. Operational Test: Verify actuation of each sensor and adjust time delays.

B. Quality Control Demonstration:

1. Demonstrate proper operation of lighting control devices to Architect of Record and to Government representatives identified by Project Director/COR and correct deficiencies or make adjustments as directed.
2. Occupancy Adjustments: Adjust occupancy sensor settings to minimize undesired activations while optimizing energy savings, and to achieve desired function of each space.
3. Sensor Location Adjustments: In accordance with design intent, make reasonable minor adjustments to locations of in-wall occupancy sensors to optimize coverage, and to avoid conflicts or problems affecting coverage.

C. Remove and replace lighting control devices where test results indicate that they do not comply with specified requirements.

D. Correct deficiencies, make necessary adjustments, and retest. Verify that specified requirements are met.

E. Additional testing and inspecting, at Contractor's expense, may be performed to determine compliance of replaced or additional work with specified requirements.

F. Verify normal operation of each luminaire after installation.

G. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify normal transfer to backup source and retransfer to normal.

3.5 DEMONSTRATION

A. Training: Train Government maintenance personnel on lighting control devices. Provide minimum of one two-hour classroom session and one four-hour demonstrations. Use operation and maintenance manual as training reference, supplemented with additional training materials as required. Refer to Division 01 Section "Closeout Procedures."

1. Topics: Start-up, normal operation, shutdown, unoccupied operation, seasonal changeover, manual operation, controls set-up and programming, and alarms for maintaining lighting control system in coordination with lighting, sensors, and shading device instrumentation and controls. Review control drawings and schematics, and interactions with other systems.
2. Instructor: Qualified contractor familiar with the project and with sufficient knowledge of the installed lighting control devices.

END OF SECTION 260924

SECTION 260934 - CENTRALIZED DIMMING CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Lighting control module – preset scene main unit.
2. Integrated, multipreset, modular dimming controls.

B. Related Sections include the following:

1. Section 122413 “Window Shading System” for motorized shade system integration with centralized lighting control system.
2. Section 230905 “Instrumentation and Controls for HVAC” for BAS system integration via BACnet with centralized lighting control system.
3. Section 262725 "Wiring Devices" for wall-box dimmers and manual light switches.
4. Section 260924 "Lighting Control Devices" for photoelectric switches, in-wall occupancy sensor switches, and multipole contactors.
5. Section 265105 “Interior Lighting” for LED drivers and fixtures.

1.2 DEFINITIONS

A. Channel: Lighting fixture or group of lighting fixtures controlled simultaneously as single entity. Also known as a "zone."

B. DALI: Digital Addressable Lighting Interface

C. Fade:

1. Fade Override: Ability to temporarily set fade times to zero for all lighting scenes.
2. Fade Rate: Time it takes each channel to arrive at next scene, depending on degree of change in lighting level.
3. Fade Time: Time it takes channel to fade from one lighting scene to another.

D. LED: Light-emitting diode.

E. NRTL: Nationally recognized testing laboratory.

F. Scene: Lighting effect created by adjusting several channels of lighting to desired intensity.

G. Wall-Box Dimmer: Self-contained dimmer that fits into switch box.

1.3 SYSTEM PERFORMANCE

A. Provide complete system with controls indicated on control diagrams on Construction Drawings. Provide lighting control matrix in accordance with room type.

B. Provide centralized lighting control system with graphical floorplan software for Public Access Area (PAA) and General Work Area (GWA).

C. Controlled Access Area (CAA):

1. Provide centralized lighting control system with floorplan software represented in grid format with area name only for Controlled Access Area (CAA). CAA centralized lighting control system shall be separate, self-contained system, and not integrated with GWA centralized lighting control system.
2. Provide stand-alone lighting control solution for CAA Core.
3. Refer to requirements for wired sensors at CAA in Article on INTEGRATED, MULTI-PRESET, MODULAR DIMMING.

D. Wireless lighting controls are prohibited.

E. Centralized lighting control solution shall be able to control all LED lighting sources from single software program, including switching, 0-10V, digital, and tunable white fixtures.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

1. For dimming controls, include dimensions, features, characteristics, and ratings.
2. Device plates and plate color and material.
3. Sound data including results of operational tests of dimming controls.
4. For occupancy/vacancy sensors, include detailed basic motion detection coverage range diagrams
5. Operational documentation for software and firmware, including manufacturer's security statement indicating lighting control system conforms to most current NIST Framework requirements.
6. Identify compliance with performance requirements in Drawings and Specifications.

B. Shop Drawings: Detail assemblies of standard components, custom assembled for specific application on Project. Indicate dimensions, weights, arrangement of components, and clearance and access requirements.

1. Include elevation views of front panels of control and indicating devices and control stations.
2. Wiring Diagrams: Power, signal, and control wiring.
3. Load schedule indicating actual connected load, load type, and voltage per circuit, circuits and their respective control zones, circuits that are on emergency, and capacity, phase, and corresponding circuit numbers.

4. System schematic indicating component interconnections. Include requirements for interface with other systems, such as BAS and motorized shades, as required per Project.
5. Sequence of Operation Report for each area/room type.

C. Samples for Initial Selection: For units with factory-applied color finishes and technical features for flush-mounting, dimming control station faceplates.

D. Samples for Verification: Manufacturer's standard sizes for flush-mounting, dimming control station faceplates.

E. Qualifications:

1. Manufacturer in accordance with Article on QUALITY ASSURANCE.
2. Service Start-Up Engineer: Manufacturer’s certificate.

F. Field quality-control test reports: Written reports of tests and observations. Record defective materials and workmanship and unsatisfactory test results. Record repairs and adjustments.

G. Operation and Maintenance Data: For dimming controls with remote-mounting dimmers to include in emergency, operation, and maintenance manuals. Include detailed information on lighting control system operation, equipment programming and setup, replacement parts, and recommended maintenance procedures and intervals. In addition to items specified in Division 01 Section " Operation and Maintenance Data," include the following:

1. Software manuals.
2. Adjustments of scene preset controls, adjustable fade rates, and fade overrides.
3. Operation of adjustable zone controls.
4. Testing and adjusting of panic and emergency power features.

H. Warranties: Submit sample of manufacturer’s Warranty as specified under Article on WARRANTY.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain dimming controls from single source with total responsibility for compatibility of lighting control system components specified in this Section and Section 260924 "Lighting Control Devices" and Section 265105 “Interior Lighting.”

B. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

C. Comply with 47 CFR 15, Subparts A and B, for Class A digital devices.

D. Manufacturer Qualifications:

1. Company with not less than ten years of experience manufacturing lighting control systems of similar complexity to specified system.
2. Registered to ISO 9001, including in-house engineering for product design activities.
3. Qualified to supply specified products and to honor claims against product presented in accordance with warranty.
4. Capable of providing onsite service support for Project during construction and post-occupancy.
5. NIST 800-171 Program certified by third-party auditor that includes dedicated physical space and network to properly handle and safeguard SBU documents.

E. Service Start-Up Engineer: Certified by manufacturer as capable of performing start-up in relation to system requirements included in this Section.

1.6 COORDINATION

A. Coordinate features of devices specified in this Section with systems and components specified in other Sections to form an integrated system of compatible components. Match components and interconnections for optimum performance of specified functions. Include coordination with the following:

1. Section 122413 “Window Shade System,” as required per Project.
2. Section 230905 “Instrumentation and Controls for HVAC.”
3. Section 260924 "Lighting Control Devices."
4. Section 265105 “Interior Lighting.”

1.7 WARRANTY

A. Control System Component Extended Warranty: Manufacturer’s standard form in which manufacturer agrees to repair or replace control system materials or workmanship within specified warranty period. Lighting management system computer warranty will be addressed in the project one-year warranty provisions for components and labor.

1. Failure includes, but is not limited to, failure of components due to surge.
2. Failure does not include failure of LED drivers.
3. Warranty Period: Two years from date of Substantial Completion, with eight years for surge damage.
4. Warranty service shall include troubleshooting and diagnosis of associated lighting issues.
5. Response for on-site service when required shall be first available.
6. Warranty shall include telephone technical support available 24 hours per day, 7 days per week, excluding manufacturer holidays.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Lighting Controller: Full-size units equal to 10 percent of amount installed for each size indicated, but no fewer than two.
2. Control Stations: Equal to 10 percent of amount installed for each size installed, but no fewer than three.
3. Interfaces and Modules: Equal to 10 percent of amount installed for each type installed, but no fewer than two.
4. Occupancy and Daylight Sensors: Equal to 10 percent of amount installed for each type installed, but no fewer than two.

PART 2 - PRODUCTS

2.1 GENERAL DIMMING DEVICE REQUIREMENTS

A. Line-Voltage Surge Suppression: Factory installed as integral part of 120- and 277-V ac, solid-state dimmers and control panels.

1. Alternative Line-Voltage Surge Suppression: Field-mounting surge suppressors that complies with UL 1449 and with IEEE C62.41, for Category A locations.

B. Compatibility: Dimming control components shall be compatible with other elements of lighting fixture types, drivers, transformers, sensors, and lighting controls.

C. Dimmers and Dimmer Modules: Comply with UL 508.

1. Audible Noise and Radio-Frequency Interference Suppression: Solid-state dimmers shall operate smoothly over their operating ranges without audible lamp or dimmer noise or radio-frequency interference. Modules shall include integral or external filters to suppress audible noise and radio-frequency interference.
2. Dimmer or Dimmer-Module Rating: As indicated, but not less than 125 percent of connected load.

D. Design lighting control equipment for minimal 10 year operational life while operating continually at any temperature in ambient temperature range of 0 degrees C to 40 degrees C and 90 percent non-condensing relative humidity.

E. Panic Switch: Include where indicated or required by local authorities having jurisdiction (with confirmation of requirement by OBO/PDCS/DE authority having jurisdiction). Switch operation overrides dimmer settings, and restores lights on connected output circuits to full brightness regardless of settings.

2.2 LIGHTING CONTROL MODULE – PRESET SCENE MAIN UNIT

A. Description: Factory-fabricated equipment providing manual dimming control consisting of wall-box mounted master main unit, with preset lighting control scenes and channel override.

1. Provide preset scene main unit(s) with configuration and quantity of zones as indicated or as required to control loads as indicated. User-programmable channel and scene names with astronomical time clock and programmer interface.

    a. Controls and commands for adjustment of each dimmer-channel setting for each scene change from one preset scene to another.
    b. Master channel raises and lowers lighting level.
    c. Adjustable fade rate for each scene from zero fade to one hour.

2. Able to connect to network lighting control system or function as stand-alone dimmer control, as required per Project.
3. Main unit shall have any wireless or IR sensor functions permanently disabled/removed from unit.
4. Mounting: Single, flush-mounting wall box with manufacturer's standard faceplate.

B. Remote-Control Stations:

1. Numbered push buttons to select scenes.
2. Off switch to turn master station off.
3. On switch turns all scenes of master station to full bright.
4. LED indication lights of light level and scene.
5. For temporary local overrides, individual raise/lower buttons to allow zones to be adjusted for operation without altering scene values stored in memory.
6. Allow for easy reprogramming without replacing unit.
7. Replacement of units shall not require reprogramming.
8. Control Wiring: NFPA 70, Class 1 or 2.
9. Mounting: Single, flush-mounting wall box with manufacturer's standard faceplate.

2.3 INTEGRATED, MULTI-PRESET, MODULAR DIMMING CONTROLS

A. Description: Microprocessor-based, solid-state controls; centralized lighting control system.

1. Operation: Automatically changes variable dimmer settings of indicated number of channels simultaneously from one preset scene to another when push button is operated.
2. Electrolytic capacitors shall operate when temperatures are at least 20 degree C below component manufacturer’s maximum temperature rating when device is under fully loaded conditions in 40 degrees C ambient temperature.
3. Load Handling Thyristors, Field Effect Transistors and Isolated Gate Bipolar Transistors: Manufacturer’s maximum current rating minimum two times control’s rate operating current.
4. In-Rush Tolerance: Capable of withstanding repetitive inrush current of 50 times operating current without impacting lifetime of dimmer.
5. Electrostatic Discharge Tolerance: Design and test equipment to withstand electrostatic discharges without impairment when tested according to IEC 61000-4-2.
6. Design and test dimmer system to withstand line side surges of 6,000 volts without impairment to performance per ANSI/IEEE C62.41B and C62.41C.

7. Utilize air gap off, activated when user selects “off” at any control to disconnect load from line supply.
8. System shall possess power failure memory such that if power is interrupted and subsequently returned, lights will automatically return to same levels (dimmed setting, full on, or off) prior to power interruption within 3 seconds.
9. Assign each dimmer load type that will provide proper dimming curve for specific light source.
10. System shall possess ability to have load types assigned per circuit, configured in field.
11. Minimum and maximum light levels shall be user adjustable on circuit by circuit basis.
12. System shall control all light sources in smooth and continuous manner. Dimmers with visible steps are not acceptable. Incorporate electronic “soft-start” default at initial turn-on that smoothly ramps lights up to appropriate levels within 0.5 seconds.
13. Provide real time cycle by cycle compensation for incoming line voltage variations including changes in RMS voltage (plus or minus 2 percent change in RMS voltage/cycle), frequency shifts (plus or minus 2 Hz change in frequency/second), dynamic harmonics, and line noise.
14. Provide each system with master control and remote-station controls.
15. Each channel shall be configurable to control the following:

    a. Low-voltage lamps.
    b. LED fixtures.

16. Memory: System shall retain presets and fade settings through power failures for at least seven days by retaining physical settings of controls or by on-board, automatically recharged battery.

B. Lighting Controllers:

1. Provide lighting controllers as indicated or as required to control the lighting loads as indicated.
2. Delivered and installed as listed factory-assembled panel.
3. Passively cooled via free-convection, unaided by fans or other means.
4. Connection without interface to wired occupancy sensors and wired daylight sensors.
5. Connects to lighting management hub.
6. Switching/0-10V analog lighting controllers:

    a. Single low voltage dimming module capable of dimming 0-10V analog voltage signal or 10-0V analog voltage signal at Class 2 isolated output signal conforming to IEC 60929.
    b. Rated life of switching relay shall be minimum of 1,000,000 cycles at fully rated 16 amp for all lighting loads.
    c. Utilize air gap off, activated when user selects “off” at any control to disconnect load from line supply.
    d. Controller to integrate up to four individually controlled zones, each with capacity of up to 16 amps of high in-rush lighting load.

7. Digital fixture lighting controller

a. Each low-voltage digital communication link to support up to 64 LED drivers capable of NFPA 70 Class 1 or Class 2 installation.
b. Provides two-way feedback with digital fixtures for energy monitoring, light level status, and driver failure reporting.
c. Provide testing capability using manual override buttons.

C. Lighting Management Hubs:

1. Provided in pre-assembled NEMA listed enclosure with terminal blocks for listed field wiring.
2. Enables light management software to control and monitor compatible LED drivers, power panels, power modules, and motorized shades (if applicable).
3. Integrates control station devices, power panels, motorized shades, preset lighting controls, and external inputs into a single customizable lighting control system with:

a. Distributed architecture provides fault containment. Single hub failure or loss of power does not compromise lights and motorized shades connected to other lighting management hubs.
b. Manual overrides.
c. Automatic control.
d. Central computer control and monitoring.
e. Integration with BAS via BACnet (if applicable to Project).

4. Maintains backup of programming in non-volatile memory capable of lasting more than ten years without power.
5. BACnet Test Laboratory (BTL) listed.

D. Lighting Management System Software

1. Provide system software license and hardware that is designed, tested, manufactured, and warranted by single manufacturer.
2. Windows-based, capable of running on either a central server or remote client over TCP/IP connection.
3. Allows control and monitoring of the following:

a. Area lights can be monitored for on/off status, as well as all lights in an area can be turned on/off or sent to specific light level.
b. Area occupancy can be monitored, as well as area occupancy can be disabled to override occupancy control in case of occupancy sensor problems.
c. Daylight status can be monitored, as well as daylighting can be enabled/disabled.
d. Load shed reduction can be applied to selected areas and triggered via software or BACnet.
e. Scheduling: Monitor and adjust scheduled events and astronomic time clock/
f. Reporting: Provide reporting capability to building manager for energy reports, energy saving by strategy report, activity report, system alert reports, and system diagnostics.

4. Administration Access:

a. Allow new user accounts to be created and existing user accounts to be edited.
b. Area and feature access can be restricted based on login credentials with customized access levels available.

E. Control Stations

1. Provide control stations with configuration as indicated or as required to control loads as indicated.
2. Control stations can be replaced without reprogramming.

F. Wired Sensors

1. Occupancy Sensors

a. Furnished with field-adjustable controls for time delay and sensitivity to override any adaptive features.
b. Furnished with all necessary mounting hardware and instructions.
c. Dual Technology Sensors:

1) These sensor types are permitted only in Public Access Area (PAA) and General Work Area (GWA); prohibited in CAA.
2) Dual technologies used shall be Passive Infrared (PIR) and Ultrasonic.
3) Microphonic technology is prohibited in CAA.

d. CAA and CAA Restricted: Only Passive Infrared (PIR) sensors are permitted.
e. Centralized dimming control is not permitted in CAA Core.
f. See also the Article on SYSTEMS PERFORMANCE regarding system restrictions in CAA.

2. Sensor Power Packs: Provide sensor power packs where required for power connection to sensor.
3. Daylight Sensors

a. Open-loop basis for daylight sensor control scheme.
b. Partially shielded for accurate detection of available daylight to prevent fixture lighting and horizontal light component from skewing sensor detection.
c. Provide linear response from 0 to 500 footcandles.

G. Low Voltage Control Interfaces

1. Contact Closure Interfaces: Where contact closures are used to integrate between lighting controls and other building systems

a. Input open circuit voltage shall not exceed 36 volts.
b. Input short circuit current shall not exceed 0.5 mA.
c. Mechanical contact closures shall be dry contact rated.
d. Solid state contact closures: output off state leakage current shall not exceed 50mA, and output on state saturation voltage shall not be less than 2 volts.

e. Contact closure input device shall accept both momentary and maintained contact closures.

2. AC Motor Group Controller shall integrate control of AC motor shades, screens and blinds into preset lighting control system as required by project.
3. Emergency Lighting Interface, as required by project, shall:

a. Provide total system listing to UL924.
b. Sense all three phases of building power.
c. Provide an output to power panels if power on any phase fails and sends all lights controlled by these devices to an emergency light level setting. Lights to return to their previous intensities when normal power is restored.
d. Accept contact closure input from fire alarm control panel.

4. Provide power supplies as indicated or as required to power system devices.

2.4 CONDUCTORS AND CABLES

A. Wiring to Supply Side of Remote-Control Power Sources: Not smaller than 4.0 mm^2 complying with Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

B. Classes 2 and 1.0 mm^2: Comply with Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

C. Class 1 Control Cable: Multiconductor cable with stranded copper conductors not smaller than 2.5 mm^2, complying with Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

D. Install unshielded, twisted-pair cable for control and signal transmission conductors, complying with Section 271505 “Communication Horizontal Cabling.”

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Install equipment in accordance with manufacturer’s installation instructions, and as indicated on Drawings.

B. Define each dimmer’s load type, assign each load to a channel, and set control functions.

C. Mount daylight sensors with constant view of daylight for open loop system. Follow manufacturer’s installation instructions for mounting.

D. Ensure that daylight sensor placement minimizes sensors view of electric light sources. Ceiling mounted and lighting fixture mounted daylight sensors shall not have direct view of lighting fixtures.

E. Sensor locations indicated are diagrammatic. Within the design intent, reasonably minor adjustments to locations may be made in order to optimize coverage and avoid conflicts or problems affecting coverage, in accordance with manufacturer's recommendations.

3.2 WIRING INSTALLATION

A. Wiring Method: Comply with Section 260518 " Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size shall be13 mm.

B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.

C. Install field-mounted surge protective devices for lighting control devices in Category A locations that do not have integral line-voltage surge protection.

D. Size conductors according to lighting control device manufacturer's written instructions, unless otherwise indicated.

E. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

F. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.3 IDENTIFICATION

A. Identify components and power and control wiring according to Division 26 Section on "Identification for Electrical Systems."

B. Label each dimmer module with a unique designation.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections. Report results in writing.

1. For PAA and GWA, factory-authorized service representative may be local, non-US citizen.
2. For CAA, factory-authorized service representative shall be US citizen. Cleared escort may be required.

B. Perform the following field tests and inspections:

1. Continuity tests of circuits.
2. Operational Test: Set and operate controls to demonstrate their functions and capabilities in a methodical sequence that cues and reproduces actual operating functions.

    a. Include testing of dimming control equipment under conditions that simulate actual operational conditions. Record control settings, operations, cues, and functional observations.

3. Emergency Power Transfer: Test listed functions.

C. Remove and replace malfunctioning dimming control components and retest as specified above.

D. Additional testing and inspecting, at Contractor's expense, may be performed to determine compliance of replaced or additional work with specified requirements.

E. Verify normal operation of each luminaire after installation. Verify normal operation of each lighting channel as designed for Project in Specs and Drawings.

F. Test Labeling: After satisfactory completion of tests and inspections, apply label to tested components indicating test results, date, and responsible agency and representative.

3.5 SYSTEM STARTUP

A. Provide services of manufacturer's certified field service engineer to perform system startup.

B. Manufacturer to conduct a minimum of three site visits to ensure proper system installation and operation.

1. Pre-Installation Visit: Review requirements with installer, including system wiring
2. System Startup: Once lighting control system is installed, manufacturer to perform system startup and verify proper system operation, including:

    a. Verify connection of power wiring, load circuits, and location of controls.
    b. Energize lighting management hubs and install lighting management software.
    c. Address all system devices.
    d. Verify system operation control by control.
    e. Configure fixture groupings for wall controls, daylight sensors, and occupancy sensors.
    f. Provide initial rough calibration of sensors
    g. Obtain sign-off on system functions.

3. System Training: Train OBO Rep on system capabilities, operation, and maintenance. See "DEMONSTRATION" for more details.

C. Include costs for lighting control system manufacturer to visit site at six months and 12 months after system startup to fine-tune sensors and evaluate system usage to make efficiency improvements that will fit with the current use of the facility.

3.6 DEMONSTRATION

A. Engage factory-authorized service representative to train Government maintenance personnel on dimming controls.

1. Provide minimum of one two-hour classroom session and one four-hour demonstration.
2. Use operation and maintenance manual as training reference, supplemented with additional training materials as required. Refer to Division 01 Section "Closeout Procedures."
3. Topics: Start-up, normal operation, shutdown, unoccupied operation, seasonal changeover, manual operation, controls set-up, and programming, and alarms for maintaining lighting control system in coordination with lighting, sensors, and shading device instrumentation and controls. Review control drawings and schematics, and interactions with other systems.

END OF SECTION 260934

SECTION 261214 - MEDIUM-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following types of transformers with medium-voltage primaries rated from 601 V up to 35 kV:

1. Dry-type distribution and power transformers.
2. Pad-mounted, liquid-filled transformers.

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete.”
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety,” including for electrical safety accessories.
3. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
4. Section 260525 “Grounding and Bonding for Electrical Systems.”
5. Division 26 Section on Identification for Electrical Systems.”
6. **[Division 26 Section on “Vibration and Seismic Controls for Electrical Systems.”]**
7. Section 260573 “Overcurrent Protective Device Coordination Study.

1.2 DEFINITIONS

A. NETA ATS: Acceptance Testing Specification.

1.3 SUBMITTALS

A. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, location of each field connection, and performance for each type and size of transformer indicated.

B. Shop Drawings: Diagram power signal and control wiring.

C. Coordination Drawings: Floor plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Underground primary and secondary conduit stub-up location.
2. Dimensioned concrete base, outline of transformer, and required clearances.
3. Ground rod and grounding cable locations.

D. Qualification Data: For testing agency.

E. Field quality-control test reports including Power-Factor Tests, Insulation Resistance Tests, and Insulation Power Factor (Doble) Tests. Final test reports shall be provided to the Project Director/COR for forwarding to OBO/PDCS/DE/EE for approval, and to OBO/CFSM/FAC for inclusion in the Maintenance Database. Refer to Article on FIELD QUALITY CONTROL. Identify the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Test results that do not comply with requirements and corrective actions taken to achieve compliance with requirements.

F. Certifications:

1. PCBs in Oil-Filled Units: As applicable, certification that, in accordance with OBO Building Code Section 414, the oil contains no PCBs; see Article on QUALIFICATION TESTING.
2. Certification of compliance with NETA ATS, Section 7.2 test parameters; see Article on FIELD QUALITY CONTROL.

G. Follow-up service reports in accordance with Article on FOLLOW-UP SERVICE.

1. Record of Infrared Scanning: Prepare certified report that identifies switchgear checked and that describes infrared-scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

H. Operation and Maintenance Data: For transformer and accessories to include in emergency, operation, and maintenance manuals.

1. Include safety Standard Operating Procedures (SOP), including de-energization and isolation procedures.

1.4 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA) or that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or the National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Comply with ANSI C57.12.28, IEEE C57.12.10, IEEE C57.12.70, and IEEE C57.12.80.

C. Comply with requirements of the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project

Director/COR based upon input from OBO/PDCS/DE/EE, and marked for the intended use.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store transformers protected from weather so condensation will not form on or in units. Provide temporary heating according to manufacturer's written instructions.

1.6 PROJECT CONDITIONS

A. Service Conditions: IEEE C37.121, usual service conditions except for the following:

1. Altitudes above 1000 m.
2. Exposure to fumes, vapors, or dust.
3. Exposure to hot and humid climate or to excessive moisture, including steam, salt spray, and dripping water.
4. Exposure to seismic shock or to abnormal vibration, shock, or tilting.
5. Exposure to excessively high or low temperatures.
6. Unusual transportation or storage conditions.
7. Unusual grounding-resistance conditions.

B. Lightning and Surge Protection:

1. Main transformers serving compound buildings shall have distribution class lightning arresters on primary side, and surge protectors on secondary side of transformer.
2. Provide surge protection at service entrance to each building.

1.7 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000 “Cast-in-Place Concrete.”

B. Coordinate installation of louvers, doors, spill retention areas, and sumps. Coordinate installation so no piping or conduits are installed in space allocated for medium-voltage transformers except those directly associated with transformers.

1.8 QUALIFICATION TESTING

A. Expand transformer manufacturer’s standard tests to include; insulation power factor (Doble) tests, insulation oil tests, and dielectric tests. For oil-filled units manufacturer shall certify that, in accordance with OBO Building Code Section 414, oil contains no PCBs, and shall affix label to that effect on transformer tank and on each oil drum containing insulating oil.

B. Added oil condition (acidity, water, power factor, dissolved gas, and dielectric), and insulation power factor test (Doble Test). Maximum acceptable insulation power factor test value is five percent. Tests shall be conducted in accordance with IEEE C57.12.90, IEEE Std. 62, ASTM D 3612, and ASTM D 3487. Manufacturer shall certify that insulating oil contains no PCBs, and shall affix label to that effect on transformer tank, and on each oil drum containing insulating oil.

PART 2 - PRODUCTS

2.1 PAD-MOUNTED, LIQUID-FILLED TRANSFORMERS

A. Description: ANSI C57.12.13, IEEE C57.12.00, IEEE C57.12.22 IEEE C57.12.26, pad-mounted, 2-winding transformers. Stainless-steel tank base and cabinet.

B. Insulating Liquid: Mineral oil, complying with ASTM D 3487, Type II, and tested according to ASTM D 117; or less- flammable type, fire-resistant biodegradable seed oil (Envirotemp FR3 or equal).

C. Insulation Temperature Rise: 80 deg C when operated at rated kVA output in 40 deg C ambient temperature. Transformer shall be rated to operate at rated kilovolt ampere in average ambient temperature of 30 deg C over 24 hours with maximum ambient temperature of 40 deg C, without loss of service life expectancy.

D. Basic Impulse Level: 95 kV.

E. Full-Capacity Voltage Taps: Four 2.5 percent taps, two above and two below rated medium-voltage; with externally operable tap changer for de-energized use and with position indicator and padlock hasp.

F. Medium-Voltage Switch: Make-and-latch rating based on calculated short circuit available, symmetrical, arranged for radial feed with 3-phase, 2-position, gang-operated, load-break switch that is oil immersed in transformer tank with hook-stick operating handle in primary compartment.

G. Primary Fuses: Fuse assembly with fuses complying with IEEE C37.47. Rating of current-limiting fuses shall be 50-kA RMS at specified system voltage.

1. Current-limiting type in dry-fuse holder wells, mechanically interlocked with liquid-immersed switch in transformer tank to prevent disconnect under load.
2. Internal liquid-immersed cartridge fuses.
3. Bay-O-Net liquid-immersed fuses which are externally replaceable without opening transformer tank.
4. Bay-O-Net liquid-immersed fuses in series with liquid-immersed current-limiting fuses. Bay-O-Net fuses shall be externally replaceable without opening transformer tank.
5. Bay-O-Net liquid-immersed current-limiting fuses which are externally replaceable without opening transformer tank.

H. Surge Arresters: Distribution class, one for each primary phase; complying with IEEE C62.11 and NEMA LA 1; support from tank wall within medium-voltage compartment. Transformers shall have three arresters for radial-feed circuits.

I. Medium-Voltage Terminations and Equipment: Live front with externally clamped porcelain bushings and cable connectors suitable for terminating primary cable.

J. Medium-Voltage Terminations and Equipment: Dead front with universal-type bushing wells for dead-front bushing-well inserts, complying with IEEE 386 and including the following:

1. Bushing-Well Inserts: One for each medium-voltage bushing well.

2. Surge Arresters: Dead-front, elbow-type, metal-oxide-varistor units.
3. Parking Stands: One for each medium-voltage bushing well.
4. Portable Insulated Bushings: Arranged for parking insulated, medium-voltage, load-break cable terminators; one for each primary feeder conductor terminating at transformer.

K. Accessories:

1. Drain Valve 25 mm, with sampling device.
2. Dial-type thermometer.
3. Liquid-level gage.
4. Pressure-vacuum gage.
5. Pressure Relief Device: Self-sealing with an indicator.
6. Mounting provisions for low-voltage current transformers.
7. Mounting provisions for low-voltage potential transformers.

8. Busway terminal connection at low-voltage compartment.
9. Alarm contacts for gages and thermometer listed above.

L. Size transformer according to that indicated on Drawings or size calculations in accordance with OBO Electrical Code Chapter 2. If size must be adjusted to accommodate load different from that in calculations, provide 20 percent spare capacity over actual demand. Include provisions for future addition of fans to extend capacity 20 percent beyond self-cooled OA rating for future growth.

M. Include provisions for future addition of fans to extend capacity 20 percent beyond self-cooled OA rating for future growth.

N. Transformer impedance should be selected to limit fault current to 65kA.

2.2 IDENTIFICATION DEVICES

A. Nameplates: Engraved, laminated-plastic or metal nameplate for each transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 26 Section on "Identification for Electrical Systems."

2.3 SOURCE QUALITY CONTROL

A. Factory Tests:

1. General: Perform design and routine tests according to standards specified for components. Conduct transformer tests according to ANSI and IEEE Standards.
2. Perform the following factory-certified tests on each transformer:

   a. Resistance measurements of all windings on rated-voltage connection and on tap extreme connections.
   b. Ratios on rated-voltage connection and on tap extreme connections.
   c. Polarity and phase relation on rated-voltage connection.
   d. No-load loss at rated voltage on rated-voltage connection.
   e. Excitation current at rated voltage on rated-voltage connection.
   f. Impedance and load loss at rated current on rated-voltage connection and on tap extreme connections.
   g. Applied potential.
   h. Induced potential.

   i. Temperature Test: If transformer is supplied with auxiliary cooling equipment to provide more than one rating, test at lowest kilovolt-ampere Class OA or Class AA rating and highest kilovolt-ampere Class OA/FA or Class AA/FA rating.

      1) Temperature test is not required if record of temperature test on an essentially duplicate unit is available.

   j. The Government, at its option, may witness all required factory tests. Notify Project Director/COR at least 14 days before date of tests and indicate their approximate duration.

2.4 COILS

A. For transformers to be installed in high fault current areas, aluminum and sheet windings should be avoided.

2.5 INSULATING OIL

A. Neutralization Number shall not be greater than 0.03 gm KOH/ml when measured in accordance with ASTM D 974. Emulsified water shall not exceed 25ppm at 20 deg C. When measured in accordance with ASTM D 1553. Power factor shall not exceed 0.5 percent at 20 deg C when measured in accordance with ASTM D 924.

2.6 AVR AND MEDIUM VOLTAGE TRANSFORMERS

A. AVR and Medium Voltage Transformer Configurations: Without exception, all medium voltage automatic voltage regulators shall be delta connected. Without exception, all medium voltage transformers shall have delta connected primaries and wye connected secondaries.

2.7 PAINTING

A. For all outdoor applications and all indoor applications in harsh environment refer to Division 09 Section on “High Performance Coatings.” After fabrication, all exposed ferrous metal surfaces of transformer and component equipment shall be cleaned and painted.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions for compliance with requirements for medium-voltage transformers.

B. Examine roughing-in of conduits and grounding systems to verify the following:

1. Wiring entries comply with layout requirements.
2. Entries are within conduit-entry tolerances specified by manufacturer and no feeders will have to cross section barriers to reach load or line lugs.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and that requirements in Section 260525 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 10 ohms at location of transformer.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install transformers on concrete bases.

1. Anchor transformers to concrete bases according to manufacturer's written instructions, seismic codes at Project, and requirements in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."
2. Construct concrete bases of dimensions indicated, but not less than 100 mm larger in both directions and 100 mm high.
3. Use 20.7-MPa , 28-day compressive-strength concrete and reinforcement as specified in Section 033000 "Cast-in-Place Concrete."

4. Install dowel rods to connect concrete bases to concrete floor. Unless otherwise indicated, install dowel rods on 450-mm centers around full perimeter of base.
5. Install epoxy-coated anchor bolts, for supported equipment, that extend through concrete base and anchor into structural concrete floor.
6. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
7. Tack-weld or bolt transformers to channel-iron sills embedded in concrete bases. Install sills level and grout flush with floor or base.

B. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and the OBO Electrical Code.

3.3 IDENTIFICATION

A. Identify field-installed wiring and components and provide warning signs as specified in Division 26 Section on "Identification for Electrical Systems."

3.4 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

3.5 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections:

1. After installing transformers but before primary is energized, verify that grounding system at substation is tested at specified value or less.
2. After installing transformers and after electrical circuitry has been energized, test for compliance with requirements.
3. Perform electrical test and visual and mechanical inspection stated in NETA ATS, Section 7.2.
4. Test and adjust controls and safeties.

B. Upon satisfactory completion of insulation resistance test, perform insulation power factor test and an excitation test on transformer windings. Added oil tests to be performed after electrical tests of the transformer. Transformer shall not be energized until recorded test data have been approved by Project Director/COR.

1. Power Factor Testing: For transformer rated under 100KVA and less than 4160 volts on both primary and secondaries, power factor testing is optional acceptance test. Transformers shall be tested in accordance with IEEE Std 62.

2. Dielectric Testing: Liquid filled transformers shall have insulating liquid dielectrically tested after installation and before being energized. Insulating liquid shall be tested in accordance with ASTM D 877, and breakdown voltage shall not be less than 2, 5, or 8,000 volts as specified.
3. Power Factor Tests: Liquid filled transformers shall have oil power factored at 20 deg C, per ASTM D 924 prior to being energized. Results shall not be greater than 0.5 percent at 20 deg C.
4. Insulation Resistance Tests: Additional industry test specifications.
5. Insulation Power Factor (Double) Tests: Perform insulation power factor test and winding excitation test on transformer windings in accordance with ANSI IEEE C57.12.90. Insulation power factor shall not exceed 0.5 percent for new liquid filled units. New dry type units with power factors up to five percent are still be acceptable.

C. Remove malfunctioning units, replace with new units, and retest as specified above.

D. Acceptance: Final test reports shall be provided to Project Director/COR for forwarding to OBO/CFSM/FAC for inclusion in Maintenance Database.

E. Prepare test reports.

3.6 FOLLOW-UP SERVICE

A. Voltage Monitoring and Adjusting: If requested by Government, perform the following voltage monitoring after Substantial Completion but not more than six months after Final Acceptance:

1. During period of normal load cycles as evaluated by Government, perform seven days of three-phase voltage recording at secondary terminals of each transformer. Use voltmeters with calibration traceable to National Institute of Science and Technology (NIST) standards, and with chart speed of not less than 25 mm per hour. Voltage unbalance greater than one percent between phases, or deviation of any phase voltage from nominal value by more than plus or minus five percent during test period, is unacceptable.
2. Corrective Actions: If test results are unacceptable, perform the following corrective actions, as appropriate:

   a. Adjust transformer taps.
   b. Prepare written request for voltage adjustment by electric utility.

3. Retests: After corrective actions have been performed, repeat monitoring until satisfactory results are obtained.
4. Report: Prepare written report covering monitoring and corrective actions performed.

B. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform infrared scan of each switchgear. Remove front and rear panels so joints and connections are accessible to portable scanner.

1. Follow-up Infrared Scanning: Perform additional follow-up infrared scan of each switchgear 11 months after date of Substantial Completion.

2. Instrument: Use infrared-scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

3.7 DEMONSTRATION AND TRAINING

A. Coordinate with Project Director/COR and post Facility Manger to identify staff, including locally employed staff (LES) maintenance personnel, who may access transformer.

B. Train Government maintenance personnel in the following:

1. Coordinate training with training for other related equipment.
2. Training Topics:

a. Standard Operating Procedures (SOP) described in O&M Data Manual
b. Review data in manufacturer's maintenance manuals, including interface with written SOP.
c. Review safety precautions and use of medium-voltage safety accessories with requirements in Section 260508 "Common Work Results for Electrical, Communications, and Electronic Safety" and Section 260573 "Overcurrent Protective Device Coordination Study."
d. De-energizing procedures to safely de-energize, isolate and lock-out transformers prior to any maintenance or repair work.
e. Features and construction of project equipment.
f. Routine testing and monitoring operations.
g. Interpretation of readings of indicating and alarm devices.
h. Routine inspection procedures.
i. Access control panel to maintain operations log in accordance with procedures of OBO/CFSM/FAC.
j. Removal and replacement of control panel or components.
k. Cleaning of connections and conductors on basis identified by OBO/CFSM/FAC considering input from manufacturer.

C. Schedule training with Project Director/COR with at least seven days' advance notice.

END OF SECTION 261214

SECTION 262214 - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1000 kVA:

1. Distribution transformers.
2. Buck-boost transformers.
3. Control and signal transformers.

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete.”
2. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
3. Section 260525 “Grounding and Bonding for Electrical Systems.”
4. **[Division 26 Section on “Vibration and Seismic Controls for Electrical Systems.”]**

1.2 SUBMITTALS

A. Product Data Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.

B. Shop Drawings: Wiring and connection diagrams.

C. Source quality-control test reports.

D. Output Settings Reports: Record of tap adjustments specified in Article on ADJUSTING.

1.3 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for the intended use.

B. Comply with IEEE C 57.12.91.

C. Energy-Efficiency:

1. Comply with 10 CFR 431 (DOE 2016) efficiency levels.
2. Marked as compliant with DOE 2016 efficiency levels by an NRTL

1.4 DELIVERY, STORAGE, AND HANDLING

A. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000 “Cast-in-Place Concrete.”

B. Coordinate installation of wall-mounting and structure-hanging supports.

C. Lightning and Surge Protection:

1. Main transformers serving the Post buildings shall have distribution class lightning arresters on the primary side and surge protectors on the secondary side of the transformer.
2. Provide surge protection at the service entrance to each building.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Source Limitations: Obtain each transformer type from single source from single manufacturer.

B. Description: Factory-assembled and -tested, air-cooled units for 50 or 60-Hz service.

C. Cores: Grain-oriented, non-aging silicon steel.

D. Coils: Continuous windings without splices, except for taps.

1. Internal Coil Connections: Brazed or pressure type.
2. Coil Material: Copper.

2.2 TRANSFORMERS, GENERAL

A. Transformers: Provide a minimum of 20 percent spare capacity above demand load without requiring fan cooling.

B. Utility (Service) Transformers: Provide either oil filled or encapsulated dry type pad mounted outdoor type incoming commercial service transformers. Prove the transformer with a delta connected primary and a grounded wye connected secondary. The transformer shall be capable of being easily replaced or repaired by the local utility company. Provide encapsulated dry type transformers where there are known problems with PCB contamination in locally available mineral oil.

2.3 DISTRIBUTION TRANSFORMERS

A. Distribution Transformers: Locate distribution transformers adjacent to their associated panel and be sized with 20 percent reserve capacity. Transformers shall be specified with two 2.5 percent FCAN (full capacity above normal) and two 2.5 percent FCBN (full capacity below normal) taps. The transformers shall be indoor, dry, heavy-duty type in NEMA-1 enclosures unless otherwise required. Transformers serving loads with high harmonic content (non-linear loads) shall be K-factor rated to compensate for these effects.

B. Comply with NEMA ST 20, and list and label as complying with UL 1561.

C. [Provide transformers that are internally braced to withstand seismic forces specified in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."]

D. Cores: Electrical grade, non-aging silicon steel with high permeability and low hysteresis losses: One leg per phase.

E. Coils: Continuous windings without splices except for taps.

1. Coil Material: Copper.
2. Internal Coil Connections: Brazed or pressure type.
3. Terminal Connections: Welded.

F. Enclosure:

1. NEMA 250, Type 2: Core and coil shall be encapsulated within resin compound to seal out moisture and air.
2. KVA Ratings: Based on convection cooling only and not relying on auxiliary fans. Wiring Compartment: Sized for conduit entry and wiring installation.
3. Finish: Comply with NEMA 250.

G. Wiring Compartment: Sized for conduit entry and wiring installation.

H. Encapsulation: Transformers smaller than 30 kVA shall have core and coils completely resin encapsulated.

I. Indoor Transformer Enclosure Finish: Comply with NEMA 250 for “Indoor Corrosion Protection.”

1. Finish Color: ANSI 61 gray.

J. Insulation Class: 220 deg C, UL-component-recognized insulation system with a maximum of 150 deg C rise above 50 deg C ambient temperature.

K. Taps for Transformers:

1. Transformers Smaller than 3 kVA: One 5 percent tap above normal full capacity.
2. Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity voltage.
3. Transformers 25 kVA and Larger: Two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.

L. Grounding: Provide ground-bar kit or a ground bar installed on the inside of the transformer enclosure.

M. K-Factor Rating: Transformers indicated to be K-factor rated shall comply with UL 1561 requirements for nonsinusoidal load current-handling capability to the degree defined by designated K-factor.

1. Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor.
2. Indicate value of K-factor on transformer nameplate.
3. Neutral: Rated 200 percent of full load current for K-factor-rated transformers.
4. All power and lighting transformers located in office spaces shall be K-13 rated.

N. Electrostatic Shielding: Each winding shall have an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.

1. Arrange coil leads and terminal strips to minimize capacitive coupling between input and output terminals.
2. Include special terminal for grounding the shield.
3. Shield Effectiveness:

a. Capacitance between Primary and Secondary Windings: Not to exceed 33 picofarads over a frequency range of 20 Hz to 1 MHz.
b. Common-Mode Noise Attenuation: Minus 120 dBA minimum at 0.5 to 1.5 kHz; minus 65 dBA minimum at 1.5 to 100 kHz.
c. Normal-Mode Noise Attenuation: Minus 52 dBA minimum at 1.5 to 10 kHz.

O. Wall Brackets: Manufacturer's standard brackets.

P. [Fungus Proofing: Permanent fungicidal treatment for coil and core.]

Q. Low-Sound-Level Requirements: Maximum sound levels, when factory tested according to IEEE C57.12.91, as follows:

1. 9.00 kVA and Less: **[40] <Insert value>** dBA.
2. 9.01 to 30.00 kVA: **[45] <Insert value>** dBA.
3. 30.01 to 50.00 kVA: **[45 dBA for K-factors of 1, 4, and 9] [48 dBA for K-factors of 13 and 20] <Insert dBA>**.

4. 50.01 to 150.00 kVA: **[50 dBA for K-factors of 1, 4, and 9] [53 dBA for K-factors of 13 and 20] <Insert dBA>**.
5. 150.01 to 300.00 kVA: **[55 dBA for K-factors of 1, 4, and 9]** dBA.

2.4 BUCK-BOOST TRANSFORMERS

A. Description: Self-cooled, two-winding dry type, rated for continuous duty and with wiring terminals suitable for connection as autotransformer. Transformers shall comply with NEMA ST 20 and shall be listed and labeled as complying with UL 506 or UL 1561.

B. Enclosure: Ventilated, NEMA 250, Type 2.

1. Finish Color: ANSI 61 gray.

2.5 CONTROL AND SIGNAL TRANSFORMERS

A. Description: Self-cooled, two-winding dry type, rated for continuous duty, complying with NEMA ST 20, and listed and labeled as complying with UL 506.

B. Ratings: Continuous duty. If rating is not indicated, provide at least 50 percent spare capacity above connected peak load.

2.6 SOURCE QUALITY CONTROL

A. Test and inspect transformers according to IEEE C57.12.01 and IEEE C57.12.91.

1. Resistance measurements of all windings at rated voltage connections and at all tap connections.
2. Ratio tests at rated voltage connections and at all tap connections.
3. Phase relation and polarity tests at rated voltage connections.
4. No load losses, and excitation current and rated voltage at rated voltage connections.
5. Impedance and load losses at rated current and rated frequency at rated voltage connections.
6. Applied and induced tensile tests.
7. Regulation and efficiency at rated load and voltage.
8. Insulation-Resistance Tests:

   a. High-voltage to ground.
   b. Low-voltage to ground.
   c. High-voltage to low-voltage.

9. Temperature tests.

B. Factory Sound-Level Tests: Conduct sound-level tests on equipment for this Project.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.

C. Examine walls and floors for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Section 260526 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer.

1. [Brace wall-mounting transformers as specified in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."]

B. Install floor-mounting transformers level on concrete bases. Construct concrete bases of dimensions indicated, but not less than 100 mm larger in both directions than supported unit and 100 mm high.

1. [Anchor transformers to concrete bases according to manufacturer's written instructions, seismic codes at Project, and requirements in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."]

C. Secure transformer to concrete base according to manufacturer's written instructions.

D. Secure covers to enclosure and tighten all bolts to manufacturer-recommended torques to reduce noise generation.

E. Remove shipping bolts, blocking, and wedges.

3.3 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

D. Provide flexible connections at all conduit and conductor terminations and supports to eliminate sound and vibration transmission to the building structure

3.4 ADJUSTING

A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 5 percent. Submit recording and tap settings as test results.

B. Adjust buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5 percent, at secondary terminals.

C. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.5 CLEANING

A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION 262214

SECTION 262300 – LOW-VOLTAGE SWITCHGEAR

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes metal-enclosed, low-voltage, power circuit-breaker switchgear rated 1000 V and less for use in AC systems.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communication and Electronic Safety” for facility voltages and safety accessories.
2. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
3. Section 260525 “Grounding and Bonding for Electrical Systems.”
4. **[Division 26 Section on vibration and seismic controls for electrical systems for mounting and anchoring switchgear.]**
5. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash study, ARMS reduction level or alternative means of compliance for worker safety, and arc flash training.
6. Section 260915 "Electrical Power Monitoring" for interfacing communication and metering requirements.
7. Section 262313 "Paralleling Switchgear".
8. Section 262325 "Power Sequence of Operations.”
9. Section 262412 “Switchboards.”
10. Division 26 Section on fuses for fuses and spare-fuse cabinets.

1.2 SUBMITTALS

A. Product Data: For each type of switchgear, circuit breaker, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each type of switchgear and related equipment.

1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Include the following:

   a. Tabulation of installed devices with features and ratings.
   b. Enclosure types and details.
   c. Outline and general arrangement drawing showing dimensions, shipping sections, and weights of each assembled section.
   d. Bus configuration with size and number of conductors in each bus run, including phase, neutral, and ground conductors of main and branch buses.
   e. Current rating of buses.
   f. Short-time and short-circuit current rating of switchgear assembly.

g. Nameplate legends.
h. Mimic-bus diagram.
i. Utility company's metering provisions with indication of approval by utility company.
j. Arc flash reduction switch.
k. Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

2. Wiring Diagrams: Power, signal, and control wiring.

C. Coordination Drawings: Floor plans showing dimensioned layout, required working clearances, and required area above and around switchgear where pipe and ducts are prohibited. Show switchgear layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.

D. Samples: Representative portion of mimic bus with specified finish. Manufacturer's color charts showing colors available for mimic bus.

E. Field quality-control test reports.

F. Certificates of Compliance: Manufacturer of switchgear shall certify compliance with referenced standards.

G. Qualification data for firms and persons as required in the Part 1 Article on QUALITY ASSURANCE.

1. Testing Agency:
2. Support Services Vendor: Identify vendor firm name and contact, location, distance from project, number of years servicing product line.

H. Updated mimic-bus diagram reflecting field changes after final switchgear load connections have been made, for record.

I. Operation and Maintenance Data: For switchgear and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
2. Time-current curves, including selectable ranges for each type of overcurrent protective device.

1.3 OWNERSHIP OF PROPRIETARY MATERIAL

A. Government shall retain all rights to software and passwords used for this project.

B. The Government will sign copy of manufacturer’s standard software and firmware licensing agreement as condition of this contract. Such license shall grant use of all programs and

application software to the Government as defined by manufacturer's license agreement, while protecting manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. Licensing agreement shall not preclude use of software by individuals under contract to Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to the Government will be restricted to use on Government's computers, and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation shall become property of Government.

1.4 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Source Limitations: Obtain switchgear through one source from single manufacturer.

C. [Basis of Design: Drawings indicate size, profiles, and dimensional requirements of switchgear and are based on specific system indicated. Other manufacturers' products complying with requirements may be considered.]

D. Comply with the OBO Electrical Code (NFPA 70 "National Electrical Code as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

E. Industry Standards: In addition to standards identified elsewhere in this Section, conform to the following:

1. Institute of Electrical and Electronics Engineers (ANSI/IEEE):

a. C37.13 Standard for Low-Voltage AC Power Circuit breakers Used in Enclosures."
b. C37.16 "Switchgear - Low-Voltage Power Circuit Breakers and AC Power Circuit Protectors - Preferred Ratings, Related Requirements, and Application Recommendations."
c. C37.50 "Test Procedures of Low-Voltage AC Power Circuit Breakers Used in Enclosures."
d. C37.51 "Conformance Test Procedures of Metal-Enclosed Low-Voltage AC Power Circuit Breaker Switchgear Assemblies."
e. C57.13 "Standard Requirements for Instrument Transformers."

f. C62.22 "Guide for the Application of Metal-Oxide Surge Arrestors for Alternating-Current Systems)."

2. National Electrical Manufacturers Association (NEMA):

a. SG3 Low Voltage Power Circuit Breakers.
b. SG5 Power Switchgear Assemblies.

3. Underwriters Laboratories, Inc. (UL):

a. 1558 "Metal Enclosed Low-Voltage Power Circuit Breaker Switchgear."

F. Certification: Manufacturer of switchgear shall certify compliance with standards referenced in this Article.

G. Support Service Capability: Manufacturer approved support services Vendor to commission switchgear, and available to provide ongoing maintenance services. Vendor shall be approved by manufacturer. Vendor shall be located within 1500 km (1000 miles) of project site. Vendor shall have performed these services on this product line for at least five years.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver switchgear in sections of lengths that can be moved past obstructions in delivery path.

B. Storage: Store in one of the following manners:

1. Store switchgear indoors in clean dry space with uniform temperature to prevent condensation. Protect switchgear from exposure to dirt, fumes, water, corrosive substances, and physical damage.
2. If stored in areas subjected to weather, cover switchgear to provide protection from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside switchgear; install electric heating (250 W per section) to prevent condensation.

1.6 PROJECT CONDITIONS

A. [Installation Pathway: For renovation and system upgrade projects, remove and replace building components and structures to provide pathway for moving switchgear into place.]

B. [Existing Utilities: Do not interrupt utilities serving facilities occupied by the Government or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Project Director/COR not less than seven days in advance of proposed utility interruptions. Identify extent and duration of utility interruptions.
2. Indicate method of providing temporary utilities.

3. **Do not proceed with utility interruptions without Project Director/COR's written permission.]**

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchgear, including clearances between switchgear, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

D. Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:

1. Ambient Temperature: Not exceeding **[40][50][60]** deg C.
2. Altitude: Derate as required if over **<insert altitude>** above sea level.

1.7 COORDINATION

A. Coordinate layout and installation of switchgear and components with other construction that penetrates ceilings or is supported by them, including conduit, piping, equipment, and adjacent surfaces. Maintain required clearances for workspace and equipment access doors and panels.

B. Coordinate size and location of concrete bases.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Six of each type and rating used. Include spares for potential transformer fuses, control power fuses, and fuses and fusible devices for fused circuit breakers.
2. Indicating Lights: Six of each type installed.
3. Touchup Paint: Three containers of paint matching enclosure finish, each 250 mL.

PART 2 - PRODUCTS

2.1 RATINGS

A. Nominal System Voltage: Site Distribution Voltage.

B. Main-Bus Continuous: **[4000] [xxx]** A, or as indicated on Drawings.

C. Short-Time and Short-Circuit Current: Match rating of highest-rated circuit breaker in switchgear assembly.

2.2 SWITCHGEAR FEEDERS

A. Circuit breakers shall be a minimum of 800-ampere frame.

B. Breakers/feeders with trip ratings at or under 800 ampere shall be switchboard construction. See Section 262412 “Switchboards.”

2.3 FABRICATION

A. Factory assembled and tested and complying with IEEE C37.20.1 “Metal Enclosed Low-Voltage Power Circuit-Breaker Switchgear.”

B. Indoor Enclosure Material: Steel.

C. Finish: Manufacturer's standard gray finish over rust-inhibiting primer on phosphatizing-treated metal surfaces, complying with IEEE C37.20.1.

D. Extend section barriers between main and tie circuit-breaker compartments to rear of section.

E. Arrange bus isolation barriers to isolate line bus from load bus at each main and tie circuit breaker.

F. Equip circuit-breaker compartments to house drawout-type circuit breakers, and fit with hinged outer doors.

G. Fabricate enclosure with removable, hinged, rear cover panels, secured by captive thumbscrews, to allow access to rear interior of switchgear.

H. Auxiliary Compartments: Match and align with basic switchgear assembly. Include the following:

1. Utility metering compartment that complies with utility company requirements.
2. Bus transition sections.
3. **[Incoming-line pull sections.]**
4. Hinged front panels for access to metering, accessory, and blank compartments.
5. Pull box on top of switchgear for extra room for pulling cable, with removable top, front, and side covers and ventilation provisions adequate to maintain air temperature in pull box within same limits as switchgear.

    a. Set pull box back from front to clear circuit-breaker lifting mechanism.
    b. Bottom: Insulating, fire-resistant material with separate holes for cable drops into switchgear.
    c. Cable Supports: Arranged to ease cabling and adequate to support cables indicated, including those for future installation.

I. Provide bus bars between vertical sections and between compartments. Cable connections are not permitted.

1. Main Phase Bus: Fully rated entire length of assembly; do not taper.

2. Neutral Bus: 100 percent of phase-bus ampacity. Equip bus with pressure-connector terminations for outgoing circuit neutral conductors.
3. Vertical Section Bus Size: Comply with IEEE C37.20.1, including allowance for spare circuit breakers and spaces for future circuit breakers.
4. Phase-and Neutral-Bus Material: Hard-drawn copper of 98 percent minimum conductivity, with copper feeder circuit-breaker line connections.
5. Use copper for connecting circuit-breaker line to copper bus.
6. Contact Surfaces of Buses: Silver plated.
7. Feeder Circuit-Breaker Load Terminals: Silver-plated copper bus extensions equipped with pressure connectors for outgoing circuit conductors.
8. Ground Bus: Hard-drawn copper of 98 percent minimum conductivity, with pressure connector for feeder and branch-circuit ground conductors, minimum size 6 mm by 50 mm. Extend entire length of the switchgear.
9. Supports and Bracing for Buses: Adequate strength for indicated short-circuit currents.
10. Neutral bus equipped with pressure-connector terminations for outgoing circuit neutral conductors.
11. Neutral Disconnect Link: Bolted, uninsulated, 6 mm by 50 mm copper bus, arranged to connect neutral bus to ground bus, if required.
12. Facilitate future extensions from either end of main-phase-neutral and ground bus by providing predrilled bolt-holes and connecting links.
13. Bus-Bar Insulation: Individual bus bars wrapped with factory-applied, flame-retardant tape, or vertical and horizontal busses shall be isolated from cable compartments by glass reinforced polyester barriers.
14. Size busbars to limit temperature rise to 65 deg C above 40 deg C ambient temperature, but shall not exceed 155 amperes per square centimeter.
15. Brace busbars contained in each section to withstand mechanical forces exerted during short circuit conditions. Minimum short circuit bracing shall be 65,000 amperes RMS symmetrical at rated voltage.
16. Completely isolate/insulate entire switchgear bus system with insulated nut covers or grounded metal barriers to preclude accidental contact with live busbars while working in outgoing power cable compartment. Only exposed energized parts in rear power cable compartment shall be outgoing feeder connections.
17. A-B-C type bus arrangement, left-to-right, top-to-bottom, and front-to-rear, as viewed from the front, shall be used throughout. Mount main horizontal bus bars, with all three phases arranged in same vertical plane. Provide full capacity neutral.
18. Identify busbars in each cubicle, both line and load, with adhesive red letters applied to busbar. This identification shall be in each cubicle, as seen from rear cable compartment for all phases, neutral and ground busses in accordance with A-B-C type bus arrangement defined above.
19. Busbar supports shall be non-carbonizing, non-tracking insulators arranged to provide short circuit bracing of 65,000 amperes symmetrical at rated voltage, three-phase.
20. Provide fire-resistive supports to which cable shall be adequately secured and racked within rear compartment.
21. Segregate buses in separate compartment from breaker and feeder cable compartment.
22. Provide main breaker section with vertical barriers between sections extending all the way to rear.
23. Provide main circuit breaker with horizontal isolation barrier or combination of barriers to completely separate bus line from load bus.

24. Provide black vinyl plastic "mimic bus" on front of switchgear depicting current distribution (flow) through each circuit protective device. Secure bus to switchgear enclosure using screws and nuts.
25. From terminals on load side of breaker compartment, extend insulated bus toward back of board to vertical wiring compartment to avoid cables threaded through line bus bars.

J. Fabricate switchgear with ability to remove access covers to facilitate maintenance activities. Facilitate access to inspect device while circuits are energized (e.g., using infrared imaging). Minimum distances to energized circuits shall comply with OSHA standard in CFR 29, Part 1910.333.

2.4 COMPONENTS

A. Instrument Transformers:

1. Potential Transformers: Secondary-voltage rating of 120 V and NEMA accuracy class of
2. 0.3 with burdens of W, X, and Y.
3. Current Transformers: Ratios as indicated; burden and accuracy class suitable for connected relays, meters, and instruments.

B. [Multifunction Digital-Metering Monitor: UL-listed or -recognized, microprocessor-based unit suitable for three- or four-wire systems and with the following features:

1. Inputs from sensors or 5-A current-transformer secondaries, and potential terminals rated to 600 V.
2. Switch-selectable digital display of the following:

a. Phase Currents, Each Phase: Plus-or-minus 1 percent.
b. Phase-to-Phase Voltages, Three-Phase: Plus-or-minus 1 percent.
c. Phase-to-Neutral Voltages, Three-Phase: Plus-or-minus 1 percent.
d. Three-Phase Real Power: Plus-or-minus 2 percent.
e. Three-Phase Reactive Power: Plus-or-minus 2 percent.
f. Power Factor: Plus-or-minus 2 percent.
g. Frequency: Plus-or-minus 0.5 percent.
h. Integrated Demand, with Demand Interval Selectable from 5 to 60 Minutes: Plus-or-minus 2 percent.
i. Accumulated energy, in megawatt hours (joules), plus-or-minus 2 percent; stored values unaffected by power outages for up to 72 hours.

3. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.]

C. [Analog Instruments: Rectangular, 115-mm square, accurate within 1 percent, semiflush, with antiparallax 250-degree scale and external zero adjustment, complying with ANSI C39.1.

1. Voltmeters: Cover expanded scale range of normal voltage plus 10 percent.

2. Voltmeter Selector Switch: Rotary type with off position to provide readings of phase-to-phase and phase-to-neutral voltages.
3. Ammeters: Cover an expanded scale range of bus rating plus 10 percent.
4. Ammeter Selector Switch: Permits current reading in each phase and keeps current-transformer secondary circuits closed in off position.
5. Locate meter and selector switch on circuit-breaker compartment door for indicated feeder circuits only.
6. Watt-Hour Meters: Flush or semiflush type, 5 A, 240 V, three-phase, 3 wire; with three elements, 15-minute indicating demand register, and provision for testing and adding pulse initiation.
7. Recording Demand Meter: Usable as totalizing relay or indicating and recording maximum demand meter with 15-minute interval.

a. Operation: Meter counts and records succession of pulses entering two channels.
b. Housing: Drawout, back-connected case arranged for semiflush mounting.]

D. [Relays: Comply with IEEE C37.90, types and settings as indicated; with test blocks and plugs.]

E. Surge Arresters: Distribution class, metal-oxide-varistor type.

1. Install in cable termination compartments and connect in each phase of circuit.
2. Coordinate rating with circuit voltage.
3. Status and indicator lights shall be visible to operators in room with switchgear.

F. Provision for Future Devices: Equip compartments with rails, mounting brackets, supports, necessary appurtenances, and bus connections.

G. Provide 10 percent spare circuit breakers installed in switchgear, 20 percent spaces for future breakers, and 20 percent overall spare current carrying capacity for future expansion.

H. [Fungus Proofing: Permanent fungicidal treatment for switchgear interior, including instruments and instrument transformers.]

I. [Control Power Supply: Control power transformer supplying 220 or 240 V control circuits through secondary disconnect devices. Include the following features:

1. Dry-type transformers, in separate compartments for units larger than 3 kVA, including primary and secondary fuses.
2. Two control power transformers in separate compartments with necessary interlocking relays; each transformer connected to line side of associated main circuit breaker.

a. Secondary windings connected through relay or relays to control bus to effect automatic transfer scheme.
b. Secondary windings connected through internal automatic transfer switch to switchgear control power bus.

3. Control Power Fuses: Primary and secondary fuses with current-limiting and overload protection.]

J. Control Wiring: Factory installed, complete with bundling, lacing, and protection; and complying with the following:

1. Flexible conductors for 10 mm^2 and smaller, for conductors across hinges and for conductors for interconnections between shipping units.
2. Conductors sized according to the NFPA 70 for the duty required.

K. Operating Frequency: U.S. manufactured switchgear is normally designed to operate at 60 Hertz. Where operation at other frequencies is required, consult manufacturer for derating factor. Most manufacturers do not derate for operation at 50 Hertz.

L. Furnish and install power system controller for controlling Essential Bus main breaker, Utility Bus main breaker, HVAC bus main breaker, and tie breaker between Essential and Utility busses.

1. The controller shall utilize programmable logic controller (PLC). Electromagnetic control relays are not acceptable.
2. Provide duplicate “hot standby” PLC in same enclosure as primary. Changeover shall require no more than moving keyed wiring connects and resetting processor but automatic switchover without manual intervention is preferred.
3. Provide 24 hour dedicated battery for system back up.

M. Mechanical Interlock: Provide mechanical interlock where dual feed sources are installed. Mechanical interlock shall limit closing of individual breaker pairs fed from dual sources.

N. Manual/Automatic Operation control: Provide manual control of Switchgear within operating switchgear. Manual control shall override automatic and software control. Remote manual/automatic selection is not permitted.

O. Arc Reduction Maintenance Switch (ARMS): Dual parameter sets that enable trip unit, when activated by maintenance personnel, to automatically lower instantaneous setting, and thereby lower available energy in fault condition (commonly referred to as “maintenance mode”); this causes breaker to trip faster when maintenance is being performed in proximity to energized equipment, thus minimizing arc flash dangers. Refer to Section 260573 “Overcurrent Protective Device Coordination Study” for required arc flash levels or alternative means of compliance for worker safety protection.

P. Each section of the switchgear shall be provided with a thermostatically controlled space heater.

Q. Power for space heaters, work lights and convenience receptacles shall be obtained from a transformer with the switchgear.

2.5 CIRCUIT BREAKERS

A. Construction and Circuit Breakers, General:

1. Switchgear for Operation Above 600 Volts: Provide metal-clad construction. Provide draw-out, vacuum break circuit breakers selected for appropriate voltage, frequency, impulse withstand voltage, and interrupting duty. Use direct current control. Provide copper busbars.
2. Switchgear for Operation at 600 Volts or Below: Provide metal-clad construction consisting of metal-enclosed type construction or molded case circuit breakers. Provide draw-out, air break metal enclosed circuit breakers selected for appropriate voltage, frequency, impulse withstand voltage, and interrupting duty. Alternating current control and solid-state trip units are preferred. Adjustable long-time, short-time, instantaneous, and ground fault sensing shall be selected to coordinate with other system protective devices. Provide copper busbars.

B. Description: Comply with IEEE C37.13 “Standard for Low-Voltage AC Power Circuit Breakers Used in Enclosures.”

C. Ratings: As indicated for continuous, interrupting, and short-time current ratings for each circuit breaker; voltage and frequency ratings same as switchgear.

D. Operating Mechanism: Mechanically and electrically trip-free, stored-energy operating mechanism with the following features:

1. Normal Closing Speed: Independent of both control and operator.
2. Stored-Energy Mechanism: Electrically charged.
3. Operation counter.

E. Trip Devices: Solid-state, overcurrent trip-device system consisting of one or two current transformers or sensors per phase, release mechanism, and the following features:

1. Functions: Long-time-delay, short-time-delay, and instantaneous-trip functions, independent of each other in both action and adjustment.
2. Temperature Compensation: Ensures accuracy and calibration stability from minus 5 to plus 40 deg C.
3. Field-adjustable, time-current characteristics.
4. Current Adjustability: Dial settings and rating plugs on trip units or sensors on circuit breakers, or a combination of these methods.
5. Three bands, minimum, for long-time- and short-time-delay functions; marked "minimum," "intermediate," and "maximum."
6. Pickup Points: Five minimum, for long-time- and short-time-trip functions. Equip short-time-trip function for switchable I2t operation.
7. Pickup Points: Five minimum, for instantaneous-trip functions.
8. Ground-fault protection with at least three short-time-delay settings and three trip-time-delay bands; adjustable current pickup. Arrange to provide protection for the following:

    a. Three-wire circuit or system.
    b. Four-wire circuit or system.
    c. Four-wire, double-ended substation.

9. Trip Indication: Labeled, battery-powered lights or mechanical targets on trip device to indicate type of fault.

F. Auxiliary Contacts: For interlocking or remote indication of circuit-breaker position, with spare auxiliary switches and other auxiliary switches required for normal circuit-breaker operation, quantity as indicated. Each consists of two Type "a" and two Type "b" stages (contacts) wired through secondary disconnect devices to terminal block in stationary housing.

G. Drawout Features: Circuit-breaker mounting assembly equipped with racking mechanism to position circuit breaker and hold it rigidly in connected, test, and disconnected positions. Include the following features:

1. Interlocks: Prevent movement of circuit breaker to or from connected position when it is closed, and prevent closure of circuit breaker unless it is in connected, test, or disconnected position.
2. Circuit-Breaker Positioning: Open circuit breaker may be racked to or from connected, test, and disconnected positions only with associated compartment door closed, unless live parts are covered by full dead-front shield. Open circuit breaker may be manually withdrawn to position for removal from structure with door open. Status for connection devices for different positions includes the following:

   a. Test Position: Primary disconnect devices disengaged, and secondary disconnect devices and ground contact engaged.
   b. Disconnected Position: Primary and secondary devices and ground contact disengaged.

3. Operator shall be able to close and trip circuit breakers electrically as "test" made by using control switches on front. Electrical interlocks shall still work to prevent inadvertent paralleling.

H. Arc Chutes: Readily removable from associated circuit breaker when it is in disconnected position, and arranged to permit inspection of contacts without removing circuit breaker from switchgear.

I. Padlocking Provisions: For installing at least three padlocks on each circuit breaker to secure its enclosure and prevent movement of drawout mechanism.

J. Operating Handle: One for each circuit breaker capable of manual operation.

K. Electric Close Button: One for each electrically operated circuit breaker.

L. Mechanical Interlocking of Circuit Breakers: Uses mechanical tripping lever or equivalent design and electrical interlocks.

M. Key Interlocks: Arranged so keys are attached at devices indicated. Mountings and hardware are included where future installation of key-interlock devices is indicated.

N. Undervoltage Trip Devices:

1. Instantaneous, with adjustable pickup voltage.
2. Adjustable time-delay and pickup voltage.

O. Shunt-Trip Devices: Where indicated.

P. Fused Circuit Breakers: Circuit breaker and fuse combinations complying with requirements for circuit breakers and trip devices and with the following:

1. Fuses: NEMA FU 1, Class L current limiting, sized to coordinate with and protect associated circuit breaker.
2. Circuit Breakers with Frame Size 1600 A and Smaller: Fuses on line side of associated circuit breaker, on common drawout mounting, arranged so fuses are accessible only when circuit breaker is in disconnected position.
3. Circuit Breakers with Frame Sizes More Than 1600 A: Fuses and circuit breakers may be installed in separate compartments on separate drawout mountings. Fuse drawout element is interlocked with associated power circuit breaker to prevent drawing out fuse element unless circuit breaker is in open position.
4. Open-Fuse Trip Device: Positive means of tripping and holding circuit breaker in open position when fuse opens. Open-fuse status is indicated at front of circuit breaker or fuse drawout element.

Q. Indicating Lights: To indicate circuit breaker is open or closed, for main and bus tie circuit breakers interlocked either with each other or with external devices.

2.6 ACCESSORIES

A. Accessory Set: Furnish tools and miscellaneous items required for circuit-breaker and switchgear test, inspection, maintenance, and operation.

1. Racking handle to manually move circuit breaker between connected and disconnected positions.
2. Portable test set for testing all functions of circuit-breaker, solid-state trip devices without removal from switchgear.
3. Relay and meter test plugs suitable for testing switchgear meters and switchgear class relays.

B. [Circuit-Breaker Removal Apparatus: Portable, floor-supported, roller-base, elevating carriage arranged for moving circuit breakers in and out of compartments.]

C. [Circuit-Breaker Removal Apparatus: Overhead-circuit-breaker lifting device, track mounted at top front of switchgear and complete with hoist and lifting yokes matching each size of drawout circuit breaker installed.]

D. Control Cabinets:

1. Provide true redundant controllers for operation to include cabinets, controllers, and independent wiring with manual toggle selector switch between the two controllers.

2. Mount switchgear control components in individual cabinets; cabinet footprint shall be approximately 600 mm (2 feet) deep x 1500 mm (5 feet) high.
3. Cabinet shall consist of two-step rack with electrical connections between battery cells and between rows of cells. Include two flexible connectors with bolted-type terminals for output leads. Battery rack, cell supports, and anchorage shall be rated for seismic requirements of location.
4. Access to cabinet shall be from front, using hinged doors.

E. Spare-Fuse Cabinet: Identified and compartmented steel box, or cabinet with lockable door.

F. Storage for Manual: Include rack or holder, near operating instructions, for copy of maintenance manual.

2.7 DC POWER SYSTEM

A. General:

1. Provide **[48] [24]** VDC power system for control power required for all switchgear device operations.
2. System shall consist of number of batteries, battery cabinets, battery chargers, and other components required for proper operation of this system. Interior UPS units are strictly prohibited.
3. System Requirements: Battery shall have number of cells and ampere-hour capacity based upon initial specific gravity of 1.2 at 25 deg C with electrolyte at normal level, and minimum ambient temperature of 15 deg C. Cycle battery before shipment to guarantee rated capacity upon installation. Arrange battery top operate ungrounded.

B. Battery Charger: Static-type rectifier equipped with automatic regulation, and with provision for manual and automatic adjustment of charging rate. Unit shall automatically maintain output voltage within 0.5 percent from no load to rated charger output current, with ac input-voltage variation of plus or minus 10 percent, and input-frequency variation of plus or minus 3 Hz. Other features of charge shall include the following:

1. DC ammeter.
2. DC Voltmeter: Maximum error of 5 percent at full-charge; operates with toggle switch to select between battery and charger voltages.
3. Ground Indication: Two appropriately labeled lights shall indicate circuit ground, connected in series between negative and positive terminals, and with midpoint junction connected to ground by normally open push-button contact.
4. Capacity: Sufficient to supply steady load, float-charge battery between 2.20 and 2.25 V per cell and equalizing charge at 2.3.3 B per Cell.
5. Charging-Rate Switch: Manually operated switch that provides for transferring to higher charging rate. Charger operates automatically after switch operation until reset.
6. Power Supply and Charging: AC power supply is site standard, subject to +/- 10 percent variation in voltage, and +/- 3 Hz variation in frequency.

a. After loss of AC power supply for any interval, charger shall automatically resume charging battery.
b. Charger shall regulate rate of change to prevent damage due to overload, and to prevent fuses or circuit breakers from opening.

7. Protective Feature: Feature provide current-limiting device or circuit which limits output current to rating of charger, but does not disconnect charger from either battery or AC supply; feature shall protect charger from damage due to overload, including due to short circuit on output terminals.
8. Audible noise shall be less than 70 dBA at 1 meter.

C. Batteries:

1. Battery Type: Sealed, maintenance-free lead acid type.
2. Expected Life: 10-year life when operated and maintained within its specifications.
3. Final Discharge Voltage: 1.75 volts per cell.
4. Nominal Float Voltage: 2.25 volts per cell.
5. Battery Recharge Time: Charger shall have capacity to recharge batteries from 10 percent to 90 percent capacity within 12 hours.
6. Battery Circuit Protection: Protection via fuse or circuit breaker.
7. Nominal Battery Ampere Hour (A.H.) Capacity: **[100] [XX]** A.H.; **[sized to provide proper operation of the gear for at least 48 hours with the anticipated number of breaker operations likely to occur with [YY] commercial power losses and returns.]**
8. System batteries shall be suitable for service at ambient temperature ranging from minus 18 to plus 40 deg C.

2.8 FACTORY TESTING

A. Perform factory test of switchgear.

1. Perform each case identified in Article on SEQUENCE OF OPERATIONS in Section 262315 “Double-Ended Switchgear.”
2. Re-rest all failed test until successful test is achieved.
3. Factory testing shall be witnessed by representative from OBO/PDCS/DE/EE. Provide notification to Project Director/COR within 30 calendar days of scheduled test. Representative from OBO/PDCS/DE/EE may perform factory inspection at that time as well.

2.9 SOFTWARE

A. At project closeout, submit two electronic copies of PLC software, password, operating software platform, and source code to Project Director/COR for distribution to Post Facility Manager and OBO/OPS/FAC/PS. PLC software shall facilitate future modifications to power transfer scheme by Post Facility Manager, and operating software platform shall facilitate future reading of PLC software by programmer.

1. In addition, submit two hardcopy manuals of PLC software and code to Project Director/COR for similar distribution as with software.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive switchgear for compliance with installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with applicable portions of NECA 400.

B. Anchor switchgear assembly to 100-mm (4-inch), channel-iron floor sill embedded in floor or concrete base and attach by bolting.

1. Sills: Select to suit switchgear; level and grout flush into floor or concrete base.
2. **[Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26 Section on vibration and seismic controls for electrical systems for seismic-restraint requirements.]**
3. Concrete Bases: 100-mm (4-inch) high, reinforced, with chamfered edges. Extend base no more than 75 mm (3 inches) in all directions beyond maximum dimensions of switchgear unless otherwise indicated or unless required for seismic anchor support. Construct concrete bases according to Division 26 Section on vibration and seismic controls for electrical systems.

C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, brackets, and temporary blocking of moving parts from switchgear units and components.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section on identification for electrical systems.

B. Diagram and Instructions - General:

1. Frame and mount under clear acrylic plastic on front of switchgear.

C. Operating Instructions: Printed basic instructions for switchgear, including control and key-interlock sequences and emergency procedures.

D. System Power Riser Diagrams: Depict power sources, feeders, distribution components, and major loads.

1. Storage for Maintenance: Include a rack or holder, near the operating instructions, for a copy of maintenance manual.

E. Mimic Bus: Continuous mimic bus, arranged in single-line diagram format, using symbols and lettered designations consistent with approved mimic-bus diagram.

1. Mimic-bus segments coordinated with devices in switchgear sections to which applied, to produce concise visual presentation of principal switchgear components and connections.
2. Medium: Painted graphics, as selected or accepted by Project Director/COR.
3. Color: Contrasting with factory-finish background; as selected or accepted by Project Director/COR from manufacturer's full range.

F. System Power Riser Diagrams: Depict power sources, feeders, distribution components, and major loads. Include as-built data for low-voltage power switchgear and connections as follows:

1. Frame size of each circuit breaker.
2. Trip rating for each circuit breaker.
3. Conduit and wire size for each feeder.

3.4 CONNECTIONS

A. Ground equipment according to Chapter 2 of the OBO Electrical Code. Refer to Section 260525 “Grounding and Bonding for Electrical Systems.”

B. Connect wiring according to Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

3.5 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each switchgear bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Manufacturer's Field Service: Engage factory-authorized service representative to perform the following:

1. Inspect switchgear installation, including wiring, components, connections, and equipment.
2. Verify that electrical control wiring installation complies with manufacturer's submittal by means of point-to-point continuity testing. Verify that wiring installation complies with requirements in Division 26 Sections.
3. Complete installation and startup checks according to manufacturer's written instructions.

4. Assist in field testing of equipment including pretesting and adjusting of equipment and components.
5. Report results in writing.

C. Testing: After installing switchgear and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

1. Perform each electrical test and visual and mechanical inspection identified in NETA ATS. Certify compliance with test parameters.

D. Switchgear: Perform tests and inspections stated in NETA, Section 7.1.

E. Circuit Breakers: Perform tests and inspections stated in NETA, Section 7.6.

1. Primary Injection
2. Secondary Injection

F. Protective Relays: Perform tests and inspections stated in NETA, Section 7.9.

G. Instrument Transformers: Perform tests and inspections stated in NETA, Section 7.10.

H. Metering and Instrumentation: Perform tests and inspections stated in NETA, Section 7.11.

I. Ground-Fault Systems: Perform tests and inspections stated in NETA, Section 7.14.

J. Correct malfunctioning units on-site where possible, and retest to demonstrate compliance. Remove and replace malfunctioning units, and retest as specified above until compliance is demonstrated.

K. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform infrared scan of each switchgear. Remove front and rear panels so joints and connections are accessible to portable scanner. Testing shall include connections and inductive heating of cabling at entrances or where racked in trenches.

1. Follow-up Infrared Scanning: Perform additional follow-up infrared scan of each switchgear 11 months after date of Substantial Completion.
2. Instrument: Use infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
3. Record of Infrared Scanning: Prepare certified report that identifies switchgear checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Set field-adjustable, protective-relay trip characteristics according to results in Section 260573 "Overcurrent Protective Device Coordination Study."

3.7 CLEANING

A. On completion of installation, inspect interior and exterior of switchgear. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

3.8 PROTECTION

A. Temporary Heating: Apply temporary heat to switchgear, according to manufacturer's written instructions, throughout periods when switchgear environment is not controlled for temperature and humidity within manufacturer's stipulated service conditions.

3.9 STARTUP SERVICES

A. Engage factory-authorized service representative to perform startup service.

B. Verify that switchgear is installed and connected according to the Contract Documents.

C. Verify that electrical control wiring installation complies with manufacturer's submittal by means of point-to-point continuity testing. Verify that wiring installation complies with requirements in Division 26 Sections.

D. Complete installation and startup checks according to manufacturer's written instructions.

3.10 DEMONSTRATION

A. Engage a factory-authorized service representative to train post maintenance personnel to adjust, operate, and maintain switchgear. Refer to Division 01 Section “Demonstration and Training.”

1. Train on procedures and schedules for general troubleshooting, servicing, and maintaining equipment and schedules, and for equipment isolation and de-energization procedures.
2. Refer to the Part 3 Article on ARC FLASH TRAINING in Section 260573 “Overcurrent Protective Device Coordination Study” for associated training requirements.
3. Review data in maintenance manuals.
4. Schedule training with the Project Director/COR with at least seven days' advance notice.

END OF SECTION 262300

SECTION 262313 - PARALLELING SWITCHGEAR

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes **[metal-clad][metal enclosed]**, **[low][medium]**-voltage, circuit-breaker switchgear rated **[1000][5000][15000][35000]** V and less, and associated control systems, for paralleling generators on an isolated bus and for distributing power in ac systems.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety” for facility voltages and safety accessories.
2. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
3. Section 260525 “Grounding and Bonding for Electrical Systems.”
4. **[Division 26 Section on vibration and seismic controls for electrical systems for mounting and anchoring switchgear.]**
5. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash study, ARMS reduction level or alternative means of compliance for worker safety, and arc flash training.
6. Section 260915 "Electrical Power Monitoring" for interfacing communication and metering requirements.
7. Section 262300 "Low-Voltage Switchgear."
8. Section 262315 “Double-Ended Switchgear.”
9. Section 262325 “Power Sequence of Operation.”
10. Section 263214 "Engine Generators."
11. **[Division 26 Section “MV switchgear.”]**

C. Where requirements in this Section are in conflict with those in Section 263214 "Engine Generators" and Section 262300 "Low-Voltage Switchgear," the requirements herein shall govern.

1.2 REFERENCES

A. General: In addition to standards identified elsewhere in this Section, conform to the applicable Standards in this Article.

B. Institute of Electrical and Electronics Engineers (IEEE):

1. C37.13, “Standard for Low-Voltage AC Power Circuit breakers Used in Enclosures.”
2. C37.16, “Switchgear - Low-Voltage Power Circuit Breakers and AC Power Circuit Protectors - Preferred Ratings, Related Requirements, and Application Recommendations.”

3. C37.50 "Test Procedures of Low-Voltage AC Power Circuit Breakers Used in Enclosures."
4. C37.51, "Conformance Test Procedures of Metal-Enclosed Low-Voltage AC Power Circuit Breaker Switchgear Assemblies."

C. Underwriters Laboratories, Inc. (UL):

1. 1558, "Metal Enclosed Low-Voltage Power Circuit Breaker Switchgear."

1.3 DEFINITIONS

A. GFCI: Ground-fault circuit interrupter.

B. HMI: Human machine interface.

1.4 SUBMITTALS

A. Product Data: For each type of switchgear and related equipment, include the following:

1. Technical data on features, performance, electrical characteristics, ratings, and finishes.
2. Rated capacities, operating characteristics, furnished specialties, and accessories for individual circuit breakers.
3. Features, characteristics, ratings, factory settings, and time-current characteristic curves for individual relays and overcurrent protective devices.
4. Description of sequence of operation for paralleling controls.

B. Shop Drawings: For each type of switchgear and related equipment, include the following:

1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Include the following:

a. Tabulation of installed devices with features and ratings.
b. Enclosure types and details.
c. Outline and general arrangement drawing showing dimensions, shipping sections, and weights of each assembled section.
d. Floor plan drawing showing locations for anchor bolts**[and leveling channels]**.
e. Bus configuration with current rating, size, and number of conductors in each bus run, including phase, neutral, and ground conductors of main and branch buses.
f. Short-time and short-circuit current rating of switchgear assembly.
g. Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
h. Nameplate legends.
i. Mimic-bus diagram.
j. Arc flash reduction switch.
k. UL listing for series rating of installed devices.

2. Wiring Diagrams: For switchgear, paralleling control system, and related equipment, include the following:

   a. Power, signal, and control wiring.
   b. Schematic control diagrams.
   c. Diagrams showing connections of component devices and equipment.
   d. Three-line diagrams of current and future circuits showing device terminal numbers and internal diagrams.
   e. Schematic diagrams showing connections to remote devices.

3. Design Calculations: Signed and sealed by a qualified professional engineer. Calculate requirements for selecting seismic restraints.

C. Coordination Drawings: Floor plans showing dimensioned layout, required working clearances, and required area above and around switchgear where pipe and ducts are prohibited. Show switchgear layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.

D. [Manufacturer Seismic Qualification Certification: Submit certification that switchgear, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Division 26 Section on vibration and seismic controls for electrical systems. Include the following:

1. Basis of Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.]

E. Certificates of Compliance: Manufacturer of switchgear shall certify compliance with referenced standards.

F. Qualification Data:

1. Support Services Vendor: Identify vendor firm name and contact, location, distance from project, years and servicing product line.
2. Testing Agency: As required in Article on QUALITY ASSURANCE.

G. Source quality-control test reports.

H. Field quality-control test reports.

I. Updated mimic bus diagram reflecting field changes after final switchgear load connections have been made, for record.

J. Operation and Maintenance Data: In addition to items specified in Division 01 Section "Systems Manual and O&M Data," include the following:

1. Manufacturer's written instructions for sequence of operation.
2. Manufacturer's sample system checklists and log sheets.
3. Manufacturer's written instructions for testing and adjusting relays and overcurrent protective devices.
4. Time-current curves, including selectable ranges for each type of relay and overcurrent protective device.
5. Range and set points for all adjustable time delay functions.

1.5 OWNERSHIP OF PROPRIETARY MATERIAL

A. The Government shall retain all rights to software and passwords used for this project.

B. The Government will sign a copy of manufacturer's standard software and firmware licensing agreement as condition of this contract. Such license shall grant use of all programs and application software to the Government as defined by manufacturer's license agreement, but shall protect manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. The licensing agreement shall not preclude use of software by individuals under contract to the Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to the Government will be restricted to use on the Government's computers and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation shall become the property of the Government.

1.6 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), or a nationally recognized testing Laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA, the NRTL, or the National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Source Limitations: Obtain switchgear through one source from a single manufacturer.

C. **[Basis of Design: Drawings indicate size, profiles, and dimensional requirements of switchgear and are based on the specific system indicated.]**

D. Comply with the OBO Electrical Code (NFPA 70 "National Electrical Code" as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

E. Support Service Capability: Manufacturer approved support services Vendor to commission switchgear and available to provide ongoing maintenance services. Vendor shall be approved by manufacturer. Vendor shall be located within 1500 km (1000 miles) of project site. Vendor shall have performed these services on this product line for at least five years.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver switchgear in sections of lengths that can be moved past obstructions in delivery path.

B. Storage: Store in one of the following manners:

1. Store switchgear indoors in clean dry space with uniform temperature to prevent condensation. Protect switchgear from exposure to dirt, fumes, water, corrosive substances, and physical damage.
2. If stored in areas subjected to weather, cover switchgear to provide protection from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside switchgear; install electric heating (250 W per section) to prevent condensation.

1.8 PROJECT CONDITIONS

A. [Installation Pathway: For renovation and system upgrade projects, remove and replace building components and structures to provide pathway for moving switchgear into place.]

B. [Existing Utilities: Do not interrupt utilities serving facilities occupied by Government or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Project Director/COR not less than seven days in advance of proposed utility interruptions. Identify extent and duration of utility interruptions.
2. Indicate method of providing temporary utilities.
3. Do not proceed with utility interruptions without Project Director/COR's written permission.]

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchgear, including clearances between switchgear and adjacent surfaces and other items. Comply with indicated maximum dimensions.

D. Environmental Limitations: Rate equipment for continuous operation at indicated ampere ratings for the following conditions:

1. Ambient temperature not exceeding **[40 deg C (104 deg F)] [50 deg C (122 deg F)] [60 deg C (140 deg F)]**.
2. Altitude: Derate as required if over <**Insert elevation**> above sea level.
3. <**Insert unusual service conditions.**>

1.9 COORDINATION

A. Coordinate layout and installation of switchgear and components with other construction that penetrates ceilings or is supported by them, including conduit, piping, equipment, and adjacent surfaces. Maintain required clearances for workspace and equipment access doors and panels.

B. Coordinate size and location of concrete bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000 "Cast-in-Place Concrete."

1.10 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Six of each type and rating used. Include spares for potential transformers, control power circuits and fusible devices. Fuses are specified in Division 26 Section on fuses.
2. Indicating Lights: Six of each type installed.
3. Touchup Paint: Two containers of paint matching enclosure finish, each 250 mL (0.5 pint).

B. Maintenance Tools: Furnish tools and miscellaneous items required for switchgear test, inspection, maintenance, and operation. Include the following:

1. Traveling-type lifting device, rail mounted on top of switchgear and all other items necessary to remove circuit breaker from housing and transport to remote location.
2. Racking handle to move circuit breaker manually between connected and disconnected positions, and a secondary test coupler to permit testing of circuit breaker without removal from switchgear.

PART 2 - PRODUCTS

2.1 GENERATOR PARALLELING MONITOR AND CONTROL SYSTEM

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in to the Work include, but are not limited to, the following:

1. Caterpillar; Engine Div.
2. Emerson; ASCO Power Technologies, LP.
3. GE Zenith Controls.
4. Kohler Co.; Generator Division.
5. Onan Corp.; Cummins Inc.; Industrial Business Group.
6. Russelectric.

B. Individual Generator Control and Monitoring Panel: Provide each generator with a control and monitoring panel that allows the operator to view status and control operation of respective generator. **[Select display items and functional controls may be provided instead by the HMI**

required for the Master Control System subject to specific submittal, review, and approval by OBO.] Provide panel with the following features and characteristics:

1. Generator Metering: 1 percent accuracy class or better.

    a. Ammeter, Voltmeter, Frequency Meter, Wattmeter, Kilowatt-Hour Meter, and Power Factor Meter:

        1) For three-phase and four-wire systems, indicate line-to-line and line-to-neutral conditions on voltmeter.
        2) Provide switches or other provisions to allow reading of both generator and bus voltages and frequencies from this metering set.

    b. Synchroscope and "Generator Set Synchronized" Indication:

        1) Provide lamp or LED indication of synchronization.
        2) Provide electronic synchronization control.

    c. Engine run-time meter, start counter, rpm meter, and battery voltage meter.
    d. Engine oil temperature gage and engine coolant temperature gage.

2. Generator Protective and Control Switches: Provide oiltight, industrial-grade switches in generator control and monitoring panel.

    a. Mode Selector Switch (Run or Manual/Off/Auto):

        1) "Run or Manual" mode to start and accelerate unit to rated speed and voltage, but not close paralleling circuit breaker.
        2) "Off" mode to prevent generator from starting or to immediately shutdown generator if running.
        3) "Auto" mode to allow generator to start on receipt of remote start signal.

    b. Circuit-Breaker Trip/Close Switch: Interlocked with system control so that circuit-breaker closure is impossible unless the following occurs:

        1) Mode selector switch is in "Run or Manual" position.
        2) Generator set is synchronized with system bus.

    c. Control/reset with flashing lamp or error message to indicate generator is locked out due to fault condition.
    d. Lamp test push button to simultaneously test all lamps on panel.
    e. [Control Panel Illumination: DC lamps to illuminate panel when lighting from surrounding environment is not available.]
    f. Emergency Stop Push Button: Red mushroom-head switch maintaining its position until manually reset.
    g. Voltage and Frequency Raise/Lower Controls:

        1) Allow plus/minus 5 percent adjustment when generator set is operating but not paralleled.

3. Generator Protective and Control Devices: Solid-state industrial relays, integrated microprocessor-based control devices, and other accessories and devices located either in generator control and monitoring panel or in switchgear control section to provide the following features and functions:

   a. Kilowatt Load Sharing Control:

      1) Operates engine governors during synchronizing and provides isochronous load sharing when paralleled.
      2) Allows generator set to ramp up to kilowatt load level signaled by system master controller.

   b. Load-Demand Governing Control:

      1) Causes generator set to ramp down to zero load when signaled to shut down in load-demand mode.
      2) Causes generator set to ramp up to a proportional share of total bus load.

   c. Kilovolt Ampere Rating Load Sharing Control:

      1) Operates alternator excitation system while generator set is paralleled.
      2) Causes sharing of reactive load among all generator sets to within 1 percent of equal levels without voltage drop.

   d. Sync-Check and Paralleling Monitor and Control:

      1) Monitors and verifies that generator set has reached 90 percent of nominal voltage and frequency before closing to bus.
      2) Prevents out-of-phase paralleling if two or more generator sets reach operating conditions simultaneously, by sending "inhibit" signal to sets not designated by system as "first to close to bus."
      3) Recognizes failure of "first-to-close" generator set and signals system paralleling to continue.
      4) Prevents out-of-phase closure to bus due to errant manual or automatic operation of synchronizer.

   e. Synchronizer Control:

      1) Adjusts engine governor to match voltage, frequency, and phase angle of paralleling bus.
      2) Maintains generator set voltage within 1 percent of bus voltage, and phase angle within 20 electrical degrees of paralleling bus for 0.5 seconds before circuit-breaker closing.
      3) Provides "fail-to-synchronize time delay" adjustable from 10 to 120 seconds; with field selectivity to either initiate alarm or shut down generator set on failure condition.

   f. Reverse Power Monitor and Control:

1) Prevents sustained reverse power flow in generator set.
2) Trips generator circuit breaker and initiates generator set shutdown when reverse power condition exceeds 10 percent of generator set kilowatt rating for three seconds or with settings as recommended by generator set manufacturer.

g. Phase Rotation Monitor and Control:

1) Verifies generator set and paralleling bus phase rotation match prior to closing paralleling circuit breaker.

h. Electronic Alternator Overcurrent Alarm and Shutdown Control:

1) Monitors current flow at generator set output terminals.
2) Initiates alarm when load current on generator set **[is more than [110][105] percent of rated current for more than [60][X] seconds][reaches a state requiring warning]**.
3) Provides overcurrent shutdown function matched to thermal damage curve of alternator. Provide without instantaneous-trip function.

i. Electronic Alternator Short-Circuit Protection:

1) Provides shutdown when combined time/load current approaches thermal damage curve of alternator. Provide without instantaneous-trip function.

j. Loss of Excitation Monitor:

1) Initiates alarm when sensing loss of excitation to alternator while paralleled to system bus.

k. Generator Set Start Contacts: Redundant system, 10 A at 32-V dc.
l. Cool-Down Time-Delay Control: Adjustable, 0 to 600 seconds.
m. Start Time-Delay Control: Adjustable, 0 to 300 seconds.
n. Paralleling Circuit-Breaker Monitor and Control:

1) Monitors circuit-breaker auxiliary contacts.
2) Initiates fault signal if circuit breaker fails to close within adjustable time-delay period (0.5 to 15 seconds).
3) Trips open and locks out paralleling circuit breaker upon paralleling circuit breaker failure to close, until manually reset.

4. Engine Protection and Local Annunciation:

a. Provide annunciation and shutdown control modules for alarms indicated.
b. Provide visual alarm status indicator and alarm horn with silence/acknowledge push button on generator control and monitoring panel.
c. Annunciate the following conditions:

1) Status, Light Only (Nonlatching):

a) Generator engine control switch not in auto (red).
b) Generator engine control switch in auto (green).
c) Emergency mode (red).
d) Generator circuit breaker closed (red).
e) Generator circuit breaker open (green).
f) Engine stopped (green).
g) Engine running (red).
h) Engine cool-down (amber).

2) Pre-Alarm, Light and Horn (Nonlatching):

a) Pre-high coolant temperature (amber).
b) Pre-low oil pressure (amber).
c) Low coolant temperature (amber).
d) Engine low battery (amber).
e) Engine low fuel (amber).
f) Generator fails to synchronize (amber).

3) Shutdown Alarm, Light and Horn (Latching):

a) Engine overcrank (red).
b) Engine overspeed (red).
c) Engine low oil pressure (red).
d) Engine high coolant temperature (red).
e) Engine low coolant level (red).
f) Engine remote emergency shutdown (red).
g) Generator circuit breaker tripped (red).
h) Generator loss of field (red).
i) Generator reverse power (red).
j) Generator undervoltage (red).
k) Generator overvoltage (red).
l) Generator underfrequency (red).
m) Generator overfrequency (red).

C. Master Control System and Monitoring Equipment: Paralleling and monitoring equipment, components, and accessories for multiple generators with the following features and characteristics:

1. Components and devices shall be mounted in the switchgear control section of the switchgear lineup.
2. Paralleled System Metering: 1 percent accuracy class or better to monitor total output of generator bus.

a. Ammeter, voltmeter, frequency meter, wattmeter, kilowatt-hour meter, power factor meter, kilovolt ampere, kilovolt ampere rating, and kilowatt demand meters.

1) For three-phase/four-wire systems, indicate line-to-line and line-to-neutral conditions on voltmeter.

2) Display all functions on the HMI device.

3. Full-Color HMI Device: Touchscreen with minimum diagonal length of 43 cm. (17 inches).

a. Allows operator to monitor and control the complete system of paralleled generator sets.
b. Screens shall include the following:

1) Main Menu: Include date, time, and system status messages with screen push buttons to access one-line diagram, system controls, load controls, alarms, bus metering, and individual generator set data.
2) One-Line Diagram Screen: Depicting system configuration and system status by screen animation, screen colors, text messages, or pop-up indicators. Indicate the following minimum system conditions:

a) Generator sets, buses, and paralleling circuit breakers energized/de-energized.
b) Generator set mode (run or manual/off/auto/cooldown).
c) Generator set status (normal/warning/shutdown/load-demand/stop).
d) Paralleling circuit-breaker status (open/closed/tripped).
e) Bus conditions (energized/de-energized).
f) Provide access to other screens.

3) AC Metering Screen: Displays the following minimum meter data for the paralleling bus:

a) Phase volts and amperes, kilowatts, kilovolt amperes, power factor, frequency.
b) Kilowatt hour usage total with daily, weekly, and monthly recording options.
c) Real-time trend chart for system kilowatts and volts updated on not less than one-second intervals.

4) Generator Set Control Screen: Provides control over individual generator sets from master system control panel. Includes the following minimum functions:

a) Generator manual start/stop control (functional only when generator set mounted control switch is in "Auto" position).
b) Generator set alarm reset.
c) Manual paralleling and circuit-breaker controls.

5) Generator Set Data Display Screen: Provide the following minimum parameters:

a) Engine speed, oil pressure and temperature, coolant temperature, and engine operating hours.

b) Three-phase voltage and current, kilowatt, power factor, and kilowatt hour.
c) Generator control switch position and paralleling circuit-breaker position.
d) All generator set alarms.

6) System Control Screen: Password protected and with the following minimum functions:

a) System Test Modes: Test with load/test without load/normal/retransfer time-delay override.
b) Test with Load: Starts and synchronizes generator sets on paralleling bus; all loads are transferred to bus.
c) Test without Load: Starts and synchronizes generator sets on paralleling bus but does not transfer loads to bus.
d) Time adjustments for retransfer time delay, transfer time delay, system time delay on stopping, and system time delay on starting.

7) Load-Demand (or Gen-Demand) Control Screen: Monitors total load on system bus and controls number of generator sets running so that capacity tracks load demand.

a) Load-Demand Control: On/off.
b) Load-Demand Pickup Set Point: Adjustable from 90 to 40 percent in 5 percent increments.
c) Load-Demand Dropout Set Point: Adjustable from 20 to 70 percent in 5 percent increments.

8) Manual Load Control Screen: Allows operator to manually add or delete generator sets from paralleled system in response to system load parameters.

a) Indication of system available in kilowatts and amperes.
b) Control functions allow manual addition/removal of generator sets on system, and activation of load-shed/load-restore functions.

9) Load-Add/Load-Shed Sequence Screen: Password protected and with the following minimum functions:

a) Assigns "load-add sequence priority" to each load control relay with designation for relay operation after a set number of generator sets are online.
b) Assigns "load-shed sequence priority" to each load control relay with designation for relay operation depending on number of generator sets online.

10) Alarm Summary and Run Report Screen:

a) Lists most recent alarm conditions and status changes.

b) Lists a minimum of the most recent 32 alarm conditions by name and time/date; acknowledges alarm conditions with time/date.
c) Lists start time and date and stop time and date for individual generator sets.

4. Solid-State System Status Panel:

a. Provides visual alarm status indicator and alarm horn with silence/acknowledge push button. May be integrated into the HMI or be a stand alone panel.
b. Annunciates the following conditions:

1) Status, Light Only:

a) Running Status: Display generator set number and "green" running-status light.
b) Load-demand mode (green).
c) Priority Load shed Status: Display load number and "green" on-status light.
d) System test (green).
e) Normal source available (green).
f) Connected to normal (green).
g) Generator source available (green).
h) Connected to generator source (green).

2) Status, Light and Alarm:

a) Load-Shed Level Status: Displays load number and load-shed, status light.
b) Generator Alarm Status: Displays generator number and "Check Generator" status light.
c) Controller malfunction (red).
d) Check station battery (red).
e) Bus overload (red).
f) System not in auto (red).

D. General Description of System Operation. See spec Section 262325 “Power Sequence of Operation” for more details.

2.2 SWITCHGEAR

A. Refer to Section **[262300 “Low-Voltage Switchgear”][Division 26 Section “MV Switchgear”]** for requirements for **[low][medium]** voltage, **[metal-clad][metal enclosed]**, circuit breakers, instruments, surge protection devices, provisions, ARMS, associated components, mimic bus, and control components. Provide additional features as indicated below.

B. Mechanical Interlock: Provide mechanical interlock where dual feed sources are installed. Mechanical interlock shall limit closing of individual breaker pairs fed from dual sources.

C. Spare Generator Connection: Switchgear shall have spare control breaker to connect portable temporary generator.

1. Provide connection point for cabling for power and control.
2. Ensure that paralleling switchgear controls are capable of operating with portable generator.
3. Size breaker, conductors and cabling so that they are two times size required for single facility generator.
4. Operational Interface: A qualified engineer shall analyze two operational situations below, and coordinate system design accordingly:

a. Synchronize with Facility Generators: If portable generator is suitable for paralleling with facility generators, then switchgear controls shall operate generator for synchronization.
b. Operate as Stand-Alone Generator: However, if generator is not capable of synchronizing with facility generators, then system shall be developed with procedures to load-shed non-critical loads to operate system on single portable generator.

2.1 FACTORY TESTING

A. Perform factory test of switchgear.

1. Perform each case identified in Article on SEQUENCE OF OPERATIONS in Section 262325 “Power Sequence of Operation.”
2. Re-test all failed test until successful test is achieved.
3. Factory testing may be witness by Government representative. Provide notification to Project Director/COR within 30 days of scheduled test. Government representative may perform factory inspection at that time as well.

2.2 SOFTWARE

A. At project closeout, submit two electronic copies of PLC software, password, operating software platform, and source code to Project Director/COR for distribution to Post Facility Manager and OBO/CFSM/FM/PS. The PLC software will facilitate future modifications to power transfer scheme by Post Facility Manager, and the operating software platform will facilitate future reading of PLC software by programmer.

1. In addition, submit two hardcopy manuals of PLC software and code to Project Director/COR for similar distribution.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces where switchgear will be installed for compliance with installation tolerances, required clearances, and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's installation instructions and with applicable portions of NECA **[400 for LV switchboards][430 for MV switchgear]**.

B. Anchor switchgear assembly to 100-mm (4-inch) channel-iron embedded in concrete base and attach by bolting.

1. Sills: Select to suit switchgear; level and grout flush into concrete base.
2. **[Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details. See Division 26 Section on vibration and seismic controls for electrical systems for seismic-restraint requirements.]**
3. Concrete Bases: Install in accordance with Section 260508 "Common Work Results for Electrical, Communications, and Electronic Safety."

C. Surge Protection Devices:

1. Install in cable termination compartments and connect in each phase of circuit per manufacturer's design and recommendations.
2. Place surge protection devices so status and indicator lights are visible to operators in room.

D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, brackets, and temporary blocking of moving parts from switchgear units and components.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section on identification for electrical systems and the applicable Division 26 switchgear specification.

B. Diagram and Operations and Maintenance Manual storage:

1. Frame and mount under clear acrylic plastic on front of switchgear a System Single Line Diagram: Depict power sources, feeders, major distribution components, and major centers.

2. Storage for Operations and Maintenance Manual: Include a rack or holder or place behind a compartment door for a copy of the Paralleling System Operations and Maintenance manual.

3.4 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to **Section [260518 "Low-Voltage Electrical Power Conductors and Cables.] [Division 26 Section on MV conductor and cables.]** Install and relieve any unacceptable stress on conductor terminations by using appropriate mechanical support mechanisms and devices as recommended by the manufacturer.

3.5 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each switchgear bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following:

1. Inspect switchgear installation, including wiring, components, connections, and equipment. Test and adjust components and equipment.
2. Verify that electrical control wiring installation complies with manufacturer's submittal by means of point-to-point continuity testing. Verify that wiring installation complies with requirements in Division 26 Sections.
3. Complete installation and startup checks according to manufacturer's written instructions.
4. Assist in field testing of equipment including pretesting and adjusting of equipment and components.
5. Report results in writing

C. Testing: After installing switchgear and after electrical circuitry has been energized, demonstrate capability of switchgears and compliance with requirements.

1. Perform each electrical test and each visual and mechanical inspection in accordance with InterNational Electrical Testing Association (ANSI/NETA) "Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems (ATS)." Certify compliance with test parameters. Perform NETA ATS tests and inspections for each of the following NETA ATS categories:

a. Switchgear: Perform tests and inspections stated in NETA ATS Section 7.1.
b. Circuit Breakers: Perform tests and inspections stated in NETA ATS Section 7.6.

1) Primary Injection
2) Secondary Injection

c. Protective Relays: Perform tests and inspections stated in NETA ATS Section 7.9.
d. Instrument Transformers: Perform tests and inspections stated in NETA ATS Section 7.10.
e. Metering and Instrumentation: Perform tests and inspections stated in NETA ATS Section 7.11.
f. Ground-Fault Systems: Perform tests and inspections stated in NETA ATS Section 7.14.

2. Correct malfunctioning units on-site where possible, and retest as specified above until compliance is demonstrated.

D. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform an infrared scan on each switchgear. Remove front and rear panels so joints and connections are accessible to portable scanner. Testing shall include connections and inductive heating of cabling at entrances or where racked in trenches.

1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchgear 11 months after date of Substantial Completion.
2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
3. Record of Infrared Scanning: Prepare a certified report that identifies switchgear checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Set field-adjustable, protective-relay trip characteristics according to results in Section 260573 "Overcurrent Protective Device Coordination Study."

3.7 CLEANING

A. On completion of installation, inspect interior and exterior of switchgear. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair damaged finishes.

3.8 PROTECTION

A. Temporary Heating: Apply temporary heat to switchgear, according to manufacturer's written instructions, throughout periods when switchgear environment is not controlled for temperature and humidity within manufacturer's stipulated service conditions.

3.9 DEMONSTRATION

A. Engage a factory-authorized service representative to train post maintenance personnel to adjust, operate, and maintain switchgear. Refer to Division 01 Section "Demonstration and Training."

1. Train on procedures and schedules for general troubleshooting, servicing, and maintaining equipment and schedules, and for equipment isolation and de-energization procedures.
2. Refer to Article on ARC FLASH TRAINING in Section 260573 “Overcurrent Protective Device Coordination Study” for associated training requirements.
3. Review data in Operation and Maintenance manuals.
4. Schedule training with the Project Director/COR with at least seven days' advance notice.

END OF SECTION 262313

SECTION 262315 - DOUBLE-ENDED SWITCHGEAR

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes metal-enclosed, low-voltage, power circuit-breaker double-ended switchgear rated 1000 V and less for use in ac systems.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety” for facility voltages and safety accessories.
2. **[Division 26 Section on vibration and seismic controls for electrical systems for mounting and anchoring switchgear.]**
3. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash study, ARMS reduction level or alternative means of compliance for worker safety, and arc flash training.
4. Section 260915 “Electrical Power Monitoring.”
5. **[Section 262313 “Paralleling Switchgear.”]**
6. Section 262325 “Power Sequence of Operation.”
7. Section 262412 “Switchboards.”
8. Division 26 Section on fuses for fuses and spare-fuse cabinets.
9. **[Section 263214 “Engine Generators.”]**
10. Section 263237 “Resistive Load Banks.”

1.2 SUBMITTALS

A. Product Data: For each type of switchgear, circuit breaker, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For the double-ended switchgear and related equipment.

1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

   a. Enclosure types and details.
   b. Nameplate legends.
   c. Bus configuration with size and number of conductors in each bus run, including phase, neutral, and ground conductors of main and branch buses.
   d. Current rating of buses.
   e. Short-time and short-circuit current rating of switchgear assembly.
   f. Mimic-bus diagram.

g. Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
h. Overall dimensions of double-ended switchgear.
i. Front and section views of double-ended switchgear.
j. Internal wiring diagrams.
k. Electrical characteristics of equipment, including ampere ratings of buses, maximum short circuit withstand ratings and control voltages.
l. Approximate weight of each section of double-ended switchgear and total weight with information required for design of supports and housekeeping pad.
m. Double-ended switchgear elevation with dimensions including available conduit space for each section of double-ended switchgear, front view shipping splits, mounting details and wiring details.
n. Double-ended switchgear device layouts.
o. An anchor bolt plan with dimensions.
p. Isometric of bussing showing ampacities for vertical and horizontal busses.
q. Bus bracing of each section.
r. Arc flash reduction switch.

2. Wiring Diagrams: Provide required wiring diagrams to indicate required power, signal, and control wiring. Wiring diagrams shall differentiate between manufacturer-installed and field-installed wiring details. In addition, wiring diagrams shall show all required relays, controllers, interlocks, and interface devices needed for proper operation of power distribution system. Refer to other Division 26 Sections for interface requirements with this switchgear.

C. Coordination Drawings: Floor plans showing dimensioned layout, required working clearances, and required area above and around switchgear where pipe and ducts are prohibited. Show double-ended switchgear layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.

D. Field Test Reports: Submit written test reports and include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

E. Manufacturer's field service report.

F. Qualification data for testing agency as required in Article on QUALITY ASSURANCE.

G. Updated mimic-bus diagram reflecting field changes after final double-ended switchgear load connections have been made, for record.

H. Maintenance Data: For the double-ended switchgear and components to include in maintenance manuals. In addition to requirements specified in Division 01 include the following:

1. Routine maintenance requirements for double-ended switchgear and all installed components.
2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
3. Time-current curves, including selectable ranges for each type of overcurrent protective device.

I. Maintenance and Operating Manuals:

1. Contents:

a. Each item of equipment and each system: Include description of unit or system, and component parts. Give function, normal operating characteristics, and limiting conditions. Include performance curves, commercial number of replaceable parts.
b. Provide approved engineering submittals.
c. Provide manufacturer's installation wiring diagrams.
d. Include as-installed color-coded wiring diagrams.
e. Operating procedures: Include start-up, break-in, and routine normal operating instructions and sequences. Include regulation, control, stopping, shut-down, and emergency instruction. Include summer, winter, and any special operating instructions.
f. Maintenance requirements: Include routine procedures and guide for troubleshooting; disassembly, repair and reassembly instructions; and alignment, adjusting, balancing and checking instructions.
g. Include manufacturer's printed installation, operation and maintenance instruction.
h. Provide manufacturer's control diagram for each particular item.
i. Include sequence of operation by controls manufacturer.
j. Provide original manufacturer's parts list, illustration, assembly drawings, and diagrams required for maintenance.
k. Provide list of original manufacturer's spare parts, current prices, and recommended quantities to be maintained in storage.

1.3 OWNERSHIP OF PROPRIETARY MATERIAL

A. Government shall retain all rights to software and passwords used for this project.

B. Government will sign copy of manufacturer’s standard software and firmware licensing agreement as condition of this contract. Such license shall grant use of all programs and application software to Government as defined by manufacturer’s license agreement, but shall protect manufacturer’s rights to disclosure of Trade Secrets contained within such software.

C. Licensing agreement shall not preclude use of software by individuals under contract to Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to Government will be restricted to use on Government’s computers, and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation shall become property of Government.

1.4 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or the National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Source Limitations: Obtain double-ended switchgear**[and all switchgear specified in [Section 262313 "Paralleling Switchgear,"]]** through one source from single manufacturer.

C. Product Options: Drawings indicate size, profiles, and dimensional requirements of double-ended switchgear and are based on specific system indicated. Other manufacturers' products complying with requirements may be considered.

D. Comply with the OBO Electrical Code (NFPA 70 "National Electrical Code" as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

E. Standards: Conform to the following:

1. American National Standards Institute (ANSI):

a. C37.13 Standard for Low-Voltage AC Power Circuit breakers Used in Enclosures
b. C37.16 Switchgear - Low-Voltage Power Circuit Breakers and AC Power Circuit Protectors - Preferred Ratings, Related Requirements, and Application Recommendations
c. C37.20.1 Metal Enclosed Low-Voltage Power Circuit-Breaker Switchgear
d. C37.50 Test Procedures of Low-Voltage AC Power Circuit Breakers Used in Enclosures
e. C37.51 Conformance Test Procedures of Metal-Enclosed Low-Voltage AC Power Circuit Breaker Switchgear Assemblies

2. Underwriters Laboratories, Inc. (UL):

a. 1558 Metal Enclosed Low-Voltage Power Circuit Breaker Switchgear

F. Certification: Provide certificate of compliance to referenced standards from manufacturer of switchgear.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver double-ended switchgear in sections of lengths that can be moved past obstructions in delivery path.

B. Store double-ended switchgear indoors in clean dry space with uniform temperature to prevent condensation. Protect switchgear from exposure to dirt, fumes, water, corrosive substances, and physical damage.

C. If stored in areas subjected to weather, cover double-ended switchgear to provide protection from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside switchgear. Install electric heating (250 W per section) to prevent condensation.

1.6 PROJECT CONDITIONS

A. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchgear, including clearances between all surrounding electrical equipment (clearances based on equipment ratings or manufacturer requirements), and adjacent surfaces and other items. Comply with indicated maximum dimensions.

B. Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:

1. Ambient Temperature: Not exceeding **[40][50][60]** deg C.
2. Altitude: Derate as required if over <altitude> above sea level.
3. Relative humidity: Up to 100 percent non-condensing.
4. Seismic Acceleration.

1.7 COORDINATION

A. Coordinate layout and installation of switchgear and components with other construction, including conduit, piping, equipment, and adjacent surfaces. Maintain required clearances for workspace and equipment access doors and panels.

B. Coordinate size and location of concrete bases.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Six of each type and rating used. Include spares for potential transformer fuses, control power fuses, and fuses.
2. Indicating Lights: Six of each type installed.
3. Plug in Relays: Three of each type used.

4. Touchup Paint: Three containers of paint matching enclosure finish, each 250 mL

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Siemens Energy & Automation, Inc.
2. GE Electrical Distribution & Control.
3. Square D Co./Groupe Schneider NA.
4. Cutler-Hammer, Inc.

2.2 GENERAL

A. Provide low-voltage metal-enclosed double-ended switchgear consisting of stationary structure on and within which shall be mounted power air circuit breaker units, overcurrent and other protective devices, buses, barriers, and devices designed, manufactured and tested in accordance with NEMA SG 5 and all referenced ANSI standards as minimum requirements.

B. Arrange double-ended switchgear for connection to the Site Distribution Voltage incoming line through bottom of gear.

C. Double-ended switchgear shall be indoor type and furnished in single line-up assembly.

D. Power double-ended switchgear from same source; power both ends from either generator source or from utility source. Switchgear shall not be powered by combination of utility and generator source at the same time. Closed transition is not permitted.

E. Circuit breakers shall be minimum of 800-ampere frame.

F. Breakers/feeders with trip ratings at or under 800 ampere shall be switchboard construction. See Division 26 Section on switchboards.

G. Vertical secondary distribution switchgear sections shall align front and rear with depth.

H. Double-ended switchgear shall be complete factory assembled, wired and tested before delivery to site.

I. Place UL labels on required sections of double-ended switchgear in factory before delivery to site.

J. Double-ended switchgear shall be rated for Site Distribution Voltage, with 100 percent neutral.

K. Control wiring within switchgear shall be minimum of 2.5 mm^2 insulated copper; larger conductor sizes, if required to perform intended function, shall be furnished by equipment manufacturer. Conductor insulation shall be suitable for operating temperature of 90 deg C, and shall be one of types approved and listed by NFPA 70 for use in substation construction. Neatly rack and bind control wiring with self-locking plastic ties. Make termination of control wiring for internal and external connections in numbered strips, complete with permanent wire markers on each wire. Connectors used at terminal locations shall be of pressure lug type.

L. Removable rear access panels shall be of hinged type.

M. Completely enclose front with hinged panels covering each breaker, metering, or blank compartment.

N. Provide hinged covers with hinges, latches, and cut-outs where necessary for ventilation, operating mechanism, mechanical trip, and position indication.

O. Each compartment, such as circuit breaker, metering, current transformer, bus and cable compartments of the total assembly shall be completely and totally isolated on top, bottom, except cable compartments, and sides from all other compartments by suitable metal barriers.

P. Arrange separate steel breaker compartments in tiers in each unit section. Provide barrier to divide each unit section vertically into compartments.

Q. Provide engraved nameplates for main, and feeder circuits, including control fuses and indicating lights and instruments. Nameplates shall give item designation, circuit number, name of load servicing, frame ampere rating, sensor ampere rating, and trip ampere rating. Secure nameplates fastened to equipment with screws. Provide white laminated nameplates with black letters engraved, approximately 50 mm by 75 mm with 6 mm high lettering.

R. Provide master nameplate giving double-ended switchgear designation, voltage, ampere rating, bracing, manufacturer's name, identification, reference and serial numbers.

S. Arrange double-ended switchgear for service as indicated on Drawings complete with spares, spaces and circuit protective devices with capacities indicated.

T. Fabricate structure so that extension of double-ended switchgear may be accomplished in future by addition of new cubicles and by simple splice plates on horizontal bus. Where "space" is indicated on Drawings, space shall be completely bussed and provided with breaker draw-out mechanism for future acceptance of breaker and its instrumentation.

U. Installation and connection of switchgear shall not require removal or disassembly of any factory mounted stationary high voltage devices.

V. Provide 10 percent spare circuit breakers installed in switchgear, 20 percent spaces for future breakers, and 20 percent overall spare current carrying capacity for future expansion.

W. Arc Flash Maintenance Reduction Switch (ARMS): Dual parameter sets that enable trip unit, when activated by maintenance personnel, to automatically lower instantaneous setting, and thereby lower available energy in fault condition (commonly referred to as “maintenance mode”); this causes breaker to trip faster when maintenance is being performed in proximity to energized equipment, thus minimizing arc flash dangers. Refer to Section 260573 “Overcurrent Protective Device Coordination Study” for required arc flash levels or alternative means of compliance for worker safety protection.

2.3 ENCLOSURE

A. Enclosure shall be listed under UL-1558 "Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear." Switchgear assembly shall be UL listed and labeled.

B. Completely isolate each breaker compartment from other breaker compartments by grounded metal barriers.

C. To the extent practicable, fabricate each breaker compartment door without ventilation slots for operator safety. If ventilation slots are required, then they shall be located in such a way prevent possibility of metal objects being inserted through them and easily contacting energized parts.

D. Door of each breaker compartment shall remain closed when racking the breaker to any of its three positions (disconnected, test, connected) unless double steel barrier exists between operating personnel and breaker mechanism/live parts which make it safe to operate breaker with outer steel door open.

E. Each section enclosure shall consist of three compartments: Breaker compartment located in the front, bus compartment located in center, and cable compartment located at rear. Isolate breaker compartment and bus compartment from each other by barriers. Each section of the switchgear shall be provided with a thermostatically controlled space heater.

F. Breaker compartment shall contain drawout circuit breaker elements. Active and spare breaker cells shall be complete with circuit breaker, breaker drawout mechanism and all instrumentation.

G. Bus compartment shall contain section riser and the main cross bus.

H. Size cable compartment to accommodate incoming and outgoing cables, including future cables associated with future breakers required within each vertical switchgear section.

I. Mount integral, roll along breaker lifting device on top of distribution switchgear enclosure.

J. All secondary circuit breakers shall be top or bottom fed.

K. Power for space heaters, work lights and convenience receptacles shall be obtained from a transformer with the switchgear.

2.4 FABRICATION

A. Finish: IEEE C37.20.1 “Metal Enclosed Low-Voltage Power Circuit-Breaker Switchgear,” manufacturer's standard gray finish over a rust-inhibiting primer on phosphatizing-treated metal surfaces.

B. Equip circuit-breaker compartments to house drawout-type circuit breakers, and fit with hinged outer doors.

C. Auxiliary Compartments: Match and align with basic switchgear assembly. Include the following:

1. Incoming-line pull sections.
2. Hinged front panels for access to metering, accessory, and blank compartments.

2.5 BUS STRUCTURE

A. Provide bus bars between vertical sections and between compartments. Cable connections are not permitted.

1. Main Phase Bus: Fully rated the entire length of assembly; do not taper.
2. Neutral Bus: 100 percent of phase-bus ampacity. Equip bus with pressure-connector terminations for outgoing circuit neutral conductors..
3. Vertical Section Bus Size: Comply with IEEE C37.20.1, including allowance for spare circuit breakers and spaces for future circuit breakers.
4. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent minimum conductivity, with copper feeder circuit-breaker line connections.
5. Use copper for connecting circuit-breaker line to copper bus.
6. Contact Surfaces of Buses: Silver plated.
7. Feeder Circuit-Breaker Load Terminals: Silver-plated copper bus extensions equipped with pressure connectors for outgoing circuit conductors.
8. Ground Bus: Hard-drawn copper of 98 percent minimum conductivity, with pressure connector for feeder and branch-circuit ground conductors, minimum size 6 mm by 50 mm. Extend entire length of the switchgear.
9. Supports and Bracing for Buses: Adequate strength for indicated short-circuit currents.
10. Neutral bus equipped with pressure-connector terminations for outgoing circuit neutral conductors.
11. Neutral Disconnect Link: Bolted, uninsulated, 6 mm by 50 mm copper bus, arranged to connect neutral bus to ground bus, if required.
12. Facilitate future extensions from either end of main phase, neutral, and ground bus by providing predrilled bolt-holes and connecting links.
13. Bus-Bar Insulation: Individual bus bars wrapped with factory-applied, flame-retardant tape, or vertical and horizontal busses shall be isolated from the cable compartments by glass reinforced polyester barriers.
14. Size busbars to limit temperature rise to 65 deg C above 40 deg C ambient temperature, but shall not exceed 155 amperes per square centimeter.

15. Brace busbars contained in each section to withstand mechanical forces exerted during short circuit conditions. Minimum short circuit bracing shall be 65,000 amperes RMS symmetrical at Site Distribution Voltage.
16. Completely isolate/insulate entire switchgear bus system with insulated nut covers or grounded metal barriers to preclude accidental contact with live busbars while working in outgoing power cable compartment. The only exposed energized parts in rear power cable compartment shall be outgoing feeder connections.
17. A-B-C type bus arrangement, left-to-right, top-to-bottom, and front-to-rear, as viewed from the front, shall be used throughout. Mount main horizontal bus bars with all three phases arranged in same vertical plane. Provide full capacity neutral.
18. Identify busbars in each cubicle, both line and load, with adhesive red letters applied to busbar. This identification shall be in each cubicle, as seen from rear cable compartment for all phases, neutral and ground busses in accordance with A-B-C type bus arrangement defined above.
19. Busbar supports shall be non-carbonizing, non-tracking insulators arranged to provide short circuit bracing of 65,000 amperes symmetrical at Site Distribution Voltage.
20. Provide fire-resistive supports to which cable shall be adequately secured and racked within rear compartment.
21. Segregate buses in separate compartment from breaker and feeder cable compartment.
22. Provide main breaker section with vertical barriers between sections extending all the way to rear.
23. Provide main circuit breaker with horizontal isolation barrier or combination of barriers to completely separate bus line from load bus.
24. Provide black vinyl plastic "mimic bus" on front of switchgear depicting current distribution (flow) through each circuit protective device. Secure bus to switchgear enclosure using screws and nuts.
25. From terminals on load side of breaker compartment, extend insulated bus toward back of board to vertical wiring compartment to avoid cables threaded through line bus bars.

2.6 COMPONENTS

A. Instrument Transformers: Comply with IEEE C57.13.

1. Potential Transformers: Secondary-voltage rating of Utilization Voltage or Control Voltage, and NEMA accuracy class of 0.3 with burdens of W, X, and Y.
2. Current Transformers: Ratios as indicated; burden and accuracy class suitable for connected relays, meters, and instruments.

B. Multifunction Digital-Metering Monitor: UL-listed or -recognized, microprocessor-based unit suitable for three- or four-wire systems and with the following features:

1. Inputs from sensors or 5-A current-transformer secondaries, and potential terminals rated to 600 V.
2. Switch-selectable digital display of the following:

a. Phase Currents, Each Phase: Plus or minus 1 percent.
b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
d. Three-Phase Real Power: Plus or minus 2 percent.
e. Three-Phase Reactive Power: Plus or minus 2 percent.
f. Power Factor: Plus or minus 2 percent.
g. Frequency: Plus or minus 0.5 percent.
h. Integrated Demand, with Demand Interval Selectable from 5 to 60 Minutes: Plus or minus 2 percent.

3. Mounting: Display and control unit flush or semi-flush mounted in instrument compartment door.
4. Unit shall have built-in communications capability which allows communication to the Electrical Power Monitoring System. It shall be possible to monitor and trend electrical demand and energy use, as well as other features specified above in switch-selectable digital display, through the Electrical Power Monitoring System.
5. Provide unit at each circuit breaker (mains, ties and feeders).

C. Relays: Comply with IEEE C37.90, types and settings as indicated, with test blocks and plugs.

D. [Fungus Proofing: Permanent fungicidal treatment for switchgear interior, including instruments and instrument transformers.]

E. Provide controllers or relays required for implementation of applicable sequence scenario in Section 262325 “Power Sequence of Operation.” Relays shall operate on DC control voltage. "Sequence of operation" involves start and stop of multiple generators and open and close of multiple circuit breakers. Provide power system controller for controlling essential bus main breaker, utility bus main breaker, and tie breaker between essential and utility buses. Controller shall use programmable logic controller (PLC); electromagnetic control relays are not permitted. Provide duplicate “hot standby” PLC in same enclosure as primary. Changeover shall require only moving keyed wiring connects and resetting processor. Provide DC power system, including required batteries, charger, cabinet, and other accessories needed to control all electrically operated circuit breakers for implementation of "sequence of operation" as described in this Section. Provide DC power from this system to switchgear as needed to operate all circuit breakers.

F. Upon loss of utility power on incoming side of circuit breaker CB1, circuit breaker CB1 shall trip after adjustable time delay (0-30 seconds); set at 15 seconds and field verify setting. Time delay setting shall be higher than time required for generator to come on line and be ready to accept loads. Loss of voltage sensing is required to comply with the Sequence of Operation as defined in applicable Article in Section 262325 “Power Sequence of Operation.”

G. Upon loss of utility power on incoming side of circuit breaker CB3, circuit breaker CB3 shall trip after adjustable time delay (0-30 seconds); set at 15 seconds and field verify setting. Time delay setting shall be higher than time required for generator to come on line and be ready to accept loads. Loss of voltage sensing is required to comply with applicable Article in Section 262325 “Power Sequence of Operation.”

2.7 CIRCUIT BREAKERS

A. Description: Comply with IEEE C37.13 “Standard for Low-Voltage AC Power Circuit Breakers Used in Enclosures.”

B. Main, tie and feeder breakers shall be drawout type capable of interrupting available short circuit.

C. Main, tie and feeder breakers shall be rated for 100 percent of their continuous ampere rating.

D. Main, tie and feeder breakers shall be rated for minimum of 65,000 amperes symmetrical.

E. Breakers trip mechanism shall be of solid state trip as specified for main breakers and feeder breakers.

F. Breakers shall be UL listed for application in intended enclosure.

G. Provide breakers with true, stored energy mechanism providing maximum of 6 cycle closing. Energy required for closing breaker shall be completely stored and held in readiness pending release to close action. Mechanism shall be charged by constant force manual charging lever. Breaker shall have multiple charge/close provisions providing the following possible sequence: Charge - close - recharge - open - close - open. As safety feature, provisions shall be available to manually discharge stored energy without closing breaker.

H. Breaker control face plate shall include color coded visual indicators to indicate contact "open" and "closed" positions, and to indicate mechanism "charge" and "discharged" positions. Provide local control pushbuttons for opening the breaker.

I. Provide breakers with self-aligning fingers to engage line and load primary disconnects. Drawout mechanism shall firmly support breaker from fully connected to fully disconnected position.

J. Provide selective override circuit on breakers having short time adjustments that will allow breaker to be applied at its maximum interrupting rating while providing full selectivity up to its rms symmetrical short-time rating. This selective override circuit shall allow breaker to ride through fully offset (asymmetrical) fault equal to its rms symmetrical short-time rating in system having an X/R ratio of 6.6 with maximum single phase peak current of 2.3 times the rms symmetrical short time rating.

K. Locate instrumentation required for each breaker in one place in compartment to eliminate cross-hinge wiring. Instrumentation shall include control fuse blocks, blown fuse lock-out relays, etc., as required for breaker operation.

L. Provide primary disconnect shutter to form protective barrier in front of energized primary disconnects when breaker is moved to its disconnected position.

M. Insulate and support vertical buses provide insulation between adjacent bus bars.

N. Main and Tie Breakers:

1. Breakers shall be electrically operated, sized as shown on the drawings. Control power shall be provided from DC power system.
2. Breakers shall have high endurance characteristics as listed in ANSI Standards. Breakers shall be equipped with field replaceable contacts.
3. Provide complete system selective coordination using single, self-contained programmer having harmonic restraint characteristics with the following nine function solid state trip mechanism:

    a. Current setting.
    b. Long time pickup.
    c. Long time delay.
    d. Short time pickup.
    e. Short time delay (l^2t).
    f. Ground fault pick-up.
    g. Ground fault delay (l^2t).
    h. Fault trip annunciator.

4. Make adjustments of solid state trip mechanism using dial type switches as part of solid state trip mechanism described in complete system selective coordination above.
5. Provide fault trip annunciator with up to three visual indicators to indicate automatic trip point mode of breaker:

    a. Overload.
    b. Short circuit.
    c. Ground fault.

6. Provide ground fault protection as part of solid state trip mechanism.
7. Breakers shall have adjustable trip setting.
8. Provide main breaker with phase failure/phase reverse relay.

O. Feeder Breakers:

1. Breakers shall be 100 percent rated.
2. Breakers shall be manually operated, sized as indicated on Drawings.
3. Equip breakers with nine function solid state trip mechanism with the following adjustments:

    a. Current setting.
    b. Long time pickup.
    c. Long time delay.
    d. Short time pickup.
    e. Short time delay (l^2t).
    f. High range instantaneous pick-up.
    g. Ground fault pick-up.
    h. Ground fault delay (l^2t).
    i. Fault trip annunciator.

4. Make adjustments of solid state trip mechanism using dial type switches as part of solid state trip mechanism described in complete system selective coordination above.
5. Provide fault trip annunciator with up to three visual indicators to indicate automatic tripping mode of breaker:

    a. Overload.
    b. Short circuit.
    c. Ground fault.

6. Provide ground fault protection as part of solid state trip mechanism.
7. Breakers of same frame shall be interchangeable.
8. Breakers 800 amperes frame shall have adjustable trip setting between 100 amperes and 800 amperes.
9. Breakers 1600 amperes frame shall have adjustable trip setting between 300 amperes and 1600 amperes.

P. Auxiliary Contacts: For interlocking or remote indication of circuit-breaker position, with spare auxiliary switches and other auxiliary switches required for normal circuit-breaker operation, provide quantity indicated. Each consists of two Type "a" and two Type "b" stages (contacts) wired through secondary disconnect devices to terminal block in stationary housing.

Q. Drawout Features: Equip circuit-breaker mounting assembly with racking mechanism to position circuit breaker and hold it rigidly in connected, test, and disconnected positions. Include the following features:

1. Interlocks: Prevent movement of circuit breaker to or from connected position when it is closed, and prevent closure of circuit breaker unless it is in connected, test, or disconnected position.
2. Circuit-Breaker Positioning: An open circuit breaker may be racked to or from connected, test, and disconnected positions only with associated compartment door closed, unless live parts are covered by full dead-front shield. Open circuit breaker may be manually withdrawn to position for removal from structure with door open. Status for connection devices for different positions includes the following:

    a. Test Position: Primary disconnect devices disengaged, and secondary disconnect devices and ground contact engaged.
    b. Disconnected Position: Primary and secondary devices and ground contact disengaged.

3. Provide trip/close control switch for circuit breakers in accordance with the Section 262325 “Sequence of Operation.”
4. Provide single “HAND/AUTO” selector switch.
5. When circuit breakers are in the test position, operator shall be able to open and close circuit breakers through their associated trip/close control switch, when position of “HAND/AUTO” selector switch is in “HAND” mode only.
6. When circuit breakers are in connect position, operator shall be able to open and close circuit breakers through their associated trip/close control switch only when operating in “HAND” mode. Operator shall not be able to open or close circuit breakers when operating

in "AUTO" mode. Circuit breakers shall be capable of opening and closing automatically when "HAND/AUTO" selector switch is in "AUTO" mode.

a. [For close operation in the "HAND" mode refer to Article on SEQUENCE OF OPERATION: UTILITY/ATS.]

R. Include provisions for installing at least three padlocks on each circuit breaker to secure its enclosure and prevent movement of drawout mechanism.

S. Electric Trip/Close Control Switch: One for each electrically operated circuit breaker.

T. Indicating Lights: To indicate circuit breaker is open or closed, for all air circuit breakers (green for open, red for closed).

2.8 DC POWER SYSTEM

A. General:

1. Provide 48 VDC power system for control power required for all switchgear device operations.
2. System shall consist of required number of batteries, battery cabinet, battery charger(s) and other components required for proper operation of this system.

B. Battery Charger:

1. Battery charger shall be voltage-regulated type.
2. Size battery charger with ampere rating sufficient to meet simultaneous demand of required switchgear loads and self-discharge losses of batteries.

C. Cabinet:

1. Mount components in cabinet, with footprint approximately 0.6 m deep by 1.5 m high.
2. Access to the cabinet shall be from front, using hinged doors.

D. Batteries:

1. Battery Type: Batteries shall be of sealed, maintenance free lead acid type.
2. Expected life: 10 year life when operated and maintained within specifications.
3. Nominal Battery String Voltage: 48 VDC
4. Final Discharge Voltage: 42 VDC (1.75 volts per cell).
5. Nominal Float Voltage: 54 VDC (2.25 volts per cell)
6. Battery Recharge Time: Charger shall have capacity to recharge batteries from 10 percent to 90 percent capacity in 12 hours.
7. Battery Circuit Protection: Via fuse or circuit breaker.
8. Nominal Battery Ampere Hour (A.H.) Capacity: **[100][XX]** A.H. **[sized to provide proper operation of the gear for at least 48 hours with the anticipated number of breaker operations likely to occur with [YY] commercial power losses and returns.]**

2.9 ACCESSORIES

A. Accessory Set: Furnish tools and miscellaneous items required for circuit-breaker and switchgear test, inspection, maintenance, and operation.

1. Racking handle to manually move circuit breaker between connected and disconnected positions.
2. Portable test set for testing all functions of circuit-breaker, solid-state trip devices without removal from switchgear.
3. Relay and meter test plugs suitable for testing switchgear meters and switchgear class relays.

B. Circuit-Breaker Removal Apparatus: Overhead-circuit-breaker lifting device, track mounted at top front of switchgear and complete with hoist and lifting yokes matching each size of drawout circuit breaker installed.

2.10 IDENTIFICATION

A. Mimic Bus: Continuous mimic bus, arranged in single-line diagram format, using symbols and lettered designations consistent with approved mimic-bus diagram.

1. Mimic-bus segments coordinated with devices in switchgear sections to which applied, to produce a concise visual presentation of principal switchgear components and connections.
2. Medium: Painted graphics.
3. Color: Contrasting with factory-finish background.

2.11 FACTORY TESTING

A. Perform factory test of switchgear.

1. Perform each case identified in applicable Articles in Section 262325 “Power Sequence of Operation.”
2. All test results shall be documented including all failed tests.
3. Re-test all failed tests until successful test is achieved.
4. Factory testing may be witnessed by the Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. Government representative may perform factory inspection at that time as well.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive switchgear for compliance with installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Mounting of switchgear:

1. Unit shall be bolted directly to housekeeping pad.
2. Concrete Base: Install in accordance with Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”

B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, brackets, and temporary blocking of moving parts from switchgear units and components.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section on identification for electrical systems.

B. Operating Instructions: Printed basic instructions for switchgear, including control and key-interlock sequences and emergency procedures.

3.4 CONNECTIONS

A. Install equipment grounding conductors for switchgear with ground continuity to main electrical ground bus.

B. Tighten bus joints, electrical connectors, and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.5 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each switchgear bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Testing: After installing switchgear and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

1. Perform each electrical test and visual and mechanical inspection in accordance with InterNational Electrical Testing Association (NETA) “Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems (ATS).” Certify compliance

with test parameters. Perform NETA ATS tests and inspections for each of the following NETA ATS categories:

a. Switchgear: Perform tests and inspections stated in NETA ATS, Section 7.1.
b. Circuit Breakers: Perform tests and inspections stated in NETA ATS, Section 7.6.
c. Protective Relays: Perform tests and inspections stated in NETA ATS, Section 7.9.
d. Instrument Transformers: Perform tests and inspections stated in NETA ATS, Section 7.10.
e. Metering and Instrumentation: Perform tests and inspections stated in NETA ATS, Section 7.11.
f. Ground-Fault Systems: Perform tests and inspections stated in NETA ATS, Section 7.14.

2. Correct malfunctioning units on-site, where possible, and retest as specified above until compliance is demonstrated,

C. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform an infrared scan of each switchgear. Remove front and rear panels so joints and connections are accessible to portable scanner. Testing shall include connections and inductive heating of cabling at entrances or where racked in trenches.

1. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
2. Record of Infrared Scanning: Prepare a certified report that identifies switchgear checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Set field-adjustable, protective-relay trip characteristics.

3.7 CLEANING

A. Upon completion of installation, inspect interior and exterior of switchgear. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

3.8 PROTECTION

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions.

3.9 STARTUP SERVICES

A. Engage a factory-authorized service representative to perform startup service.

B. Verify that switchgear is installed and connected according to Contract Documents.

C. Verify that electrical control wiring installation complies with manufacturer's submittal by means of point-to-point continuity testing. Verify that wiring installation complies with requirements in Division 26 Sections.

D. Complete installation and startup checks according to manufacturer's written instructions.

3.10 DEMONSTRATION

A. Engage a factory-authorized service representative to train Government maintenance personnel to adjust, operate, and maintain switchgear. Refer to Division 01 Section "Demonstration and Training."

1. Train post maintenance personnel on procedures and schedules for general troubleshooting, servicing, and maintaining equipment and schedules, and for equipment isolation and de-energizing procedures.
2. Demonstrate compliance with the requirements of Section 262325 "Sequence of Operation."
3. Refer to Article on ARC FLASH TRAINING in Section 260573 "Overcurrent Protective Device Coordination Study" for associated training requirements.
4. Review data in maintenance manuals.
5. Schedule training with the Project Director/COR with at least seven days' advance notice.

END OF SECTION 262315

SECTION 262325 - POWER SEQUENCE OF OPERATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes metal-enclosed, low-voltage, power circuit-breaker double-ended switchgear rated 1000 V and less for use in ac systems.

B. Related Sections include the following:

1. Section 142105 “Electric Traction Elevators.”
2. Section 230905 “Instrumentation and Controls for HVAC” for building automation system (BAS) for mechanical systems.
3. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety” for facility voltages and safety accessories.
4. **[Division 26 Section on vibration and seismic controls for electrical systems for mounting and anchoring switchgear.]**
5. Section 260573 “Overcurrent Protective Device Coordination Study” for arc flash study, ARMS reduction level or alternative means of compliance for worker safety, and arc flash training.
6. Section 260915 “Electrical Power Monitoring.”
7. Section 262300 “Low-Voltage Switchgear.”
8. Section 262313 “Paralleling Switchgear.”
9. Section 262315 “Double-Ended Switchgear.”
10. Section 262412 “Switchboards.”
11. Division 26 Section on fuses for fuses and spare-fuse cabinets.
12. Section 263214 “Engine Generators.”
13. Section 263237 “Resistive Load Banks.”
14. Section 263600 “Transfer Switches.”

1.2 SUBMITTALS

A. Operation Data: For sequence indicated, include manufacturers' technical data on features, performance, operation, timing, and control.

B. Shop Drawings: For sequence of operation and controller.

1. Wiring Diagrams: Provide required wiring diagrams to indicate signal, and control wiring. Wiring diagrams shall differentiate between manufacturer-installed and field-installed wiring details. In addition, wiring diagrams shall show all required relays and interface devices needed for proper operation of power distribution system. Refer to other Division 26 Sections for interface requirements with this switchgear.

C. Field Test Reports: Submit written test reports and include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

D. Manufacturer's field service report.

E. Qualification data for testing agency as required in Article on QUALITY ASSURANCE.

F. Maintenance Data: For sequence of operation, include maintenance manuals for scenarios indicated and for testing and operation procedures. In addition to requirements specified in Division 01, include the following:

G. Maintenance and Operating Manuals:

1. Contents:

a. Routine testing requirements for sequence of operation and all installed components.
b. Operating procedures: Include start-up, and routine normal operating instructions and sequences. Include regulation, control, stopping, shut-down, and emergency instruction. Include summer, winter, and any special operating instructions.
c. Include manufacturer's printed operation and maintenance instruction.
d. Provide manufacturer's control diagram for each particular item.

1.3 OWNERSHIP OF PROPRIETARY MATERIAL

A. Government shall retain all rights to software and passwords used for this project.

B. All project developed software, files and documentation shall become property of Government.

1.4 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.5 PROJECT CONDITIONS

A. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchgear, including clearances between double-ended switchgear, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

1.6 COORDINATION

A. Coordinate sequence of operation with all installed electrical equipment and components.

B. A pre-transfer contact closure signal (user selectable from 30 to 120 seconds) shall be sent to the elevator controllers to allow the elevators to be parked with doors open prior to switching from standby power to normal power.

1.7 LOSS OF POWER FROM UTILITY COMPANY

A. Definition: It is considered to be a loss of power from utility company not only if the power is interrupted, but also if the power is abnormal (i.e., any of the power parameters are outside the limits for the time periods as specified below).

1. Undervoltage (dropout): < 90 percent for 5 seconds (adjustable at least 1 to 10 seconds).
2. Overvoltage (pickup): > 105 percent for 5 seconds (adjustable 1 to 10 seconds).
3. Under/over frequency: > +/- 3 percent for 5 seconds (adjustable 1 to 10 seconds).
4. Reverse Phase: Instantaneous trip (no intentional delay).
5. Loss of phase: >= 5 seconds (adjustable at least 1 to 10 seconds).

B. Generator startup: After loss of power from utility company, generator start signal(s) shall be given. **[Normal source stays connected for ATS.]**Main circuit breaker trips open at the end of any condition timeout.

1. Generators must be up to 90 percent frequency and voltage before supplying loads.
2. Individual generator shall be powering loads within 10 seconds.
3. Multiple paralleled generators shall be supplying loads as soon as possible within 30 seconds.

1.8 POWER FROM UTILITY COMPANY IS RESTORED

A. Definition: It is considered to be a return of normal power (after being on standby power) when all the conditions below have been met.

1. Undervoltage: > 95 percent for 10 minutes (adjustable 1 to 60 minutes).
2. Overvoltage: < 105 percent for 10 minutes (adjustable 1 to 60 minutes).
3. Under/over frequency: within +/- 1 percent for 10 minutes (adjustable 1 to 60 minutes).
4. Restoration of phase: Proper 3-phase operation has been restored for 10 minutes (adjustable 1 to 60 minutes).

B. Transfer to Normal Power: After timeout of any condition above, the transfer sequence back to Normal Utility source shall be started. Transfer shall have a neutral position (open circuit) time delay of 3 seconds (adjustable 1 to 10 seconds) to allow load-side fields to collapse and minimize system switching surges or out-of-phase transition effects.

C. Cooldown: Generator cooldown period shall be 5 minutes (adjustable 1 to 30 minutes).

PART 2 - PRODUCTS

2.1 SEQUENCE OF OPERATION: UTILITY/ATS

A. The following cases No. 1 through No. 10 shall be implemented when circuit breakers “CB1”, “CB2”, “CB3”, “CB4” and “CBM” are operating in the “AUTO” mode. Circuit breakers “CB1”, “CB2” and “CB3” shall be electrically interlocked as such that tie circuit breaker “CB2” shall close only if circuit breakers “CB1” or “CB3” are open. Refer to one-line diagram for designation of circuit breakers, Generators and transformers.

B. Case No. 1: Normal power is available from utility company.

1. CBM (SWG1 main breaker) is closed.
2. CB1 (essential bus main breaker) shall be in closed position.
3. CB2 (tie breaker between essential and utility buses) shall be in open position.
4. CB3 (utility bus main breaker) shall be in closed position.
5. CB4 (breaker between utility bus No. 1 and HVAC bus) shall be in closed position.

C. The following cases No. 2 through No. 10 shall be implemented Monday through Friday from 6:00am to 8:00pm. It shall be possible to adjust time schedule if required.

D. Case No. 2: In the event of loss of power from utility company, or failure of any of medium voltage feeders or service transformer or automatic voltage regulator, and both E and U are available, the following sequence shall be initiated:

1. CBM shall open.
2. Generator "E" (essential) shall start automatically.
3. Generator "U" (utility) shall start automatically.
4. ATS-E (essential) transfers service to E.
5. ATS-U (utility) transfers service to U.
6. Power service to essential and utility distribution switchgear is restored.
7. Generators E and U shall be ready to accept loads in less than 10 seconds.

E. Case No. 3: When power from utility company is restored or when medium voltage feeder or service transformer or automatic voltage regulator is back in service (Case No. 2), the following sequence shall be initiated:

1. CBM shall close.
2. CB1 shall remain in closed position.
3. CB2 shall remain in open position.
4. CB3 shall remain in closed position.
5. CB4 shall remain in closed position.
6. ATS-E shall transfer service back to utility supply, from Generator E.
7. ATS-U shall transfer service back to utility supply, from Generator U.
8. Generators E and U shall continue to run (cool down) for period of time as specified in Section 263214, “Engine Generators” before shutting down.

F. Case No. 4: In the event of loss of power from utility company, or failure of any of medium voltage feeders or service transformer or automatic voltage regulator, and Generator E is available, but Generator U is not available, the following sequence shall be initiated:

1. CBM shall open.
2. Generator E shall start automatically.
3. ATS-E shall transfer service to E.
4. CB1 shall remain in closed position.
5. CB3 shall open, after specified time delay. (Refer to Article on COMPONENTS).
6. CB4 shall open.
7. CB2 shall close, after both CB3 and CB4 are open.
8. ATS-U will not transfer service to unavailable source.
9. Generator E shall be ready to accept loads in less than 10 seconds.

G. Case No. 5: In the event that Generator U becomes available after implementation of sequence of operation listed under Case No. 4, the following sequence shall be initiated:

1. CBM is open.
2. Generator U shall start automatically.
3. ATS-U shall transfer service to U.
4. CB2 shall open, after detection of voltage on line side of CB3.
5. CB3 shall close, after CB2 is open.
6. CB4 shall close.
7. Generator U shall be ready to accept loads in less than 10 seconds.

H. Case No. 6: When power from utility company is restored or when the medium voltage feeder or service transformer or automatic voltage regulator is back in service (Case No. 4), the following sequence shall be initiated:

1. After specified time delay, CBM shall close.
2. CB1 shall remain in closed position.
3. ATS-U shall transfer service back to utility supply, from Generator U, if required.
4. ATS-E shall transfer service back to utility supply, from Generator E.
5. CB2 shall open, after detection of voltage on line side of CB3.
6. CB3 shall close, after CB2 is open.
7. CB4 shall close.
8. Generators E shall continue to run (cool down) for period of time as specified in Section 263214 ”Engine Generators” before shutting down.

I. Case No. 7: In the event of loss of power from utility company, or failure of any of medium voltage feeders or service transformer or automatic voltage regulator, and Generator E is not available, but Generator U is available, the following sequence shall be initiated:

1. CBM shall open.
2. Generator U shall start automatically.
3. ATS-U shall transfer service to Generator U.
4. CB3 shall remain in closed position.
5. CB1 shall open, after specified time delay.

6. CB4 shall open.
7. CB2 shall close, after both CB1 and CB4 are open.
8. ATS-E will not transfer service to unavailable source.
9. Generator U shall be ready to accept loads in less than 10 seconds.

J. Case No. 8: In the event that Generator E becomes available after implementation of sequence of operation listed under Case No. 7, the following sequence shall be initiated:

1. CBM is open.
2. Generator E shall start automatically.
3. ATS-E shall transfer service to E.
4. CB2 shall open, after detection of voltage on line side of CB1.
5. CB1 shall close, after CB2 is open.
6. CB4 shall close.
7. Generator E shall be ready to accept loads in less than 10 seconds.

K. Case No. 9: When power from utility company is restored or when medium voltage feeder or service transformer or automatic voltage regulator is back in service (Case No. 7), the following sequence shall be initiated:

1. CBM shall close.
2. CB3 shall remain in closed position.
3. ATS-E shall transfer service back to utility supply, from Generator E, if required.
4. ATS-U shall transfer service back to utility supply, from Generator U.
5. CB2 shall open, after detection of voltage on line side of CB1.
6. CB1 shall close, after CB2 is open.
7. CB4 shall close.
8. Generators U shall continue to run (cool down) for period of time as specified in this Section before shutting down.

L. Case No. 10: When power from utility company is restored or when medium voltage feeder or service transformer or automatic voltage regulator is back in service (Case No. 5 and No. 8), the following sequence shall be initiated:

1. After specified time delay, CBM shall close.
2. CB1 shall remain in closed position.
3. CB2 shall remain in open position.
4. CB3 shall remain in closed position.
5. CB4 shall remain in closed position.
6. ATS-E shall transfer service back to utility supply, from Generator E.
7. ATS-U shall transfer service back to utility supply, from Generator U.
8. Generators E and U shall continue to run (cool down) for period of time as specified in Section 263214 ”Engine Generators” before shutting down.

M. The following Cases No. 11 through No. 15 shall be implemented Monday through Friday from 8:00pm to 6:00am and Saturday and Sunday. It shall be possible to adjust time schedule if required.

N. Case No. 11: In the event of loss of power from utility company, or failure of any of medium voltage feeders or service transformer or automatic voltage regulator, and both Generators E and U are available, the following sequence shall be initiated:

1. CBM shall open.
2. CB1 shall remain in closed position.
3. Generator E (essential) shall start automatically.
4. ATS-E (essential) shall transfer service to Generator E.
5. CB3 shall open, after specified time delay. (Refer to Article on COMPONENTS).
6. CB2 shall close, after CB3 is open.
7. The loads connected to Generator E shall be continuously monitored. It shall be possible, if required, for operator to manually connect load bank to Generator with required load steps needed to ensure that Generator is at least loaded to 50 percent of its rating.
8. ATS-U (utility) shall not transfer service to Generator U.
9. Power service to essential and utility distribution switchgear is restored.
10. Generator "E" shall be ready to accept loads in less than 10 seconds.

O. Case No. 12: When power from utility company is restored or when medium voltage feeder or service transformer or automatic voltage regulator is back in service (Case No. 11), the following sequence shall be initiated:

1. After specified time delay, CBM shall close.
2. CB1 shall remain in closed position.
3. CB2 shall open, after detection of voltage on line side of CB3.
4. CB3 shall close, after CB2 is open.
5. CB4 shall remain in closed position.
6. ATS-E shall transfer service back to utility supply, from Generator E.
7. Power service to essential and utility distribution switchgear is restored.
8. Load bank, if connected, shall be disconnected.
9. Generator E shall continue to run (cool down) for period of time as specified in Section 263214 “Engine Generators” before shutting down.

P. Case No. 13: In the event of loss of power from utility company, or failure of any of medium voltage feeders or service transformer or automatic voltage regulator, and Generator E is not available, but Generator U is available, the following sequence shall be initiated:

1. CBM shall open.
2. CB3 shall remain in closed position.
3. Generator U shall start automatically.
4. ATS-U (utility) shall transfer service to Generator U.
5. CB1 shall open, after specified time delay; refer to Article on COMPONENTS.
6. CB4 shall remain in closed position.
7. CB2 shall close, after CB1 is open.
8. The loads connected to Generator U shall be continuously monitored. It shall be possible, if required, for operator to manually connect load bank to Generator with required load steps needed to ensure that Generator is at least loaded to 50 percent of its rating.
9. ATS-E shall not transfer service to E.
10. Power service to essential and utility distribution switchgear is restored.

11. Generator U shall be ready to accept loads in less than 10 seconds.

Q. Case No. 14: In the event that Generator E becomes available after implementation of sequence of operation listed under Case No. 13, no changes to sequence of operation shall be made.

R. Case No. 15: When power from utility company is restored or when medium voltage feeder or service transformer or automatic voltage regulator is back in service (Case No. 13), the following sequence shall be initiated:

1. CBM shall close.
2. CB3 shall remain in closed position.
3. CB2 shall open, after detection of voltage on line side of CB1.
4. CB1 shall close, after CB2 is open.
5. CB4 shall remain in closed position.
6. ATS-U shall transfer service back to utility supply, from Generator U.
7. Power service to essential and utility distribution switchgear is restored.
8. Generator U shall continue to run (cool down) for period of time as specified in Section 263214 “Engine Generators” before shutting down.

S. The following cases No. 16 through No. 26 shall be implemented when circuit breakers CB1 or CB2 or CB3 are not operating under “AUTO” mode and as such ‘HAND” mode will have to be implemented, and during Monday through Friday from 6:00am to 8:00pm. It shall be possible to adjust time schedule if required. Circuit breakers CB1, CB2 and CB3 shall be electrically interlocked as such that tie circuit breaker CB2 shall close only if circuit breakers CB1 or CB3 are open.

T. Case No. 16: When utility or Generator power is available at line side of circuit breakers CB1 and CB3, but two breakers not being able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Trip open CB2 through trip/close control switch, if it is closed.
3. Close circuit breakers CB1 and CB3 through trip/close control switch.
4. CB4 shall remain closed.

U. Case No. 17: When utility power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB1 is not being able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. CB2 shall remain in open position.
3. CB4 shall remain in closed position.
4. Close CB1 through trip/close control switch.
5. Close CB3 through trip/close control switch.

V. Case No. 18: When utility power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB1 is not able to close due to malfunction in circuit breaker and "AUTO"

functions are not operational due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Close CB3 through trip/close control switch.
3. Trip open CB4 through trip/close control switch.
4. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
5. Close CB4 through trip/close control switch.

W. Case No. 19: When utility power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB3 is not being able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. CB2 shall remain in open position.
3. CB4 shall remain in closed position.
4. Close CB1 through trip/close control switch.
5. Close CB3 through trip/close control switch.

X. Case No. 20: When utility power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB3 is not able to close due to malfunction in circuit breaker and "AUTO" functions are not operational due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Close CB1 through trip/close control switch.
3. Trip open CB4 through trip/close control switch.
4. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
5. Close CB4 through trip/close control switch.

Y. Case No. 21: When Generator power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB1 is not able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated.

1. Switch the selector switch to “HAND” mode.
2. CB2 shall remain in open position.
3. CB4 shall remain in closed position.
4. Close CB1 through trip/close control switch.
5. Close CB3 through trip/close control switch.

Z. Case No. 22: When Generator power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB1 is not able to close due to malfunction in circuit breaker and "AUTO" functions are not operational due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Close CB3 through trip/close control switch.
3. Trip open CB4 through trip/close control switch.

4. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
5. CB4 shall remain open.

AA. Case No. 23: When there is no power at line side of circuit breaker CB1 due to utility power not being available, E fails to start and power transfer scheme fails to be activated in “AUTO” mode, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Trip open CB1 through trip/close control switch if it is closed.
3. Close CB3 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
6. CB4 shall remain open.

BB. Case No. 24: When Generator power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB3 is not able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. CB2 shall remain in open position.
3. CB4 shall remain in close position.
4. Close CB1 through trip/close control switch.
5. Close CB3 through trip/close control switch.

CC. Case No. 25: When Generator power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB3 is not able to close due to malfunction in circuit breaker and "AUTO" functions are not operational due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Close CB1 through trip/close control switch.
3. Trip open CB4 through trip/close control switch.
4. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
5. CB4 shall remain open.

DD. Case No. 26: When there is no power on line side of circuit breaker CB3 due to utility power not being available, U fails to start and power transfer scheme fails to be activated in “AUTO” mode, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Trip open CB3 through trip/close control switch if it is closed.
3. Close CB1 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
6. CB4 shall remain open.

EE. The following cases No. 27 through 38 shall be implemented when circuit breakers CB1 or CB2 or CB3 are not operating under “AUTO” mode and as such ‘HAND” mode will have to be

implemented, and during Monday through Friday from 8:00pm to 6:00am and on Saturday and Sunday. It shall be possible to adjust time schedule if required. Circuit breakers “CB1”, “CB2” and “CB3” shall be electrically interlocked as such that tie circuit breaker “CB2” shall close only if circuit breakers “CB1” or “CB3” are open.

FF. Case No. 27: When utility power is available at line side of circuit breakers CB1 and CB3 but two breakers are not able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Trip open CB2 through trip/close control switch, if it is closed.
3. Close breakers CB1 and CB3 using trip/close control switch.
4. CB4 shall remain closed.

GG. Case No. 28: When utility power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB1 is not being able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Trip open CB2 through trip/close control switch, if it is closed.
3. CB4 shall remain in closed position.
4. Close CB1 using trip/close control switch.
5. Close CB3 using trip/close control switch.

HH. Case No. 29: When utility power is available at line side of circuit breakers CB1 and CB3, but circuit breaker CB1 is not able to close due to malfunction in circuit breaker and “AUTO” functions are not operational due to malfunction in automatic control scheme.

1. Switch the selector switch to “HAND” mode.
2. Close CB3 through trip/close control switch.
3. Trip open CB4 through trip/close control switch.
4. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
5. Close CB4 through trip/close control switch.

II. Case No. 30: When utility power is available at line side of circuit breakers CB1 and CB3 but circuit breaker CB3 is not able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Trip open CB2 through trip/close control switch, if it is closed.
3. CB4 shall remain in closed position.
4. Close CB1 through trip/close control switch.
5. Close CB3 through trip/close control switch.

JJ. Case No. 31: When utility power is available at line side of circuit breakers CB1 and CB3 but circuit breaker CB3 is not able to close due to malfunction in circuit breaker and “AUTO” functions are not operational due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Close CB1 through trip/close control switch.
3. Trip open CB4 through trip/close control switch.
4. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
5. Close CB4 through trip/close control switch.

KK. Case No. 32: When Generator power (E) is available at line side of circuit breaker CB1, but circuit breaker CB1 is not able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Close CB1 through trip/close control switch.
3. Trip open CB3 through trip/close control switch.
4. Close CB2 through trip/close control switch.
5. Close CB4 through trip/close control switch.

LL. Case No. 33: When Generator power is available at line side of circuit breaker CB1, but circuit breaker CB1 is not able to close due to malfunction in circuit breaker and "AUTO" functions are not operational due to malfunction in automatic control scheme.

1. Switch the selector switch to "HAND" mode.
2. Trip open CB1 through trip/close control switch.
3. Close CB3 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
6. Close CB4 through trip/close control switch.

MM. Case No. 34: When there is no power at line side of circuit breaker CB1 due to utility power not being available, E fails to start and power transfer scheme fails to be activated in “AUTO” mode, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Trip open CB1 through trip/close control switch if it is closed.
3. Close CB3 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
6. Close CB4 through trip/close control switch.

NN. Case No. 35: When Generator power (U) is available at line side of circuit breaker CB3, but circuit breaker CB3 is not able to close under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to “HAND” mode.
2. Close CB3 through trip/close control switch.
3. Trip open CB1 through trip/close control switch.
4. Close CB2 through trip/close control switch.
5. Close CB4 through trip/close control switch.

OO. Case No. 36: When Generator power is available at line side of circuit breaker CB3, but circuit breaker CB3 is not able to close due to malfunction in circuit breaker and "AUTO" functions are not operational due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Trip open CB3 through trip/close control switch.
3. Close CB1 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
6. Close CB4 through trip/close control switch.

PP. Case No. 37: When there is no power at line side of circuit breaker CB3 due to utility power not being available, U fails to start and power transfer scheme fails to be activated in “AUTO” mode, the following sequence shall be initiated:

1. Switch the selector switch to "HAND" mode.
2. Trip open CB3 through trip/close control switch if it is closed.
3. Close CB1 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch. CB2 cannot close unless CB4 is open.
6. Close CB4 through trip/close control switch.

QQ. Case No. 38: When Generator power (E) is available at line side of circuit breaker CB1 but circuit breaker CB3 is not able to open under “AUTO” mode due to malfunction in automatic control scheme, the following sequence shall be initiated:

1. Switch to "HAND" mode.
2. Close CB1 through trip/close control switch if it is open.
3. Trip open CB3 through trip/close control switch.
4. Trip open CB4 through trip/close control switch.
5. Close CB2 through trip/close control switch.
6. Close CB4 through trip/close control switch.

2.2 SEQUENCE OF OPERATION: UTILITY/PARALLELING SWITCHGEAR

A. The following Cases No. 1 through No. 8 shall be implemented when circuit breakers PSGU, PSGE, PSG1, PSG2, CB1, CB2, CB3 and load shed breaker(s) **[CB4]** are operating in “AUTO” mode. Circuit breakers CB1, CB2 and CB3 shall be electrically interlocked as such that tie circuit breaker CB2 shall close only if circuit breakers CB1 or CB3 are open. Transfer switching pair breakers PSGE/PSG1 and PSGU/PSG2 shall be both electrically and mechanically interlocked. Refer to one-line diagram for designation of circuit breakers, Generators and transformers.

B. Case No. 1: Normal power is available from utility company.

1. PSGU (Generator switchgear incoming breaker 1) shall be in closed position.
2. PSGE (Generator switchgear incoming breaker 2) shall be in closed position.
3. PSG1 (Generator switchgear output breaker 1) shall be in open position.

4. PSG2 (Generator switchgear output breaker 2) shall be in open position.
5. CB1 (essential bus main breaker) shall be in closed position.
6. CB2 (tie breaker between essential and utility buses) shall be in open position.
7. CB3 (utility bus main breaker) shall be in closed position.
8. Load shed breaker(s) **[CB4 (breaker between utility bus No. 1 and HVAC bus)] [name other breakers here and in cases below]** shall be in closed position.

C. Case No. 2: In the event of loss of power from utility company, or failure of any of medium voltage feeders, service transformer or both main incoming circuit breakers or automatic voltage regulator, and N **[=X]** Generators are available, the following sequence shall be initiated:

1. After an adjustable time delay (preset to 5 seconds), PSGE and PSGU shall open.
2. All generators shall start automatically and synchronize as described in Section 263213 "Paralleling Switchgear." Generators shall be ready to accept loads in less than 30 seconds.
3. PSG1 shall close and transfer service to E bus.
4. PSG2 shall close and transfer service to U bus.
5. Power service to essential and utility distribution switchgear is restored.

D. Case No. 3: When power from utility company is restored or when medium voltage feeder or service transformer or main incoming breakers or automatic voltage regulator is back in service (Case No. 2), the following sequence shall be initiated:

1. After an adjustable time delay (preset to 10 minutes), PSG1 shall open.
2. After short delay, PSGE shall close and transfer service to E bus.
3. PSG2 shall open.
4. After short delay PSGU shall close and transfer service to U bus.
5. CB1 shall remain in closed position.
6. CB2 shall remain in open position.
7. CB3 shall remain in closed position.
8. **[CB4]** shall remain in closed position.
9. Generators shall continue to run (cool down) for a period of time as specified in Section 263214 "Engine Generators" before shutting down.

E. Case No. 4: In the event of loss of power from utility company, or failure of any of medium voltage feeders, service transformer, or both main incoming circuit breakers or automatic voltage regulator, (Case 2) and N-1 **[=Y]** Generators are available, the following sequence shall be initiated:

1. PSGE and PSGU shall open.
2. All generators (available) shall start automatically and synchronize as described in Section 263213 "Paralleling Low-Voltage Switchgear". Generators shall be ready to accept loads in less than 30 seconds.
3. Load shed **[breaker CB4 shall open] [priority sequence shall be initiated to match generator availability.]**
4. PSG1 shall close and transfer service to E bus.
5. PSG2 shall close and transfer service to U bus.
6. Power service to essential and utility distribution switchgear is restored. HVAC bus is shed to accommodate lack of Generator availability.

F. Case No. 5: In the event that additional Generator becomes available after implementation of sequence of operation listed under Case No. 4, the following sequence shall be initiated:

1. [CB4 shall close.] [Restore shed loads in priority order.]

G. Case No. 6: When power from utility company is restored or when medium voltage feeder or service transformer or main incoming breakers or automatic voltage regulator is back in service (Case No. 4 or 5), the following sequence shall be initiated:

1. CB1 shall remain in closed position.
2. CB2 shall remain in open position.
3. CB3 shall remain in closed position.
4. **[CB4]** shall remain in closed position.
5. After an adjustable time delay (preset to 10 minutes), PSG1 shall open.
6. After short delay, PSGE shall close and transfer service to E bus.
7. PSG2 shall open
8. After short delay, PSGU shall close and transfer service to U bus
9. Generators shall continue to run (cool down) for a period of time as specified in Section 263214 “Engine Generators” before shutting down.

H. Case No. 7: In the event of loss of breaker PSGE or PSG1, or associated feeder from paralleling switchgear to utility switchgear. Utility power available:

1. PSGE shall open.
2. CB1 shall open.

3. [CB4 shall open.]
4. PSGU shall remain closed.
5. CB2 shall close and transfer service to U bus.
6. Power service to essential and utility distribution switchgear is restored. **[HVAC bus is shed to accommodate lack of additional utility availability.]**
7. After failed element is repaired, the system shall be manually operated to return to Case 1 (normal state).

I. Case No. 8: In the event of loss of breaker PSGU or PSG2, or associated feeder from paralleling switchgear to utility switchgear. Utility power available:

1. PSGU shall open.
2. CB3 shall open.

3. [CB4 shall open.]
4. PSGE shall remain closed.
5. CB2 shall close and transfer service to E bus.
6. Power service to essential and utility distribution switchgear is restored. **[HVAC bus is shed to accommodate lack of additional utility availability.]**
7. After failed element is repaired, the system shall be manually operated to return to Case 1 (normal state).

2.3 [SEQUENCE OF OPERATION: PRIME/PARALLELING SWITCHGEAR]

A. The following cases No. 1 through No. **[X]** shall be implemented when **[xxx xxx.]** Refer to one-line diagram for designation of circuit breakers, Generators, and transformers.

B. Case No. 1: **[Xxx xxx.]**

1. [YYY (xxx xxx) shall …]
2. [ZZZ (xxx xxx) shall …]

2.4 SEQUENCE OF OPERATION: NOB

A. The following shall be implemented when circuit breakers CBA, CBB, and CBC are operating in "AUTO" mode. Circuit breakers CBA, CBB, and CBC shall be electrically interlocked as such that tie circuit breaker CBB shall close only if circuit breakers CBA or CBC are open due to loss of voltage at input of circuit breaker or if breaker has been manually opened and tagged out. Tie breaker CBB shall not close when circuit breaker CBA or CBC are open due to operation of protection circuits for conditions such as overcurrent, overvoltage, or short circuit, etc. Refer to one-line diagram for designation of circuit breakers, Generators and transformers.

B. Case No. 1: Normal power is available from the dual feeds to NOB switchgear.

1. CBA (essential bus main breaker) shall be in closed position.
2. CBB (tie breaker between essential and utility buses) shall be in open position.
3. CBC (utility bus main breaker) shall be in closed position.

C. Case No.2: When voltage is not sensed from single feed to either NOB switchgear main circuit breaker CBA or CBC.

1. After adjustable 0-30 second time delay, Circuit breaker with feeder failure shall open,
2. Circuit breaker operating with voltage detected shall remain closed.
3. Bus tie breaker (CBB) shall close.

D. Case No. 3: Power is restored to feeder in Case No. 2 above:

1. Bus tie breaker CBB shall open.
2. After adjustable 0-30 second time delay, either CBA and CBC (which was opened in Case 2) shall close returning service to both E and U busses of NOB switchgear.

2.5 FACTORY TESTING

A. Perform factory test of switchgear.

1. Perform each case identified in Articles on SEQUENCE OF OPERATION in this Section.
2. All test results shall be documented including all failed tests.
3. Re-test all failed tests until successful test is achieved.

4. Factory testing may be witnessed by the Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. Government representative may perform factory inspection at that time as well.

PART 3 - EXECUTION

3.1 IDENTIFICATION

A. Operating Instructions: Printed basic instructions for sequence of operation, including sequences and emergency procedures.

3.2 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test all scenarios of sequence of operation.

B. Testing: After installing all switchgear and electrical components, and after electrical circuitry has been energized, demonstrate control capability and compliance with requirements.

1. Perform each electrical test to demonstrate automatic control of all circuit breakers for each scenario identified in sequence of operation.
2. Correct non-compliant sequences.

3.3 STARTUP SERVICES

A. Engage a factory-authorized service representative to perform startup service.

B. Verify that electrical control wiring installation complies with manufacturer's submittal by means of point-to-point continuity testing. Verify that wiring installation complies with requirements in Division 26 Sections.

C. Complete installation and startup checks according to manufacturer's written instructions.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Government maintenance personnel to operate and test sequence of operation scenarios. Refer to Division 01 Section “Demonstration and Training.”

1. Train post maintenance personnel on procedures and schedules for general testing procedures.
2. Schedule training with the Project Director/COR with at least seven days' advance notice.

END OF SECTION 262325

SECTION 262412 - SWITCHBOARDS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes service and distribution switchboards rated 600 V and less.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety” for safety accessories.

2. [See Division 26 Section on “Vibration and Seismic Controls for Electrical Systems.”]
3. Section 260573 “Overcurrent Protective Device Coordination Study.”
4. Section 262325 “Power Sequence of Operation.”
5. See Division 26 Section on "Fuses" or fusible devices in switchboards.
6. Section 264315 “Surge Protective Devices.”

1.2 SUBMITTALS

A. Product Data: For each type of switchboard, overcurrent protective device, transient voltage suppression device, ground-fault protector, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each switchboard and related equipment.

1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

a. Enclosure types and details for types other than NEMA 250, Type 1.
b. Bus configuration, current, and voltage ratings.
c. Short-circuit current rating of switchboards and overcurrent protective devices.

d. Descriptive documentation of optional barriers specified for electrical insulation and isolation.
e. Utility company's metering provisions with indication of approval by utility company.
f. Mimic-bus diagram.
g. Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

2. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports including the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

D. Certificates of Compliance: Manufacturer of switchgear shall certify compliance with referenced standards.

E. Qualification data for firms and persons as required in Article on QUALITY ASSURANCE.

1. Testing agency.

F. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals. Include:

1. Routine maintenance requirements for switchboards and all installed components.
2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
3. Time-current curves, including selectable ranges for each type of overcurrent protective device.

1.3 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Source Limitations: Obtain switchgear through one source from a single manufacturer.

C. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

D. Standards: In addition to standards identified elsewhere in this Section, conform to the following:

1. Institute of Electrical and Electronics Engineers (ANSI/IEEE):
2. National Electrical Manufacturers Association (NEMA):

a. PB2 Deadfront Distribution Switchboards

E. Underwriters Laboratories, Inc. (UL):

a. 891 “Switchboards”
b. 489 “Molded Case Circuit Breakers

PART 2 - PRODUCT

2.1 MANUFACTURED UNITS

A. Switchboard Construction: Use switchboards with molded case breakers except where coordination and protective relaying require the use of power circuit breakers.

1. Switchboards shall consist of all distribution devices sized at or below 800 amperes trip rating. All other distribution lineups over 800 ampere shall be switchgear construction.

a. Contractor may provide circuit breaker for disconnect and bus ampere reduction from switchgear to switchboard transition.

2. Mechanical/HVAC Bus: Utilize switchboard construction with branch breakers up to 1200 amp rating for distribution to mechanical equipment. Any main or feeder breakers with 1000 amp or greater trip rating shall be drawout type.

B. Switchboard Configuration: Front, side, and rear accessible, with drawout type, individually mounted main device, panel mounted branches, and adjacent vertical sections front aligned.

C. Buses and Bus Connections: Three phase, four wire, unless otherwise indicated. Materials and Features as follows:

1. Main-Bus Continuous Rating: **[[2000] [xx] A.] [as indicated on Drawings.]**
2. Material for Main Bus: Hard-drawn copper of 98 percent conductivity.
3. Connections to Main and Feeder Protective Devices:

a. Copper.

D. Enclosure Finish: Factory-applied finish in manufacturer's standard gray color over a rust-inhibiting primer on treated metal surface.

E. Vertical Barriers: Between adjacent switchboard sections to separate breakers of 800 amp or larger frame sizes.

F. Utility Metering Compartment: Comply with utility company's requirements. If separate vertical section is required for utility metering, match and align with basic switchboard.

G. Bus Transition and Incoming Pull Sections: Match and align with basic switchboard.

H. Pull Box on Top of Switchboard: Provide adequate ventilation to maintain temperature in pull box within same limits as switchboard.

1. Bottom: Insulating, fire-resistive material with separate holes for cable drops.

I. Cable Supports: Arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.

J. Load Terminals: Insulated, rigidly braced, silver-plated, copper runback bus extensions equipped with pressure connectors for outgoing circuit conductors.

K. Ground Bus: 6-by-50-mm (1/4-by-2-inch) minimum size, drawn-temper copper of 98 percent conductivity, equipped with pressure connectors for feeder and branch-circuit ground conductors. For busway feeders, extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.

L. Contact Surfaces of Buses: Silver plated.

M. Main Phase Buses, Neutral Buses, and Equipment Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.

N. Neutral Buses: 100 percent of the ampacity of the phase buses, unless otherwise indicated, equipped with pressure connectors for outgoing circuit neutral cables.

O. Future Devices: Equip positions with mounting brackets, supports, bus connections, load terminals, and appurtenances rated at maximum capacity available for future unit.

P. [Bus-Bar Insulation: Flame-retardant, 105 deg C minimum tape wrapping, or flame-retardant, sprayed-on insulation of same temperature rating, factory-applied to individual bus bars.]

Q. Provide 10 percent spare circuit breakers, 20 percent spaces for future breakers, and 20 percent overall spare current carrying capacity for future expansion.

R. Provide maintenance mode arc flash reduction switch as applicable to provide dual parameter sets that enable trip unit to automatically lower instantaneous setting, and thereby lower available energy in fault condition (commonly referred to as “maintenance mode”), making breaker trip faster while engaged in any form of maintenance while being in proximity to energized equipment to minimize arc flash dangers. Refer to Section 260573 “Overcurrent Protective Device Coordination Study” for required arc flash levels or alternative means of compliance for worker safety protection.

2.2 SURGE SUPPRESSION DEVICES

A. Provide Surge Suppression in accordance with Section 264315 “Surge Protective Devices.”

2.3 OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breakers: UL 489, with standard frame sizes, trip ratings, and number of poles, and interrupting capacity to meet available fault currents. Types shall be as indicated on the Drawings.

1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
3. Electronic Trip Unit Circuit Breakers: RMS sensing; field-replaceable rating plug; with the following field-adjustable settings:

   a. Instantaneous trip.
   b. Long- and short-time pickup levels.
   c. Long- and short-time time adjustments.
   d. Ground-fault pickup level, time delay, and I2t response.

4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
5. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker; trip activation on fuse opening or on opening of fuse compartment door.

B. Molded-Case Circuit-Breaker Features and Accessories: Standard frame sizes, trip ratings, and number of poles.

1. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HACR for heating, air-conditioning, and refrigerating equipment.
2. Ground-Fault Protection: Remote-mounted sensor, relay, and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
3. Shunt Trip: 240 V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.
4. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage with field-adjustable 0.1- to 0.6-second time delay.
5. Auxiliary Switch: One SPDT switch or two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts as noted only.
6. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
7. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.

C. Enclosed, Insulated-Case Circuit Breaker: Fixed mounting, manually closed, fully rated, encased-power circuit breaker with interrupting capacity rating to meet available fault current.

1. Two-step, stored-energy closing.

2. Microprocessor-based trip units with interchangeable rating plug, LED trip indicators, and the following field-adjustable settings:

   a. Instantaneous trip.
   b. Long- and short-time pickup levels.
   c. Long- and short-time time adjustments with I2t response.
   d. Ground-fault pickup level, time delay, and I2t response.

3. Remote trip indication and control capability.
4. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
5. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.

D. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.

2.4 INSTRUMENTATION

A. Instrument Transformers: NEMA EI 21.1, IEEE C57.13, and the following:

1. Potential Transformers: Secondary voltage rating of 120 V and NEMA accuracy class of 0.3 with burdens of W, X, and Y.

2. Current Transformers: Ratios shall be as indicated with accuracy class and burden suitable for connected relays, meters, and instruments.

B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:

1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:

   a. Phase Currents, Each Phase: Plus or minus 1 percent.
   b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
   c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
   d. Megawatts: Plus or minus 2 percent.
   e. Megavars: Plus or minus 2 percent.
   f. Power Factor: Plus or minus 2 percent.
   g. Frequency: Plus or minus 0.5 percent.
   h. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from 5 to 60 minutes.
   i. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent. Accumulated values unaffected by power outages up to 72 hours.

2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.

C. Watt-Hour Meters: Flush or semiflush type, rated 5 A, 220 or 240 V, 3 phase, 3 wire, with 3 elements, 15-minute-indicating-demand register, and provision for testing and adding pulse initiation.

D. Recording Demand Meter: Usable as totalizing relay or as indicating and recording maximum-demand meter with 15-minute interval. Meter shall count and control a succession of pulses entering two channels. House in drawout, back-connected case arranged for semiflush mounting.

2.5 CONTROL POWER

A. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kV.

B. Control Circuits: 220 or 240 V, supplied through secondary disconnecting devices from control-power transformer.

C. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

D. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for 10 mm^2 and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

2.6 ACCESSORY COMPONENTS

A. Accessory Set: Tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Portable Test Set: To test functions of solid-state trip devices without removal from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.

C. Spare-Fuse Cabinet: Suitably identified, wall-mounted, lockable, compartmented steel box or cabinet. Arrange for wall mounting.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install switchboards and accessories according to NEMA PB 2.1.

B. Support switchboards on concrete bases, 100-mm nominal thickness.

C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.

D. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.

3.2 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section on "Identification for Electrical Systems."

B. Switchboard Nameplates: Label each switchboard compartment with engraved metal or laminated-plastic nameplate mounted with corrosion-resistant screws.

3.3 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Testing: After installing switchboards and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

1. Procedures: Perform each electrical test and visual and mechanical inspection indicated in NETA ATS, Sections 7.1, 7.5, 7.6, 7.9, 7.10, 7.11, and 7.14 as appropriate. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

C. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform an infrared scan of each switchboard. Remove front and rear panels so joints and connections are accessible to portable scanner.

1. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
2. Record of Infrared Scanning: Prepare a certified report that identifies switchboards checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

D. Report test results in writing.

3.4 ADJUSTING

A. Set field-adjustable switches and circuit-breaker trip ranges **[as indicated][as specified in Section XXXXX].**

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Post's maintenance personnel to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 262412

SECTION 262417 - PANELBOARDS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes load centers and panelboards, overcurrent protective devices, and associated auxiliary equipment rated 600 V and less for the following types:

1. Lighting and appliance branch-circuit panelboards.
2. Distribution panelboards.
3. Surge protective device panelboards.
4. Food Service panelboards

B. Related Sections include the following:

1. Section 114000 “Foodservice Equipment.”

2. [Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."]
3. Section 260573 “Overcurrent Protective Device Study.”
4. Section 260915 "Electrical Power Monitoring."
5. Section 264315 “Surge Protective Devices.”
6. Section 280508 "Common Work Results for Technical Security Systems (TSS)” for TSS panelboards.

1.2 DEFINITIONS

A. GFCI: Ground-fault circuit interrupter.

B. MCB: Main circuit breaker.

C. MLO: Main lug only.

D. SPD: Surge protective device.

1.3 SUBMITTALS

A. Product Data - General: For each type of panelboard, overcurrent protective device, surge protective device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.

1. Dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings. Include the following:

a. Enclosure types and details for types other than NEMA 250, Type 1.
b. Bus configuration, current, and voltage ratings.
c. Short-circuit current rating of panelboards and overcurrent protective devices.
d. Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
e. Significant interaction with TSS components.

2. Wiring Diagrams: Power, signal, and control wiring.

C. [Qualification Data: For testing agency.]

D. Field quality-control test reports including the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

E. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

F. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. Include:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
2. Time-current curves, including selectable ranges for each type of overcurrent protective device.

1.4 QUALITY ASSURANCE

A. [Independent Testing Agency Qualifications: Where required elsewhere in the Contract, utilize testing agency that is a member company of the InterNational Electrical Testing Association (NETA) and that is acceptable to Project Director/COR based upon input of OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in Part 3.]

B. Comply with NEMA PB 1.

C. Comply with requirements of the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

1.5 PROJECT CONDITIONS

A. [Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:

1. Ambient Temperature: Not exceeding 40 deg C (104 deg F).
2. Altitude: Not exceeding 2000 m (6600 feet).]

B. [Service Conditions: NEMA PB 1, usual service conditions, as follows:

1. Ambient temperatures within limits specified.
2. Altitude not exceeding 2000 m (6600 feet).]

C. [Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Post or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:

1. Notify Project Director/COR no fewer than two days in advance of proposed interruption of electrical service.
2. Do not proceed with interruption of electrical service without Project Director/COR's written permission.]

1.6 COORDINATION

A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, and encumbrances to workspace clearance requirements.

1.7 EXTRA MATERIALS

A. Keys: Six spares of each type of panelboard cabinet lock.

PART 2 - PRODUCTS

2.1 FABRICATION AND FEATURES

A. Enclosures: Flush or surface-mounted cabinets. NEMA PB 1, Type 1, to meet environmental conditions at installed location.

1. Indoor Locations not Subject to Moisture: NEMA 250, Type 1.
2. Outdoor Locations: NEMA 250, Type 3R.
3. Kitchen Areas: NEMA 250, Type 4X, stainless steel.
4. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.

5. Locations in Marine Environments: **[XX]**.

6. Separate neutral and grounding buses for all panelboards.
7. [Hazardous Areas Indicated on Drawings: NEMA 250, Type 7C.]

B. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box.

C. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover. Gasketed cover where identified by location.

D. Finish: Manufacturer's standard enamel finish over corrosion-resistant treatment or primer coat.

E. Directory Card: With transparent protective cover, mounted inside metal frame, inside panelboard door. Complete and install upon completion of load balancing.

F. Panelboards shall have factory ground neutral connection (links, bonds, screws) removed. Only standalone panelboards may have connections per NFPA 70 (NEC) for service locations. All bonding for office compounds shall be bonded at service transformer and main switchgear (paralleling generators or ATS).

G. Bus: Hard-drawn copper.

H. Bus Bars of Power Distribution and Branch Circuit Panelboards:

1. Provide hard drawn copper. The neutral bus shall be isolated from both the ground bus and the cabinet.
2. Mounting shall comply with available interrupting current (AIC) as calculated by arc fault study to minimize arc flash hazards; see Section 260573 “Overcurrent Protective Device Coordination Study.”

I. Main and Neutral Lugs: Compression or mechanical type suitable for use with conductor material.

J. Isolated Equipment Ground Bus: Adequate for feeder and branch-circuit equipment ground conductors; bonded to box.

K. Service Equipment Label: UL labeled for use as service equipment for panelboards with main service disconnect switches.

L. Surge Protective Device (SPD) Protection: Power and distribution panelboards shall have SPD protection. This protection may be integrated into panelboards. See Section 264315 “Surge Protective Devices.”

M. Spares and Future Device Capacity: Provide mounting brackets, bus connections, and associated appurtenances to support future installation of devices.

1. 20 percent overall spare current carrying capacity for future expansion.
2. Sufficient buss sections with 20 percent spaces for future breakers.
3. 10 percent spare circuit breakers to include at least one spare breaker of each size and rating used in that panelboard.

4. Engineer of Record shall ensure Panelboard schedules do not conflict with any spare or space requirements identified in contract requirements.

N. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads.

O. Gutter Space: Provide extra wire gutter space needed for all of individual circuit neutral and ground wires.

P. [Split Bus: Vertical buses divided into individual vertical sections.]

Q. [Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor.]

R. [Gutter Barrier: Arrange to isolate individual panel sections.]

S. Feed-through Lugs: Compression or mechanical type suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.

2.2 PANELBOARD SHORT-CIRCUIT RATING

A. Fully rated to interrupt symmetrical short-circuit current available at terminals.

2.3 LOAD CENTERS

A. Overcurrent Protective Devices: Plug-in, full-module circuit breaker.

B. Conductor Connectors: Mechanical type for main, neutral, and ground lugs and buses.

2.4 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

A. Branch Circuit Panelboards: Branch protective devices in panelboards shall be of the bolt-on type circuit breakers. Locate panelboards at the utility area nearest the center of the load. Panelboards shall have main circuit breakers. Where multiple section panelboards are required, each section shall have a main breaker. Size panels as noted above.

B. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.

C. Doors: Front mounted; concealed hinges; secured with flush latch with tumbler lock; keyed alike.

2.5 DISTRIBUTION PANELBOARDS

A. Power Distribution Panelboards: Panelboards serving three-phase motors and other power equipment shall be of bolt-on circuit breaker type. Size the panel bus, lugs, and circuit breakers to match the transformer kVA and system fault level.

B. Doors: Front mounted; secured with vault-type latch with tumbler lock; keyed alike.

C. Main Overcurrent Protective Devices: Main circuit breaker; do not use Main Lug Only.

2.6 FOODSERVICE PANELBOARDS

A. Electrical Sub-Panel: NEMA 4X stainless steel construction

B. Doors: Front mounted; concealed hinges; secured with flush latch with tumbler lock; keyed alike, fully gasketed.

C. Main Overcurrent Protective Devices: Main circuit breaker; do not use Main Lug Only.

2.7 SURGE SUPPRESSION

A. Transient voltage disturbances from commercial power systems associated with lightning storms and switching surges externally, as well as harmonics generated by adjustable speed drives and SCR power supplies associated with UPS equipment internally may cause stress and damage to electrical equipment. Therefore, surge protection is required at the service entrance to all buildings, at all main distribution panels and all secondary power panels. The surge protection shall be provided in accordance with Section 264315 " Surge Protective Devices."

2.8 OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker: NEMA AB 1, with interrupting capacity to meet available fault currents.

1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
3. Electronic Trip Unit Circuit Breakers: RMS sensing; field-replaceable rating plug; with the following field-adjustable settings:

   a. Instantaneous trip.
   b. Long- and short-time pickup levels.
   c. Long- and short-time time adjustments.
   d. Ground-fault pickup level, time delay, and I2t response.

4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
5. GFCI Circuit Breakers: Single- and two-pole configurations with trip sensitivity in accordance with NFPA (125 V) or IEC (240 V).

B. Molded-Case Circuit-Breaker Features and Accessories. Standard frame sizes, trip ratings, and number of poles.

1. Lugs: Mechanical or Compression style, suitable for number, size, trip ratings, and material of conductors.
2. Application Listing: Appropriate for application.
3. Ground-Fault Protection: Remote-mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
4. Communication Capability: Circuit-breaker-mounted, Universal-mounted, Integral or Din-rail-mounted communication module with functions and features compatible with power monitoring and control system.
5. Shunt Trip: 220 or 240 V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.

C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.

2.9 ACCESSORY COMPONENTS AND FEATURES

A. Furnish accessory set including tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Fungus Proofing: In humid environments, provide permanent fungicidal treatment for panelboard interior, including overcurrent protective devices and other components.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Install panelboards and accessories according to NEMA PB 1.1.

B. Comply with mounting and anchoring requirements specified in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."

C. Mounting Heights: Top of trim 1880 mm above finished floor, unless otherwise indicated.

D. Mounting: Plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish.

E. Install high visibility safety striping in front of panelboard areas.

F. Circuit Directory: Create a directory to indicate installed circuit loads after balancing panelboard loads. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.

G. Install filler plates in unused spaces.

H. Provision for Future Circuits at Flush Panelboards: Except in locations where ceilings are not readily accessible, install stub four empty 21-mm metallic rigid conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four empty 21-mm metallic rigid conduits into raised floor space as applicable.

I. Wiring in Panelboard Gutters: Arrange conductors into groups and bundle and wrap with wire ties after completing load balancing.

J. Panelboards mounted on damp or wet surfaces shall be PVC coated unistrut or other non-corroding material.

3.2 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety."

B. Panelboard Nameplates: Label each panelboard with engraved metal or laminated-plastic nameplate mounted with corrosion-resistant screws.

3.3 CONNECTIONS

A. Install equipment grounding connections for panelboards with ground continuity to main electrical ground bus.

B. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Testing: Perform field testing. Testing entity shall be as identified elsewhere in the Contract:

1. [Engage a qualified independent testing agency to perform specified testing.]

2. [Contractor Testing: After installing panelboards and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

a. Procedures: Perform each visual and mechanical inspection and electrical test indicated in NETA ATS, Section 7.5 for switches and Section 7.6 for molded-case circuit breakers. Certify compliance with test parameters. Limit panelboard circuit breaker NETA injections test to 200A and above.

b. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.]

C. Balancing Loads: Within 60 days of issuance of Substantial Completion, measure load balancing and make circuit changes as follows:

1. Measure as directed during period of normal system loading.
2. Perform load-balancing circuit changes outside normal occupancy/working schedule of the facility and at time directed. Avoid disrupting critical 24-hour services such as fax machines and online data-processing, computing, transmitting, and receiving equipment.
3. After circuit changes, recheck loads during normal load period. Record all load readings before and after changes and submit test records.
4. Tolerance: Difference exceeding 20 percent between phase loads, within a panelboard, is not acceptable. Rebalance and recheck as necessary to meet this minimum requirement.

D. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform an infrared scan of each panelboard. Remove panel fronts so joints and connections are accessible to portable scanner.

1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
3. Record of Infrared Scanning: Prepare a certified report that identifies panelboards checked and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

A. If settings are indicated on Drawings or identified in Coordination Report, set field-adjustable switches and circuit-breaker trip ranges.

3.6 CLEANING

A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

END OF SECTION 262417

SECTION 262500 - ENCLOSED BUS ASSEMBLIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Feeder-bus assemblies.

B. Related Sections include the following:

1. Division 07 Section on "Penetration Firestopping."
2. Division 07 Section on "Joint Sealants."
3. Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety."
4. Section 260518 "Low-Voltage Electrical Power Conductors and Cables."
5. Section 260525 "Grounding and Bonding for Electrical Systems."
6. **[Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."]**

1.2 SUBMITTALS

A. Product Data: Include technical descriptions, dimensions, rated capacities, weights, finishes, and accessories for the following:

1. Feeder-bus assemblies.
2. Plug-in bus assemblies.
3. Bus plug-in devices.

B. Shop Drawings: For each type of **[bus assembly][and plug-in device]**.

1. Show fabrication and installation details for enclosed bus assemblies. Include plans, elevations, and sections of components. Designate components and accessories, including clamps, brackets, hanger rods, connectors, fire stops, weather stops, straight lengths, and fittings.
2. Indicate required clearances, method of field assembly, and location and size of each field connection. Indicate and draw special emphasis to critical dimensions and tolerances for installation of bridging joint sections.
3. Detail connections to switchgear, switchboards, transformers, and panelboards.
4. Wiring Diagrams: Power**[, signal, and control]** wiring.

5. **[Seismic-Restraint Details: Signed and sealed by a qualified professional engineer.**

a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints.
b. Detail fabrication, including anchorages and attachments to structure and to supported equipment.]

C. Coordination Drawings: Floor plans and sections, drawn to scale. Include scaled bus-assembly layouts and relationships between components and adjacent structural, mechanical, and electrical elements. Show the following:

1. Vertical and horizontal enclosed bus-assembly runs, offsets, and transitions.
2. Clearances for access above and to the side of enclosed bus assemblies.
3. Vertical elevation of enclosed bus assemblies above the floor or bottom of structure.
4. Support locations, type of support, and weight on each support.
5. Location of adjacent construction elements including light fixtures, HVAC and plumbing equipment, fire sprinklers and piping, signal and control devices, and other equipment.

D. Product Certificates: For each type of enclosed bus assembly, signed by product manufacturer.

E. [Manufacturer Seismic Qualification Certification: Submit certification that enclosed bus assemblies,[plug-in devices,] accessories, and components will withstand seismic forces defined in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.]

F. Qualification Data: For professional engineer.

G. Field quality-control documentation. Refer to Part 3 Article on FIELD QUALITY CONTROL.

1. Test Reports:

a. Notations on inspection of installation.
b. Notations on compliance on installation with manufacturer’s requirements and approved shop drawings.
c. Infrared Scanning: Documentation on infrared scanning device calibration. Provide data from required scans.

2. Certifications:

   a. Critical installation details.
   b. Compliance with NETA ATS test parameters.
   c. Report of results from this field service including certification that the busway installation fully complies with manufacturer's requirements and recommendation
   d. Certified report identifying bus assembly checked and describing results of infrared scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

H. Operation and Maintenance Data: For enclosed bus assemblies, include the following in the Systems Manual:

   1. Routine inspection and re-torquing requirements as recommended by the manufacturer.
   2. Data for critical elements required in Part 3 Article on FIELD QUALITY CONTROL, which tracks the periodic torquing of bridging sections of busway and the periodic infrared scanning of the bridging sections and busway in general. Submit in spreadsheet format.

      a. Bolt torquing data: List each bridge joint section, its torque values left, dates of initial and recheck of bolt torques, any loosening/retightening of bolt events for any reason, and initials of person doing the operation. Foot notes shall list manufacturer's acceptable torque ranges.
      b. Infrared Scan data: List each bridge joint section, its scan temperature, dates scans were taken, and initials of the person doing the scan.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain enclosed bus assemblies through one source from a single manufacturer.

B. Qualification for Electrical Professional Engineer: Engineer shall possess valid, current, professional registration issued in the United States or host country, and competent is subject matter of this Section.

C. Comply with UL 857, "Busways."

D. Comply with requirements of the OBO Electrical Code (NFPA 70, "National Electrical Code as amended by OBO).

   1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with NFPA 70, Article 100 by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle enclosed bus assemblies according to NEMA BU 1.1, "General Instructions for Proper Handling, Installation, Operation and Maintenance of Busway Rated 600 Volts or Less."

1.5 PROJECT CONDITIONS

A. Derate enclosed bus assemblies for continuous operation at indicated ampere ratings for ambient temperature not exceeding 40 deg C.

1.6 COORDINATION

A. Coordinate layout and installation of enclosed bus assemblies and suspension system with other construction that penetrates ceilings or floors or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified electrical professional engineer to design enclosed bus assemblies, plug-in devices, and components.

2.2 ENCLOSED BUS ASSEMBLIES

A. Feeder-Bus Assemblies: UL 857, low-impedance bus assemblies in nonventilated housing, single-bolt joints, ratings as indicated.

1. Voltage: **[380/220]** Volts; 3 phase; 100 percent neutral capacity.
2. Temperature Rise: 55 deg C above 40 deg C ambient maximum for continuous rated current.
3. Bus Materials: Current-carrying copper conductors, fully insulated with minimum Class B 130 deg C insulation except at joints; plated surface at joints.
4. Ground:
   a. 50 percent capacity internal busbar of material matching bus material.
5. Enclosure: Aluminum or steel with manufacturer's standard enamel finish.
6. Fittings and Accessories: Manufacturer's standard.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Support bus assemblies independent of supports for other elements such as equipment enclosures at connections to panelboards and switchboards, pipes, conduits, ceilings, and ducts.

1. **[Design each fastener and support to carry load indicated by seismic requirements and to comply with seismic-restraint details according to Division 26 Section on "Vibration and Seismic Controls for Electrical Systems."]**

2. **[Design each fastener and support to carry 90 kg or 4 times the weight of bus assembly, whichever is greater.**
3. **Support bus assembly to prevent twisting from eccentric loading.**
4. **Support bus assembly with not less than 10-mm steel rods. Install side bracing to prevent swaying or movement of bus assembly. Modify supports after completion to eliminate strains and stresses on bus bars and housings.**
5. **Fasten supports securely to building structure according to Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety."]**
6. Carefully install successive sections of busway in manner to prevent damage or compromise of component integrity (e.g., damage to insulation) which may cause future failure of the busway or its components.

B. Install expansion fittings at locations where bus assemblies cross building expansion joints. Install at other locations so distance between expansion fittings does not exceed 90 percent of manufacturer's recommended distance between fittings.

C. Install firestop fittings where bus assemblies penetrate fire-rated elements such as walls, floors, and ceilings. Seal around penetrations according to Division 07 Section on "Penetration Firestopping," and as directed by authorities having jurisdiction.

D. Install appropriate weatherseal fittings and flanges where bus assemblies penetrate exterior elements such as walls or roofs. Seal around openings to make weathertight. See Division 07 Section on "Joint Sealants" for materials and application.

E. Coordinate bus-assembly terminations to equipment enclosures to ensure proper phasing, connection, and closure.

F. Tighten bus-assembly bridging joints with torque wrench or similar tool recommended by bus-assembly manufacturer. Recheck and re-torque all joints again after bus assemblies have been energized for 30 days and again just before Substantial Completion of the project. Record data on O&M data spreadsheet identified in Part 1 Article on SUBMITTALS.

G. Furnish and install one-time use multiple point temperature indicating labels on each bridging joint section.

1. These shall be self-stick labels with at least six temperature points that change color permanently when their temperature reaches its indicated value.
2. The range of temperature values selected shall be determined after consulting the manufacturer; the highest two values shall be that which indicates that the joint exceeded its recommended operating temperature.
3. Install labels after testing.
4. Labels shall be located for easy visibility by maintenance staff.
5. Furnish 20 percent extra labels as extra material.

3.2 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Manufacturer’s Field Service: Engage a factory-authorized service representative to perform the following:

1. Inspect busway and component installation.
2. Verify installation complies with all aspects of manufacturer’s requirements and complies with approved shop drawings.
3. Certify critical installation details such as component spacings (especially those associated with the bridge joints), adjustments, adequate support, and proper torquing of bolts affecting electrical joint conductivity have been done properly in compliance with manufacturer’s requirements.
4. Certify that the busway installation fully complies with manufacturer’s requirements and recommendations.

B. Perform the following field tests and inspections:

1. After installing enclosed bus assemblies and after electrical circuitry has been energized, test for compliance with requirements.
2. Perform each electrical test and visual and mechanical inspection identified in NETA ATS, Section 7.4. Certify compliance with test parameters.

C. Remove and replace units that do not pass tests or inspections and retest as specified above.

D. Infrared Scanning: Within 60 days of issuance of Substantial Completion, perform an infrared scan of bus assembly including joints and plug-in units.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values.
2. Perform two follow-up infrared scans of bus assembly, one at four months and the other at 11 months after Substantial Completion.

E. Record data of critical elements:

1. Bolt torquing data.
2. Infrared Scan data.

3.4 ADJUSTING

A. Set field-adjustable, circuit-breaker trip ranges and overload relay trip settings as indicated.

3.5 CLEANING

A. After completing system installation, clean enclosed bus assemblies, supports, and accessories. Inspect exposed finishes and repair damaged finishes. Remove scratches, burrs, and surface defects.

3.6 PROTECTION

A. Provide final protection to ensure that moisture does not enter bus assembly.

END OF SECTION 262500

SECTION 262725 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Ground-fault circuit interrupters.
2. Single-standard-grade receptacles.
3. USB receptacles.
4. GFCI receptacles, 125 V, 20 A.
5. Twist-locking receptacles.
6. Pendant cord-connector devices.
7. Cord and plug sets.
8. Toggle switches and dimmer switches.
9. Device wall plates.
10. Floor service outlets
11. Multioutlet assemblies.

B. Related Sections include the following:

1. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
2. Section 260525 “Grounding and Bonding for Electrical Systems.”
3. Section 260935 “Centralized Dimming Controls.”
4. Division 27 Sections for audio-visual devices for coordination with various multimedia applications, including audio and visual devices.
5. Section 280508 “Common Work Results for Technical Security Systems (TSS)” and related Division 28 TSS subsystem Sections for additional electrical infrastructure requirements, for deterrent, detection, and response systems, and Security Management Systems Enterprise (SMSe).” This Section includes interface between Technical Security Systems (TSS) and general electrical systems.

1.3 TECHNOLOGY RESTRICTIONS

A. In accordance with Chapter 1 of the OBO Electrical Code, switches may not contain ultrasonic technology, or wireless technology, even if not implemented. This includes prohibition of Wi-Fi, Bluetooth, Near Field Communication, ZigBee, Low Power Wide Area Networks, and similar technology.

B. Floor mounted receptacles are not permitted in CAA.

1.4 DEFINITIONS

A. AFCI: Arc-fault circuit interrupter.

B. DFCI: Dual function circuit interrupters; utilize both GFCI and AFCI detection technology.

C. BAS: Building automation system.

D. EMI: Electromagnetic interference.

E. GFCI: Ground-fault circuit interrupter, unless noted otherwise or different definition clear from context.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of wiring device through one source from a single manufacturer.

B. Comply with the requirements of the OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.7 COORDINATION

A. Receptacles for Government-Furnished Equipment (GFE):

1. General GFE: Match plug configurations where known. Otherwise, provide cord and plug sets matching equipment requirements.
2. Electrified Furniture (GFE Furniture) Wiring System:

a. 8 wire or 10 wire as coordinated with GFE.

PART 2 - PRODUCTS

2.1 GENERAL WIRING-DEVICE REQUIREMENTS

A. Comply with the following standards:

1. NEMA WD 1 and NEMA WD 6.
2. UL 498.

B. Wiring Devices:

1. Provide U.S. NEMA type wiring devices and associated devices, boxes, and covers in CAA, and as indicated on Construction Drawings.
2. Outside CAA all wiring devices shall be U.S. NEMA type. Receptacles other than 125-volt or 250-volt general-purpose convenience outlets shall be marked on cover plates with voltage, amperage, phase, and frequency.
3. Provide matching plugs; plugs shall conform to UL 498.

C. Wire and Cable:

1. Select types of insulation according to application.
2. Refer to OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO) for insulation types, operating temperatures, ambient temperature, and voltage classes.
3. Cable and wire sizes, types, and insulation shall be in accordance with U.S. standards to obtain suitable quality transmission for security, data, and other signal cables.
4. Provide solid conductors for conductors sized 6.0 mm^2 and smaller.
5. Provide stranded conductors for conductors sized 10 mm^2 and larger.
6. Provide copper branch circuits and feeder conductors sized at 125 percent of full load capacity.
7. Use full-sized neutral conductor and separate ground conductor for each circuit.
8. Circuits and feeders that supply power for electronic equipment may require oversized neutral to compensate for high harmonic neutral currents; such feeders shall be identified and neutral increased to minimum of two times full rated size.
9. Non-metallic sheathed cable (“Romex”), and armored or metal clad cable, Types AC or MC are prohibited.

2.2 RECEPTACLES

A. Receptacles, General: General-purpose receptacles shall be installed on 15 and 20-amp branch circuits and shall be of grounding type with effective grounding contacts. NEMA type receptacles shall be used in all spaces. GFCI protection shall be provided for receptacles in restrooms, bathrooms, kitchen, other wet areas, and outdoors in accordance with the OBO Electrical Code and NFPA 70.

1. Local standard receptacles may be used where approved by OBO/PDCS/DE/EE. Where used, they shall be rated 220V, 16-A; receptacles rated 220V, 10-A or 13-A are not permitted.

B. Straight-Blade and Twist Locking Receptacles: Heavy-Duty grade. NEMA 6-20R for 220V, 230V, or 240V applications.

1. Exception for TSS: All TSS equipment racks shall be provided with NEMA L6-30R receptacles supplied by nominal 200 to 240 volt single phase power. See TSS Electrical Distribution Design Guidance for specific connection details.

C. NEMA 6-20R Neutral Pin Polarization: NEMA 6-20R receptacles rated at 250 volts used on 2-pole, 3-wire grounding system (380Y/220, 400Y/230 or 415Y/240 volt) systems, shall have T-shaped slot of the receptacle used for connection of white neutral wire

D. GFCI receptacles shall not be used for 220V receptacles. Outlets designated for GFCI protection shall be fed from general-use non-time delay GFCI breaker; mount either within panelboard or in residual current device (RCD) enclosure adjacent to panelboard feeding branch circuit.

E. AFCI receptacles are not permitted. Outlets designed for AFCI protection shall be fed from AFCI circuit breaker mounted within panelboards.

1. Exception: Use of AFCI and DFCI breakers and circuits is only permitted for residential uses for 125V, 60 Hz applications in accordance with NFPA 70.

F. Provide one 20-A and one 15-A cord plug cap for each duplex receptacle, and two of each for each quadraplex receptacle. Plug caps shall be of grounding type, utilizing only screw terminals for terminating conductors.

G. Receptacles used for floor outlets shall have GFCI circuit protection, and shall conform to requirements for as wet locations.

2.3 USB RECEPTACLES

A. USB Charging Receptacles :

1. Description: Single-piece, rivetless, nickel-plated, all-brass grounding system. Nickel-plated, brass mounting strap.
2. USB Receptacles:

a. Type-A: Dual and quad, USB Type-A, 5 V DC, and 2.1 A per receptacle (minimum).
b. Type-C: Dual and quad, USB Type-C, capable of delivering 5 V to 20 V DC, and 3.0 A to 5.0 A per receptacle (minimum) based on Power Delivery (PD) specifications.

3. Standards:

a. USB Type-A: Comply with UL 1310 and USB 3.0 devices.
b. USB Type-C: Comply with UL 1310, USB 3.1/3.2, and USB Power Delivery (PD) 2.0/3.0 standards.

2.4 SWITCHES

A. Single- and Double-Pole Switches, Three Way and Four Way: Comply with UL 20 and FS W-S-896.

B. Snap Switches: Heavy-Duty grade, quiet type; comply with UL 20.

C. Dimmer Switches: Comply with UL1472 – Solid-State Dimming Controls Modular, full-wave, solid-state units with integral, quiet on/off switches and audible frequency and EMI/RFI filters.

1. Control: **[Provide full range, continuously variable control of light intensity, and flicker free operation. Continuously adjustable slider; with single-pole or three-way switching to suit connections.]**
2. Operate at rated capacity across full ambient temperature range including modified capacities for ganging configurations which require removal of fins. Operation at rated capacity shall be possible across full ambient temperature range, without shortening design lifetime.
3. Possess power failure memory such that if power is interrupted and subsequently returned, lights will automatically return to same levels (dimmed setting, full on, or off) prior to power interruption for minimum period of two years.
4. When dimmer switch is in “off’ position, load shall be fully disconnected from line supply eliminating any leakage current.
5. Withstand electrostatic discharges up to 16,000 volts without impairment per IEC 801-2.
6. Withstand line-side surges without impairment to performance when subjected to surges of 6,000 volts, 200 amps per ANSI/IEEE C62.41C.
7. Provide preset 3-way control from the dimmer location regardless of the position of other 3-way switch location.
8. Standards: Comply with UL 1472.

D. Pilot-Light, Single-Pole Switches:

1. Description: Illuminated when switch is on.
2. Standards: Comply with UL 20 and FS W-S-896.

E. Lighted Single-Pole Switches:

1. Description: Handle illuminated when switch is on.
2. Standards: Comply with NEMA WD 1, UL 20, and FS W-S-896.

F. Key-Operated, Single-Pole Switches:

1. Description: Factory-supplied key in lieu of switch handle.
2. Standards: Comply with UL 20 and FS W-S-896.

G. Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches:

1. Description: For use with mechanically held lighting contactors.
2. Standards: Comply with NEMA WD 1, UL 20, and FS W-S-896.

2.5 WALL PLATES

A. Single Source: Obtain wall plates from same manufacturer of wiring devices.

B. Single and combination types shall match corresponding wiring devices.

1. Plate-Securing Screws: Metal with head color to match plate finish.
2. Material for Finished Spaces. Refer to Construction Drawings for selected finish by space. The following are requirements for type of selected material:

   a. Steel with white baked enamel, suitable for field painting.
   b. Smooth, high-impact thermoplastic.
   c. 1-mm- thick, satin-finished, Type 302 stainless steel.
   d. 1-mm- thick, brushed brass with factory polymer finish.
   e. 1.2-mm- thick, anodized aluminum.
   f. 1-mm- thick steel with chrome-plated finish.

3. Material for Unfinished Spaces: Galvanized steel.
4. Material for Damp Locations: Cast aluminum with spring-loaded lift cover and listed and labeled for use in wet and damp locations.

C. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant, die-cast aluminum.

D. Antimicrobial Cover Plates:

1. Contact surfaces treated with a coating that kills 99.9 percent of certain common bacteria within two hours when regularly and properly cleaned.
2. Tarnish resistant.

2.6 FLOOR SERVICE FITTINGS

A. Floor service fittings are discouraged. Requests for limited use shall be submitted to Project Director/COR for approval with input from OBO/PDCS/DE/EE electrical engineer.

1. Refer to Article on TECHNOLOGY RESTRICTIONS regarding floor mounted receptacles.
2. Type: Modular, flush-type, dual-service units suitable for wiring method used.
3. Power Receptacle: NEMA, Configuration 6-20R, unless otherwise indicated or scheduled. Colors shall match interior color scheme approved by the Project Director/COR.
4. Signal Outlet: Blank cover with bushed cable opening, unless otherwise indicated or scheduled.
5. Floor mounted fittings shall be Ground Fault protected.

2.7 MULTIOUTLET ASSEMBLIES

A. Components of Assemblies: Products from a single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.

B. Wire: 4.0 mm^2.

2.8 FINISHES

A. Devices and face plates shall match or be provided as below **[or in accordance with wall plate and device finish schedule]**. Single and combination types shall match corresponding wiring devices.

1. Face Plate-Securing Screws: Metal with head color to match plate finish.
2. Material for Finished Spaces: **[Provide in accordance with wall plate and device finish schedule][Gray device][1-mm- thick, brushed stainless steel]**.
3. Material for Unfinished Spaces: Gray device; Galvanized steel face plate.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL

A. Coordination with Other Trades:

1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes, and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate raceway system, conductors, and cables.
3. Install device boxes in brick or block walls so that cover plate does not cross joint unless joint is troweled flush with face of the wall.
4. Install wiring devices after all wall preparation, including painting, is complete.

B. Conductors:

1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
2. Strip insulation evenly around conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. Length of free conductors at outlets for devices shall comply with model NFPA 70, Article 300, without pigtails.
4. Existing Conductors:

a. Cut back and pigtail, or replace all damaged conductors.
b. Straighten conductors that remain and remove corrosion and foreign matter.
c. Pigtailing existing conductors is permitted, provided outlet box is large enough.

C. Device Installation:

1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
2. Keep each wiring device in its package, or otherwise protect until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 150 mm (6 inches) in length.
5. When there is choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of way around terminal screw.
6. Use torque screwdriver when a torque is recommended or required by manufacturer.
7. When conductors larger than $4mm^2$ are installed on 15- or 20-A circuits, splice 4mm2 pigtails for device connections.
8. Tighten unused terminal screws on device.
9. When mounting into metal boxes, remove fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.

D. Receptacle Orientation:

1. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the right.

E. Install devices and assemblies level, plumb, and square with building lines. Comply with NECA 1.

F. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush, or when they do not cover rough wall opening.

G. Dimmers:

1. Install dimmers within terms of their listing.
2. Define each dimmer’s load type, assign each load to a zone, and set control functions.
3. Verify that dimmers used for fan-speed control are listed for that application.
4. Install unshared neutral conductors on line and load side of dimmers according to manufacturers' device, listing conditions in written instructions

H. Install equipment in accordance with manufacturer’s installation instructions.

I. Provide equipment at locations and in quantities indicated on drawings. Provide any additional equipment required to provide control intent.

J. Perform full-function testing on all completed assemblies. Statistical sampling is not acceptable.

K. Install wall dimmers to achieve indicated rating after derating for ganging according to manufacturer's written instructions.

L. Install unshared neutral conductors on line and load side of dimmers according to manufacturers' written instructions.

M. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical, and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates where possible.

N. Remove wall plates and protect devices and assemblies during painting.

O. Adjust locations of floor service outlets to suit arrangement of partitions and furnishings.

3.2 MULTIMEDIA RECEPTACLE INSTALLATION

A. Where wall mounting is indicated or scheduled for various multimedia devices (e.g., flat panel displays), locate receptacles as follows:

1. Coordinate for elevation above finished floor.
2. Coordinate with mounting elements for multimedia devices, including brackets and hardware, and wall blocking.
3. Install with recessed receptacle boxes behind mounting hardware to allow for relief of plug and cord.

3.3 IDENTIFICATION

A. Comply with Division 26 Section on "Identification for Electrical Systems."

1. Receptacles: Identify panelboard and circuit number from which served. Use hot, stamped or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.
2. Switches: Where three or more switches are ganged, and elsewhere as indicated, identify each switch with approved legend engraved on wall plate.

3.4 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.5 FIELD QUALITY CONTROL

A. Test Instruments: Use instruments that comply with UL 1436 as applicable.

B. Test Instrument for Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.

C. Perform the following field tests and inspections and prepare test reports:

1. After installing wiring devices and after electrical circuitry has been energized, test for proper polarity, ground continuity, and compliance with requirements.
2. Test GFCI operation with both local and remote fault simulations according to manufacturer's written instructions.
3. Test AFCI operation with both local and remote fault simulations according to manufacturer’s written instructions.

D. Remove malfunctioning units, replace with new units, and retest as specified above.

END OF SECTION 262725

SECTION 263105 – SOLAR PHOTOVOLTAIC SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes photovoltaic (PV) panels and their associated mounting systems, photovoltaic system inverters, and associated Data Acquisition System (DAS). PV system applications for this project include:

1. [Flat rooftop installation.]
2. [Covered parking and covered walkway installation.]
3. [Ground mounted installation]

B. [This project involves installing PV system on existing structure.]

C. Related Sections include the following:

1. Section 230905 “Instrumentation and Controls for HVAC.”
2. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety.”
3. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
4. Section 260525 “Grounding and Bonding for Electrical Systems.”
5. Division 26 Section on raceways and boxes.
6. Section 260915 “Electrical Power Monitoring.”
7. Division 26 Section on enclosed switches and circuit breakers.
8. Section 262214 “Low-Voltage Transformers.”
9. [Division 26 Section on Energy Storage Systems.]

1.2 REFERENCE STANDARDS

A. American National Standards Institute (ANSI):

1. C12.1: Standard for Electricity Meters.
2. C12.20: Standard for Electrical Meters.

B. American Society for Testing and Materials International (ASTM)

1. E1890: Standard Test Methods for Determining Integrity of Photovoltaic Modules

C. The Institute of Electrical and Electronics Engineers, Inc (IEEE):

1. IEEE 929: Recommended Practice for Utility Interface of Intermediate PV Systems.
2. IEEE 80: Recommended Grounding Practices.
3. IEEE 1547: Standard for Interconnecting Distributed Resources with Electric Power Systems.

4. IEEE 1547.1: Standard for Conformance Test Procedures for Equipment Interconnecting Distributed Resources with Electric Power Systems.

D. Underwriters Laboratories, Inc. (UL):

1. 96: Lightning Protection Components.
2. 1741: Standard for Safety for Static Inverters, Converters, Controllers and Interconnection System Equipment for Use in Photovoltaic Power Systems.
3. 1703: Standard for Flat-Plate Photovoltaic Modules and Panels.
4. 2703: Rack Mounting Systems and Clamping Devices for Flat-Plate Photovoltaic Modules and Panels.
5. 61215: Standard for Terrestrial Photovoltaic (PV) Modules

E. 61730: Standard for Photovoltaic (PV) Module Safety Qualification International Electrotechnical Commission (IEC)

1. 61000-30 – Testing and Measurement Techniques.
2. 61215 - Terrestrial photovoltaic (PV) modules.
3. 61730 - Photovoltaic (PV) module safety qualification.
4. 61727 - Photovoltaic (PV) systems - Characteristics of the utility interface.
5. 62109-1/2 - Safety of Power Converters for Use in Photovoltaic Power Systems.
6. 61683 - Power conditioners – Procedure for measuring efficiency.
7. 62116 - Utility-interconnected photovoltaic inverters - Test procedure of islanding prevention measures.

F. National Fire Protection Association

1. 780: Standard for the Installation of Lightning Protection Systems.

G. National Electrical Installation Standards (NEiS)

1. NECA 412 “Std for Installing & Maintaining PV Power Systems.”

H. OBO Electrical Code (NFPA 70, "National Electrical Code" including amendments by OBO); reference Article 690 and other Articles as applicable.

I. OBO Fire Code (International Fire Code including amendments by OBO); applicable provisions include but are not limited to model code Section 1204.

1.3 SUBMITTALS

A. Product Data: Submit for panels, mounting hardware, inverters, Data Acquisition System (DAS), accessories, and components indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Site Parameters Report: Submit report identifying environmental and bioclimatic conditions at site including, but not limited to, solar irradiation, solar insolation, altitude, humidity,

temperatures, assumed PV array temperature adjustments for mounting conditions, and seasonal ambient conditions that impact energy production of PV system.

C. System Performance estimate: AC kWh energy production estimation: Provide per the following web sites or software programs or approved equal.

1. RETScreen® International: www.retscreen.net/ang/d_o_view.php
2. PVSYST: www.pvsyst.com

D. Shop Drawings: For PV system and related equipment, submit the following:

1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

   a. PV System Array and Equipment Layouts.
   b. Total system rated capacity and total system nominal capacity in kW including subtotals by area.
   c. Mounting system.
   d. Sections and Elevations.
   e. Roof Penetrations.
   f. Construction Staging and Storage Areas.
   g. Test Reports.
   h. System Weight, including subtotals by area.

2. Wiring Diagrams: Submit complete single-line and wiring diagrams indicating required power, signal, monitoring, and control wiring. Include all schematic diagrams, overcurrent protection sizes, wire sizes, and similar information. Wiring diagrams shall differentiate between manufacturer-installed and field-installed wiring details.

E. Data Acquisition System (DAS): For DAS, submit the following product data:

1. Technical specifications for measurement devices to be utilized.
2. Catalog cut sheets of all devices to be used. Clearly indicate which model number is being submitted on all cut sheets.
3. Technical specifications for all types of wires to be provided.
4. One example of charts and reports.
5. Identification of deviations from materials or methods described in this Section for DAS.
6. Proofs of all display screens for DAS for Government review and approval. Refer to Part 2 Article on DATA ACQUISITION SYSTEM.

F. Structural Certification: Certification by licensed structural engineer demonstrating ability of a structure to support all loads required for PV system.

G. Factory Test Reports: PV modules, racking system and inverters.

H. Field Test Reports: Submit written test reports; include the following:

1. Test procedures used.

2. Final Test results. Include all test results and demonstrate their comparison to and compliance with requirements.
3. Report shall include results of all failed tests and corrective action taken to achieve test results that comply with requirements.

I. Operation and Maintenance Manuals:

1. In addition to the items specified in Division 01, Section 017825 Systems Manual and O&M Data include the following documentation:

a. Each item of equipment and each system: Include description of unit or system, and component parts. Give function, normal operating characteristics, and limiting conditions. Include commercial number of replaceable parts.
b. Provide approved engineering submittals. Include equipment sizing calculations.
c. Provide manufacturer's installation wiring diagrams and schematic diagrams.
d. Operating procedures: Include routine normal operating instructions and sequences. Include regulation, control, stopping, shut-down, and emergency instruction. Include summer, winter, and any special operating instructions.
e. Maintenance requirements: Include required materials, routine procedures and guide for cleaning, troubleshooting, equipment isolation, AC and DC lockout, tagout, and repairing PV Modules including disassembly, repair and reassembly instructions, alignment, adjusting, balancing, and checking instructions. Include procedures for testing printed circuit boards, cells, and modules
f. For field installed circuits, include color coded wiring diagrams and schematic diagrams with wire functions labeled on the diagrams.
g. For adjustable mounting systems, include the preferred mounting angle of PV Modules for summer and winter optimum performance.
h. Provide a screen shot of each display page of DAS output.
i. For PV systems with PV Modules installed in a manner that limits maintenance access to less than two sides of each PV modules, provide preferred method for preventing undesirable vegetation around PV Modules and for protecting the PV Modules while removing vegetation around PV Modules.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain PV modules from single manufacturer. Mounting for PV system specified in this Section shall be from single manufacturer. PV system inverters shall be from single manufacturer. DC combiner boxes shall be from a single manufacturer. DC disconnects shall be from a single manufacturer. AC combiner panels shall be from single manufacturer. PV system isolation transformers shall be from single manufacturer.

1. [The use of multiple manufacturers where custom detailing of visible portions with aesthetic consideration of the PV system panel installation, shall be permitted with approval by Project Director/COR.]

B. Manufacturer: Manufacturer of any PV equipment shall be a company specializing in manufacturer of PV equipment and have documented experience with their hardware in commercial applications in field.

C. Listing and Labeling: Electrical components, devices, and accessories, Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

D. Certificate of Compliance: Provide certificate of compliance to referenced standards from manufacturer of PV Systems.

E. Qualifications:

1. Installation Personnel: Submits evidence prior to work that persons who are to perform work herein have appropriate training or experience in PV system installation, design, and applicable safety procedures, and hold proper licenses where applicable.
2. Commissioning Personnel: Provide qualifications including experience of personnel responsible for PV system startup and commissioning work.

F. Pre-installation Conference: Before installation of PV system begins, conduct pre-installation conference at project site with installers, and other interested parties to review procedures, schedules, safety and coordination of installation with other elements of the work. Contractor shall notify Project Director/COR of anticipated date of this conference at least three weeks prior to meeting. Several conferences may be needed, depending upon system complexities and construction schedule.

G. All materials supplied for this project shall be new.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver and receive all PV system materials required for the work.

B. Prior to and during construction, provide secure storage on site for all PV system materials stored on site.

C. Store and handle to comply with manufacturer's directions, and as required to prevent damage to glass, PV materials, and system component electronics.

D. If stored in areas subjected to weather, cover PV modules and system component electronics to provide protection from weather, dirt, dust, corrosive substances, and physical damage.

E. Replace any scratched or damaged PV system materials or system components.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation under the following site-specific conditions, unless otherwise indicated:

1. Temperatures:

   a. Annual Ambient: **[enter site specific value]** deg C to **[enter site specific value]** deg C.
   b. Record low temperature: **[enter site specific value]** deg C.
   c. Maximum monthly high temperatures (to determine PV string length):

      January **[enter site specific value]** deg C.
      February **[enter site specific value]** deg C.
      March **[enter site specific value]** deg C.
      April **[enter site specific value]** deg C.
      May **[enter site specific value]** deg C.
      June **[enter site specific value]** deg C.
      July **[enter site specific value]** deg C.
      August **[enter site specific value]** deg C.
      September **[enter site specific value]** deg C.
      October **[enter site specific value]** deg C.
      November **[enter site specific value]** deg C.
      December **[enter site specific value]** deg C.

2. Altitude: **[Sea level]**,**[enter site specific value]**.
3. Relative humidity: **[enter site specific value]**,**[Up to 100% non-condensing]**.
4. **[enter other site-specific conditions such as wind ratings, sand/dust, seismic activity, salt air, fog, marine corrosiveness, etc.]**

1.7 COORDINATION

A. Coordinate layout and installation of PV System and components with other construction, including conduit, piping, equipment, roof drains, roof penetrations, antennas, and adjacent obstructions and surfaces. Maintain required clearances for workspace and equipment access.

B. Coordinate size and locations of mounting bases and casting of anchor-bolt inserts into concrete slabs, beams and columns.

C. Coordinate location of ballast support rails with existing structural framing.

D. Coordinate system with structural capability of roof structure. Coordination of loading from PV mounting system with design of main building is responsibility of Structural Engineer of Record.

E. Coordinate Roof Slope and outfall: Project-specific application will define PV system slope; however, coordinate mounting system with roof slope and drainage arrangement (gutter/downspout/sheetflow) toward suitable outfall.

F. Coordination with roof membrane: Contractor shall coordinate type, thickness, and construction of roof membrane. PV System shall be able to function with installed roof membrane and not create leaks in roof. Contractor shall ensure that PV system does not cause roof to leak. **[For separate PV projects, it is responsibility of PV contractor to ensure roof does not leak.]**

G. Provide system technical coordination for utility interconnection agreements. Provide grid connection as required, and in location as designated by local utility company.

H. Coordinate electrical voltage, phase, and hertz characteristics of PV system's output with electrical characteristics of local utility company. Provide isolation transformers where indicated to **[step-up]**, **[step-down]** PV system output voltage to match local utility company's voltage.

1.8 WARRANTIES

A. General: Provide 5 years of technical phone support for technicians and designated maintenance personnel for PV system components and Data Acquisition System (DAS) from the date of Substantial Completion.

B. Mono or Polycrystalline PV Modules (bifacial and monofacial type): From the date of Substantial Completion, PV modules installed in system shall have 10-year materials and workmanship warranty, and PV modules shall have a 25-year service warranty to exhibit power output of not less than 80 percent of rated power . If during the service warranty period, any of the PV modules exhibits power output of less than 80 percent, manufacturer shall replace the affected modules. Refer to Article on COMMISSIONING.

C. Power Conditioning Equipment: Power conditioning equipment shall have 10-year product warranty from the date of Substantial Completion. During warranty period, manufacturer shall repair or replace power conditioning unit. Warranty shall include on-site troubleshooting completed by local electrician with phone support from equipment manufacturer.

D. Data Acquisition Equipment: Data acquisition equipment shall have a 5-year product warranty from the date of Substantial Completion, with option to purchase -ten-year warranty. During warranty period, manufacturer shall repair or replace the unit. Warranty shall include on-site troubleshooting completed by local electrician with phone support from equipment manufacturer.

E. [Existing structures: Existing roof is under warranty at start of PV system installation. Contractor shall coordinate and work with existing roof warranty provider to uphold and maintain existing roof warranty during and after PV system retrofit.]

1.9 EXTRA MATERIALS

A. Based upon systems used for this project, furnish extra materials described below that match products installed, packaged with protective covering for storage, and identified with labels describing contents.

1. PV modules: Quantity of modules to meet 1.5 percent of total PV system size, or no less than three modules.
2. String Inverters: Two per inverter model used for the PV system.
3. DC combiner and disconnect fuses: Quantity of fuses to meet 5 percent of the total installed quantity.
4. PV module connectors: Quantity of connectors to meet 5 percent of the total installed quantity.

5. Bypass Diodes: Quantity of diodes to meet 2 percent of the total installed quantity.

1.10 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date for a period of one calendar year with a renewable option for an additional year, provide proposal for system maintenance service based on manufacturer's recommended daily, weekly, quarterly, semi-annual, and annual maintenance activities. The proposal shall be submitted to the COR/Project Director at least 120 days prior to Substantial Completion.

B. The intent is to provide full maintenance service.

C. Maintenance service shall include preventive maintenance, repair or replacement of worn or defective components, required supply of cleaning solutions,**[performing scheduled cleaning,]** and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks shall also align with the manufacturer's recommended checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 SYSTEM PERFORMANCE REQUIREMENTS

A. Photovoltaic Modules:

1. The PV modules shall be framed flat-plate crystalline or polycrystalline **[monofacial][bifacial]** silicone modules.
2. PTC ratings shall not be less than 11.5% of the rated nameplate power output.
3. The PV modules shall meet or exceed the requirements of UL 1703 and IEC 61215
4. The PV arrays shall be sized to achieve the production of electrical (kWh) AC power noted on the drawings within the area specified on plan. The indicated rating shall be based upon the PTC rating of the modules.

B. Product selection for mounting:

1. Support PV systems associated with new construction by structure using fixed mounted system as specified herein and in the contract documents.
2. **[Support PV systems associated with existing structures by ballast-mounted non-penetrating system as specified herein and in contract documents. Vertical, lateral, and overturning forces with PV system shall be resisted by ballasted roof system mounting system.]**
3. **[Support PV systems associated with new construction of covered parking by structure using fixed mounted system as specified herein and in contract documents.]**
4. **[Support PV systems associated with new construction of walkway canopies by structure using fixed mounted system as specified herein and in contract documents.]**

5. **[Support PV systems associated with new construction of ground mounted system by structure using fixed mounted system as specified herein and in contract documents.]**

C. Side Voltages: Conform to limitations identified in NFPA 70.

D. Structural Performance: Provide mounting systems capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Design Loads: As indicated on Drawings and required in Chapter 16 of the OBO Building Code (International Building Code as amended by OBO), including referenced ASCE 7, "Minimum Design Loads for Buildings and Other Structures."
2. Dead Loads: Include vertical loads induced by the PV system and their associated mounting systems, as well as personnel access where applicable.
3. Roof Snow Loads: Include vertical loads induced by weights of snow based on loads identified for project, or Chapter 16 of the OBO Building Code if not identified. Allow for unbalanced and drift loads in design.
4. Wind Loads: Include horizontal loads and uplift induced by basic wind speed corresponding to mean-recurrence interval at Project site based upon loads identified for project, or Chapter 16 of the OBO Building Code if not identified.
5. Seismic Loads: Include horizontal loads induced by effects of earthquake motions in accordance with Chapter 16 of the OBO Building Code, including referenced ASCE 7, "Minimum Design Loads for Buildings and Other Structures."
6. Load combinations: Design mounting system to withstand most critical effects of load factors and load combinations as required by Chapter 16 of the OBO Building Code, including referenced ASCE 7, "Minimum Design Loads for Buildings and Other Structures." **[For existing structures, analyze if adequate to support PV system and associated mounting system to withstand most critical effects of load factors and load combinations as required by ASCE 7, "Minimum Design Loads for Buildings and Other Structures."]**

2.2 MANUFACTURERS

A. PV Module Manufacturers: Equipment manufacturers are subject to meeting the specified performance requirements within this document.

B. String Inverter Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. SMA America, Rocklin, CA.
2. Schneider Electric.

C. Central Inverter Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. SMA America, Rocklin, CA.
2. Schneider Electric.

D. Combiner/Collector Box Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. SMA America, Rocklin, CA.
2. SolarBOS Corp, Livermore, CA.
3. Bentek Corp., San Jose, CA.

2.3 GENERAL

A. PV module Electrical Termination: Potted block with factory installed positive and negative Multi-Contact MC4 connectors as indicated on the contract drawings or an approved equal.

B. [Thin Film PV module Electrical Termination: Edge termination with factory installed positive and negative Multi-Contact MC4 connectors as indicated on the contract drawings or an approved equal.]

C. All cell interconnections on all types of PVs shall be made with the encapsulation.

D. Diodes: All PV Modules shall be supplied with factory installed by-pass diodes.

E. Single Phase String Inverters: Match inverter frequency to local utility company frequency. Match inverter output voltage to local utility company utilization voltage. **[Provide isolation transformers where indicated to match PV system voltage to local utility voltage.]**

F. Three Phase String Inverters: Match inverter frequency to local utility company frequency. Match inverter output voltage to local utility company utilization voltage. **[Provide isolation transformers where indicated to match PV system voltage to local utility voltage.]**

G. Three Phase Central Inverters: Match inverter frequency to local utility company frequency. Match inverter output voltage to local utility company utilization voltage. **[Provide isolation transformers where indicated to match PV system voltage to local utility voltage.]**

H. Provide AC disconnect switches to building power distribution system.

I. Isolation Transformer: Provide isolation transformer and associated disconnect switches between AC collector boxes and building power distribution system connection, where these are not integral to the Inverter(s).

J. Power line conditioners: Provide power line conditioners between AC collector boxes and building power distribution system connection to minimize ground currents on facility electrical system and to reduce electromagnetic interference (EMI) and Radio Frequency Interference (RFI) on power lines. Filters may be integrated into inverters.

K. Exposed Conduit: All exterior exposed conduits shall be galvanized rigid steel (RMC) with threaded fittings.

L. Disconnect Switches: Provide AC and DC disconnect switches as required.

M. PV Module and PV Wire Connectors: Provide connectors as recommended by manufacturer. Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Multi-Contact
2. Tyco
3. Huber+Suhner

N. PV system Output: Where grid tied PV systems are acceptable to local utility company, PV system's inverters shall match local utility company exactly in voltage, phase, and frequency to allow it to be grid-tied in accordance with local utility company's safety and power quality requirements. **[PV system shall not produce energy in excess of what will be consumed at site. Provide and arrange revenue meter where PV system generated energy is not registered on utility meter.] [PV system may produce energy in excess of what will be consumed at site. Provide net metering at utility meter to account for PV system generated power being registered on utility meter for power generation credit.] [PV system may produce energy in excess of what will be consumed at site. Provide revenue metering at utility meter to account for PV system generated power being registered on utility meter for power generation credit based upon time of day and PV power generated.]** Coordinate all requirements with local utility company. Refer to Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety" for additional metering requirements. Provide safety disconnect switches to disconnect PV system from local utility line in event of utility failure, complying with utility requirements.

O. Internet Connectivity: Contractor shall provide cellular modems and balance of equipment, allowing for GSM/GPRS remote monitoring of PV system data logging. Cellular service will be established and maintained by post. No device or system may be permitted to have or require internet connectivity to function. There will be no connectivity to internet or intranet.

P. Battery Storage: Battery storage system, as required as part of PV system, shall be fully enclosed cabinets, **[complying with Division 26 Section on Energy Storage Systems],** and shall be listed for application in accordance with OBO-ICS NEC Chapters 1 and 7.

Q. Electrical materials must be durable for the expected life of the systems (25 years). This shall include but not be limited to; material selection for structural elements, **[corrosive resistant coatings for members and connections (bolts, nuts, washers, etc.), high temperature ratings for electrical equipment (to include additional heat dispersion methods)],** protective coatings for conduits and cablings.

R. [Integrate the PV system with the existing electrical distribution system, matching system voltages and electrical characteristics]

2.4 ROOF MOUNTING SYSTEMS

A. Fixed mounted supported systems.

1. Support PV system with fixed mounted system for new construction or in conjunction with complete roof replacement. Design support system for maximum span lengths and

minimum roof penetrations. Attach mounting system to structure using post-installed anchors, embedded anchors or as indicated in contract documents. Provide minimum stand-off height above roof surface that is required for roof system and mounting system as well as inspection and maintenance.

2. Flash fixed mounted support systems in accordance with "The NRCA Roofing and Waterproofing Manual" recommendations for type of roofing system being affected. All flashing and penetrations shall be inspected by roofing supplier/contractor and warrantied with roof system.

B. [Ballast mounted support systems.

1. Support PV systems with ballast-mounted system on existing buildings. Design support system to resist overturning and sliding effects from wind and seismic loads. Do not penetrate roof deck or roofing material. Structural Engineer of Record shall verify existing structure has capacity to support load from ballast mounting system. Verify roof deck and roofing material can support ballast system without damage to either.

2. Alternate mounting systems may be submitted for review with explanation and justification for such system. Include design calculations supporting justifications. All deviations in systems, materials and methods must receive written approval from Project Director/COR based upon input from OBO/PDCS/DE/EE.]

2.5 [COVERED PARKING AND COVERED WALKWAY ARRAY COMPONENTS

A. Covered parking and covered walkway PV system shall include an array of contract-specified PV Modules, mounted on covered walkway structure [structure by others] in such manner to secure PV array to structure. Provide PV Module to PV Module multi-connect connectors, as specified herein or an approved equal.

1. Canopies shall be designed to allow for underside access of all serviceable components including, but not limited to, wiring and modules. Systems shall not require overhead access for module replacement.

2. Canopies which are designed without underside access shall be treated as a roof with unprotected edge in terms of requirements for temporary railings, access pathways, and personnel fall protection.]

2.6 [GROUND MOUNTED ARRAY COMPONENTS

A. Ground mounted PV system shall include array of contract-specified PV Modules mounted on fixed ground mounted structure in such as manner to secure PV array to structure. Provide PV Module to PV Module Multi-connect connectors, as specified herein or an approved equal.]

2.7 INVERTERS

A. DC-AC Inverters: Inverters shall provide output waveform to match building power distribution system when grid tied to local utility or in combination with generator operation where applicable. Inverter output shall comply with all local utility company requirements. Inverters shall be compatible with its associated PV system array output and utility input as indicated on Construction Drawings. Inverters shall be capable of complete automatic unattended operation including start-up, synchronization, and disconnect, and operating in parallel with other inverters, utility, and generators. Voltage and frequency tolerances shall match the requirements of the local utility company or generators. The inverters shall be capable of shutting down without damage when PV array output is outside tolerance parameters of inverter, and in accordance with rapid shutdown. Manufacturer shall connect array to ground in inverter in accordance with array requirements, as indicated on Construction Drawings. Inverters shall be at minimum listed to UL1741 and compliant with IEEE 1547. Inverters shall be at minimum rated 95.5 percent efficient.

B. Power control feedback: Provide a power control feedback system to monitor the utility, standby generators (photovoltaic diesel hybrid system), and the total PV inverter output. The PV system shall be designed to optimize generator use. For facilities with diesel generators, PV output must be controlled to maximize the generator loading for greatest efficiency of generator operation (single or paralleled generator application), and to protect from back loading generators. Utility integration shall maximize power factor, as observed by the utility, to avoid power factor charges form the utility.

1. Power control feedback shall be managed from the **[energy storage system's micro-grid controller][hybrid control system]** as the primary controller.

2. **[Hybrid Control System: PV system design shall include control system allowing for hybrid operation of PV system with diesel generator systems. Control system shall automatically monitor and control all PV inverters to allow stable operation of the photovoltaic diesel hybrid system. Controller shall continuously monitor operating state of generators and loads and shall adjust output power of inverters accordingly. Possible technologies include, but are not limited to ABB PVI-PMU, SMA Fuel Save Controllers and DEIF Automatic Sustainable Controllers.]**
3. Provide return time delay of 30 seconds when utility return or generator transfer to allow clearance of fields, and address transient spikes associated with switching equipment upstream or downstream.

2.8 ACCESSORIES

A. DC Combiner Box: UL listed components and suitable for the environment in which installed with provisions for 1000Vdc or 600Vdc fuses of appropriate size for each source circuit in accordance with NFPA 70 guidelines with electrical characteristics, as indicated on Construction Drawings.

1. Combiner/Collector Boxes: DC combiner boxes shall be UL 1741 listed with required number of inputs and outputs for PV system configuration.

2. DC combiner boxes shall include control wiring and hardware required to be deenergized via shunt trip as part of rapid shutdown control requirements per OBO-ICS NEC.
3. DC combiner boxes shall be located local to each PV array to maintain compliance with rapid shutdown boundary requirements per OBO-ICS NEC.

B. Devices and enclosures shall be rated for application. Exterior installations of components shall have minimum steel NEMA **[3R][4X]** rating for exterior wet locations and project conditions. Enclose interior installations in minimum steel NEMA 1 enclosures.

C. Fabrication of supports for system components (excluding PV module support) shall be heavy-duty, self-supporting galvanized steel channel provided with captive clips for panels, boxed and conduits.

D. Cabling: All conductors, cabling, and associated connectors shall be UL listed for environmental conditions in which they will operate.

1. No fine-stranded conductors may be used for ground connections.

E. Rapid shut-down devices performing rapid shutdown complying with OBO-ICS NEC requirements and compatible with inverter(s) and power conditioning equipment, including push button and accessories for a complete solution.

2.9 DATA ACQUISITION SYSTEM

A. Provide all data acquisition system (DAS) equipment required for complete and working DAS. DAS equipment shall include all of sensors and wiring required to measure and record parameters indicated herein.

B. All equipment supplied for DAS shall have capability of operating at voltage and frequency available at installation location.

C. Integrate DAS with building automation system (BAS). Instruments and measuring equipment may report directly to BAS. DAS shall provide output to lobby display. When BAS is not available at site, provide computer for DAS of latest available technology, with latest version of Windows operating system, and with ability to share data collected by DAS system with remote computer as described in this Section, and to future BAS via RS-485/Ethernet connection.

D. The DAS shall perform the following tasks:

1. Sample listed parameters data at least 20 times per minute and log the average values to data storage area in maximum of 5-minute intervals.
2. Retain logged data upon loss of power.
3. Start logging data and reestablish network connections automatically when power is restored.
4. Generate daily and monthly files as defined herein.
5. Store logged data for a minimum of five years.

E. The following parameters shall be monitored.

1. Ambient temperature (C) shall be measured with stainless steel sheathed temperature sensor module. House temperature sensor in shielded enclosure.
2. Measure wind Speed (m/s) with approved anemometer.
3. Measure plane of array (rooftop) irradiance (W/m2) by approved PV reference cell
4. Measure module temperature with surface mounted temperature sensor (mounted on rear of module) adhered with high temperature epoxy.
5. Instantaneous voltage (V), amps (A), power (kW), and accumulated (kWh) energy output for the PV system.
6. Soiling: Soil sensor shall be used to monitor and determine soiling losses, and to optimize washing schedule.

F. Daily file shall be generated by DAS that includes, at minimum, 15-minute averaged data over entire day for each of parameters listed above in tabular format.

G. Monthly file shall be generated by DAS that include, the following parameters in tabular format presented for each day in month.

1. Daily total irradiance (kWh/m^2)
2. Total daily AC energy produced by PV system (kWh)
3. Peak AC power output for PV system (kW)
4. Average temperature for day (°C)
5. Maximum temperature for day (°C)
6. Maximum module temperature for day (°C)
7. Minimum temperature for day (°C)
8. Average wind speed for day (m/s)
9. Total calculated CO_2 abated by use of PV system.

H. DAS system shall have ability to broadcast instantaneous data onto a Ethernet TCP/IP network via MODBUS communication protocol to a datalogger. The data on the logger must be accessible through an HTML interface.

I. When there is no BAS, provide and program computer to display in a location designated by Project Director/COR, real time data that is broadcast by DAS equipment.

J. Display shall be updated at minimum of 12 times per minute, and it shall allow for flexibility in content, such that content and appearance may be changed at any time.

K. Real time display shall include in graphical format, at minimum, the following:

1. Instantaneous irradiance as measured by PV reference cell.
2. Instantaneous ambient temperature.
3. Instantaneous wind speed.
4. Combined instantaneous AC power being produced by all PV systems.
5. Total daily AC energy produced by all PV system as running sum.
6. Total year to date AC energy produced by all PV systems as running sum.
7. Total lifetime AC energy produced by all PV systems as running sum.
8. Aggregate amount of CO_2 abated by use by all PV systems as running total.

9. Alerts or alarms registering overheating in power conversion equipment, departure from reference PV cell to array output, faults or general failure of components or performance.

L. Provide an additional 1-meter (diagonal) LCD or LED Screen display, suitably equipped with mounting hardware for wall-mounted application in remote location of main office building entry lobby; exact location will be determined by Project Director/COR. The display must be a commercial model designed for continuous use. In addition, provide computer to interface with display as described herein. Computer shall communicate with BAS via RS-485/Ethernet. Computer shall be current technology with Windows 7 (or newer version) operating system, and shall have ability to support display and minimum of the following:

1. 2 GB RAM.
2. 500 GB Hard Drive.
3. 2.8 GHz Processor.
4. 10/100/1000 mbps Network card (or compatible card for building network system).
5. Keyboard and mouse.
6. Surge protection power supply.
7. Five minutes of 720 watts of battery backup with automatic shutdown on extended. outages of electrical power.

M. Provide high quality digital video cable to connect display computer with remote lobby display. Cable shall be compatible with both computer and display, and shall be installed in rigid conduit and boxes.

N. Mount remote display at maximum of 100 meters from computer. Remote display and computer shall display seven continuously cycling pages as described herein. Display time periods shall be adjustable from initial settings described below. All pages shall include appropriate graphics to convey information in addition to supporting text for each page as outlined herein. All graphics shall be reviewed and approved by the government prior to implementation. Page content is as follows:

1. Page 1: Display all real time parameters as described above. All parameters shall be updated minimum of every five seconds. Display Page 1 for two minutes.
2. Page 2: Display description of climatic conditions that are measured as described herein. Page 2 shall include description of effect of these parameters on PV system performance. Display Page 2 for 1 minute.
3. Page 3: Display description of combined instantaneous AC power output of all arrays as measured. Page 3 shall provide description of photovoltaic conversion process of sunlight into AC energy. Display Page 3 for 1 minute.
4. Page 4: Display description of daily, yearly and lifetime energy production as calculated herein. Page 4 shall describe basic unit of electrical energy and example of how energy produced is related to climactic conditions. Display Page 4 for 1 minute.
5. Page 5: Display aggregate amount of CO_2 abated from atmosphere from use of PV system, as well as description of methods of calculating these figures. Display Page 5 for 1 minute.
6. Page 6: Display estimate of number typical households or local equivalent that could be powered by expected annual energy harvest of entire array for installation as defined by Construction Drawings. Display Page 6 for 1 minute.

7. Page 7: Display list of all major component providers with specific reference to location of each component in array. Components included shall include at a minimum: PV module, inverter, mounting systems, DC combiners/disconnects and DAS equipment manufacturers, Display Page 7 for 1 minute.

O. Provide data logging computer, display, and keyboard as described.

P. Mount weather instrumentation with hardware designed for such purpose.

Q. All exposed wiring, including weather instrumentation sensor leads, shall be made with sunlight resistant wire.

R. Signal wire shall be 1.0 mm^2 (18 AWG) min. stranded single pair twisted shielded cable with nonmetallic outer jacket.

S. Thermocouple wire shall be Type T 0.5 mm^2 (20 AWG) min. single pair twisted shielded cable with nonmetallic outer jacket.

T. Provide labeling to DAS conduit runs. This labeling shall identify content of conduit, and shall be visible by maintenance personnel. Labels shall be printed in permanent and durable manner, and in size constant with conductor diameter. Repeat labels as required for continuous identification purposes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive PV system components for compliance with installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Mounting of PV array:

1. Mounting structure shall be securely fastened to **[roof structure]**, **[roof surface]**, **[covered walkway structure]**, **[covered parking structure]**, **[ground system]**, **[ballast system]**, **[vertical building structure]** as specified in contract.
2. Bolt units directly to mounting structure.
3. Securely fasten combiners, collectors, inverters and system components to building walls, or mount on self-supportive structure located adjacent to array.
4. Mount isolation transformers on 100-mm high concrete housekeeping pad; see Section 033000 “Cast-in-Place Concrete.”

B. String Inverters: Mount PV system inverters in locations approved by Project Director/COR based upon input from OBO/PDCS/DE/EE. Mount as close to DC combiner boxes as possible or PV modules as applicable.

C. Three Phase Central Inverters: For PV systems where total distance of each DC circuit does not exceed 50 meters, mount three phase inverters in locations approved by Project Director/COR based upon input from OBO /PDCS/DE/EE. Mount as close to DC combiner boxes as possible.

D. Power Control Feedback: Mount the power control feedback modules in proximity to inverter location for interaction with all inverters. Identify pathways and provide materials (cabling, current transformers, potential transformers, controllers) to monitor the utility and/or generator systems. Provide interconnection to generators or paralleling switchgear to identify generator operation (loading).

E. Once installed, PV Modules shall be visually uniform and shall be subject to visual inspection for consistency. Replacement of unacceptable PV Modules is responsibility of Contractor.

F. Work of this Section includes work required for PV systems up to, and connection to, each PV system to AC building power distribution system disconnect switches.

G. PV array shall not exceed five PV Modules in at least one direction for maintenance access. PV array shall facilitate maintenance access to all roof drains, antennas, and equipment mounted adjacent to PV array.

H. Safety Requirements:

1. Provide clear and unobstructed access route to PV installations.
2. Installations shall be in accordance with OSHA requirements.
3. Where required provide OSHA approved safety railings at and along access routes to PV systems.

3.3 CONNECTIONS

A. Install equipment grounding conductors for components, with ground continuity to main electrical ground bus of building electrical system to which PV system is connected. See Article on ACCESSORIES regarding restrictions at ground connections.

1. Fine stranded conductors are not permitted for ground connections.

B. Tighten bus joints, electrical connectors, and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B. Make a permanent mark on all joints, connectors and terminals after they have been torqued to the proper value.

3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section on identification for electrical systems.

B. PV system signs shall be printed in English and in local language.

C. Appropriately identify and label PV system equipment as required in NFPA 70 with permanent, self-adhesive, engraved red stock with white core plastic with minimum thickness 1.5mm (or approved equal). Lettering shall be standard engravers letter style using standard size appropriate for application in accordance with NFPA 70.

D. Label DC combiners, AC combiner panels, DC-AC inverters, DAS enclosures, and PV system disconnects. Use permanent, self-adhesive, printed labels identifying system component pertaining to PV system, and provided in both English and local language. Lettering shall be standard engravers letter style using standard size appropriate for application in accordance with NFPA 70.

E. Provide warning signs for PV system startup and restart for inverters with DC disconnect switch. Refer to Article on START-UP SERVICES.

F. Provide warning signs for PV system at DC disconnect switches indicating that voltage is present on DC PV Module portion of circuit during daylight hours. Provide warning signs for PV system at AC disconnect switches indicating that voltage is present on local electrical utility portion of circuit when utility power is available.

G. Operating Instructions: Printed basic instructions for PV system components, including operation, disconnection, and emergency procedures.

H. Label DC system components with material described herein for operating DC current (Imax), system operating DC Voltages (Vmax), maximum string DC voltage (Voc), and maximum system DC current (Isc).

3.5 FIELD QUALITY CONTROL

A. Testing: After installing PV System components and after building electrical system has been energized, demonstrate product capability and compliance with requirements.

B. Contractor shall be present for complete system review and startup acceptance test with Project Director/COR and other Government representatives. Contractor shall be prepared at any time during this process to provide access to all portions of installation and shall remedy any portion of system that is not in compliance with this specification within 30 days of noted deficiency, that does not perform to manufacturer's operating specifications, or that fails to operate due to poor workmanship.

C. In addition to the following test sequence, Contractor shall perform all tests required by manufacturer as outlined in inverter's installation and operator's manual.

1. Ensure that inverter is switched off before proceeding.
2. Test and record AC line voltage at the inverter to ensure that it is within proper limits as stated by the manufacturer.
3. Test that phase sequencing is correct, if applicable.
4. Check continuity of all fuses.
5. Check that DC open circuit voltage is within manufacturer's recommended range at DC disconnects.
6. If DC voltage is correct, close inverter cover, close DC and AC disconnect switches, and turn on inverter.
7. After Manufacturer's specified start-up time, confirm that inverter is operating by recording DC operating voltage and currents, AC Phase voltages and phase currents and inverter power.
8. Close all open equipment enclosures.
9. Look and listen for, find the cause of, and remedy anything unusual from the PV array or PV system components.

D. Additional testing shall demonstrate proper functional operation of control and protective features under normal and abnormal conditions. In some cases, devices external to inverters can handle one or more of these features:

1. Confirm wake-up and sleep operations of PV system.
2. Confirm inverter sleep operation during loss of building power and loss of array.
3. Confirm Power feedback controller operation for **[Generator], [Utility]** interface.

E. Provide photo record of installation and major components, including PV Modules, inverters, transformers, combiners, collectors, and all display screens shall be made. Include photos showing connections within all installed enclosures. Provide electronic copies of photo record on compact disc and hard copy of the photo record (with labels for each photo) in Operation and Maintenance Manual identified in Article on SUBMITTALS.

F. [Flood Testing: Prior to installation flood test each deck area for leaks according to recommendations in ASTM 5957. After installation of waterproofing, flood test disturbed areas before overlying construction is placed. Install temporary containment assemblies, plug drains and flood with potable water. Contractor shall continuously monitor testing both interior and exterior to ensure all leaks are immediately identified and repaired. In event of detected leak, stop test immediately.

1. Flood to average depth of 65 mm (2-1/2 inches), with minimum depth of 25 mm (1 inch), and not exceeding depth of 100 mm (4 inches). Maintain 50 mm (2 inches) of clearance from top of sheet flashings.
2. Flood each area for 24 hours.
3. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight.

G. Engage independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.]

3.6 PRE-OPERATIONAL APPROVALS

A. For sites served by local electric utility company, do not connect PV system to building electrical power distribution system for testing purposes without Interconnection Agreement from local electric utility company. The Contractor shall coordinate with the local Utility Company and assist the US Government as required by preparing and submitting an Interconnection Application and obtaining a new or amending an existing "Interconnection Agreement" in accordance with the serving Utility Company requirements. Once entire PV system is correctly installed and properly wired, and preliminary field-testing, system review and start-up test are successfully completed, Contractor shall contact utility to schedule and be present for any inspections required for PV system approval. Interconnection Agreement from local electric utility company must be received before system is permanently paralleled with their system. Contractor shall obtain this approval from local electric utility company and include a copy in the Operation and Maintenance Manual.

3.7 CLEANING

A. Remove all excess sealants, fillings, grease, tape residue, dust and debris from PV system components.

B. Protect work from damage by other trades.

C. Ensure site is clean and secure, in workman like condition, during and at completion of the project.

D. [Patch and repair existing walls, roofs, irrigation, asphalt, concrete, hardscape, painting, and other existing construction impacted by the project to match original condition(s).]

3.8 STARTUP SERVICES

A. Perform testing as prescribed in this specification and in accordance with manufacturer's recommendations.

B. For PV system incorporating inverters with ON switch, all PV system disconnects are in CLOSED position prior to turning on inverter. For PV system incorporating inverters that do not incorporate an ON switch, PV system will be turned on when all PV system disconnects are in CLOSED position.

C. Ensure there is interconnection agreement from local utility company for interconnection of PV system with utility grid is obtained prior to startup. Local utility company may require that representative of utility be on-site during initial interconnection; Contractor shall accommodate this requirement, if stated by utility.

D. Startup for the Data Acquisition System (DAS). Perform the following tests before system is deemed complete.

1. Confirm that DAS reads zero for all measurements when respective instruments are turned off.
2. Verify and record that all measurements are reading in proper range when respective instruments are turned on. Include copy of test results in Operation and Maintenance manual described herein.
3. Verify that all files created by DAS are in proper format and have proper values.
4. Verify that real time data is being displayed properly on lobby display.
5. Confirm that all links to real time and archived data are working properly.
6. Confirm that data files are retained upon loss of power.
7. Confirm that daily, monthly, and total since system installation files are being generated properly.
8. Confirm that UPS shuts down computer upon extended power outages.
9. Confirm that data acquisition system starts automatically and re-established network connections upon restoration of power.

3.9 COMMISSIONING

A. Commissioning Agent: Engage electrically qualified commissioning agent to inspect, field test, and document performance of components and equipment after installation. Commissioning agent shall prepare written test results in report. Report shall include documentation of all potential shading obstructions on PV Modules.

B. All test instruments shall be identified in Report and listed by manufacturer, model number, serial number, date of calibration, and calibration authority. All test instruments shall have been calibrated within past year. Test instruments shall have attached calibration sticker that is traceable to NIST.

C. Obtain copy of local utility company's agreement to connect PV system to building power distribution system prior to all testing.

D. Contractor shall obtain written commissioning procedures document. Procedure entries shall include: Date; time; person taking data; recorded value of data; indication if recorded value is out of range of system and/or equipment tolerance. Each page of the procedures must include: test name; equipment tested; location; date; time; person performing test; model number of equipment; serial number of equipment; manufacturer; tolerance ranges of equipment tested for reference. Approach to numbering PV Modules in PV array for testing shall be identified.

E. Witness startup of PV system. Government representative shall witness startup with Commissioning Agent.

F. Commissioning Agent shall keep Commissioning Issues Log and include it as appendix to Report. Log shall include, but not be limited to: issue description; log tracking number; date; time; person investing issue; action taken; person taking action; date of closure of issue. Include copy of Commissioning Issues Log in written procedures to Contractor.

G. Perform the following field tests and inspections as follows for test report:

1. Test insulation resistance and continuity for each DC circuits, AC feeders, grounding including ground fault protection, and control circuits. Disconnect all sensitive electronic equipment prior to testing. Visually and mechanically inspect all cabling, connections, and conduits. Verify color coding of conductors per NFPA 70. Verify proper torque of termination connections with calibrated torque wrench.
2. Test ground fault protection of PV system (where required).
3. Test grounding continuity by measuring array-to-earth ground resistance.
4. Test output and performance of the isolating transformer in accordance with Section 262214 "Low-Voltage Transformers." Set taps as necessary.
5. Test output of each PV String. Identify which panels are shaded at any point of day between 9 AM and 4 PM.
6. Verify proper voltage and current to each input to combiner boxes, inverters, AC collector boxes, and isolation transformer.
7. Ensure string DC open circuit voltage within 5% of each other and within manufacturer tolerances.
8. Verify string maximum powerpoint voltage (Vmp) within 5% of each other and current at maximum powerpoint (Imp) within 5% of each other.
9. With collected data, calculate expected Voc, Vmp, Imp, AC watts, and power performance ratio (what is produced/what is expected).
10. Verify insulation resistance per manufacturer tolerances.
11. Test proper operation of inverters including loss of utility, restoration of utility, generator start, ATS operation, PV system shutdown/restart functions, and PV system efficiency. Set output voltage as necessary. Verify that all local utility notifications and requirements have been incorporated into PV system.
12. Measure open circuit voltage drop on all DC circuits and AC feeders. Verify that voltage drop between PV modules and inverters do not exceed 3 percent on each DC circuit. Verify that voltage drop between inverters and connection to building power distribution system does not exceed 1 percent on each AC feeder.
13. Verify operation of all disconnect switches and proper sizing of all overcurrent protection devices in accordance with Division 26 Sections on enclosed switches and circuit breakers and on panelboards.
14. Witness flood test.
15. Verify that displays accurately represent output of PV system. Independently measure energy produced by PV system, and compare data to log data of DAS. Track data and compare data to log data for minimum of one month.
16. Performance testing: Provide current-voltage (IV) curve tracing for each PV string for complete day using a PV analyzer or equivalent device. This data shall be used to compare to PV string performance with nameplate (STC) conditions. Identify and remedy PV module defects, wiring defects, or connection problems, and identify shading issues.
17. Power feedback controller: Monitor the utility power factor with the PV system functioning and with it disconnected. Identify the observed power factor. Verify the system modulates this power factor to not adversely affect utility billing.
18. Verify that remote data logging access has been established and is functioning. Provide all necessary data, IP addresses, login-ins, and passwords to post.

H. Contractor shall remove and replace malfunctioning equipment. Retest PV system as specified above.

3.10 DEMONSTRATION AND TRAINING

A. Provide 6 hours on-site training session for PV system components and Data Acquisition System (DAS). Provide Instructor with at least five years' experience in installation and operation of PV systems used in project. Session shall review system, including review of wiring diagrams, equipment list, spare parts inventory, system isolation and de-energization procedures for maintenance workers (i.e., lockout/tagout), failure modes and effects analysis by component, and proper maintenance and cleaning procedures (including use of cleaning equipment).

END OF SECTION 263105

SECTION 263214 - ENGINE GENERATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies generator sets (gensets) for use as backup electric power sources. Genset consists of:

1. Liquid-cooled compression ignition diesel engine directly connected through flexible coupling to alternating current generator with rotating exciter.
2. Solid-state voltage regulator.
3. AC output circuit breaker.
4. Electronic governor.
5. Cooling system.
6. Air intake system.
7. Exhaust system.
8. Control panel.
9. Remote monitor capability.
10. Remote control capability.
11. Engine starting system.
12. Battery.
13. Battery cables, battery retainer, and engine driven battery charger.
14. Rigid box type channel steel or formed steel base.
15. Dual wall day fuel tank.
16. Integral genset radiator.
17. Auxiliary fuel connection.
18. Vibration Protection
19. Seismic Protection
20. **[Wall-mounted static battery charger with AC input breaker.]**
21. Maintenance spare parts maintenance and repair.
22. Other components necessary to provide complete self-contained genset.

B. Related Sections:

1. Section 230719 "HVAC Piping Insulation" for muffler and exhaust pipe insulation.
2. Section 230905 “Instrumentation and Controls for HVAC” for communications-interface with building automation system (BAS).
3. Section 230548 “Vibration and Seismic Controls for HVAC” for muffler and exhaust piping vibration-isolation supports and hangers.
4. Section 231113 “Facility Fuel-Oil Piping” for interior fuel piping and fuel storage tank.
5. Section 232113 “Hydronic Piping” for coolant piping external to engine generator.
6. Section 233113 “Metal Ducts” for combustion air and radiator fan discharge connections.
7. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety” for facility voltages.
8. Section 260548 “Vibration and Seismic Controls for Electrical Systems.”

9. Section 260553 “Identification for Electrical Systems” for noise hazard signs at engine generator rooms.
10. Section 260573 “Overcurrent Protective Device Coordination Study.”
11. Section 262325 “Power Sequence of Operation.”
12. Section 263600 “Transfer Switches” for transfer switches, including sensors and relays to initiate automatic-starting and -stopping signals for engine generator sets.
13. Section 335633 “Underground Hydrocarbon Storage” for interface with fuel supply.

1.3 DEFINITIONS

A. Accuracy/error: Accuracy is ratio that defines limit of error expressed as percentage of full-scale value. Error is difference between indication and true value of quantity measured. It is quantity that gives true value when algebraically subtracted from indication. Positive error denotes that indication of meter is greater than true value.

B. Biofuels: Fuel that is manufactured from organic sources, equivalent to Biodiesel, Ethanol, and/or Methanol.

C. Damage: Damage is defined as any failure (see definition below) or degradation in life. Blowing (opening) of replaceable fuse is not considered damage, provided it is performing its intended function.

D. Dangerous flexural vibration: Dangerous flexural vibration is defined as vibration that occurs at speed at which maximum stress in shaft from flexural vibration exceeds 630 kg/cm^2 (9,000 psi).

E. Dangerous torsional critical speed: Dangerous torsional critical speed is defined as speed at which maximum vibrating stress in shaft from torsional vibration exceeds 350 kg/cm^2 (5,000 psi).

F. Dripproof enclosures/boxes: Dripproof enclosure/box is enclosure/box so constructed that falling drop of liquid or solid particles striking enclosure/box at angles from 0 to 15 degrees from vertical cannot enter enclosure/box, either directly or by striking and running along horizontal or inwardly inclined surface.

G. Failure: Failure is defined as inability of item to perform within specified limits.

H. Day fuel tank: Day fuel tank is defined as tank that is supplying fuel to engine, equipped with provisions (e.g., float valve, electric pump, solenoid) for receiving fuel from auxiliary source.

I. Deviation factor: Deviation factor of a wave is the ratio of the maximum difference between corresponding ordinates of the wave and of the equivalent sine wave to the maximum ordinate of the equivalent sine wave when waves are superimposed in such a way as to make this maximum difference as small as possible. The equivalent sine wave is defined as hiving the same frequency and the same rms value as the wave being tested.

J. Quick Connect: Hydraulic connection that allows for single hand, non-tool connection and disconnection of hoses; required for hose and connection at generator.

K. Maximum power: Maximum power is defined as largest load that genset can carry for two minutes and remain at rated voltage and frequency without damage.

L. Momentary overload: Momentary overload is defined as loads between rated and load required to trip safety devices.

M. Power exchange: Power exchange is measured difference between maximum and minimum power output delivered by one genset for constant system load.

N. Prime Rated Power (PRP): Prime power is defined (ISO 8528-1) as maximum continuous load capability of genset. Ten percent overload (ISO 3046-7) is available for one hour out of twelve hours.

O. Rated frequency: Rated frequency is specified in Article on PERFORMANCE REQUIREMENTS.

P. Rated kW: Rated kW is rating shown on genset nameplate.

Q. Rated load: Rated load is rated kW at rated power factor, rated frequency, and rated voltage.

R. Rated power factor: Rated power factor (pf) is 0.8 lagging.

S. Rated voltage: Rated voltage is genset name plate voltage.

T. Stable (engine) operating conditions: Stable (engine) operating conditions are conditions specified for short-term, steady-state performance.

U. Start: Genset is considered to have started when it is operating at rated voltage and rated frequency without further use of starting aids.

V. Stop: Genset is considered to have stopped when all rotating members are at zero rpm, except for turbocharger, if used.

W. Temperature and humidity damage: Temperature and humidity damage is defined as conditions causing malfunction of any component or part, corrosion, breakage, deformation, or reduction of insulation resistance below 50,000 ohms.

X. Telephone Influence Factor (TIF): The Telephone Influence Factor (TIF) of a synchronous generator is the measure of the possible effect of harmonics in the generator voltage wave on telephone circuits.

1.4 PERFORMANCE REQUIREMENTS

A. General:

1. Engine/generator set must be rated for **[Prime Power (PRP)][Standby]** operation.
2. Classification: Gensets and all associated components (e.g., fuel pumps) must operate at host country frequency and host country nominal voltage.

3. Voltage Connections: Gensets must be connectable for Site Distribution Voltage.
4. Generator Performance:

   a. Voltage waveform

      1) Deviation factor per NEMA MG 1: Voltage waveform deviation factor must not exceed 10 percent. The frequency must be maintained with +/- one half (0.5) percent of the value required for the test being conducted. Test must be performed where the voltage unbalance does not exceed 1 percent.
      2) Telephone Influence Factor (TIF): TIF must not exceed the values (values vary based on kVA and voltage ratings of generator) listed in NEMA MG 1. TIF must be measured in accordance with IEEE 115 at the generator terminals on open circuit at rated voltage and frequency.

   b. Phase Balance (voltage): With genset under control of exciter and voltage regulator, and operating at rated voltage, frequency, and no load, the maximum unbalanced line-to-neutral voltage must not be more than one-half (0.5) percent of rated line-to-neutral voltage.
   c. Dielectric Strength: Windings must withstand the following 50 or 60 Hz voltages applied for one minute:

      1) Generator Stator: Twice rated line-to-line voltage plus 1000 volts between phase windings, and twice rated line-to-neutral voltage plus 1000 volts between phase windings and ground.
      2) Generator Field and Exciter Windings: 10 times ceiling voltage but neither less than 1,500 nor more than 3,500 volts applied between windings and ground.
      3) Windings Energized by DC Control, Cranking, and Battery Charging Systems: 500 volts applied between windings and ground.
      4) All Others: Twice rated voltage plus 1,000 volts, applied between winding and ground and between windings where applicable.

   d. Voltage Regulation: Voltage regulation must be less than or equal to one half (0.5) percent of rated voltage.
   e. Voltage Stability: At any constant load from no load to 110 percent of rated load, voltage must remain within bandwidth of one percent of rated voltage.
   f. Voltage Drift: With genset operating at constant load and voltage, change in ambient temperature of 15 deg C in eight-hour period must not cause voltage to change more than one percent of rated voltage. Genset must be stabilized at both initial and final ambient condition.
   g. Voltage Transient Performance: With genset operating at rated frequency and voltage, transient voltage response must remain within transient voltage operating limit values listed in ISO 8528-5.

5. Voltage Operating Range: Voltage adjusting device must be capable of adjusting voltage to +/- 5 percent of rated voltage with genset operating at any load up to 110 percent rated load.

6. Short Circuit: Generator and/or excitation system must not be mechanically and/or electrically damaged when temperature is stabilized at rated load and then subjected to faults at genset load terminals that draw 300 percent rated current for 10 seconds.

7. Generator and Excitation System: Genset voltage performance must conform to performance class **[G2][G3]** of ISO 8528.
8. Starting and Operating: Genset must start (see Article on DEFINITIONS) within 10 seconds after receiving start signal under each and any combination of the following operating conditions. Immediately after starting, genset must operate without degradation or shutdown at all loads, continuous and intermittent, up to and including rated load as specified herein.

    a. At all possible relative humidity levels with ambient temperatures in the paragraph on "Service Conditions," with engine coolant at higher than + 20 deg C.
    b. At altitude specified in paragraph on "Service Conditions."

9. Starting Selection: Where multiple Gensets are installed as a system, starting sequence must be programmable for selecting individual generators for startup and transfer. If selected primary generator fails to start, secondary generator must start to close load.
10. Stopping: Genset must stop (see Article on DEFINITIONS) within 30 seconds after activation of any device intended to stop set.
11. Cool Down Period: Generators must start and come online automatically on loss of normal power. Generator must run for at least 5 minutes to cool down before generators are shut down automatically on restoration of normal power and after load has been transferred to normal power.
12. Paralleling of multiple generator systems must not be through generator onboard control without prior written approval from OBO/PDCS/DE/EE. Generator breaker is intended for servicing and protection only, not for control. No powered closers are permitted on generator mounted breaker.
13. Open Transition: When used, Automatic Transfer Switch (ATS) must allow for open transition when utility power is restored with time delay appropriate to clear onsite electric fields.
14. Operating Speeds: Operating speed for 50 Hz gensets must be 1500 revolutions per minute (rpm). Operating speed for 60 Hz gensets must be 1800 revolutions per minute (rpm).

    a. Protection: Per NEMA MG 1, generator sets must be designed to prevent damage from overspeed and torsional vibrations. Per NFPA 110, a certification must be supplied with the unit that verifies the torsional vibration compatibility of the rotating element of the prime mover and generator for the intended use of the energy converter.

15. Sound Pressure Levels: Genset sound pressure level (SPL) at 7 meters (23 feet) from surface of genset and 1.2 meters (4 feet) above genset base must not exceed average "A" weighted sound pressure level as follows:

    a. Style I (Unhoused gensets): **[90]** dBA

16. Radio Frequency Interferences: Radio interference emissions must comply with IEC 60034 when genset is operating at any load from no load to rated load.

17. Fuel: Engine must start, operate, and meet all performance requirements of this specification using commercial #2 diesel **[high-sulfur]**fuel.
18. Life (Endurance) requirements: Genset must have life expectancy of 10,000 hours at loads up to and including rated load under ambient conditions specified herein when maintained in accordance with manufacturer's instructions.
19. Ease of Servicing, Operation, and Maintenance: Design and construction of gensets must permit routine service and maintenance under field conditions. Parts that require adjustment or servicing must be capable of being adjusted or serviced by personnel wearing heavy winter clothing or mittens. Genset must be capable of being started and operated by one operator under all conditions. Starting or stopping set must not require manipulation of more than one control or switch. Hardware that requires torquing must be able to be installed and services so that nut, bolt, or screwhead is accessible for torque wrench application. In assemblies where both bolt and nut are used, nut must be accessible for torque wrench application. Genset maintenance and repair must be accomplished with common standard tools. Servicing, operation, and maintenance requirements must be capable of being met with genset in its installed location. General maintenance schedules for prime-rated equipment that will not be operated as prime generation must not require rebuilds on less than 8000-hour overhaul schedule.

B. Service Conditions:

1. Environmental Conditions: Engine generator system withstands the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

   a. Ambient temperature: Refer to Schedule on Drawings.
   b. Altitude: Refer to Schedule on Drawings.
   c. External Static Pressure: Refer to Schedule on Drawings.

2. **[Unusual Service Condition: Engine generator equipment and installation must operate under high salt/dust content in the air due to [corrosive environment (e.g., location near salt water)][and][dusty environment requiring pressure cutout sensors for clogged airflow].]**

1.5 SUBMITTALS

A. Product data for system components. Include descriptive and technical literature, catalog cuts, and installation instructions. Provide dimensioned plans and elevations showing minimum clearances and installed features and devices. Include list of materials and UL listed data.

1. **[Emissions requirements. Xxx.]**
2. Installation manual. Include the following:

   a. Genset noise levels at various distances from genset.
   b. Allowable engine exhaust restriction if using exhaust extension.

c. Allowable genset cooling air discharge restriction if cooling air is ducted away from genset.
d. Fuel pump head pressure.
e. Instructions for installation of all equipment, non-integral components, and accessories.
f. Instructions for aligning genset before initial startup and after disassembly.

B. Shop drawings must indicate fabrication details, dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Locate and identify each interface point (e.g., lube drain, exhaust outlet, fuel inlet), grounding terminal, and similar items.
2. Indicate proper genset location such as allowable ground slope, clearance required for door opening, and clearance required for engine exhaust.
3. Wiring Diagrams: Detail wiring for power and control connections and differentiate between factory-installed and field-installed wiring.
4. Vibration Isolation Base Details.

C. Design calculations. **[Xxx xxx.]**

D. Qualification data for firms and persons specified in Article on QUALITY ASSURANCE.

1. Support Services Vendor: Identify vendor firm name and contact, location, distance from project, and years servicing product line.

E. Factory Test Plans and Reports: For units to be shipped for this Project, provide evidence of compliance with specified requirements.

1. Test plans submitted for review at least 3 weeks prior to testing.
2. Test reports indicating completion and compliance with testing requirements in this specification.

F. Field Test and Observation Reports: Indicate and interpret test results and inspection records relative to compliance with performance requirements.

G. Maintenance Data: For each genset, provide manufacturer's Operations and Maintenance manual.

1.6 QUALITY ASSURANCE

A. Single-Source Responsibility: Obtain generator components from single source which assumes responsibility for compatibility of system components.

B. Support Service Capability: Genset manufacturer's representative to start-up generator, and representative must have current active certification by manufacturer.

C. Operations and Maintenance Support Services: Genset dealer authorized representative or manufacturer-approved support services representative must be available to provide ongoing maintenance services at project site within 24 hours.

D. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

E. Inspection:

1. Inspection system: Gensets, generators, and engines must be manufactured in facility that has certified quality control program such as ISO 9001.
2. Responsibility for Inspection: Unless otherwise specified, Contractor is responsible for performance of all inspection/test requirements as specified herein. Except as otherwise specified herein or elsewhere in Contract, Contractor may use their own facilities or any other facilities suitable for performance of inspection/test requirements specified herein, unless disapproved by Project Director/COR based upon input from OBO/PDCS/DE/EE. Contractor is responsible for ensuring that all components and materials used are manufactured, examined, and inspected/tested in accordance with industry standard practices.
3. Verification: Government reserves the right to perform or repeat any of inspections/tests set forth in this purchase description where such inspections/tests are deemed necessary to ensure supplies and services conform to prescribed requirements.

1.7 DELIVERY, STORAGE AND HANDLING

A. Shipping and Handling: Enclose each genset on shipping skid and take precautionary measures to protect from inclement weather and damage during transit. Equip genset skid base with towing and lifting provisions for lifting and/or towing of genset without damage using forklift, crane, or hoist. Deliver engine generator set and system components to final location in protective wrappings, containers, and other protection that will exclude dirt and moisture and will prevent damage from construction operations. Remove protection only after equipment is safe from such hazards.

B. Connection Tag: As safety precaution, the alternator must have a permanently affixed electrical output data tag.

1.8 MAINTENANCE PARTS

A. General parts: Provide one set of maintenance (spare) parts for each genset. An order of maintenance parts is defined as follows:

1. Engine lubricating oil filters (and filter gaskets if separate from filter).

2. Fuel filters (and filter gaskets if separate from filter).
3. Engine intake air filters (and filter gaskets if separate from filter).
4. A minimum of five electrical fuses of each size fuse used in the genset.
5. One belt set.

PART 2 - PRODUCTS

2.1 GENERATOR SET

A. Generator: AC generator must be synchronous, revolving field, brushless, air-cooled, self-ventilated alternator that is directly connected to engine crankshaft through flexible steel coupling. Generator must be capable of operation at **[50][60]** Hertz, must have legibly identified power leads, and must be connectable for the site distribution voltages as well as **[120/208][277/480][other voltages as directed by OBO/PCS/DE/EE]** volts. Generator must conform to applicable requirements of NEMA MG l. Generator windings must be copper and wound with 2/3 pitch. Generator must have Class H insulation system rated at 105 deg C temperature rise above 40 deg C ambient when operating at prime rated load, and generator must have amortisseur windings to minimize slot harmonics. Generator windings must have protective overcoat for added protection in harsh conditions. Generator must have drip-proof enclosure with ventilating openings covered by removable screens having mesh opening not larger than 13 mm. Rotor assembly and fan assembly must be balanced separately, and balanced in accordance with NEMA MG l. When operating at rated speed and voltage, and at any load from no load to rated load, vibration amplitude (peak-to-peak) must not exceed value as specified in NEMA MG l for rated speed of generator. Vibration amplitude in all three axes (vertical, longitudinal, and transverse) at bearing housing or on generator frame adjacent to bearing housing must comply with NEMA MG 1.

B. Materials and Components: Materials and components required, but not specifically specified must be selected by Contractor, must be subject to all requirements of this specification, and must conform to accepted industry standards.

1. Hoses and hose fittings: Use hoses and hose fittings with piping systems where there is relative motion between parts. Hoses and fittings must be suitable for pressure involved.
2. Hardware: Hardware must be as follows, with number of different sizes and types kept to minimum. All nuts, bolts and screws must have standard metric or SAE threads.
3. Pipe and fittings: Conform to SAE standards.
4. Instrument transformers: Current and potential transformers used for instrumentation and relaying must be in accordance with ANSI C57.13.1, and suitable for operation on **[50] [60]** Hz. Transformers must be 1.2 kV insulation class or higher. Instrument transformers must be within limits specified for 0.6 accuracy class. Burden rating of all transformers must be compatible with application requirements.
5. Shunts: Shunts for instrumentation purposes must have industry standard outputs.
6. Terminal lugs: Use terminal lugs for all conductors. Terminal lugs must be insulated, ring tongue style, compression, or crimp type lugs. Install compression lugs with proper tools. Terminal lugs must be proper size for conductor and stud/bolt.

7. Pushbuttons and limit switches: Limit switches must be of sealed type. Pushbuttons must be of sealed heavy-duty type. Pushbuttons and limit switches must be appropriately sized for both voltage and current.
8. Relays: Relays must be totally enclosed or hermetically sealed. Control relays must be firmly secured to their mounting using clips, spring retainers or screws.
9. Hinges and latches: Hinges must be of stainless steel. Hinges or hinge pins must be peened at ends, or other means provided to prevent workout of pins. Latches must require manual, not spring, action for closing. Parts of latches having relative motion with each other must be corrosion-resistant metal.
10. Drivebelts: Drivebelts must be resistant to battery electrolyte, antifreeze, and petroleum derivatives.

2.2 ENGINE

A. Engine: Engine must be heavy-duty standard commercial industrial diesel-fueled, liquid-cooled engine with sufficient power to drive generator and connected accessories and to accept one-step application of rated load.

2.3 GOVERNOR

A. Governing: Engine speed must be controlled by isochronous load sensing electronic governor. Genset frequency performance must conform to performance class **[G2][G3]** of ISO 8528.

1. Frequency regulation: Frequency regulation must be adjustable from 0 to three percent of rated frequency.
2. Frequency stability: At any constant load from no load to 110 percent of rated load, frequency must remain bandwidth of 1/2 percent of rated frequency.
3. Frequency drift: With genset operating at constant load and voltage, change in ambient temperature of 15 deg C in eight-hour period must not cause frequency to change more than one percent of rated frequency. Genset stabilization must be accomplished at both initial and final ambient condition.
4. Frequency adjustment range: Frequency adjustment device must be capable of adjusting frequency to plus/minus 5 percent of rated frequency.

2.4 ENGINE COOLING SYSTEM

A. Cooling System: Cooling system must have capacity to limit maximum coolant temperature from engine to value recommended by engine manufacturer while genset is operating under any of environmental conditions specified herein for "Starting and Operating." Engine must have block drain(s) as necessary to completely drain all coolant from block regardless of type of cooling system.

1. **[Genset room conditioning: Genset room must be climate controlled to maintain humidity level at or below 60 percent.]**

2. Integral radiator: Integral radiator cooling system must consist of liquid coolant to air heat exchanger (radiator) with expansion tank and pressure cap, pusher type engine driven fan, engine thermostat, engine driven coolant pump, internal engine coolant passages, and coolant hoses. Interconnect these components to provide completely closed and pressurized system. Genset radiators must have flange adequate for attaching a discharge airduct. Radiator coils/fins must be **[aluminum/aluminum.][copper/copper coils with Heresite P-413 baked phenolic epoxy or approved equal epoxy coating. Use of this coating must not reduce performance by more than 1 percent as specified in Article on PERFORMANCE REQUIREMENTS, paragraph on "Starting and Operating."]**
3. Coolant: Cooling system must operate under all conditions specified in Article on PERFORMANCE REQUIREMENTS, paragraph on "Starting and Operating" using factory-recommended commercial antifreeze and water mixture for the site-specific location, which includes engine-compatible corrosion preventive additives and water mixture.
4. Coolant jacket heater: Equip engine with thermostatically controlled electric immersion heater(s) in engine coolant. Heater system must be capable of maintaining minimum temperature of 32 deg C under all conditions specified in Article on PERFORMANCE REQUIREMENTS, paragraph on "Starting and Operating."

2.5 FUEL SUPPLY SYSTEM

A. General: Fuel system, including piping, valves, filters, and connections must prevent air from entering the system, and must prevent fuel flow from being restricted during operation under all conditions in this specification. Provide permanently installed fuel pump capable of priming the engine fuel system after air has been allowed to enter fuel system. Provide equipment and monitoring system that interfaces with installed facility fuel oil system; see 231113 "Facility Fuel-Oil Piping."

B. Dual Wall Day Fuel Tank: Dual wall day fuel tank must be Underwriters Laboratory (UL) **[142][2085]** listed, complying with NFPA 30 for this application, and must be stand-alone tank**[, unless indicated on project-specific basis by OBO/PDCS/DE/EE to be generator-base mounted]**. Provide the following features:

1. Capacity: Size for eight hours minimum of uninterrupted generator operation at 100 percent of rated power output of engine without being refilled.
2. Construction: Factory-fabricated tank constructed of steel and treated to prevent corrosion both internal and external. Tank construction must be such that finished tank will not leak or be damaged when hydrostatically tested to 35 kPa. Elevate tank not less than 100 mm above floor.
3. Containment: Provide double-walled tank with space between walls serving as secondary containment tank.
4. Locate hot fuel return such that hot fuel cannot immediately be picked up by fuel pickup tube. Install inlet of fuel pickup not less than 13 mm from bottom of tank and cut off inlet end of fuel pickup at angle or vee. Equip generator fuel suction pipe inside day fuel tank with check valve to prevent loss of prime.
5. Connections: Provide fuel supply and fuel return fittings for connection to engine fuel system. Provide 50 mm manual fill, with lockable fuel fill cap and fill tube, overflow port,

required vent openings with caps, lockable drain valves to permit complete drainage of fuel from primary tank and secondary containment, and openings for leak and level monitoring probes.

6. Monitoring and Controls: Day fuel tank monitoring and controls must be compatible with fuel pump controls and leak/load monitoring systems.

   a. Install level control probe in top of tank to monitor fuel oil level and to communicate with pump controller to control supply pump operation.
   b. Provide leak sensor located in annular space between primary and secondary tank, and interface with engine control and monitoring system to provide visual and audible signal when leak is detected.
   c. Configure Low-Level, Critical-Low, High-Level, and Day Fuel Tank Leak alarms so they are transmitted to electronic control panel via dry-contact alarms for facility fuel oil system; coordinate with Section 335633 "Underground Hydrocarbon Storage."

7. Fuel piping and electrical conduit are not permitted to be placed in the same trench.

C. Electric Duplex Fuel Transfer Pump Set Controls: Coordinate with requirements in Division 23 Section on building fuel oil piping for submersible pumps at underground storage tanks as identified in Section 335633 "Underground Hydrocarbon Storage." Fuel transfer system must maintain fuel level in day fuel tank between 80 percent and 95 percent of tank capacity. Operate duplex pumps in lead-lag configuration, with automatic changeover to lag pump if lead pump fails. Pump must be capable of continuous dry operation or provision made to permit user connection of external control to prevent pump from dry operation. Connect pump through fuel level controller and normally closed solenoid valve to terminals for auxiliary control, and then to terminals accessible for user connection to generator room power panel which is fed from ATS or essential bus.

D. Electric Auxiliary Fuel Return Pump: Where there is not gravity fed return, provide auxiliary pump capable of returning excess fuel to remote underground fuel storage tank to prevent fuel oil from overflowing from day fuel tank via vent pipes. Pump must operate automatically when day fuel tank fuel level exceeds high level alarm and must operate manually via switch.

E. Auxiliary Fuel Connection: Provide standard metric or SAE threaded fitting for connection of auxiliary fuel line between sub-base tank or stand-alone day fuel tank and external fuel source. Locate fitting to permit auxiliary fuel line to be connected or disconnected without affecting operation of genset. Provide hand-operated manual fuel transfer pump that allows day fuel tank to be filled in event of failure of primary electrical pump. Where necessary, provide 8-meters (25-foot) auxiliary fuel line; this fuel line must have fitting on each end to mate with genset auxiliary fuel connection.

F. Generator Fuel Oil Supply Line Filters/Water Separator: Fuel filtering system must have sufficient filtration capacity to allow for continuous genset operation on fuel containing up to 15 milligrams of fine test dust per liter of fuel for a minimum of 300 hours. Permanently mark inlet and outlet connection for fuel filter, water separator, and fuel strainer (if used) assemblies. Water separator must not be damaged by freezing of any water that is accumulated therein.

G. Fuel Lines: Protect fuel lines projecting through metal apertures by grommets and secured to framing members. Use cushioned clips, braces, or brackets to securely fasten all piping between tank and engine. All high-pressure fuel lines must be made of black steel pipe. Hose conforming to metric or SAE standards may be used for low-pressure fuel lines, except hose within 250 mm distance to engine exhaust system must have metal shield.

2.6 ENGINE EXHAUST SYSTEM

A. Exhaust System: Engine exhaust system must consist of hospital-grade muffler(s), black steel engine exhaust pipe, wall/roof ventilated thimble with rainguard, and discharge flapper cap to discharge exhaust gas to outside atmosphere.

1. Flexible sections and expansion joints: Provide a flexible section at each engine and an expansion joint at each muffler. Provide flexible sections and expansion joints that have flanged connections. Provide flexible sections made of convoluted seamless tube without joints or packing. Provide bellows type expansion joints. Provide stainless steel expansion and flexible elements suitable for engine exhaust gas at the maximum exhaust temperature that is specified by the engine manufacturer. Provide expansion and flexible elements that are capable of absorbing vibration from the engine and compensation for thermal expansion and contraction.

2. Exhaust muffler/silencer: Provide hospital grade muffler/silencer for each engine to reduce exhaust noise. Inlet and outlet connections must be flanged. Provide eyebolts, lugs, flanges, or other items as necessary for support in the location and position indicated. Do not exceed the engine manufacturer's recommended pressure drop. For marine environments, provide standard aluminized steel or 304 stainless steel construction with bottom or side inlet and end discharge flanged connections. Outside mufflers/silencers must be zinc coated or painted with high temperature 204 degrees C (400 degrees F) resisting paint. Provide muffler/silencer with a drain valve, nipple, and cap at the low point of the muffler/silencer.
3. Exhaust piping: Slope horizontal sections of exhaust piping downward away from the engine to a drip leg for collection of condensate with drain valve and cap. Changes in direction must be long radius. Insulate exhaust piping, mufflers and silencers installed inside any building in accordance with Article on ENGINE EXHAUST SYSTEM INSULATION and covered to protect personnel. Provide vertical exhaust piping with a hinged, gravity-operated, self-closing, rain cover.

4. Wall/Roof Ventilated Thimble: UL listed device. Thimble must be constructed of steel plate sized to match engine exhaust pipe diameter and suitable for use as roof or wall type as indicated on drawings. Provide high-temperature rated sealant RTV 100 Series conforming to MIL-A-46106 for caulking ventilated thimble endplate and at rain hood discharge as per manufacturer requirement.
5. Backpressure: Exhaust system must be such that genset will operate at rated load without exceeding manufacturer's allowable backpressure.

2.7 EMISSIONS

A. **[Submit certification from engine manufacturer stating that engine exhaust emissions must meet xxx.]**

2.8 ENGINE EXHAUST SYSTEM INSULATION

A. Provide removable, hi-temperature rated insulated blanket suitable for 600 degrees C operation, minimum 25-mm insulation thickness, to cover the entire engine exhaust system from the generator discharge to the security plates at the ventilated wall/roof thimble. Vertical engine exhaust piping within building must also be insulated up to the security plates at the roof ventilated thimble.

B. Insulation must meet the following criteria:

1. Corrosive Resistance: ASTM C665 and ASTM C795.
2. Shrinkage: ASTM C356 Linear Shrinkage 1.49% @ 600°C.
3. Dimensional Stability: ASTM C356 Linear Shrinkage 1.49% @ 650°C.
4. Moisture Sorption: 0.01% per ASTM C1104.
5. Thermal Resistance: ASTM C518 (C177) RSI value/25.4mm @ 24°C 0.74 m^2K/W.
6. Density: ASTM C 612 - Nominal 128 kg/m^3.
7. Fire Smoke Rating: ASTM E136 Behavior of Materials @ 750°C Non-Combustible, and ASTM E84 (UL 723) Surface Burning Characteristics Flame Spread and Smoke Developed (PASSED)
8. Maximum Surface Temperature: ASTM C411 Hot Surface Performance in Compliance with ASTM C612 @ 650°C.

C. Outer Jacket: 481-g gray or blue Teflon coated thermal cloth.

D. Inner Jacket: 566-g vermiculite coated thermal cloth.

E. Construction Connector: 10-ply 304 stainless steel thread.

F. Attachments: High-temp Velcro strips and belts with stainless steel double D-Rings.

2.9 COMBUSTION AIR INTAKE SYSTEM

A. Combustion Intake Air System: Air intake must include heavy-duty dry-type air cleaner with disposable barrier-filter elements. Equip air cleaner with air cleaner restriction indicator. Locate restriction indicator so that it can be readily observed. **[Include precleaner.]**

2.10 STARTING SYSTEM

A. General: System must consist of cranking motor, batteries, battery charging system, battery retainer, battery cables and other components required to make complete system.

B. Batteries: Genset batteries must be commercially available dry-charged, lead acid batteries with amp-hour rating, reserve capacity, and cold cranking amps necessary to permit fulfillment of all requirements of this Section. Install insulated boots over battery terminals. Batteries must have total cranking capacity to satisfy NFPA 110.

C. Battery cable: Battery cable must be flexible, low temperature, and oil and acid resistant. Positive cable must have non-conductive red sleeve at both ends. Provide battery terminal connectors on one end of each cable.

D. Battery Retainer: Provide means to retain battery within genset during all transportation and handling; it must be of type that permits easy removal of battery. Provide means to allow drainage of spilled electrolyte out of genset without contact with any set component except retainer. Retainer must be resistant to battery electrolyte.

E. Polarity Reversal: Genset must not be damaged (see Article on DEFINITIONS) in any manner in event polarity of battery cables is reversed. It must not be possible to crank genset with battery polarity reversed.

F. Battery Charging System (Engine Mounted): Provide engine mounted solid-state battery charging system with temperature-compensating characteristics compatible with battery specified herein. Battery charging system must not be damaged by continuous application of short or open circuit to its output. Battery charging system must be capable of maintaining batteries after starting cycle stated in subparagraph above on "Batteries" in state of full charge after four hours of operation in addition to providing required control power.

2.11 LUBRICATION SYSTEM

A. Lubrication System: Set must have positive displacement gear-driven lubrication pump and full-flow oil filtration system that meets all requirements herein using lubricants specified in Article on PERFORMANCE REQUIREMENTS. Oil-level dipstick must be double-marked to accurately indicate full and low oil-level. Place dipstick in readily accessible location.

2.12 CONTROL AND MONITORING

A. Genset Control Panel: For each genset, provide one genset digital control panel that is located on or within very close proximity to the associated genset. Genset control panel must be on face of control enclosure. Panel to provide access to control components in enclosure. Locate control panel to be readily accessible on the generator, within 1.8 meter of floor. Control panels must contain the following:

1. Automatic remote start capability.
2. “Run-Off-Automatic” switch function.
3. Shutdowns as required by NFPA 110.
4. Alarms as required by NFPA 110.
5. Controls as required by NFPA 110.
6. Load shed controls for Level 1 systems (if applicable) as required by NFPA 110.

B. Meters, Switches, and Gauges: Meters, switches, and gauges must include but are not limited to items specified in the following paragraphs.

1. AC voltmeter(s) for each phase or a phase selector switch.
2. AC ammeter(s) for each phase or a phase selector switch.
3. Frequency meter.
4. Voltage-adjusting feature to allow +/- 5 percent voltage adjustment.
5. AC Kilowatt or kVA Meter: Indicate power output of 3-phase, 4-wire genset to accuracy of three percent of full-scale value under the following conditions:

   a. Balanced load at any power factor from unity to 0.80 lagging.
   b. Unbalanced load where three phase voltages, currents, and power factor differ.
   c. With output of any one phase equal to zero.

6. Oil Pressure Gauge: Oil pressure gauge to indicate engine lubricating oil pressure (wired to sensor unit located on engine).
7. Coolant temperature gauge: Coolant temperature gauge to indicate engine coolant temperature (wired to sensor unit located on engine).
8. Running time meter: Running time meter to show only operating hours that genset is producing voltage. Meter must be capable of indicating up and including 9999.9 hours.
9. DC voltmeter: DC voltmeter to indicate battery voltage when RUN-OFF-AUTO switch is in any position except "OFF."

C. Genset Controls:

1. Voltage Adjustment Control: To allow genset output voltage to be adjusted plus/minus 5 percent of nameplate voltage.
2. Frequency Adjustment Control: To allow genset frequency to be adjusted plus/minus 5 percent of nameplate frequency.
3. Monitor Lamp Test Switch: Lamp test switch must be momentary contact switch and connected to illuminate all monitor lights when switch is in the "ON" position.
4. Communications-Interface: Each generator must be provided with Communication-Interface for monitoring by the Building Automation System (BAS); see Specification Section 230905 “Instrumentation and Controls for HVAC.”

   a. Connect Communications-Interface to the BAS via BACNET/IP protocol.
   b. At minimum, Communications-Interface must provide the following generator status parameters to the BAS: Fuel consumption rate, Total Fuel engine has burned, Engine Speed, Engine operating hours, Atmospheric pressure, Battery Voltage, Fuel filter differential pressure, High Exhaust Temperature, Fuel Filter plugged, Low Oil Pressure, and Low Battery Voltage.
   c. Generator manufacturer/vendor is responsible for coordinating this requirement with the BAS contractor to ensure proper interfacing.
   d. Generator manufacturer/vendor must provide all required on-site technical support to demonstrate proper transfer of information between generators and the BAS.

D. Remote Annunciator Panel(s): Provide wall-mounted enclosure(s) for remote annunciators. At Contractor’s option, and as wall space is available, Contractor may consolidate remote

annunciators within each of the panel locations identified below on one or more panel, except as identified in other contract attachments. Each remote annunciator panel must meet requirements of NFPA 110.

1. Panel Locations: If each genset not fully monitored by the Electrical Power Monitoring System, locate a second panel with equivalent functionality in Facility Management (FM) suite in the same room where BAS front end equipment is located. Use dry contacts to send alarm to Post 1 (entire panel functionality not required at Post 1).

    a. Refer to other contract attachments for additional requirements.
    b. Special modifications may be necessary for satisfactory operation if Post gensets are located greater than 250 meters (800 feet) from these panels.

E. Remote Control Panel(s): For ATS controlled Generators only, when required, provide wall-mounted, minimum NEMA 12 enclosure for remote control panel. Location as indicated on Construction Drawings.

1. Panel Features: Each remote control panel must include:

    a. Generator and ATS position labeling
    b. Visual Indications: Indicator lights must indicate position of associated automatic transfer switch as identified below:

        1) “Running”
        2) “Alarm”
        3) “Normal”
        4) “Generator”

    c. Audible alarm indications for alarm indication.
    d. Control toggle for:

        1) Transfer Control

            a) Normal/Auto
            b) Local

        2) Local Generator Control

            a) Off
            b) Run

        3) Local ATS Position Control

            a) Normal
            b) Generator

    e. Lamp test and alarm silence provisions.
    f. Voltage meters:

1) Normal
2) Generator

F. Automatic Transfer Switch (ATS) Interface: Genset must have provisions for acceptance of transfer switch start signal.

2.13 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. Control Power Protection: Protect AC and DC control power wiring and components by circuit breaker(s) or fuse(s).

B. Circuit Breaker: Equip genset with heavy duty molded case thermal-magnetic or electronic circuit breaker. Circuit breaker must be UL listed (or IEC rated if 50 Hz) for this application. This breaker must be rated to continuously carry 125 percent of rated current of genset. Thermal trip elements must be set to trip at 130 percent of rated current in not less than 10 seconds or more than 15 seconds. Magnetic trip elements must trip instantaneously when current in any phase exceeds 425 percent rated current. Breaker must be of trip-free design, and trip mechanism must open all phases simultaneously.

2.14 GENERATOR EXCITER AND VOLTAGE REGULATOR

A. Excitation system:

1. Exciter: Generator exciter must be rotating brushless type with rectifier assembly integral with main generator rotor. Mount rotating rectifier assemblies in manner to provide ready access for inspection and replacement of rectifier diodes.
2. Voltage regulator: Voltage regulator must be RMS sensing, 3 phase sensing solid state, and must automatically control output voltage of genset thru action on exciter field.
3. Exciter field power source: Provide power for exciter field by permanent magnet generator (PMG) integrally mounted as part of generator and exciter assembly. PMG and its controls must be capable of sustaining and regulating current supplied to any combination of single or three phase faults at 300 percent of rated current for not more than 10 seconds.

2.15 ACCESSORIES

A. Electrical Interfaces: Provide terminal strip(s), and properly identify for connection to external devices as identified below. These terminals must be readily accessible through genset control housing door(s).

1. Fuel level signal (i.e., low fuel, high fuel, rupture basin leak) from external day fuel tank.
2. Coolant jacket heater power supply.
3. Power strips for battery chargers if not wall mounted.
4. Remote emergency stop capability that overrides all other controls immediately (no intentional delay) to provide stop signal.

B. Wall Mounted Battery Charger: Provide wall-mounted, solid state battery charger. Mount charger in corrosion-resistant ventilated steel enclosure to prevent any contact with electrically energized components. This battery charger must be temperature-compensated constant-voltage type, rated to match battery voltage of genset with over current control to limit output current to 10 amps even when connected to dead battery. Provide conduit knockouts for AC input and DC output. Provide input AC circuit breaker, and indicating light to show that AC power is available. Provide ammeter on DC, connected to show charging current. Provide ground terminal electrically connected to enclosure. Wire charger to accept input AC voltage; it must be frequency compliant with line-to-neutral output voltage from generator room power panel which is fed from ATS or essential bus.

C. Skid Base: Mount and carefully align all rotating equipment of each set, including diesel-engine coupling and generator, on rigid structural steel or formed steel base capable of supporting all components, and permitting handling and lifting into position without affecting alignment of equipment. Check alignment if necessary of two-bearing generator. Provide split-bolt type grounding terminal permanently attached near load cable entrance provision and electrically bonded to skid base.

D. Vibration/Seismic Isolators: Provide **[normal spring type vibration isolators in areas with low seismicity][seismic-type isolators for areas that do not have low seismicity]** according to applicable site seismic requirements between genset skid and foundation. Where sub-base day fuel tank is used, use only one set of isolators between skid and tank, or between tank and foundation. Spring isolators must reduce transmitted vibration from genset to foundation to maximum 40 microns total amplitude throughout frequency ranges down to 66 cps during all phases of set operation.

E. Dampers: Generator dampers must be spring-actuated open and electrically closed; and control signal must also come from generator itself rather than third party BAS.

2.16 FABRICATION

A. Corrosion-Resisting Metals and Treatments: Fabricate gensets from compatible metals and materials that are inherently corrosion resistant or treated to be resistant to various forms of corrosion and deterioration that may be encountered in storage and operating environments for the project.

B. Treatment and Painting: Genset housing and external components shall be painted to manufacturers standard specifications using procedures that result in coating that meets the following: Salt Spray in accordance with ASTM B117, 1000 + hours.

C. Dissimilar Metals: Do not use dissimilar metals in intimate contact with each other unless protected against galvanic corrosion.

D. Wiring: All wire must be secured neatly into harnesses. Wires in all harnesses must be of proper length and must be so run and secured (with insulated clamps) to protect insulation against contact with sharp corners and edges, pinching, sharp bending and twisting, abrasion because of vibration or contact with moving parts, and exposure to engine fuel oil, lubricating oil, and parts at high

temperatures. Conductors must not be clamped to or supported by fuel or oil lines. Where cable or wire is run between parts that move relative to each other (from vibration, adjustment, inspection, or as matter of normal operation), leave sufficient slack in harness to allow repeated movement to take place without bending or twisting to point of damaging wire in any manner. Splicing of wires is prohibited. Terminate wiring harnesses in connectors or terminal lugs at each end or branch, except solder connections may be made to potentiometers, resistors, semiconductors, fuseholders, capacitors, and press-to-test indicator lights. Provide means to prevent liquids from contacting any electrical connection for all operating conditions specified herein. Do not attach more than two terminal lugs with any one screw on screw type terminal boards and attach no more than four terminal lugs to any one stud on stud-type terminal boards. Terminals on electrical components must not have more than one wire attached.

E. Soldering: Soldering must be in accordance with standard commercial practice.

F. Safety: Exposed moving parts, parts that have exposed high operating temperatures, parts which may be electrically energized, and parts that are hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices in such a manner that proper operation of equipment is not impaired, and in accordance with NEMA MG 10012 requirements.

2.17 SOURCE QUALITY CONTROL

A. Tests (Gensets): All witness testing of the gensets must be accomplished using coolant, fuel, and lubricating oil as specified herein. Where paralleling switchgear is used, there must be system witness test at the factory. Where switchgear and generators are manufactured and tested by two different companies, arrangements must be made for system factory witness test. Witness testing must be attended by Department of State participant from OBO/PDCS/DE Electrical Engineer; notify OBO/PDCS/DE/EE through Project Director/COR a minimum of three weeks in advance of witness testing.

B. Production Genset Tests: Production generator test must include dielectric strength (high pot) test. Generator test results must be identified with applicable generator model and serial number, and ship results with generator to genset assembler for inclusion with genset test results that are shipped with genset. Test each genset before delivery; identify test results with applicable genset model and serial number and be ship results with genset. Production tests must include the following as a minimum:

1. Start and Stop tests (local control).
2. Start and Stop tests (remote control).
3. For standby units, operate at rated load for three hours minimum. For Prime Rated Power units, operate at rated load for two hours minimum followed by test at 110 percent of rated load for one hour. Note amount of fuel used during timed test(s).
4. Application and dropping of rated load in one step (minimum of 5 times).
5. Proper operation of all indicators and controls.
6. Simulate each abnormal condition associated with each protective device to verify proper operation of shutdown protective system wiring.

7. Voltage and frequency transients on time-based plot for step loads based on figure 6 of ISO 8528. Record voltage and frequency transient response and ensure compliance with category **[G2][G3]**.
8. Total harmonic distortion of phase to neutral voltages at no load and 100 percent rated load.

PART 3 - EXECUTION

3.1 EXAMINATION

A. With Installer present, examine areas, equipment foundation, and conditions for compliance with requirements for installation and other conditions affecting packaged engine generator performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Examine roughing-in of cooling-system piping systems and electrical connections. Verify actual locations of connections before packaged engine generator installation.

3.2 INSTALLATION

A. Comply with packaged engine generator manufacturers' written installation and alignment instructions, and with NFPA 110.

B. Equipment Grounding: All non-energized metal parts of genset must be electrically bonded together and connected to genset ground stud. Connect generator frame to ground stud.

C. Where installed indoors, locate sound attenuators and plenum walls minimum of 0.75 meters from intake louvers and screens to allow access for cleaning. Engine radiator to be connected to ductwork with flexible connection and no less than 1:4 transition to the sound attenuator.

D. Verify that intake motorized damper is operational and programmed to open prior to generator startup.

E. Verify that either a backdraft damper on radiator discharge is installed to open in direction of airflow, or that motorized damper is operational and programmed to open prior to generator startup.

F. Verify day fuel tank controls are operational for fuel oil filling.

3.3 CONNECTIONS

A. Connection Tag: Contractor must verify nameplate and connections prior to connection of cables and other elements of the system.

B. Hoses and Hose Fittings: Install hoses with no sharp bend or twisting, and without contact with any adjacent structures to avoid rubbing.

C. Piping Installation: Construction Drawings indicate general arrangement of piping and specialties. The following are specific connection requirements:

1. Install fuel oil piping adjacent to packaged engine generator in trench to allow service and maintenance. Fuel oil piping between day fuel tank and generator is not to route high in room to prevent flooding of the fuel injectors.
2. Install day fuel tank primary, emergency and secondary containment tank vents to outside of building with security tank vent caps at vent discharge.
3. Connect engine exhaust-system piping to diesel engines. Install engine exhaust piping accessories (muffler and ventilated thimble) in accordance with Mechanical details and manufacturer’s recommendations. Install tap and drain valve at base of vertical risers in the building.

3.4 IDENTIFICATION

A. Nameplates: Provide permanently attached nameplate in accordance with ISO 8528-5 mounted in visible location on outside of genset. Nameplate must include winding wound with 2/3 pitch.

3.5 FIELD QUALITY CONTROL

A. Pretesting: Upon completing installation of system, align, adjust, and balance system, and perform complete start-up and pretesting. Determine, through pretesting, conformance of system to requirements of contract, and to Construction Drawings and Specifications. Correct deficiencies observed in pretesting. Replace malfunctioning and damaged items with new, and retest (at no cost to Government) until satisfactory performances and conditions are achieved. Prepare forms for systematic recording of acceptance test results.

1. Battery Equalization: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.

B. Report of Pretesting: After pretesting is complete, provide letter certifying installation is complete and fully operable; include names and titles of witnesses to pretests.

3.6 COMMISSIONING

A. Manufacturer's Field Service: Engage factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections, and to assist in testing. Report results in writing.

B. Testing: Perform generator and day fuel tank field quality-control testing under supervision of the manufacturer's factory-authorized service representative.

C. Tests: Include those identified above in Article on SOURCE QUALITY CONTROL and the following:

1. Tests recommended by manufacturer.

2. Exclude Source Quality Control test for operation at 110 percent of rated load for one hour if there is no 110 percent loading available on site.
3. InterNational Electrical Testing Association Tests: Perform each visual and mechanical inspection and electrical and mechanical test in NETA ATS for emergency generator sets, except omit vibration baseline test. Certify compliance with test parameters for tests performed.
4. NFPA 110 Acceptance Tests: Perform tests required by NFPA 110 that are additional to those specified here including, but not limited to, single-step full-load pickup test.
5. Battery Tests: Measure charging voltage and voltages between available battery terminals for full-charging and float-charging conditions. Check electrolyte level and specific gravity under both conditions. Test for contact integrity of all connectors. Perform an integrity load test and a capacity load test for the battery. Verify acceptance of charge for each element of battery after discharge. Verify measurements are within manufacturer's specifications.
6. Battery-Charger Tests: Verify specified rates of charge for both equalizing and float-charging conditions.
7. System Integrity: Methodically verify proper installation, connection, and integrity of each element of engine generator system before and during system operation. Check for air, exhaust, and fluid leaks.
8. Exhaust-System Back-Pressure Test: Use a manometer with a scale exceeding 120 kPa (40 inches w.g.). Connect to exhaust line close to engine exhaust manifold. Verify back pressure at full-rated load is within manufacturer's written allowable limits for the engine.

D. Coordinate tests with tests for transfer switches and run them concurrently.

E. Retest: Correct deficiencies identified by tests and observations, and retest until specified requirements are met.

F. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation resistances, time delays, and other values and observations. Attach label or tag to each tested component indicating satisfactory completion of tests.

G. Test instruments must have been calibrated within last 12 months, traceable to standards of National Institute for Standards and Technology, and adequate for making positive observation of test results. Make calibration records available for examination on request.

3.7 CLEANING

A. Cleaning: Upon completion of installation, inspect system components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish. Clean components internally using methods and materials recommended by manufacturer.

3.8 DEMONSTRATION AND TRAINING

A. After completion of commissioning responsibilities, provide services of Manufacturer's factory-authorized service representative to demonstrate and train post maintenance personnel. Provide minimum of 8 hours training. Refer to Division 01 Section “Demonstration and Training.”

1. Train on procedures and schedules for operating, troubleshooting, servicing, and preventive maintenance of system, and for equipment isolation and de-energization procedures.
2. Refer to Article on ARC FLASH TRAINING in Section 260573 “Overcurrent Protective Device Coordination Study” for associated training requirements.
3. Review data in maintenance manuals.
4. Schedule training with the Project Director/COR with at least seven days advance notice.

END OF SECTION 263214

SECTION 263237 – RESISTIVE LOAD BANKS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes forced air-cooled resistive load bank. These units shall provide manual exercising system for engine generators.

B. Related Sections include the following:

1. Division 26 Section on “Vibration and Seismic Controls for Electrical Systems.”

1.2 SUBMITTALS

A. Product Data: Provide physical data of load and control enclosures including dimensions, weights, cable access, mounting, operating clearances, and details of component arrangements.

B. Wiring Diagrams: Provide detailed wiring diagrams of power and control circuits, including point-to- point wiring, wire numbers, connection point identification, components labeled by device legend.

C. Manufacturer Seismic Qualification Certification: Submit certification that load bank will withstand seismic forces defined in Division 26 Section on "Vibration and Seismic Controls for Electrical Systems." Include the following:

1. Provide certification based on test of prototype.
2. Basis of Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
3. The term "withstand" means "unit will remain in place without separation of internal and external parts during seismic event and the unit will be fully operational after event."
4. Dimensioned Outline Drawings of Equipment: Identify center of gravity and locate and describe mounting and anchorage provisions.
5. Detailed description of equipment anchorage devices on which certification is based, and their installation requirements.

D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

E. Product Test Reports: Certified copies of manufacturer’s design and routine factory tests required by referenced standards.

F. Sound-Level Test Reports: Certified copies of manufacturer’s sound-level tests applicable to equipment for this Project.

G. Maintenance Data: For equipment to include in maintenance manuals. Include the following:

1. Lists of spare parts and replacement components recommended for storage at Project site.

1.3 QUALITY ASSURANCE

A. Comply with requirements of the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.4 PROJECT CONDITIONS

A. Product Selection for Restricted Space: Drawings indicate maximum dimensions for load bank, including clearances. Comply with indicated maximum dimensions.

B. Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:

1. Ambient Temperature: **[-10 deg C to 50 deg C.]**
2. Altitude: **[620m above sea level.]**
3. Relative humidity: **[Up to 60 percent non-condensing.]**

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. The Load Bank shall be complete system with all necessary pilot and power control wiring, and devices to provide functional system. The only additional wiring shall be site required electrical wiring to power source and interconnections from control panel to load enclosure.

B. Load bank is required for all paralleled generators and other single generator systems.

C. The load bank shall have capability of load testing engine generator lineup up to 100 percent rating of single generator unit, to verify its performance and supplemental load system.

D. Sound Levels for noise shall conform to requirements in Chapter 12 of the OBO Building Code.

1. Provide Screen Wall attenuation to achieve STC 60 at screen line.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Load Technology, Inc. (LOADTEC).
2. ASCO Power Technologies
3. Cannon Load Banks.
4. Kohler Co.

2.3 CONFIGURATION

A. The load bank shall consist of the following items:

1. Load bank enclosure containing load resistors, cooling fans, and power control devices.
2. Control panel containing required pilot controls and indicators.

B. Refer to Construction Drawings for location of load bank enclosure and control panel.

2.4 RATINGS

A. Rating shall correspond to 100 percent of one generator KW output rating at 1.0 power factor.

B. Load steps shall be rated at 25 percent, 50 percent, 100 percent, or combination of these steps.

C. Duty cycle shall be continuous at rated ambient conditions.

D. Tolerances:

1. Total: Plus or minus 5 percent of nominal rating.
2. Balance: Plus or minus 2 percent of mean phase.

2.5 ENCLOSURES

A. Load Enclosure:

1. Enclosure shall be suitable of outdoor installation, with bolt down provisions for permanent mounting to concrete pad.
2. Provide enclosure with lifting eyes and captive fork lifting tubes.
3. Discharge air flow from the unit shall be vertical. Unit shall be constructed to prevent re-circulation of cooling air.
4. Fabricate enclosure to isolate heated air flow through load resistor chamber, from control section containing power control and distribution components.

5. Control Section:

a. [Low and Moderate Atmospheric Corrosivity Levels: NEMA 3 rated with gasketed access doors. Load section shall be NEMA 3R with fixed louvers and guards on intake and exhaust openings.]
b. [Extreme Corrosivity Levels]: NEMA 4X.]

6. Enclosure shall have adequate space to install the conduits from the power source. .
7. Enclosure shall be fabricated of electroplated galvanized steel or aluminized steel. Exhaust louvers, if used, shall be fabricated of stainless steel.

B. Stand Alone Control Enclosure:

1. Stand alone control enclosure shall be indoor type, suitable for wall mounting.
2. Enclosure shall be NEMA 3 rated with hinged and gasketed access door.
3. All control components shall be sub-panel mounted with pilot controls and indicators mounted and wired to the exterior door.

C. PLC integrated control enclosure:

1. Coordinate controls with PLC cabinet enclosure.
2. Provide for loadbank control from exterior of cabinet under normal operation. All control components shall be sub-panel mounted, with pilot controls and indicators mounted and wired to exterior.

D. Paralleling Switchgear Control:

1. Coordinate controls with switchgear enclosure.
2. Provide for load bank control from exterior switchgear under normal operation. All control components shall be sub-panel mounted, with pilot controls and indicators mounted and wired to exterior door of single cubicle.

E. Paint:

1. Metal surfaces shall be properly prepared, primed, and painted. There shall be no raw surfaces except for stainless steel or panels that have platings.
2. Prepare surfaces to be painted in accordance with the Society for Protective Coatings (SSPC) Surface Preparation requirements:

   a. Standard SP1.

3. Prime surfaces to be painted using etching primer intended for use on galvanized steel, and applied in accordance with manufacturer's recommendations.
4. Provide finish coat on primed surfaces using exterior U.V. resistant polyurethane enamel paint applied in accordance with manufacturer's recommendations.

2.6 LOAD RESISTORS

A. Load resistors shall be open wire wound type that are continuously supported length of resistor structure. If resistor alloy should fail, resistor material shall be held captive to prevent contact with any surrounding resistors or ground.

B. Resistor's continuous support shall consist of segmented ceramic tubes assembled on stainless steel rods with fastening provided to compensate for thermal expansion of ceramic tubes.

C. Resistors shall be fabricated of corrosion resistant chromium alloy that has minimum continuous operating temperature of 1000 deg C.

D. Resistor shall not operate at any point in excess of 67 percent of alloy's maximum continuous operating temperature at ambient extremes.

E. Resistors shall be installed in multiple field removable trays that are small enough to facilitate easy maintenance. Each tray shall be individually removable without affecting any adjacent tray.

F. Resistor terminals shall be brought to exterior of tray through high grade electrical ceramics. No plastic or polyester glass laminates shall be used in any part of resistor assembly.

G. Resistor terminations shall be formed from alloy material or have fabricated terminals of similar material welded to alloy.

H. Resistors shall not require cool down period. Failure shutdown of cooling fan during operation of resistors shall not shorten their life expectancy.

2.7 COOLING SYSTEM

A. Load Bank shall be of forced air cooled type.

B. Cooling fan(s) shall be one piece cast aluminum.

C. Fan(s) shall be direct driven by three phase, TEFC, induction motor.

1. Motor shall be rated at maximum brake horsepower of fan propeller for applied static pressure load.

2.8 PROTECTIVE SYSTEM

A. Cooling failure:

1. Provide failure circuit to monitor cooling system operation, and to disconnect load steps before damage can occur.
2. Provide airflow switch for each cooling fan to monitor fan operation.
3. Provide temperature switch at load chamber exhaust of each cooling fan to monitor excessive exhaust temperature.

B. Fuses:

1. Fuse each individual load section/load step to protect its wiring and control device.
2. Provide required fuses to protect control power transformer and wiring.

C. Cooling fan:

1. Each cooling fan shall be protected by thermal magnetic molded case circuit breaker in combination with contactor and thermal overload relay.

2.9 WIRING AND LOAD BUS

A. Wiring:

1. Load wiring shall have minimum rating of 150 deg C.
2. Control wiring shall have minimum rating of 105 deg C.
3. Wire shall be sized at 125 percent of maximum ampacity at rated ambient.
4. Control wiring shall have sleeve wire numbers that are identified on wiring diagrams.
5. Terminate external interconnect wiring at barrier terminal blocks.

B. Load Bus:

1. Main bus shall run length of control section of load enclosure so that bus mounted fuses will require only short jumpers to load contactors.
2. Load bus shall be tin or silver plated copper and sized for temperature rise at full ampacity rating of load. Load bus shall have maximum temperature rise of 35 deg C.
3. Provide mechanical lugs to connect power source. Number and size of lugs shall accept number and size of the conductors shown on Construction Drawings.
4. Provide mechanical lugs to accept required equipment grounding conductors shown on Construction Drawings.

C. Ground Load Bank in accordance with the OBO Electrical Code

2.10 POWER CONTROLS

A. Load shall be controlled by contactors capable of continuous and cycling operations.

B. Control devices shall be clearly and permanently labeled.

2.11 PILOT CONTROLS

A. Provide required control circuitry needed to achieve functions described for control switches and indicators.

B. Display: Panel consists of the following components:

1. LCD Graphics Display Screen
2. Control Keypad
3. Audible Input Signal
4. LED General Operational Indicators
5. Lamp & Graphical Display Test
6. The LCD Display provides:

a. Soft Key Legend
b. Metering display
c. Operational Mode
d. Operational status and alarm condition details

C. Exterior control devices shall be permanently and clearly marked for function and operational settings. Control devices shall be clearly and permanently labeled on interior of enclosure.

D. Control switches and indicators shall be industrial oil tight type if control enclosure is not mounted inside an appropriately NEMA rated control compartment within load bank.

E. Locate control and monitor adjacent to or within paralleling switchgear lineup, adjacent to or integrated with PLC control panel, or stand alone when no PLC or paralleling switchgear is present.

F. Provide ethernet port and serial ports for optional remote monitoring or control.

G. Control panel shall have the following control switches:

1. Control Mode Switch to select operational mode of system. Switch shall have the following three positions for functions:

   a. AUTO Position: Load bank shall automatically drop connected load steps, and be ready to respond to requirements of sequence of operation for power as defined in Division 26 Section for Utility/ATS, in event of utility power failure or other cause that requires power source to service its normal loads. Loadbank control in AUTO shall also be controllable by PLC for paralleling generator switchgear for adding or removing load in normal operation and in test conditions.
   b. OFF Position: Load bank shall be locked out and all circuits reset.
   c. MANUAL Position (to be used only for testing of generators in presence of operator): Load bank shall automatically drop connected load steps in event of utility power failure or other cause that requires power source to service its normal loads. In this case, operator shall manually change position of Control Mode Switch from the MANUAL position to AUTO position. Load bank shall then be ready to respond to requirements of sequence of operation as defined elsewhere.

2. Automatic load sequencing.
3. Fan Control/Cooling Failure Reset switch to control cooling fan(s), and reset any cooling failure alarms. Switch shall be three positions for functions of Off-On- Reset (momentary).
4. Master Load switch, which allows simultaneous control of preselected load steps.
5. Load Step switches to control each load step.

H. Control lineup shall have the following indicators:

1. Fan running indicator with green lens to annunciate if fan(s) is running.
2. Cooling failure indicator with red lens to annunciate fault condition.
3. Load Step indicators with blue lenses to annunciate energization of each load step.
4. Metering for load bank time and operation

a. True RMS
b. Voltage each Phase
c. Voltage Average
d. Current each Phase
e. Current Average
f. Frequency
g. Kilowatts Average

I. Auxiliary Contacts

1. Generator Normal Operation
2. Generator Failure
3. Generator Start
4. Common failure

2.12 CONTROL POWER

A. Control Circuits:

1. Control power shall not exceed 240 volts.

B. Fan Power:

1. Fan power shall be facility power characteristics. Coordinate number of required circuits and ratings with equipment supplier.

C. Thermal overload relays with thermal magnetic circuit breaker for protection and disconnect.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install load enclosure and control panels in accordance with manufacturer's drawings and instructions in location shown on Construction Drawings.

B. Install power and control wiring in accordance with manufacturer's drawings and instructions.

C. Install control wiring to paralleling switchgear PLC controller.

D. Install switch, within sight of load bank, to disconnect all power to load bank during servicing.

3.2 FINAL ACCEPTANCE

A. Load Bank system shall be adjusted and inspected in accordance with manufacturer's initial operation instructions.

B. Entire system shall be operated to demonstrate function of each control panel and accuracy of applied load.

1. Operate each failure sensor to demonstrate operation of safety system.

END OF SECTION 263237

SECTION 263313.11 – RESIDENTIAL ENERGY STORAGE SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the Energy Storage System (ESS) for residential applications and their associated internal components that create the entire system, including inverters, power conversion systems, microgrid interconnect devices, energy storage components, monitoring and control systems, miscellaneous electrical equipment, associated integral HVAC, Fire Protection and Fire Alarm Systems.

B. Related Sections include the following:

1. Section 230905 "Instrumentation and Controls for HVAC"
2. Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety"
3. Section 260518 "Low-Voltage Electrical Power Conductors and Cables"
4. Section 260525 "Grounding and Bonding for Electrical Systems"
5. Division 26 Section on raceways and boxes for conduits and outlet boxes
6. Section 260573 “Overcurrent Protective Device Coordination Study”
7. Section 260915 "Electrical Power Monitoring"
8. Division 26 Section on Enclosed Switches and Circuit Breakers
9. Division 26 Section on Fuses
10. Section 262214 "Low-Voltage Transformers"
11. Section 263105 "Solar Photovoltaic Systems"
12. Division 26 Section on “Vibration and Seismic Controls for Electrical Systems”

1.2 REFERENCE STANDARDS

A. In addition to standards identified elsewhere in this Section and related Sections, conform to the following:

1. America National Standards Institute (ANSI)

   a. ANSI-C12.1 “Std. for Electricity Meters”

2. Institute of Electrical and Electronics Engineers (IEEE)

   a. IEEE-1547 “Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces”
   b. NESC “National Electrical Safety Code”

3. National Electrical Installation Standards (NEiS)

a. NECA-405 "Std for Installing & Commissioning Interconnected Generation Systems"
b. NECA-416 "Recommended Practice for Installing Energy Storage Systems"
c. NECA-417 "Std for Designing, Installing, Operating, & Maintaining Microgrids"
d. NECA-701-13 "Std for Energy Mgmt., Demand Response & Energy Solutions"

4. Electrical Manufacturers Association (NEMA)

a. NEMA-250 "Enclosures for Electrical Equipment (1.0 kV Maximum)"

5. National Fire Protection Association (NFPA)

a. NFPA-855 "Std for the Installation of Stationary Energy Storage Systems"
b. NFPA-780 "Std for the Installation of Lightning Protection Systems"

6. Underwriters Laboratories, Inc. (UL)

a. UL-1642 "Std. for Lithium Batteries"
b. UL-1741 "UL Standard for Safety Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources"
c. UL-1741SA "Standard for Safety Inverters, Converters, Controllers, and Interconnection System Equipment for Use with Distributed Energy Resources – Supplement A"
d. UL-1973 "Batteries for Use in Stationary and Motive Auxiliary Power Applications"
e. UL-9540 "Energy Storage Systems and Equipment" (ESS)
f. UL-9540A "Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems"

7. OBO Electrical Code (NFPA 70, "National Electrical Code" including amendments by OBO); reference Article 706 Energy Storage Systems, Article 705 Interconnected Electric Power Sources, and other Articles as applicable.
8. OBO Fire Code (International Fire Code including amendments by OBO); reference model code Section 1207 "Electrical Energy Storage Systems" and others as applicable.
9. OBO Residential Code (International Residential Code including amendments by OBO); reference model code section R328 "Energy Storage Systems" and others as applicable

1.3 DEFINITIONS

A. BESS: Battery Energy Storage System

B. BMS: Battery Monitoring System

C. EMS: Energy Management System

D. ESS: Energy Storage System

E. MCS: Microgrid Control System

F. NIST: National Institute of Standards and Technology

G. O&M: Operation and Maintenance

1.4 SUBMITTALS

A. Product Data: For Energy Storage System components. Include: Technical data on features, performance, electrical characteristics, ratings, weights, and finishes; rated capacities, operating characteristics, furnished specialties, and accessories; Factory published product specification data sheets; list of materials and components; UL listed data and certifications.

1. Energy Storage System components include but are not limited to:

a. Energy storage system cells, modules, units, stacks, membranes, and balance of system
b. Inverters, converters, and optimizers
c. Microgrid interconnect devices and controllers
d. Charge controllers
e. Energy management system and controllers
f. Switchboards, enclosed switches, panelboards, and their overcurrent protective devices
g. Fire protection and fire alarm system devices
h. Mounting equipment cabinets, racks, and containers
i. HVAC system components
j. Miscellaneous materials and equipment

B. Shop Drawings: Project specific for ESS and related equipment, include the following:

1. ESS description, including the following:

a. ESS chemistry, major component descriptions and their role to achieve required mode of operation
b. Nameplate data, manufacturer, catalog numbers, and all major accessories used in the system
c. System electrical characteristics: usable energy storage capacity; rated power; AC efficiency (including auxiliary loads); cycle life; and annual degradation factor.
d. Fire protection/suppression system and fire alarm description including plan for thermal runaway detection and mitigation
e. Ambient temperature control system and environmental condition parameters

2. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

a. Site plan or floor plan showing the ESS location including dimensions, access, and auxiliary HVAC units.
b. ESS Cabinet/Container system dimensions including climate control units mounted on the side.

c. ESS assembly and equipment layouts
d. Centerlines for all external conduit and grounding cable connections, and wall/floor/roof penetrations for auxiliary equipment.
e. Sections and elevations with height of components/container from floor level to top of components/containers highest non-moveable point.
f. Mounting system.
g. System weight, including subtotals by area
h. Shipping center of gravity for each container and major equipment
i. Construction staging and storage areas.
j. Owner requirements for all control and auxiliary equipment
k. Fire protection and fire alarm system layouts

3. Structural Certification: Certification by licensed structural engineer demonstrating ability of a structure to support all loads required for the ESS.
4. Electrical studies and schematic diagrams, include the following:

a. One-line diagram between major ESS components and interconnection to electrical distribution, including identification of DC versus AC-coupling.
b. Control wiring diagrams, with cross reference for checking and verifying all the control circuit and wiring diagrams, along with the terminal designations for termination of the field wiring of all equipment.
c. Communication and control diagrams.
d. Electrical studies to determine control response and settings, including load flow analysis, short circuit coordination, ampacity, and arc flash analysis in coordination with Section 260573 Overcurrent Protective Device (OCPD) Study

5. ESS component equipment covered by other specification sections must comply with submittal requirements of the relevant specification section (i.e.: panelboards, switchboards, HVAC equipment, fire protection, fire alarm, enclosed switches, etc.).

C. Certificates of compliance: Provide certificates of compliance for referenced standards, and reports for referenced testing standards.

D. Qualification Data:

1. Support services vendor: Identify vendor firm name and contact, location, distance from project, years, and servicing product line.

E. Field Test reports: Submit written test reports, include the following:

1. Functional test procedures used.
2. Final test results. Include all test results and demonstrate their comparison to and compliance with requirements.
3. Report must include results of all failed tests and corrective action taken to achieve test results that comply with requirements.

F. Commissioning Test reports: Submit written test reports, include the following:

1. Commissioning test procedures tailored to the storage chemistry and operational performance.
2. Final commissioning test results and Commissioning Issues Log described in part three of this specification.
3. Commissioning test report must include results of all failed tests and corrective action taken to achieve test results to comply with requirements.

G. Operation and Maintenance Manuals:

1. In addition to the items specified in Division 01, Section 017825 *Operations & Maintenance Data* include the following ESS documentation:

   a. ESS equipment and components: Include description of unit or system, recommended maximum depth of discharge (DoD) and degradation rate, and component parts. Give function, normal operating characteristics, and limiting conditions.
   b. Provide approved engineering submittals. Include equipment sizing calculations.
   c. Provide manufacturer's installation wiring diagrams and schematic diagrams.
   d. Operating procedures: Include routine normal operating instructions and sequence of operations. Include regulation, control, stopping, shutdown, system balancing and maintenance (i.e., full discharge and slow charge) and emergency instruction.
   e. Special or recommended operating procedures to minimize energy storage capacity degradation over time with respect to seasons, depth of charge/discharge, voltage, humidity, etc.
   f. Maintenance requirements: Include required materials, routine procedures and guide for cleaning, troubleshooting, equipment isolation, lockout, tagout, and ESS adjusting, balancing, and checking instructions.

2. ESS Fire protection procedures and instructions for authorized personnel and local firefighting personnel.

H. Record Documents: As specified in Division 01, Section 017705 *Closeout Procedures*.

1. Final as-built drawings and information
2. Assembly and wiring diagrams
3. Installation and operation information
4. Training materials for the operation and maintenance (O&M)

1.5 QUALITY ASSURANCE

A. Qualifications

1. The manufacturer of the ESS must be a company specializing in the manufacture of ESS equipment and have at least (5) continuous years of documented experience with their hardware in commercial applications in the field.
2. Installation personnel: submit evidence prior to work that persons performing the work herein have manufacturer approved training and qualified experience in ESS installation, design, and applicable safety procedures, and hold proper licenses where applicable.

3. Commissioning personnel: Provide qualifications including experience of certified personnel responsible for ESS startup and commissioning work.

B. Listing and labeling:

1. Electrical components, devices, and accessories must be listed and labeled in accordance with a qualified testing agency and marked for intended location and application.
2. Certificates of compliance: Provide certificates of compliance for referenced standards.
3. Applications and installations must comply with the requirements of the codes and standards listed in this Section. Where required, certified test reports substantiating the compliance must be submitted upon request.

C. Support Service Capability:

1. ESS manufacturer must maintain a call center for technical and emergency support for this system.
2. ESS manufacturer must provide authorized field service vendor with factory-trained personnel for startup, maintenance, and repair of ESS and related equipment.
3. Availability of Service personnel: Manufacturer must have worldwide service organization, with authorized factory-trained service personnel available within to provide support remotely 24 hours a day, 7 days a week, 365 days a year, and ability for onsite service.
4. Availability of Spare Parts: Manufacturers must have worldwide robust supply chain for components and system distributorships, with replacement parts available from manufacturer using their regularly available expediting delivery for receipt within 48hours of request.

D. All materials supplied for this project must be new.

1.6 DELIVERY, STORAGE AND HANDLING

A. Equipment must be handled and stored in accordance with manufacturer's instruction, and as required to prevent any damage to system components and electronics. One (1) copy of these instructions must be included with the equipment at time of shipment.

B. Prior to and during construction, provide secure storage onsite for all ESS materials.

C. If stored in areas subjected to weather, cover equipment to provide protection from weather, dirt, dust, corrosive substances, and physical damage.

D. Where systems are intended for use in classified areas, appropriate considerations must be taken in the delivery, storage, and handling of the equipment.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

1. Temperatures:

   a. Annual ambient: **[enter site specific value]** deg C to **[enter site specific value]** deg C.
   b. Record low temperature: **[enter site specific value]** deg C.
   c. Record high temperature: **[enter site specific value]** deg C.

2. Altitude: Derate as required if over **[enter site specific value]** meters above sea level
3. Relative humidity: **[enter site specific value]**
4. **[enter other site-specific conditions such as wind ratings, sand/dust, seismic activity, salt air, fog, marine corrosiveness, etc.]**

1.8 COORDINATION

A. Coordinate layout and installation of ESS with other construction, including conduit, piping, equipment, and adjacent obstructions and surfaces. Maintain required clearances for workspace and equipment access.

B. Coordinate size and locations of anchor-bolt inserts into concrete slabs.

C. Provide system technical coordination for utility interconnection agreements. Provide grid connection as required, and in location as designated by local utility company.

D. Coordinate electrical voltage (V), phase (Ø), and hertz (Hz) characteristics of ESS's output with electrical characteristics of local utility company, and with ESS's input if bidirectional inverter is used.

1.9 WARRANTIES

A. Provide ESS extended (10) year manufacturer's warranty (excluding energy storage modules) valid from the date of substantial completion.

B. Energy storage module(s) warranties: Extended (10) year warranty after the date of substantial completion. Battery pack must retain at least **[70 percent] [enter other percent nominal capacity]** of nominal energy capacity for the earlier of either (10) years after commissioning or after a minimum energy throughput of **[insert cumulative throughput]** kWh energy.

1.10 OWNERSHIP OF PROPRIETARY MATERIAL

A. The US Government must retain all rights to software and passwords used for this project.

B. Contractor must provide a copy of the manufacturer's standard software and end-user license agreement (EULA) for review and approval as condition of this contract. Such license must grant use of all programs and application software to the US Government as defined by manufacturer's license agreement but must protect manufacturer's rights to disclosure of Trade Secrets contained

within such software. The Contractor must obtain a signed copy of the manufacturer's software and firmware licensing agreement prior to purchase.

C. The licensing agreement must not preclude use of software by individuals under contract to the US Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to the US Government will be restricted to use on the US Government's computers and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation must become the property of the US Government.

1.11 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date, provide 12 months full maintenance by authorized field service vendor with factory-trained certified personnel. Provide system maintenance service with adjusting as required for proper operation based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. Provide parts and supplies same as those used in the manufacture and installation of original equipment. In addition to the initial year of maintenance service, provide a proposal for a five-year period with (5) one-year, annually renewable periods, starting from end of initial maintenance period. The option year proposal must be submitted **[120]** days prior to the end of the maintenance contract period.

B. Maintenance service must include preventive maintenance, repair, or replacement of worn or defective components, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks must also align with the manufacturer's recommended checklists as required in Division 01, Section 017825 *Operations & Maintenance Data*. Provide complete maintenance records inclusive of scheduling to the US Government for inclusion in the Computerized Maintenance Management System (CMMS).

C. The Maintenance Service must include an annual report to US Government verifying that the ESS is performing as intended per the battery storage strategy and manufacturer recommendations. The report must include:

1. Use case performance
2. Battery outages with root cause summary/failure modes and effects analysis, start and end time periods.
3. Summary of all O&M operations; repair and replacements
4. Summary of safety incidents, causes and resolutions
5. Contractor must perform all required maintenance to the ESS and BMS to ensure that the monthly demand reduction is provided.
6. In addition to required demonstration and training in PART 3 of this specification, the Contractor must provide an additional eight (8) hours O&M training session to the US Government O&M personnel prior to the completion of the initial 12 months of maintenance service. Training must comply with PART 3 and cover issues and resolution

encountered during the initial 12 months of maintenance service by service maintenance staff and US Government O&M.

7. Perform updates to the battery management system dispatch strategy if required due to rate tariff or major site load profile changes.
8. Ensure that all system firmware is up to date and meets US Government cybersecurity requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Enphase IQ
2. SolarEdge Home
3. Sonnen Core
4. Tesla Powerwall
5. **[other manufacturer]**

B. The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if accepted by the Project Contracting Officer Representative (COR) and Engineer **[(10)]** calendar days prior to bid date. Submit alternate manufacturer for review to allow **[(14)]** calendar days for review with sufficient documentation demonstrating compliance with project requirements.

C. The design drawings must include details, equipment dimensions, and space requirements based on the **[first listed acceptable manufacturer]**. If the Contractor selects a different equipment supplier, some redesign including locations of conduits, terminations, and space clearance may be required. Additional costs incurred for these changes must be borne by the Contractor.

2.2 GENERAL REQUIREMENTS FOR ESS

A. ESS must be listed for the intended use in accordance with OBO-ICS NEC Chapters 1 and 7.

B. ESS must be UL-9540 listed and tested in accordance with UL-9540A where required by UL-9540.

C. Provide Nameplate, System drawing, mimic bus, and arc flash ratings to be located on the doors of containers, equipment, or cabinets.

1. The System must have a **[enter kW rating]** kW-AC rating and **[enter kWh rating]** kWh-AC usable rating.

2. The System AC Voltage must be **[enter system voltage]** volts.

D. Exposed Conduit: All exterior exposed conduits must be galvanized rigid steel (RMC) with threaded fittings.

E. ESS Output: ESS must match local utility company exactly in voltage, phase, and frequency to allow it to be grid-tied in accordance with local utility company's safety and power quality requirements. Coordinate all requirements with local utility company. Refer to Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety" for additional metering requirements.

F. The ESS must contain protective relays, circuit breakers, or fuses which self-protect the ESS in the case of internal electrical faults. Set and adjust circuit protection devices according to a short circuit and coordination study.

G. A visible disconnect will be installed that isolate the ESS from utility interconnection, complying with local utility requirements.

H. Grounding: Contractor must provide grounding system for personnel protection for step and touch potential complying with IEEE-Std-80. The system also must be adequate for the detection and clearing of ground faults within the ESS. The system should be grounded in all anticipated operating modes (e.g., grid-tied, and islanded).

I. The ESS must be capable of grid forming for microgrid islanding applications, complying with all local utility requirements, and compatible with other power generating sources.

J. Seismic Performance: ESS must withstand effects of earthquake motions determined according to ASCE/SEI 7.

1. The term “withstand” means “the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operation after the seismic event.”

2.3 PERFORMANCE REQUIREMENTS

A. Integrate the ESS with the following power generation systems and **[existing]** power distribution system

1. **[enter kW nameplate capacity]** Photovoltaic system(s)
2. **[enter kW nameplate capacity]** Generator(s)
3. **[enter kW nameplate capacity]** Wind Turbine system(s)
4. **[enter kW nameplate capacity]** Fuel Cell(s)
5. **[enter other power generation]**

B. The ESS must operate for the following scenario(s):

1. Demand control: The ESS must provide grid electricity usage and demand/peak shaving to limit demand (kW) to programmed setting.

a. **[Anticipated] [Current]** site monthly peak demand is **[insert monthly peak kW demand]**, and average load is **[insert average demand in kW]**. Limit grid demand by **[specify the required demand reduction in kW.]**. The ESS must have a method for forecasting the peak load and automatically dispatching the battery or scheduling the charge/discharge in advance.
b. Time of Use Charge Reduction: Integrate the ESS to discharge during on-peak or mid-peak hours in accordance with the site's rate tariff and the resiliency requirements of the site.
c. ESS must maintain a round-trip efficiency greater than **[70][90]** percent AC-in to AC-out (confirmable by operation over a single round-trip cycle from 0 percent state of charge to 100 percent, and back to 0 percent at standard conditions specified by the manufacturer), including thermal losses and auxiliary loads, over 10 years.
d. Annual ESS savings will be generated by discharging the battery during on-peak periods, as well as during peak billing demand periods.
e. Grid stability by ramping up and down ESS output in response to utility grid frequency.

2. Grid outage: The ESS must support critical loads in microgrid operation in the event of a grid outage.

a. Install a microgrid control system and modify existing electrical distribution and automatic transfer schemes as necessary to provide electricity to the building upon grid failure. The Contractor must include the creation of a critical power circuit, including re-wiring of the critical loads and installation of critical power switchgear, in the scope of work (SOW).
b. The ESS must support the critical loads **[as indicated on drawings]**
c. The ESS must perform anti-islanding sequence and grid forming operation to enable microgrid mode with "black start" capability.
d. The ESS controller must disconnect load to prevent overload or over discharge and must manage charge/discharge function when utility grid is re-established.
e. Consider the following site-specific parameters in the system design:

1) **[Specify site-specific operating conditions: provide electric load interval data, required ramp rates for existing generators, additional information on the types of loads to be served and required modes of operation. Provide detail on existing control and monitoring systems.]**
2) Configure ESS to provide seamless transition between utility power and microgrid.
3) Optimize system to minimize generator use to conserve fuel.

2.4 ENERGY STORAGE COMPONENTS

A. Energy storage components must consist of **[lithium-ion batteries] [nickel-cadmium batteries] [nickel metal hydride batteries] [flow batteries] [lead-acid] [other battery or electrochemical ESS technology]**.

B. Energy storage systems may be individual cells, and supplied as modules comprised of cells, or as group of modules combined into units. Several units may be combined to make up the balance of the system. Cells, modules, and units must be fully enclosed in listed assembly for the intended purpose. Individual battery trays and/or racks must not be permitted.

C. Energy storage systems comprised of battery systems must be UL-1973 listed for the intended use.

D. A battery management system must monitor and balance cell voltages, currents, and temperatures within the manufacturer's specification. The battery management system must be part of the ESS component UL listing. The battery management system must perform the charging and discharging of the equipment. The BMS must be field programmable via laptop and viewing/editing on a locally hosted web browser. Programming instructions and setpoints must be shared with Agency staff.

E. [The battery management system charge controller must have Maximum Power Point Tracking (MPPT) for DC coupled PV systems.]

F. The cells, modules, units, and installation must be supplied with all required and/or manufacturer recommended accessories.

G. ESS DC voltage must not exceed **[1000Vdc] [1500Vdc] [other DC voltage]**.

H. The use of vented batteries must not be permitted.

2.5 POWER CONVERSION SYSTEMINVERTERS

A. Power Conversion System (PCS) must be UL-1741 or UL-1741SA listed for the intended use.

B. PCS output must match local utility company frequency and voltage when grid tied to local utility or in combination with **[generator operation] [microgrid control system]** where applicable.

C. PCS output connections and operation must comply with all local utility company requirements.

D. PCS must have the following electrical characteristics:

1. Efficiency: minimum 95 percent.
2. Frequency: 50/60 Hz
3. AC Voltage range: matching utility voltage
4. DC Voltage range: matching energy storage DC voltage
5. THD: < 3 percent
6. Power factor: -1 to +1

E. The PCS must have the following features to operate in the required performance scenario(s):

1. Perform grid-tie and grid-forming operation with "black start" capability and seamless transfer.

2. Bi-directional charge and discharge of the ESS with intelligent controls and interface with battery management system.
3. Complete automatic unattended operation including startup, synchronization, power disconnect, and parallel operation with the utility **[and generators]**. **[Where applicable, the system must also operate in parallel with: [photovoltaic systems,] [generators,] [other site power production,]and utility]**.
4. Shutting down without damage when ESS output is outside tolerance parameters of inverter.
5. Automatic anti-islanding in conformance with referenced standards.
6. [other features]

2.6 MICROGRID CONTROL SYSTEM (MCS)

A. The MCS may be a separate component or combined with the ESS or inverter. The MCS must be one of the following: be listed, listed individual components assembled as a system, or designed under engineering supervision.

B. The MCS must include an energy management system (EMS), when an additional onsite generating source is present (i.e., solar or generators).

C. The MCS must have the following features to achieve the intended performance scenario(s):

1. Communicate with the ESS intelligent controls and monitor energy contribution from the **[Photovoltaic system], [generators], [other site power production].**
2. Monitor, log and report the energy consumption load profile.
3. The EMS must balance the power generation inputs, load outputs and signal controls to achieve the intended performance scenarios including grid services (such as peak demand shaving and energy arbitrage) and backup power to meet resiliency requirements.
4. Must autonomously initiate anti-islanding and grid forming sequence with battery power conversion system, generator controllers, or grid-forming inverters to operate in microgrid mode.
5. Ability to control the quantity and ratings of generation sources, utility, and output loads as indicated on drawings.
6. Communicate with, and directly control, connected generation sources including PV inverters, generator control panels, and battery converters. The MCS must be capable of coordinating the interaction between multiple power sources of similar or different types, manufacturers and technologies utilizing industry standard communication protocols.
7. Provide local and remote monitoring capability complying with this specification.
8. Be housed within the ESS or in separate enclosure complying with environmental conditions in this specification.
9. Include a programmable onsite interface to adjust the operating modes and threshold values.
10. Ability to log and export historical data from each connected generation source.

2.7 VENTILATION AND AIR CONDITIONING (HVAC)

A. The ESS must be naturally ventilated with openings or through forced air to maintain operating conditions within installed locations complying with manufacturer ambient conditions.

2.8 ENCLOSURE

A. The ESS and associated equipment must be in a factory assembled enclosure that is rated for the site conditions.

B. The ESS, and associated equipment, must be provided in self-contained NEMA **[3R] [4X]** enclosure(s) rated for the site conditions. ESS enclosures must be designed to be installed onto properly prepared pads/foundations or walls.

C. Provide manufacturer **[standard enclosure finish][or][white enclosure finish]**.

D. Energy storage modules must be factory installed in cabinets or racks. Each module or unit must be arranged to maintain required spacing and materials complying with UL 9540 and UL-9540A testing recommendations.

E. Front access: All serviceable subassemblies must be modular and capable of being replaced from the front of the cabinet. Side access for installation, service, repair, or maintenance of the system must not be required.

F. Cable entry: standard cable entry for the ESS must be through the enclosure bottom.

2.9 DATA ACQUISITION AND CONTROL

A. The ESS must include a monitoring and data acquisition system and must include, at a minimum, the following information in 15-minute intervals (unless otherwise noted):

1. Real-time ESS State of charge
2. System mode (charge, discharge, island, grid-tied etc.) and condition (normal, auto, manual, override, etc.)
3. System voltages, current, and power
4. Real-time connected generation source(s) power and connected load power consumption.
5. Enclosure Ambient temperature, hourly average at hourly intervals.
6. Energy and time remaining at current discharge or charge rate
7. Time until full charge at current recharge rate
8. Forecasted charge and discharge profile
9. Round-trip efficiency on daily, weekly, monthly, yearly basis
10. System fire protection and alarm condition
11. Notification when preventive maintenance is needed
12. System alarm and events:

    a. Major: system automatically disconnected due to over/under voltage, overcurrent or over temperature.

b. Minor: voltage imbalance, voltage sensing error, under-temperature, temperature imbalance, overprotection device activation, communication failure, regular maintenance required (i.e., perform balancing charge sequence)

B. Data must be saved locally for a minimum of **[(30) days][enter number of days]** and backed up off-site with a minimum of **[(36) months][enter number of months]** of data.

C. Data transmission must be transferred to off-site storage via one of the following connections:

1. Cellular connection
2. WAN Internet Connection **[coordinate with site specific conditions]**

D. Remote connection must be for monitoring purposes only. No system or device must require internet connection to function.

E. Local display must include visual indicator of ESS operation.

F. External remote monitoring using web-based service:

1. All data collected will be available in a web-based interface accessed via an internet connection.
2. The Contractor must ensure that data acquisition and monitoring solution complies with site specific US Government cybersecurity.
3. Access must be provided via secure login ID and password:

a. There will be no user-based fee to access the data
b. An unlimited number of users can access the data at the same time

4. The user interface must have the following functionality:

a. A site summary which provides data on the overall performance of the entire site
b. Detailed asset views on each individual piece of connected equipment
c. The ability to create time-data trends for all collected data.

2.10 FIRE PROTECTION AND FIRE ALARM SYSTEMS

A. The ESS must include recommended fire alarm and fire protection systems for installation locations.

B. Fire Protection System design must consider that ESS will be unattended at most times.

C. Provide visual and audible alarm when a safety hazard exists.

2.11 SOURCE QUALITY CONTROL

A. Factory end of line tests before shipment:

1. Factory test ESS and other system components and accessories manufactured specifically for this Project. Perform tests at rated power and for modes of operations in this specification.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before ESS installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes, and locations, and electrical to verify actual locations, sizes and other conditions affecting performance, maintenance, and operations.

1. Final ESS locations indicated on Drawings are approximate. Determine exact locations before roughing-in for electrical connections.

B. Provide required clearances and clear installation area of flammable vegetation. Maintain adequate setback to other structures, vegetation, and other flammable materials.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. The ESS must be provided with foundations and structures. All design must be in accordance with local project area seismic design requirements and as specified in the specifications for this project.

B. Install equipment in accordance with manufacturer's installation instructions and recommendations including required environmental conditions to maintain warranty and minimize system degradation.

C. ESS location must be above the **[insert year]** flood plain and surge levels and must be elevated higher than any pull vaults and conduit not sloped toward any ESS electrical component to prevent equipment flooding.

3.3 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section **[260518 "Low-Voltage Electrical Power Conductors and Cables."]**

3.4 IDENTIFICATION

A. ESS signs must be clearly printed in English and in local language.

B. Identify components according to Division 26 Section on Identification for Electrical Systems and include the following:

1. Identification in accordance with OBO Electrical Code, OBO Residential Code and OBO Fire Code referenced sections.
2. ESS electrical equipment and components must have markings that identify the manufacturer, size, type, rated input and output voltages, hazard warnings, frequency, number of phases (AC only), rating in kW or kVA, available fault current at ESS output terminals, maximum output and input current at terminals, maximum output and input voltage at terminals, and utility interactive capability.
3. Posted instructions for tasks that site staff may need to perform, such as system shutdown during an emergency.
4. Clearly label all disconnects, indicating whether in the open (OFF) or closed (ON) position, the operating system voltage, available fault current, current, and system rating.
5. Provide a disconnect or remote-controlled disconnect outside the building at a readily accessible location that is labeled “EMERGENCY DISCONNECT. Marking must include: (1) Nominal battery voltage (2) Available fault current (available from manufacturer) (3) Arc-flash label (4) Date short-circuit current calculation performed.
6. Arc flash labels, per NFPA-70E.
7. Identification and location of each power source on a permanent plaque or directory. The plaque or directory must indicate the location of each power source disconnecting means and be grouped with other plaques or directories for other power sources.

C. Equipment markings must be permanent and must withstand the environmental conditions in which the equipment is installed. Provide “UV rated” for outdoor labels, or on an embossed steel placard, designed for outdoor use and fastened with adhesive and rivets.

D. Markings must be visible or easily accessible during and after installation. The Contractor must be responsible for all field-applied markings as required by local, state, and federal codes.

3.5 FIELD QUALITY CONTROL AND START-UP

A. Provide the services of a qualified and certified factory-trained manufacturer’s representative for startup of the equipment specified under this section. The manufacturer’s representative must provide technical assistance to the contractor in general installation of the equipment, connections and adjustments, and testing of the assembly and components contained therein.

B. The manufacturer’s representative must provide inspection of the final installation, perform functional testing, and startup the ESS.

C. Startup acceptance test must be witnessed by the US Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. Contractor must be prepared at any time during this process to provide access to all portions of installation and must remedy any portion of system that is not in compliance with this specification, which does

not perform to manufacturer's operating specifications, or that fails to operate due to poor workmanship.

D. Ensure there is written permission from local utility company for interconnection of the ESS with the utility grid. Local utility company may require that representative of the local utility be onsite during initial interconnection; Contractor must accommodate this requirement, if stated by utility.

E. Functional Testing must include the following, in addition to all tests required by manufacturer:

1. Pre-startup inspection of the ESS system.
2. Test in accordance with the approved operating scenarios.
3. Verify and test system alarms.
4. Test ESS with all power generating sources and loads as applicable.

F. Provide photo record of installation and major components, including ESS, MCS, and all display screens. Include photos showing connections within all installed enclosures. Provide electronic copies of photo record on compact disc and hard copy of the photo record (with labels for each photo) in Operation and Maintenance Manual identified in Article on SUBMITTALS.

3.6 COMMISSIONING

A. Third Party Commissioning Agent: Engage electrically qualified and factory approved third-party certified commissioning agent to inspect, field test, and document performance of components and equipment after installation. Commissioning agent must prepare written test results in report.

B. All test instruments must be identified in Report and listed by manufacturer, model number, serial number, date of calibration, and calibration authority. All test instruments must have been calibrated within past year. Test instruments must have attached calibration sticker that is traceable to NIST.

C. Contractor must obtain written commissioning procedures document. Procedure entries must include date; time; person taking data; recorded value of data; indication if recorded value is out of range of system and/or equipment tolerance. Each page of the procedures must have test name; equipment tested; location; date; time; person performing test; model number of equipment; serial number of equipment; manufacturer; tolerance ranges of equipment tested for reference.

D. Commissioning Agent must keep Commissioning Issues Log and include it as appendix to Report. Log must include, but not be limited to issue description; log tracking number; date; time; person investing issue; action taken; person acting; date of closure of issue. Include copy of Commissioning Issues Log in written procedures to Contractor.

E. Perform the following field tests and inspections, in addition to manufacturer recommended tests and inspections, as follows for test report:

1. Test insulation resistance and continuity for each DC circuits, AC feeders, grounding including ground fault protection, and control circuits. Disconnect all sensitive electronic equipment prior to testing. Visually and physically inspect all cabling, connections, and

conduits. Verify color coding of conductors per OBO Electrical Code. Verify proper torque of termination connections with calibrated torque wrench.

2. Test ground fault protection of ESS (where required).
3. State of Health verification via coulomb counting.
4. Test proper operation of ESS for all operating scenarios. Set output voltage, as necessary. Verify that all local utility notifications and requirements have been incorporated.
5. Verify operation of all disconnect switches and proper sizing of all overcurrent protection devices (OCPD) in accordance with Division 26 Sections on enclosed switches and circuit breakers and on panelboards.
6. Verify that displays accurately represent output of ESS.
7. Power feedback controller: Monitor the utility power factor with the ESS functioning and with it disconnected. Identify the observed power factor. Verify the system modulates this power factor to not adversely affect utility billing.
8. Verify that remote data logging access has been established and is functioning. Provide all necessary data, IP addresses, login-ins, and passwords to post.

F. Contractor must remove and replace malfunctioning equipment. Retest ESS system as specified above.

3.7 DEMONSTRATION AND TRAINING

A. Comply with Division 01, Section 017905 *Demonstration and Training* for general requirements of demonstration and training documentation.

B. The manufacturer's representative must provide 'hands-on' training course for the US Government O&M personnel.

1. Schedule as follows:

   a. Two (2) four (4) hour training sessions equally divided into in-class training and in the field training, for a total of eight (8) hours.
   b. Training must be completed within one (1) calendar week.

2. Training must cover the following topics:

   a. Overall system description and theory of operation.
   b. Local displays and control interfaces.
   c. Operating scenarios.
   d. Automatic operation.
   e. Manual operation.
   f. Protective relaying.
   g. Recommended system checklists and log sheets.
   h. Recommended preventive maintenance and instructions to be performed by qualified staff.
   i. Hazards and failure modes – thermal runaway, off gassing, stranded energy
   j. Required ambient housing conditions to maintain required operating temperature range.

k. Thermal management and maintenance of liquid vs air cooled systems
l. Thermal propagation by battery chemistry
m. Instruction on balancing cycle - full discharge and slow charge technique to reset the state of charge algorithm
n. Instruction in and troubleshooting of errors in manufacturer's user interface.
o. Instruction on the operation of the assembly, and major components within the assembly.
p. Instruction on operation or maintenance that must be completed by factory authorized representative to maintain warranty and proper operation.
q. Fire protection and fire alarm system operation and procedures for the safe operation and actions during fire event or alarm.
r. Interactions with other systems.
s. Remote monitoring systems via online web services tools including

1) Login credentials and request for additional users
2) Menu options and available information
3) Review of graphical displays, data, and components
4) Interpretation of presented data
5) Optional displays and updates

C. The Contractor and Manufacturer's representative must coordinate with local fire officials on ESS setback requirements, first responder training, and posted instructions for shutoffs:

1. The Contractor must provide training to local firefighters covering ESS operation and how to shut it down in an emergency event and form a fire suppression plan. Training must cover the main risks of storage systems, including electric shock, thermal runaway, battery reignition, and stranded energy. Training must include fire suppression tactics, including minimum water and time requirements, thermal imaging camera, vehicle tilt / lift, and battery box piercing, as well as extrication and transport.
2. The Contractor must coordinate with the fire marshal to determine where to post the permanent instructions and required markings.

END OF SECTION 263313.11

SECTION 263313.12 – ENERGY STORAGE SYSTEMS (50kWh UP TO 600kWh)

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the Energy Storage System (ESS) rated over 50 kWh and up to 600 kWh, and their associated internal components that create the entire system, including inverters, power conversion systems, microgrid interconnect devices, energy storage components, monitoring and control systems, miscellaneous electrical equipment, associated integral HVAC, Fire Protection and Fire Alarm Systems.

B. Related Sections include the following:

1. Section 230905 "Instrumentation and Controls for HVAC"
2. Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety"
3. Section 260518 "Low-Voltage Electrical Power Conductors and Cables"
4. Section 260525 "Grounding and Bonding for Electrical Systems"
5. Division 26 Section on raceways and boxes for conduits and outlet boxes
6. Section 260573 “Overcurrent Protective Device Coordination Study”
7. Section 260915 "Electrical Power Monitoring"
8. Division 26 Section on Enclosed Switches and Circuit Breakers
9. Division 26 Section on Fuses
10. Section 262214 "Low-Voltage Transformers"
11. Section 263105 "Solar Photovoltaic Systems"
12. Division 26 Section on “Vibration and Seismic Controls for Electrical Systems.”

1.2 REFERENCE STANDARDS

A. In addition to standards identified elsewhere in this Section and related Sections, conform to the following:

1. America National Standards Institute (ANSI)

   a. ANSI-C12.1 “Std. for Electricity Meters”

2. Institute of Electrical and Electronics Engineers (IEEE)

   a. IEEE-1547 “Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces”
   b. NESC “National Electrical Safety Code”

3. National Electrical Installation Standards (NEiS)

a. NECA-405 "Std for Installing & Commissioning Interconnected Generation Systems"
b. NECA-416 "Recommended Practice for Installing Energy Storage Systems"
c. NECA-417 "Std for Designing, Installing, Operating, & Maintaining Microgrids"
d. NECA-701-13 "Std for Energy Mgmt., Demand Response & Energy Solutions"

4. National Electrical Manufacturers Association (NEMA)

a. NEMA-250 "Enclosures for Electrical Equipment (1.0 kV Maximum)"

5. National Fire Protection Association (NFPA)

a. NFPA-68 "Std. on Explosion Protection by Deflagration Venting"
b. NFPA-69 "Std. on Explosion Prevention Systems"
c. NFPA-550 "Guide for the Evaluation of Fire Risk Assessments"
d. NFPA-551 "Guide for the Evaluation of Fire Risk assessments"
e. NFPA-855 "Std. for the Installation of Stationary ESSs"

6. Underwriters Laboratories, Inc. (UL)

a. UL-1642 "Std. for Lithium Batteries"
b. UL-1741 "UL Standard for Safety Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources"
c. UL-1741SA "Standard for Safety Inverters, Converters, Controllers, and Interconnection System Equipment for Use with Distributed Energy Resources – Supplement A"
d. UL-1973 "Batteries for Use in Stationary and Motive Auxiliary Power Applications"
e. UL-9540 "Energy Storage Systems and Equipment" (ESS)
f. UL-9540A "Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems"

7. OBO Electrical Code (NFPA 70, "National Electrical Code" including amendments by OBO); reference Article 706 Energy Storage Systems, Article 705 Interconnected Electric Power Sources, and other Articles as applicable.
8. OBO Fire Code (International Fire Code including amendments by OBO); reference model code Section 1207 "Electrical Energy Storage Systems" and others as applicable.

1.3 DEFINITIONS

A. BESS: Battery Energy Storage System

B. BMS: Battery Monitoring System

C. EMS: Energy Management System

D. ESS: Energy Storage System

E. MCS: Microgrid Control System

F. NIST: National Institute of Standards and Technology

G. O&M: Operation and Maintenance

1.4 SUBMITTALS

A. Product Data: For Energy Storage System components. Include: Technical data on features, performance, electrical characteristics, ratings, weights, and finishes; rated capacities, operating characteristics, furnished specialties, and accessories; Factory published product specification data sheets; list of materials and components; UL listed data and certifications.

1. Energy Storage System components include but are not limited to:

a. Energy storage system cells, modules, units, stacks, membranes, and balance of system
b. Inverters, converters, and optimizers
c. Microgrid interconnect devices and controllers
d. Charge controllers
e. Energy management system and controllers
f. Switchboards, enclosed switches, panelboards, and their overcurrent protective devices
g. Fire protection and fire alarm system devices
h. Mounting equipment cabinets, racks, and containers
i. HVAC system components
j. Miscellaneous materials and equipment

B. Shop Drawings: Project specific for ESS and related equipment, include the following:

1. ESS description, including the following:

a. ESS chemistry, major component descriptions and their role to achieve required mode of operation.
b. Nameplate data, manufacturer, catalog numbers, and all major accessories used in the system.
c. System electrical characteristics: usable energy storage capacity; rated power; AC efficiency (including auxiliary loads); cycle life; and annual degradation factor.
d. Fire protection/suppression system and fire alarm description including plan for thermal runaway detection and mitigation.
e. Ambient temperature control system and environmental condition parameters.

2. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

a. Site plan or floor plan showing the ESS location including dimensions, access, and auxiliary HVAC units.

b. ESS Cabinet/Container system dimensions including climate control units mounted on the side.
c. ESS assembly and equipment layouts.
d. Centerlines for all external conduit and grounding cable connections, and wall/floor/roof penetrations for auxiliary equipment.
e. Sections and elevations with height of components/container from floor level to top of components/containers highest non-moveable point.
f. Mounting system.
g. System weight, including subtotals by area.
h. Shipping center of gravity for each container and major equipment.
i. Construction staging and storage areas.
j. Owner requirements for all control and auxiliary equipment.
k. Fire protection and fire alarm system layouts.

3. Structural Certification: Certification by licensed structural engineer demonstrating ability of a structure to support all loads required for the ESS.
4. Electrical studies and schematic diagrams, include the following:

a. One-line diagram between major ESS components and interconnection to electrical distribution, including identification of DC versus AC-coupling.
b. Control wiring diagrams, with cross reference for checking and verifying all the control circuit and wiring diagrams, along with the terminal designations for termination of the field wiring of all equipment.
c. Communication and control diagrams.
d. Electrical studies to determine control response and settings, including load flow analysis, short circuit coordination, ampacity, and arc flash analysis in coordination with Section 260573 Overcurrent Protective Device (OCPD) Study.

5. ESS component equipment covered by other specification sections must comply with submittal requirements of the relevant specification section (i.e.: panelboards, switchboards, HVAC equipment, fire protection, fire alarm, enclosed switches, etc.).

C. Certificates of compliance: Provide certificates of compliance for referenced standards, and reports for referenced testing standards.

D. Qualification Data:

1. Support services vendor: Identify vendor firm name and contact, location, distance from project, years, and servicing product line.

E. Factory Test reports: ESS component tests (ESS modules, racking system, inverters, converters, microgrid controllers, HVAC, Fire protection and alarm, etc.) and integrated system test. Submit written test reports including test procedures used, final results and compliance with requirements.

F. Field Test reports: Submit written test reports, include the following:

1. Functional test procedures used.

2. Final test results. Include all test results and demonstrate their comparison to and compliance with requirements.
3. Report must include results of all failed tests and corrective action taken to achieve test results that comply with requirements.

G. Commissioning Test reports: Submit written test reports, include the following:

1. Commissioning test procedures tailored to the storage chemistry and operational performance.
2. Final commissioning test results and Commissioning Issues Log described in part three of this specification.
3. Commissioning test report must include results of all failed tests and corrective action taken to achieve test results to comply with requirements.

H. Operation and Maintenance Manuals:

1. In addition to the items specified in Division 01, Section 017825 *Systems Manual and O&M Data* include the following ESS documentation:

a. ESS equipment and components: Include description of unit or system, recommended maximum depth of discharge (DoD) and degradation rate, and component parts. Give function, normal operating characteristics, and limiting conditions.
b. Provide approved engineering submittals. Include equipment sizing calculations.
c. Provide manufacturer's installation wiring diagrams and schematic diagrams.
d. Operating procedures: Include routine normal operating instructions and sequence of operations. Include regulation, control, stopping, shutdown, system balancing and maintenance (i.e., full discharge and slow charge) and emergency instruction.
e. Special or recommended operating procedures to minimize energy storage capacity degradation over time with respect to seasons, depth of charge/discharge, voltage, humidity, etc.
f. Maintenance requirements: Include required materials, routine procedures and guide for cleaning, troubleshooting, equipment isolation, lockout, tagout, and ESS adjusting, balancing, and checking instructions.

2. ESS Fire protection procedures and instructions for authorized personnel and local firefighting personnel.

I. Record Documents: As specified in Division 01, Section 017705 *Closeout Procedures.*

1. Final as-built drawings and information
2. Assembly and wiring diagrams
3. Installation and operation information
4. Training materials for the operation and maintenance (O&M)

1.5 QUALITY ASSURANCE

A. Qualifications

1. The manufacturer of the ESS must be a company specializing in the manufacture of ESS equipment and have at least five (5) continuous years of documented experience with their hardware in commercial applications in the field.
2. Installation personnel: submit evidence prior to work that persons performing the work herein have manufacturer approved training and qualified experience in ESS installation, design, and applicable safety procedures, and hold proper licenses where applicable.
3. Commissioning personnel: Provide qualifications including experience of certified personnel responsible for ESS startup and commissioning work.

B. Listing and labeling:

1. Electrical components, devices, and accessories must be listed and labeled in accordance with a qualified testing agency and marked for intended location and application.
2. Certificates of compliance: Provide certificates of compliance for referenced standards.
3. Applications and installations must comply with the requirements of the codes and standards listed in this Section. Where required, certified test reports substantiating the compliance must be submitted upon request.

C. Support Service Capability:

1. ESS manufacturer must maintain a call center for technical and emergency support for this system.
2. ESS manufacturer must provide authorized field service vendor with factory-trained personnel for startup, maintenance, and repair of ESS and related equipment.
3. Availability of Service personnel: Manufacturer must have worldwide service organization, with authorized factory-trained service personnel available to provide support remotely 24 hours a day, 7 days a week, 365 days a year, and ability for onsite service.
4. Availability of Spare Parts: Manufacturers must have worldwide component and system distributorships, with replacement parts available from manufacturer using their regularly available expediting delivery for receipt within 48 hours of request.

D. All materials supplied for this project must be new.

1.6 DELIVERY, STORAGE AND HANDLING

A. Equipment must be handled and stored in accordance with manufacturer's instruction, and as required to prevent any damage to system components and electronics. One (1) copy of these instructions must be included with the equipment at time of shipment.

B. Prior to and during construction, provide secure storage onsite for all ESS materials.

C. If stored in areas subjected to weather, cover equipment to provide protection from weather, dirt, dust, corrosive substances, and physical damage.

D. Where systems are intended for use in classified areas, appropriate considerations must be taken in the delivery, storage, and handling of the equipment.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

1. Temperatures:

   a. Annual ambient: **[enter site specific value]** deg C to **[enter site specific value]** deg C
   b. Record low temperature: **[enter site specific value]** deg C
   c. Record high temperature: **[enter site specific value]** deg C

2. Altitude: Derate as required if over **[enter site specific value]** meters above sea level
3. Relative humidity: **[enter site specific value]**
4. **[enter other site-specific conditions such as wind ratings, sand/dust, seismic activity, salt air, fog, marine corrosiveness, etc.]**

1.8 COORDINATION

A. Coordinate layout and installation of ESS with other construction, including conduit, piping, equipment, and adjacent obstructions and surfaces. Maintain required clearances for workspace and equipment access.

B. Coordinate size and locations of anchor-bolt inserts into concrete slabs.

C. Provide system technical coordination for utility interconnection agreements. Provide grid connection as required, and in location as designated by local utility company.

D. Coordinate electrical voltage (V), phase (Ø), and hertz (Hz) characteristics of ESS's output with electrical characteristics of local utility company, and with ESS’s input if bidirectional inverter is used.

1.9 WARRANTIES

A. Provide ESS extended (10) year manufacturer’s warranty (excluding energy storage modules) valid from the date of substantial completion.

B. Energy storage module(s) warranties: Extended (10) year warranty after the date of substantial completion. Battery pack must retain at least **[70 percent][enter other percent nominal capacity]** of nominal energy capacity for the earlier of either (10) years after commissioning or after a minimum energy throughput of **[insert cumulative throughput]** kWh energy.

1.10 OWNERSHIP OF PROPRIETARY MATERIAL

A. The US Government must retain all rights to software and passwords used for this project.

B. Contractor must provide a copy of the manufacturer's standard software and end-user license agreement (EULA) for review and approval as condition of this contract. Such license must grant use of all programs and application software to the US Government as defined by manufacturer's license agreement but must protect manufacturer's rights to disclosure of Trade Secrets contained within such software. The Contractor must obtain a signed copy of the manufacturer's software and firmware licensing agreement prior to purchase.

C. The licensing agreement must not preclude use of software by individuals under contract to the US Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to the US Government will be restricted to use on the US Government's computers and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation must become the property of the US Government.

1.11 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date, provide 12 months full maintenance by authorized field service vendor with factory-trained certified personnel. Provide system maintenance service with adjusting as required for proper operation based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. Provide parts and supplies same as those used in the manufacture and installation of original equipment. In addition to the initial year of maintenance service, provide a proposal for a five-year period with (5) one-year, annually renewable periods, starting from end of initial maintenance period. The option year proposal must be submitted **[120]** days prior to the end of the maintenance contract period.

B. Maintenance service must include preventive maintenance, repair, or replacement of worn or defective components, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks must also align with the manufacturer's recommended checklists as required in Division 01, Section 017825 *Systems Manual and O&M Data.* Provide complete maintenance records inclusive of scheduling to the US Government for inclusion in the Computerized Maintenance Management System CMMS.

C. The Maintenance Service must include an annual report to US Government verifying that the ESS is performing as intended per the battery storage strategy and manufacturer recommendations. The report must include:

1. Use case performance.
2. Battery outages with root cause summary/failure modes and effects analysis, start and end time periods.
3. Summary of all O&M operations; repair and replacements.
4. Summary of safety incidents, causes, and resolutions.
5. Contractor must perform all required maintenance to the ESS and BMS to ensure that the monthly demand reduction is provided.

6. In addition to required demonstration and training in PART 3 of this specification, the Contractor must provide an additional eight (8) hours O&M training session to the US Government O&M personnel prior to the completion of the initial 12 months of maintenance service. Training must comply with PART 3 and cover issues and resolution encountered during the initial 12 months of maintenance service by service maintenance staff and US Government O&M.
7. Perform updates to the battery management system dispatch strategy if required due to rate tariff or major site load profile changes.
8. Ensure that all system firmware is up to date and meets US Government cybersecurity requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Kronus Engineering
2. ESS
3. Fluence
4. LG Energy Solution Vertech
5. Sungrid Solutions
6. **[other manufacturer]**

B. The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if accepted by the Project Contracting officer Representative (COR) and Engineer **[(10)]** calendar days prior to bid date. Submit alternate manufacturer for review to allow **[(14)]** calendar days for review with sufficient documentation demonstrating compliance with project requirements.

C. The design drawings must include details, equipment dimensions, and space requirements based on the **[first listed acceptable manufacturer]**. If the Contractor selects a different equipment supplier, some redesign including locations of conduits, terminations, and space clearance may be required. Additional costs incurred for these changes must be borne by the Contractor.

2.2 GENERAL REQUIREMENTS FOR ESS

A. ESS must be listed for the intended use in accordance with OBO-ICS NEC Chapters 1 and 7.

B. ESS must be UL-9540 listed and tested in accordance with UL-9540A.

C. Provide Nameplate, mimic bus, arc flash rating, and System drawing to be located on the doors of containers, equipment, or cabinets.

1. The System must have a **[enter kW rating]** kW-AC rating and **[enter kWh rating]** kWh-AC usable rating.
2. The System AC Voltage must be **[enter system voltage]** volts.

D. Exposed Conduit: All exterior exposed conduits must be galvanized rigid steel (RMC) with threaded fittings.

E. ESS Output: ESS must match local utility company exactly in voltage, phase, and frequency to allow it to be grid-tied in accordance with local utility company's safety and power quality requirements. Coordinate all requirements with local utility company. Refer to Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety" for additional metering requirements.

F. The ESS must contain protective relays, circuit breakers, or fuses which self-protect the ESS in the case of internal electrical faults. Set and adjust circuit protection devices according to a short circuit and coordination study.

G. A visible disconnect will be installed that isolate the ESS from utility interconnection, complying with local utility requirements.

H. Grounding: Contractor must provide grounding system for personnel protection for step and touch potential complying with IEEE-Std-80. The system also must be adequate for the detection and clearing of ground faults within the ESS. The system should be grounded in all anticipated operating modes (e.g., grid-tied, and islanded).

I. The ESS must be capable of grid forming for microgrid islanding applications, complying with all local utility requirements, and compatible with other power generating sources.

J. Seismic Performance: ESS must withstand effects of earthquake motions determined according to ASCE/SEI 7.

1. The term “withstand” means “the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operation after the seismic event.”

2.3 PERFORMANCE REQUIREMENTS

A. Integrate the ESS with the following power generation systems and **[existing]** power distribution system:

1. **[enter kW nameplate capacity]** Photovoltaic system(s)
2. **[enter kW nameplate capacity]** Generator(s)
3. **[enter kW nameplate capacity]** Wind Turbine system(s)
4. **[enter kW nameplate capacity]** Fuel Cell(s)
5. **[enter other power generation]**

B. The ESS must operate for the following scenario(s):

1. Demand control: The ESS must provide grid electricity usage and demand/peak shaving to limit demand (kW) to programmed setting.

   a. **[Anticipated][Current]** site monthly peak demand is **[insert monthly peak kW demand]**, and average load is **[insert average demand in kW]**. Limit grid demand by **[specify the required demand reduction in kW]**. The ESS must have a method for forecasting the peak load and automatically dispatching the battery or scheduling the charge/discharge in advance.
   b. Time of Use Charge Reduction: Integrate the ESS to discharge during on-peak or mid-peak hours in accordance with the site's rate tariff and the resiliency requirements of the site.
   c. ESS must maintain a round-trip efficiency greater than **[70][90]** percent AC-in to AC-out (confirmable by operation over a single round-trip cycle from 0 percent state of charge to 100 percent, and back to 0 percent at standard conditions specified by the manufacturer), including thermal losses and auxiliary loads, over 10 years.
   d. Annual ESS savings will be generated by discharging the battery during on-peak periods, as well as during peak billing demand periods.
   e. Grid stability by ramping up and down ESS output in response to utility grid frequency.

2. Grid outage: The ESS must support critical loads in microgrid operation in the event of a grid outage.

   a. Install a microgrid control system **[and modify existing]** electrical distribution and automatic transfer schemes as necessary to provide electricity to the campus upon grid failure. The Contractor must include the creation of a critical power circuit, including re-wiring of the critical loads and installation of critical power switchgear, in the scope of work (SOW).
   b. The ESS must support the critical loads **[as indicated on drawings]**.
   c. The ESS must perform anti-islanding sequence and grid forming operation to enable microgrid mode with "black start" capability.
   d. The ESS controller must disconnect load to prevent overload or over discharge and must manage charge/discharge function when utility grid is re-established.
   e. Consider the following site-specific parameters in the system design:

      1) [Specify site-specific operating conditions: provide electric load interval data, required ramp rates for existing generators, additional information on the types of loads to be served and required modes of operation. Provide detail on existing control and monitoring systems.]
      2) Configure ESS to provide seamless transition between utility power and microgrid.
      3) Optimize system to minimize generator use to conserve fuel.

C. Interval Testing:

1. The ESS must be demonstrated to perform on a recurring basis to ensure the Agency's desired site resilience and energy assurance. This interval testing frequency must occur approximately every twelve (12) months following final acceptance to ensure provision of power to the site in the event of a utility-provided power outage or interruption. This activity requires pre-coordination with the local servicing utility in accordance with the approved interconnection agreement, and that coordination must be led by the Contractor in consultation with the Agency's Facilities Manager (FM).
2. This periodic demonstration must stagger months, seasons, load, time of day, and weather variabilities, but must be conducted at least every twelve (12) months.
3. Periodic testing will be the responsibility of **[specify entity responsible for O&M]**.
4. In the event of an actual utility power interruption exceeding **[insert specified duration]**, the ESS's performance will satisfy this requested demonstration, thereby resetting the interval to twelve (12) months prior to the next required demonstration.
5. Any deficiencies or anomalies beyond expected design parameters, in an actual event or demonstration event, are to be reported to the Agency within twenty-four (24) hours in writing, with recommended remediation or corrective steps to prevent recurrence.

2.4 ENERGY STORAGE COMPONENTS

A. Energy storage components must consist of **[lithium-ion batteries][nickel-cadmium batteries][nickel metal hydride batteries][flow batteries][lead-acid][other battery or electrochemical ESS technology]**.

B. Energy storage systems may be individual cells, and supplied as modules comprised of cells, or as group of modules combined into units. Several units may be combined to make up the balance of the system. Cells, modules, and units must be fully enclosed in listed assembly for the intended purpose. Individual battery trays and/or racks must not be permitted.

C. Energy storage systems comprised of battery systems must be UL-1973 listed for the intended use.

D. A battery management system must monitor and balance cell voltages, currents, and temperatures within the manufacturer's specification. The battery management system must be part of the ESS component UL listing. The BMS must the charging and discharging of the equipment. The BMS must be field programmable via a laptop and viewing/editing on a locally hosted web browser. Programming instructions and setpoints must be shared with Agency staff.

E. [The battery management system charge controller must have Maximum Power Point Tracking (MPPT) for DC coupled PV systems.]

F. The cells, modules, units, and installation must be supplied with all required and/or manufacturer recommended accessories.

G. ESS DC voltage must not exceed **[1000Vdc][1500Vdc][other DC voltage].**

H. The use of vented batteries must not be permitted.

2.5 POWER CONVERSION SYSTEMS

A. Power Conversion Systems (PCS) must be UL-1741 or UL-1741SA listed for the intended use.

B. PCS output must match local utility company frequency and voltage when grid tied to local utility or in combination with **[generator operation][microgrid control system]** where applicable.

C. PCS output connections and operation must comply with all local utility company requirements.

D. PCS must have the following electrical characteristics:

1. Efficiency: minimum 95 percent
2. Frequency: 50/60 Hz
3. AC Voltage range: matching utility voltage
4. DC Voltage range: matching energy storage DC voltage
5. THD: < 3 percent
6. Power factor: -1 to +1

E. The PCS must have the following features to operate in the required performance scenario(s):

1. Perform grid-tie and grid-forming operation with “black start” capability and seamless transfer.
2. Bi-directional charge and discharge of the ESS with intelligent controls and interface with battery management system.
3. Complete automatic unattended operation including startup, synchronization, power disconnect, and parallel operation with the utility **[and generators]**. **[Where applicable, the system must also operate in parallel with: [photovoltaic systems,][generators,] [other site power production,] and utility]**.
4. Shutting down without damage when ESS output is outside tolerance parameters of inverter.
5. Automatic anti-islanding in conformance with referenced standards.
6. **[other features]**

2.6 MICROGRID CONTROL SYSTEM (MCS)

A. The MCS may be a separate component or combined with the ESS or inverter. The MCS must be one of the following: be listed, listed individual components assembled as a system, or designed under engineering supervision.

B. The MCS must include an energy management system (EMS), when an additional onsite generating source is present (i.e., solar or generators).

C. The MCS must have the following features to achieve the intended performance scenario(s):

1. Communicate with the ESS intelligent controls and monitor energy contribution from the **[Photovoltaic system,][generators,][grid,][other site power production].**
2. Monitor, log and report the energy consumption load profile.

3. The EMS must balance the power generation inputs, load outputs and signal controls to achieve the intended performance scenarios including grid services (such as peak demand shaving and energy arbitrage) and backup power to meet resiliency requirements. using an intelligent optimization algorithm.
4. Must autonomously initiate anti-islanding and grid forming sequence with battery power conversion system, generator controllers, or grid-forming inverters to operate in microgrid mode.
5. Ability to control the quantity and ratings of generation sources, utility, and output loads as indicated on drawings.
6. Communicate with, and directly control, connected generation sources including PV inverters, generator control panels, and battery converters. The MCS must be capable of coordinating the interaction between multiple power sources of similar or different types, manufacturers and technologies utilizing industry standard communication protocols.
7. Provide local and remote monitoring capability complying with this specification.
8. Be housed within the ESS or in separate enclosure complying with environmental conditions in this specification.
9. Include a programmable onsite interface to adjust the operating modes and threshold values.
10. Ability to log and export historical data from each connected generation source.

2.7 HEATING VENTILATION AND AIR CONDITIONING (HVAC)

A. The ESS must include a completely integrated HVAC system designed to always maintain component temperatures including heating, cooling, and relative humidity. Thermal conditioning systems must maintain ambient temperatures and humidity within warranty requirements and manufacturer recommendations.

2.8 ENCLOSURE

A. The ESS and associated equipment must be in a factory assembled climate-controlled enclosure that is rated for the site conditions.

B. The ESS, and associated equipment, must be provided in self-contained NEMA **[3R][4X]** enclosure(s) rated for the site conditions. ESS enclosures must be designed to be installed onto properly prepared pads/foundations.

C. Provide manufacturer **[standard enclosure finish][or][white enclosure finish]**.

D. ESS components and associated ancillary equipment must have working space clearances complying with OBO ICS NEC.

E. Energy storage modules or units must be rack mounted or installed in cabinets, per manufacturer recommendations inside factory enclosure or container. Each module or unit must be arranged to maintain required spacing and materials complying with UL-9540A testing recommendations and OBO Fire Code.

F. Front **[and rear]**access: All serviceable subassemblies must be modular and capable of being replaced from the front **[and rear]**of the cabinet. Side **[or rear]**access for installation, service, repair, or maintenance of the system must not be required.

G. Cable entry: standard cable entry for the ESS must be through the enclosure bottom.

2.9 DATA ACQUISITION AND CONTROL

A. The ESS must include a monitoring and data acquisition system and must include, at a minimum, the following information in 15-minute intervals (unless otherwise noted):

1. Real-time ESS State of charge.
2. System mode (charge, discharge, island, grid-tied etc.) and condition (normal, auto, manual, override, etc.).
3. System voltages, current, and power.
4. Real-time connected generation source(s) power and connected load power consumption.
5. Enclosure Ambient temperature, hourly average at hourly intervals.
6. Energy and time remaining at current discharge or charge rate.
7. Time until full charge at current recharge rate.
8. Forecasted charge and discharge profile.
9. Round-trip efficiency on daily, weekly, monthly, yearly basis.
10. System fire protection and alarm condition
11. Notification when preventive maintenance is needed.
12. System alarm and events:

    a. Major: system automatically disconnected due to over/under voltage, overcurrent or over temperature.
    b. Minor: voltage imbalance, voltage sensing error, under-temperature, temperature imbalance, overprotection device activation, communication failure, regular maintenance required (i.e., perform balancing charge sequence).

B. Data must be saved locally for a minimum of **[(30) days][enter number of days]** and backed up off-site with a minimum of **[(36) months][enter number of months]** of data.

C. Data transmission must be transferred to off-site storage via one of the following connections:

1. Cellular connection.
2. WAN Internet Connection **[coordinate with site specific conditions]**.

D. Remote connection must be for monitoring purposes only. No system or device must require internet connection to function.

E. Local display and control:

1. Local display must provide listed data monitoring in this specification.
2. Local control panel via interface or dedicated server must allow for local control and adjustments of setpoints and threshold values.

3. Local display may be visible without password protection. Local control must be password and user protected.
4. Local display must have touch screen interface.

F. Monitoring by Building Automation System (BAS):

1. The ESS must communicate with an external controller via MODBUS over TCP/IP.
2. The ESS must provide monitoring data and reporting to the BAS. The BAS must not have capability to modify or control the ESS remotely.

G. External remote monitoring using web-based service:

1. All data collected will be available in a web-based interface accessed via an internet connection.
2. The Contractor must ensure that data acquisition and monitoring solution complies with site specific US Government cybersecurity.
3. Access must be provided via secure login ID and password:

a. There will be no user-based fee to access the data.
b. An unlimited number of users can access the data at the same time.

4. The user interface must have the following functionality:

a. A site summary which provides data on the overall performance of the entire site
b. Detailed asset views on each individual piece of connected equipment
c. The ability to create time-data trends for all collected data.

2.10 FIRE PROTECTION AND FIRE ALARM SYSTEMS

A. The ESS must include an integrated fire protection and fire alarm system in accordance with UL-9540A test report. Fire protection system must be water-based suppression type system unless approved by OBO Fire.

B. The system must communicate with the compound Fire Alarm System.

C. Fire Protection System design must consider that ESS will be unattended at most times.

D. Provide visual and audible alarm when a safety hazard exists.

2.11 SOURCE QUALITY CONTROL

A. Factory end of line tests before shipment:

1. Factory test ESS and other system components and accessories manufactured specifically for this Project. Perform tests at rated power and for modes of operations in this specification.
2. All test results must be documented including failed tests.

3. Re-test all failed tests until successful test is achieved.
4. Factory testing must be witnessed by the US Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. US Government representative must perform factory inspection at that time as well.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before ESS installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes, and locations, and electrical to verify actual locations, sizes and other conditions affecting performance, maintenance, and operations.

1. Final ESS locations indicated on Drawings are approximate. Determine exact locations before roughing-in for electrical connections.

B. Provide required clearances and clear installation area of flammable vegetation. Maintain adequate setback to other structures, vegetation, and other flammable materials.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. The ESS must be provided with foundations and structures that are designed by or under the supervision of a qualified registered engineer. All design must be in accordance with local project area seismic design requirements and as specified in the specifications for this project.

B. Install equipment in accordance with manufacturer’s installation instructions and recommendations.

C. ESS location must be above the **[insert year]** flood plain and surge levels and must be elevated higher than any pull vaults and conduit not sloped toward any ESS electrical component to prevent equipment flooding. ESS must be located within a thermally conditioned enclosure.

3.3 CONNECTIONS

A. Ground equipment according to Section 260525 “Grounding and Bonding for Electrical Systems.”

B. Connect wiring according to Section **[260518 “Low-Voltage Electrical Power Conductors and Cables”][Division 26 Section on MV conductor and cables].**

C. Tighten bus joints, electrical connectors, and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified

in UL-486A and UL-486B. Make a permanent mark on all joints, connectors, and terminals after they have been torqued to the proper value.

3.4 IDENTIFICATION

A. ESS signs must be clearly printed in English and in local language.

B. Identify components according to Division 26 Section on Identification for Electrical Systems and include the following:

1. Identification in accordance with OBO Electrical Code and OBO Fire Code referenced sections.
2. ESS electrical equipment and components must have clear/visible markings that identify the manufacturer, size, type, rated input and output voltages, hazard warnings, frequency, number of phases (AC only), rating in kW or kVA, available fault current at ESS output terminals, maximum output and input current at terminals, maximum output and input voltage at terminals, and utility interactive capability.
3. Posted instructions for tasks that site staff may need to perform, such as system shutdown during an emergency.
4. Clearly label all disconnects, indicating whether in the open (OFF) or closed (ON) position, the operating system voltage, available fault current, current, and system rating.
5. ESS disconnecting means must indicate whether ON or OFF and be marked “ENERGY STORAGE SYSTEM DISCONNECT.” Disconnecting means must also be clearly marked to indicate: (1) Nominal ESS voltage, (2) Available fault current, (3) Arc-flash label, (4) Date calculation performed.
6. Arc flash labels, per NFPA-70E.
7. Identification and location of each power source on a permanent plaque or directory. The plaque or directory must indicate the location of each power source disconnecting means and be grouped with other plaques or directories for other power sources.

C. Equipment markings must be permanent and must withstand the environmental conditions in which the equipment is installed. Provide “UV rated” for outdoor labels, or on an embossed steel placard, designed for outdoor use and fastened with adhesive and rivets.

D. Markings must be visible or easily accessible during and after installation. The Contractor must be responsible for all field-applied markings as required by local, state, and federal codes.

3.5 FIELD QUALITY CONTROL AND STARTUP

A. Provide the services of a qualified and certified factory-trained manufacturer’s representative for startup of the equipment specified under this section. The manufacturer’s representative must provide technical assistance to the contractor in general installation of the equipment, connections and adjustments, and testing of the assembly and components contained therein.

B. The manufacturer’s representative must provide inspection of the final installation, perform functional testing, and startup the ESS.

C. Startup acceptance test must be witnessed by the US Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. Contractor must be prepared at any time during this process to provide access to all portions of installation and must remedy any portion of system that is not in compliance with this specification, which does not perform to manufacturer's operating specifications, or that fails to operate due to poor workmanship.

D. Ensure there is written permission from local utility company for interconnection of the ESS with the utility grid. Local utility company may require that representative of the local utility be onsite during initial interconnection; Contractor must accommodate this requirement, if stated by utility.

E. Functional Testing must include the following, in addition to all tests required by manufacturer:

1. Pre-startup inspection of the ESS system.
2. Test in accordance with the approved operating scenarios.
3. Verify and test system alarms.
4. Test ESS with all power generating sources and loads as applicable.

F. Provide photo record of installation and major components, including ESS, MCS, and all display screens. Include photos showing connections within all installed enclosures. Provide electronic copies of photo record on compact disc and hard copy of the photo record (with labels for each photo) in Operation and Maintenance Manual identified in Article on SUBMITTALS.

3.6 COMMISSIONING

A. Third Party Commissioning Agent: Engage electrically qualified and factory approved third party certified commissioning agent to inspect, field test, and document performance of components and equipment after installation. Commissioning agent must prepare written test results in report.

B. All test instruments must be identified in Report and listed by manufacturer, model number, serial number, date of calibration, and calibration authority. All test instruments must have been calibrated within past year. Test instruments must have attached calibration sticker that is traceable to NIST.

C. Contractor must obtain written commissioning procedures document. Procedure entries must include date; time; person taking data; recorded value of data; indication if recorded value is out of range of system and/or equipment tolerance. Each page of the procedures must have test name; equipment tested; location; date; time; person performing test; model number of equipment; serial number of equipment; manufacturer; tolerance ranges of equipment tested for reference.

D. Commissioning Agent must keep Commissioning Issues Log and include it as appendix to Report. Log must include, but not be limited to issue description; log tracking number; date; time; person investing issue; action taken; person acting; date of closure of issue. Include copy of Commissioning Issues Log in written procedures to Contractor.

E. Perform the following field tests and inspections, in addition to manufacturer recommended tests and inspections, as follows for test report:

1. Test insulation resistance and continuity for each DC circuits, AC feeders, grounding including ground fault protection, and control circuits. Disconnect all sensitive electronic equipment prior to testing. Visually and physically inspect all cabling, connections, and conduits. Verify color coding of conductors per OBO Electrical Code. Verify proper torque of termination connections with calibrated torque wrench.
2. Test ground fault protection of ESS (where required).
3. State of Health verification via coulomb counting.
4. Test proper operation of ESS for all operating scenarios. Set output voltage, as necessary. Verify that all local utility notifications and requirements have been incorporated.
5. Verify operation of all disconnect switches and proper sizing of all overcurrent protection devices (OCPD) in accordance with Division 26 Sections on enclosed switches and circuit breakers and on panelboards.
6. Verify that displays accurately represent output of ESS.
7. Power feedback controller: Monitor the utility power factor with the ESS functioning and with it disconnected. Identify the observed power factor. Verify the system modulates this power factor to not adversely affect utility billing.
8. Verify that remote data logging access has been established and is functioning. Provide all necessary data, IP addresses, login-ins, and passwords to post.

F. Contractor must remove and replace malfunctioning equipment. Retest ESS system as specified above.

3.7 DEMONSTRATION AND TRAINING

A. Comply with Division 01, Section 017905 *Demonstration and Training* for general requirements of demonstration and training documentation.

B. The manufacturer's representative must provide 'hands-on' training course for the US Government O&M personnel.

1. Schedule as follows:

   a. Two (2) eight (8) hour training sessions equally divided into in-class training and in the field training, for a total of sixteen (16) hours.
   b. Training must be completed within two (2) calendar weeks.

2. Training must cover the following topics:

   a. Overall system description and theory of operation.
   b. Local displays and control interfaces.
   c. Operating scenarios.
   d. Automatic operation.
   e. Manual operation.
   f. Protective relaying.
   g. Recommended system checklists and log sheets.
   h. Recommended preventive maintenance and instructions to be performed by qualified staff.

i. Instruction on the operation of the assembly, and major components within the assembly.
j. Instruction on operation or maintenance that must be completed by factory authorized representative to maintain warranty and proper operation.
k. Fire protection and fire alarm system operation and procedures for the safe operation and actions during fire event or alarm.
l. Interactions with other systems.
m. Overview of relevant storage chemistry, internal thermal management system, and required ambient housing conditions to maintain required operating temperature range.
n. Identification of emergency disconnects.
o. Fire suppression system maintenance – pump and distribution system maintenance for dry standpipe systems.
p. Instruction on balancing cycle and state of charge tests to gauge state of health.
q. Hazards and failure modes, including thermal runaway, off gassing, and stranded energy.
r. Mitigation / response measures for electrolyte releases, overheated batteries and fires.
s. Instruction in liquid-cooled system maintenance, including pump and coolant inspection, leak detection, visual inspection, and verification of pressure and gauge accuracy.
t. Power conversion system inspection and calibration.

C. The Contractor and Manufacturer's representative must coordinate with local fire marshals on ESS setback requirements, first responder training, and posted instructions for shutoffs:

1. The Contractor must provide training to local firefighters covering ESS operation and how to shut it down in an emergency event and form a fire suppression plan. Training must cover the main risks of storage systems, including electric shock, thermal runaway, battery reignition, and stranded energy. Training must include fire suppression tactics, including minimum water and time requirements, thermal imaging camera, vehicle tilt / lift, and battery box piercing, as well as extrication and transport.
2. The Contractor must coordinate with the fire marshal to determine where to post the permanent instructions and required markings.

D. The Contractor must provide a minimum four (4) hour online training to US Government O&M personnel, Government IT personnel, and OBO representative of the remote monitoring systems via online web services tools. The training must be recorded and remain available for ongoing access to training. The training must include:

1. Login credentials and request for additional users
2. Menu options and available information.
3. Review of graphical displays, data, and components.
4. Interpretation of presented data.
5. Optional displays and updates.

END OF SECTION 263313.12

SECTION 263313.13 – ENERGY STORAGE SYSTEMS (OVER 600 kWh)

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the Energy Storage System (ESS) rated over 600kWh and their associated internal components that create the entire system, including inverters, power conversion systems, microgrid interconnect devices, energy storage components, monitoring and control systems, miscellaneous electrical equipment, associated integral HVAC, Fire Protection and Fire Alarm Systems.

B. Related Sections include the following:

1. Section 230905 "Instrumentation and Controls for HVAC."
2. Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety."
3. Section 260518 "Low-Voltage Electrical Power Conductors and Cables."
4. Section 260525 "Grounding and Bonding for Electrical Systems."
5. Division 26 Section on raceways and boxes for conduits and outlet boxes.
6. Section 260573 “Overcurrent Protective Device Coordination Study.”
7. Section 260915 "Electrical Power Monitoring."
8. Division 26 Section on Enclosed Switches and Circuit Breakers.
9. Division 26 Section on Fuses.
10. Section 262214 "Low-Voltage Transformers."
11. Section 263105 "Solar Photovoltaic Systems."
12. Division 26 Section on “Vibration and Seismic Controls for Electrical Systems.”

1.2 REFERENCE STANDARDS

A. In addition to standards identified elsewhere in this Section and related Sections, conform to the following:

1. America National Standards Institute (ANSI)

   a. ANSI-C12.1 “Std. for Electricity Meters”

2. Institute of Electrical and Electronics Engineers (IEEE)

   a. IEEE-1547 “Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces”
   b. NESC “National Electrical Safety Code”

3. National Electrical Installation Standards (NEiS)

a. NECA-405 "Std for Installing & Commissioning Interconnected Generation Systems"
b. NECA-416 "Recommended Practice for Installing Energy Storage Systems"
c. NECA-417 "Std for Designing, Installing, Operating, & Maintaining Microgrids"
d. NECA-701-13 "Std for Energy Mgmt., Demand Response & Energy Solutions"

4. National Electrical Manufacturers Association (NEMA)

a. NEMA-250 "Enclosures for Electrical Equipment (1.0 kV Maximum)"

5. National Fire Protection Association (NFPA)

a. NFPA-68 "Std. on Explosion Protection by Deflagration Venting"
b. NFPA-69 "Std. on Explosion Prevention Systems"
c. NFPA-550 "Guide for the Evaluation of Fire Risk Assessments"
d. NFPA-551 "Guide for the Evaluation of Fire Risk assessments"
e. NFPA-855 "Std. for the Installation of Stationary Energy Storage Systems"

6. Underwriters Laboratories, Inc. (UL)

a. UL-1642 "Std. for safety for lithium batteries"
b. UL-1741 "UL Standard for Safety Inverters, Converters, Controllers and Interconnection System Equipment for Use with Distributed Energy Resources"
c. UL-1741SA "Standard for Safety Inverters, Converters, Controllers, and Interconnection System Equipment for Use with Distributed Energy Resources – Supplement A"
d. UL-1973 "Standard for batteries for use in stationary applications and Motive Auxiliary Power Applications"
e. UL-9540 "Energy Storage Systems and Equipment"
f. UL-9540A "Test method for evaluating thermal runaway fire propagation in battery energy storage systems"

7. OBO Electrical Code (NFPA 70, "National Electrical Code" including amendments by OBO); reference Article 706 Energy Storage Systems, Article 705 Interconnected Electric Power Sources, and other Articles as applicable.
8. OBO Fire Code (International Fire Code including amendments by OBO); reference model code Section 1207 "Electrical Energy Storage Systems" and others as applicable.

1.3 DEFINITIONS

A. BESS: Battery Energy Storage System

B. BMS: Battery Monitoring System

C. EMS: Energy Management System

D. ESS: Energy Storage System

E. MCS: Microgrid Control System

F. NIST: National Institute of Standards and Technology

G. O&M: Operation and Maintenance

1.4 SUBMITTALS

A. Product Data: For Energy Storage System components. Include: Technical data on features, performance, electrical characteristics, ratings, weights, and finishes; rated capacities, operating characteristics, furnished specialties, and accessories; Factory published product specification data sheets; list of materials and components; UL listed data and certifications.

1. Energy Storage System components include but are not limited to:

a. Energy storage system cells, modules, units, stacks, membranes, and balance of system
b. Inverters, converters, and optimizers
c. Microgrid interconnect devices and controllers
d. Charge controllers
e. Energy management system and controllers
f. Switchboards, enclosed switches, panelboards, and their overcurrent protective devices
g. Fire protection and fire alarm system devices
h. Mounting equipment cabinets, racks, and containers
i. HVAC system components
j. Miscellaneous materials and equipment

B. Shop Drawings: Project specific for ESS and related equipment, include the following:

1. ESS description, including the following:

a. ESS chemistry, major component descriptions and their role to achieve required mode of operation
b. Nameplate data, manufacturer, catalog numbers, and all major accessories used in the system
c. System electrical characteristics: usable energy storage capacity; rated power; AC efficiency (including auxiliary loads); cycle life; and annual degradation factor.
d. Fire protection/suppression system and fire alarm description including plan for thermal runaway detection and mitigation
e. Ambient temperature control system and environmental condition parameters

2. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:

a. Site plan or floor plan showing the ESS location including dimensions, access, and auxiliary HVAC units.

b. ESS Cabinet/Container system dimensions including climate control units mounted on the side.
c. ESS assembly and equipment layouts
d. Centerlines for all external conduit and grounding cable connections, and wall/floor/roof penetrations for auxiliary equipment.
e. Sections and elevations with height of components/container from floor level to top of components/containers highest non-moveable point.
f. Mounting system.
g. System weight, including subtotals by area
h. Shipping center of gravity for each container and major equipment
i. Construction staging and storage areas.
j. Owner requirements for all control and auxiliary equipment
k. Fire protection and fire alarm system layouts

3. Structural Certification: Certification by licensed structural engineer demonstrating ability of a structure to support all loads required for the ESS.
4. Electrical studies and schematic diagrams, include the following:

a. One-line diagram between major ESS components and interconnection to electrical distribution, including identification of DC versus AC-coupling.
b. Control wiring diagrams, with cross reference for checking and verifying all the control circuit and wiring diagrams, along with the terminal designations for termination of the field wiring of all equipment.
c. Communication and control diagrams.
d. Electrical studies to determine control response and settings, including load flow analysis, short circuit coordination, ampacity, and arc flash analysis in coordination with Section 260573 Overcurrent Protective Device (OCPD) Study

5. ESS component equipment covered by other specification sections must comply with submittal requirements of the relevant specification section (i.e.: panelboards, switchboards, HVAC equipment, fire protection, fire alarm, enclosed switches, etc.).

C. Certificates of compliance: Provide certificates of compliance for referenced standards, reports for referenced testing standards, and hazard mitigation analysis reports.

D. Qualification Data:

1. Support services vendor: Identify vendor firm name and contact, location, distance from project, years, and servicing product line.

E. Factory Test reports: ESS component tests (ESS modules, racking system, inverters, converters, microgrid controllers, HVAC, Fire protection and alarm, etc.) and integrated system test. Submit written test reports including test procedures used, final results and compliance with requirements.

F. Field Test reports: Submit written test reports, include the following:

1. Functional test procedures used.

2. Final test results. Include all test results and demonstrate their comparison to and compliance with requirements.
3. Report must include results of all failed tests and corrective action taken to achieve test results that comply with requirements.

G. Commissioning Test reports: Submit written test reports, include the following:

1. Commissioning test procedures tailored to the storage chemistry and operational performance.
2. Final commissioning test results and Commissioning Issues Log described in part three of this specification.
3. Commissioning test report must include results of all failed tests and corrective action taken to achieve test results to comply with requirements.

H. Operation and Maintenance Manuals:

1. In addition to the items specified in Division 01, Section 017825 *Systems Manual and O&M Data* include the following ESS documentation:

a. ESS equipment and components: Include description of unit or system, recommended maximum depth of discharge (DoD) and degradation rate, and component parts. Give function, normal operating characteristics, and limiting conditions.
b. Provide approved engineering submittals. Include equipment sizing calculations.
c. Provide manufacturer's installation wiring diagrams and schematic diagrams.
d. Operating procedures: Include routine normal operating instructions and sequence of operations. Include regulation, control, stopping, shutdown, system balancing and maintenance (i.e., full discharge and slow charge) and emergency instruction.
e. Special or recommended operating procedures to minimize energy storage capacity degradation over time with respect to seasons, depth of charge/discharge, voltage, humidity, etc.
f. Maintenance requirements: Include required materials, routine procedures and guide for cleaning, troubleshooting, equipment isolation, lockout, tagout, and ESS adjusting, balancing, and checking instructions.

2. ESS Fire protection procedures and instructions for authorized personnel and local firefighting personnel.

I. Record Documents: As specified in Division 01, Section 017705 *Closeout Procedures*.

1. Final as-built drawings and information
2. Assembly and wiring diagrams
3. Installation and operation information
4. Training materials for the operation and maintenance (O&M)

1.5 QUALITY ASSURANCE

A. Qualifications

1. The manufacturer of the ESS must be a company specializing in the manufacture of ESS equipment and have at least five (5) years of documented continuous experience with their hardware in commercial applications in the field.
2. Installation personnel: submit evidence prior to work that persons performing the work herein have manufacturer approved training and qualified experience in ESS installation, design, and applicable safety procedures, and hold proper licenses where applicable.
3. Commissioning personnel: Provide qualifications including experience of certified personnel responsible for ESS startup and commissioning work.

B. Listing and labeling:

1. Electrical components, devices, and accessories must be listed and labeled in accordance with a qualified testing agency and marked for intended location and application.
2. Certificates of compliance: Provide certificates of compliance for referenced standards.
3. Applications and installations must comply with the requirements of the codes and standards listed in this Section. Where required, certified test reports substantiating the compliance must be submitted upon request.

C. Support Service Capability:

1. ESS manufacturer must maintain a call center for technical and emergency support for this system.
2. ESS manufacturer must provide authorized field service vendor with factory-trained personnel for startup, maintenance, and repair of ESS and related equipment.
3. Availability of Service personnel: Manufacturer must have worldwide service organization, with authorized factory-trained service personnel available to provide support remotely 24 hours a day, 7 days a week, 365 days a year, and ability for onsite service.
4. Availability of Spare Parts: Manufacturers must have worldwide component and system distributorships, with replacement parts available from manufacturer using their regularly available expediting delivery for receipt within 48hours of request.

D. All materials supplied for this project must be new.

1.6 DELIVERY, STORAGE AND HANDLING

A. Equipment must be handled and stored in accordance with manufacturer's instruction, and as required to prevent any damage to system components and electronics. One (1) copy of these instructions must be included with the equipment at time of shipment.

B. Prior to and during construction, provide secure storage onsite for all ESS materials.

C. If stored in areas subjected to weather, cover equipment to provide protection from weather, dirt, dust, corrosive substances, and physical damage.

D. Where systems are intended for use in classified areas, appropriate considerations must be taken in the delivery, storage, and handling of the equipment.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

1. Temperatures:

   a. Annual ambient: **[enter site specific value]** deg C to **[enter site specific value]** deg C
   b. Record low temperature: **[enter site specific value]** deg C
   c. Record high temperature: **[enter site specific value]** deg C

2. Altitude: Derate as required if over **[enter site specific value]** meters above sea level
3. Relative humidity: **[enter site specific value]**
4. **[enter other site-specific conditions such as wind ratings, sand/dust, seismic activity, salt air, fog, marine corrosiveness, etc.]**

1.8 COORDINATION

A. Coordinate layout and installation of ESS with other construction, including conduit, piping, equipment, and adjacent obstructions and surfaces. Maintain required clearances for workspace and equipment access.

B. Coordinate size and locations of anchor-bolt inserts into concrete slabs.

C. Provide system technical coordination for utility interconnection agreements. Provide grid connection as required, and in location as designated by local utility company.

D. Coordinate electrical voltage (V), phase (Ø), and hertz (Hz) characteristics of ESS's output with electrical characteristics of local utility company, and with ESS’s input if bidirectional inverter is used.

1.9 WARRANTIES

A. Provide ESS extended (10) year manufacturer’s warranty (excluding energy storage modules) valid from the date of substantial completion.

B. Energy storage module(s) warranties: Extended (10) year warranty after the date of substantial completion. Battery pack must retain at least **[70 percent] [enter other percent nominal capacity]** of nominal energy capacity for the earlier of either (10) years after commissioning or after a minimum energy throughput of **[insert cumulative throughput]** kWh energy.

1.10 OWNERSHIP OF PROPRIETARY MATERIAL

A. The US Government must retain all rights to software and passwords used for this project.

B. Contractor must provide a copy of the manufacturer's standard software and end-user license agreement (EULA) for review and approval as condition of this contract. Such license must grant use of all programs and application software to the US Government as defined by manufacturer's license agreement but must protect manufacturer's rights to disclosure of Trade Secrets contained within such software. The Contractor must obtain a signed copy of the manufacturer's software and firmware licensing agreement prior to purchase.

C. The licensing agreement must not preclude use of software by individuals under contract to the US Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to the US Government will be restricted to use on the US Government's computers and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation must become the property of the US Government.

1.11 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date, provide 12 months full maintenance by authorized field service vendor with factory-trained certified personnel. Provide system maintenance service with adjusting as required for proper operation based on Original Equipment Manufacturer's (OEM) recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. Provide parts and supplies same as those used in the manufacture and installation of original equipment. In addition to the initial year of maintenance service, provide a proposal for a five-year period with (5) one-year, annually renewable periods, starting from end of initial maintenance period. The option year proposal must be submitted **[120]** days prior to the end of the maintenance contract period.

B. Maintenance service must include preventive maintenance, repair, or replacement of worn or defective components, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks must also align with the manufacturer's recommended checklists as required in Division 01, Section 017825 *Systems Manual and O&M Data*. Provide complete maintenance records inclusive of scheduling to the US Government for inclusion in the Computerized Maintenance Management System (CMMS).

C. The Maintenance Service must include an annual report to US Government verifying that the ESS is performing as intended per the battery storage strategy and manufacturer recommendations. The report must include:

1. Use case performance.
2. Battery outages with root cause summary/failure modes and effects analysis, start and end time periods.
3. Summary of all O&M operations; repair and replacements.
4. Summary of safety incidents, causes and resolutions.
5. Contractor must perform all required maintenance to the ESS and BMS to ensure that the monthly demand reduction is provided.

6. In addition to required demonstration and training in PART 3 of this specification, the Contractor must provide an additional eight (8) hours O&M training session to the US Government O&M personnel prior to the completion of the initial 12 months of maintenance service. Training must comply with PART 3 and cover issues and resolution encountered during the initial 12 months of maintenance service by service maintenance staff and US Government O&M.
7. Perform updates to the battery management system dispatch strategy if required due to rate tariff or major site load profile changes.
8. Ensure that all system firmware is up to date and meets US Government cybersecurity requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Kronus Engineering
2. ESS
3. Fluence
4. LG Energy Solution Vertech
5. Powin
6. Sungrid Solutions
7. Tesla
8. **[other manufacturer]**

B. The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if accepted by the Project Contracting Officer Representative (COR) and Engineer **[(10)]** calendar days prior to bid date. Submit alternate manufacturer for review to allow **[(14)]** calendar days for review with sufficient documentation demonstrating compliance with project requirements.

C. The design drawings must include details, equipment dimensions, and space requirements based on the **[first listed acceptable manufacturer]**. If the Contractor selects a different equipment supplier, some redesign including locations of conduits, terminations, and space clearance may be required. Additional costs incurred for these changes must be borne by the Contractor.

2.2 GENERAL REQUIREMENTS FOR ESS

A. ESS must be listed for the intended use in accordance with OBO-ICS NEC Chapters 1 and 7.

B. ESS must be UL-9540 listed and tested in accordance with UL-9540A.

C. Hazard Mitigation Analysis per OBO-IFC-1207 and NFPA-855 must be conducted, and report provided for OBO Fire review. The hazard mitigation analysis must consider the fire and explosive hazards and risks, failure model and effects analysis and identify mitigation strategies implemented including detailed system operation and requirements.

D. Provide Nameplate, mimic bus, arc flash rating, and System drawing to be located on the doors of containers, equipment, or cabinets.

1. The System must have a **[enter kW rating]** kW-AC rating and **[enter kWh rating]** kWh-AC usable rating.
2. The System AC Voltage must be **[enter system voltage]** volts.

E. Exposed Conduit: All exterior exposed conduits must be galvanized rigid steel (RMC) with threaded fittings.

F. ESS Output: ESS must match local utility company exactly in voltage, phase, and frequency to allow it to be grid-tied in accordance with local utility company's safety and power quality requirements. Coordinate all requirements with local utility company. Refer to Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety" for additional metering requirements.

G. The ESS must contain protective relays, circuit breakers, or fuses which self-protect the ESS in the case of internal electrical faults. Set and adjust circuit protection devices according to a short circuit and coordination study.

H. A visible disconnect will be installed that isolate the ESS from utility interconnection, complying with local utility requirements.

I. Grounding: Contractor must provide grounding system for personnel protection for step and touch potential complying with IEEE-Std-80. The system also must be adequate for the detection and clearing of ground faults within the ESS. The system should be grounded in all anticipated operating modes (e.g., grid-tied, and islanded).

J. The ESS must be capable of grid forming for microgrid islanding applications, complying with all local utility requirements, and compatible with other power generating sources.

K. Seismic Performance: ESS must withstand effects of earthquake motions determined according to ASCE/SEI 7.

1. The term “withstand” means “the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operation after the seismic event.”

2.3 PERFORMANCE REQUIREMENTS

A. Integrate the ESS with the following power generation systems and **[existing]** power distribution system:

1. **[enter kW nameplate capacity]** Photovoltaic system(s)
2. **[enter kW nameplate capacity]** Generator(s)
3. **[enter kW nameplate capacity]** Wind Turbine system(s)
4. **[enter kW nameplate capacity]** Fuel Cell(s)
5. **[enter other power generation]**

B. The ESS must operate for the following scenario(s):

1. Demand control: The ESS must provide grid electricity usage and demand/peak shaving to limit demand (kW) to programmed setting.

    a. **[Anticipated] [Current]** site monthly peak demand is **[insert monthly peak kW demand]**, and average load is **[insert average demand in kW]**. Limit grid demand by **[specify the required demand reduction in kW]**. The ESS must have a method for forecasting the peak load and automatically dispatching the battery or scheduling the charge/discharge in advance.
    b. Time of Use Charge Reduction: Integrate the ESS to discharge during on-peak or mid-peak hours in accordance with the site's rate tariff and the resiliency requirements of the site.
    c. ESS must maintain a round-trip efficiency greater than **[70][90]** percent AC-in to AC-out (confirmable by operation over a single round-trip cycle from 0% state of charge to 100 percent, and back to 0 percent at standard conditions specified by the manufacturer), including thermal losses and auxiliary loads, over 10 years.
    d. Annual ESS savings will be generated by discharging the battery during on-peak periods, as well as during peak billing demand periods.
    e. Grid stability by ramping up and down ESS output in response to utility grid frequency.

2. Grid outage: The ESS must support critical loads in microgrid operation in the event of a grid outage.

    a. Install a microgrid control system and **[modify existing]** electrical distribution and automatic transfer schemes as necessary to provide electricity to the campus upon grid failure. The Contractor must include the creation of a critical power circuit, including re-wiring of the critical loads and installation of critical power switchgear, in the scope of work (SOW).
    b. The ESS must support the critical loads **[as indicated on drawings]**
    c. The ESS must perform anti-islanding sequence and grid forming operation to enable microgrid mode with "black start" capability.
    d. The ESS controller must disconnect load to prevent overload or over discharge and must manage charge/discharge function when utility grid is re-established.
    e. Consider the following site-specific parameters in the system design:

        1) [Specify site-specific operating conditions: provide electric load interval data, required ramp rates for existing generators, additional information on the types of loads to be served and required modes of operation. Provide detail on existing control and monitoring systems.]

2) Configure ESS to provide seamless transition between utility power and microgrid.
3) Optimize system to minimize generator use to conserve fuel.

C. Interval Testing:

1. The ESS must be demonstrated to perform on a recurring basis to ensure the Agency's desired site resilience and energy assurance. This interval testing frequency must occur approximately every twelve (12) months following final acceptance to ensure provision of power to the site in the event of a utility-provided power outage or interruption. This activity requires pre-coordination with the local servicing utility in accordance with the approved interconnection agreement, and that coordination must be led by the Contractor in consultation with the Agency's Facilities Manager (FM).
2. This periodic demonstration must stagger months, seasons, load, time of day, and weather variabilities, but must be conducted at least every twelve (12) months.
3. Periodic testing will be the responsibility of **[Specify entity responsible for O&M]**.
4. In the event of an actual utility power interruption exceeding **[insert specified duration]**, the ESS's performance will satisfy this requested demonstration, thereby resetting the interval to twelve (12) months prior to the next required demonstration.
5. Any deficiencies or anomalies beyond expected design parameters, in an actual event or demonstration event, are to be reported to the Agency within twenty-four (24) hours in writing, with recommended remediation or corrective steps to prevent recurrence.

2.4 ENERGY STORAGE COMPONENTS

A. Energy storage components must consist of **[lithium-ion batteries] [nickel-cadmium batteries] [nickel metal hydride batteries] [flow batteries] [lead-acid] [other battery or electrochemical ESS technology]**.

B. Energy storage systems may be individual cells, and supplied as modules comprised of cells, or as group of modules combined into units. Several units may be combined to make up the full installation. Cells, modules, and units must be fully enclosed in listed assembly for the intended purpose. Individual battery trays and/or racks must not be permitted.

C. Energy storage systems comprised of battery systems must be UL-1973 listed for the intended use.

D. A battery management system must monitor and balance cell voltages, currents, and temperatures within the manufacturer's specification. The battery management system must be part of the ESS component UL listing. The BMS must perform the charging and discharging of the equipment. The BMS must be field programmable via laptop and viewing/editing on a locally hosted web browser. Programming instructions and setpoints must be shared with Agency staff.

E. [The battery management system charge controller must have Maximum Power Point Tracking (MPPT) for DC coupled PV systems.]

F. The cells, modules, units, and installation must be supplied with all required and/or manufacturer recommended accessories.

G. ESS DC voltage must not exceed **[1000Vdc] [1500Vdc] [other DC voltage].**

H. The use of vented batteries must not be permitted.

2.5 POWER CONVERSION SYSTEMS

A. Power Conversion Systems (PCS) must be UL-1741 or UL-1741SA listed for the intended use.

B. PCS output must match local utility company frequency and voltage when grid tied to local utility or in combination with **[generator operation] [microgrid control system]** where applicable.

C. PCS output connections and operation must comply with all local utility company requirements.

D. PCS must have the following electrical characteristics:

1. Efficiency: minimum 95 percent
2. Frequency: 50/60 Hz
3. AC Voltage range: matching utility voltage
4. DC Voltage range: matching energy storage DC voltage
5. THD: < 3 percent
6. Power factor: -1 to +1

E. The PCS must have the following features to operate in the required performance scenario(s):

1. Perform grid-tie and grid-forming operation with “black start” capability and seamless transfer.
2. Bi-directional charge and discharge of the ESS with intelligent controls and interface with battery management system.
3. Complete automatic unattended operation including startup, synchronization, power disconnect, and parallel operation with the utility **[and generators]**. **[Where applicable, the system must also operate in parallel with: [photovoltaic systems,][generators,] [other site power production,][and utility]**.
4. Shutting down without damage when ESS output is outside tolerance parameters of inverter.
5. Automatic anti-islanding in conformance with referenced standards.
6. **[other features]**

2.6 MICROGRID CONTROL SYSTEM (MCS)

A. The MCS may be a separate component or combined with the ESS or inverter. The MCS must be one of the following: be listed, listed individual components assembled as a system, or designed under engineering supervision.

B. The MCS must include an energy management system (EMS), when an additional onsite generating source is present (i.e., solar or generators).

C. The MCS must have the following features to achieve the intended performance scenario(s): **<edit list of features as required for selected scenarios and system technology>**

1. Communicate with the ESS intelligent controls and monitor energy contribution from the **[Photovoltaic system,][generators,][other site power production].**
2. Monitor, log and report the energy consumption load profile.
3. The EMS must balance the power generation inputs, load outputs and signal controls to achieve the intended performance scenarios including grid services (such as peak demand shaving and energy arbitrage) and backup power to meet resiliency requirements.
4. Must autonomously initiate anti-islanding and grid forming sequence with battery power conversion system, generator controllers, or grid-forming inverters to operate in microgrid mode.
5. Have the ability to control the quantity and ratings of generation sources, utility, and output loads as indicated on drawings.
6. Communicate with, and directly control, connected generation sources including PV inverters, generator control panels, and battery converters. The MCS must be capable of coordinating the interaction between multiple power sources of similar or different types, manufacturers and technologies utilizing industry standard communication protocols.
7. Provide local and remote monitoring capability complying with this specification.
8. Be housed within the ESS or in separate enclosure complying with environmental conditions in this specification.
9. Include a programmable onsite interface to adjust the operating modes and threshold values.
10. Have the ability to log and export historical data from each connected generation source.

2.7 HEATING VENTILATION AND AIR CONDITIONING (HVAC)

A. The ESS must include a completely integrated HVAC system designed to always maintain component temperatures including heating, cooling, and relative humidity. Thermal conditioning systems must maintain ambient temperatures and humidity within warranty requirements and manufacturer recommendations.

2.8 ENCLOSURE

A. The ESS and associated equipment must be in a factory assembled climate-controlled enclosure that is rated for the site conditions.

B. The ESS, and associated equipment, must be provided in self-contained NEMA **[3R][4X]** enclosure(s) rated for the site conditions. ESS enclosures must be designed to be installed onto properly prepared pads/foundations.

C. Provide manufacturer **[standard enclosure finish][or][white enclosure finish]**.

D. ESS components and associated ancillary equipment must have working space clearances complying with OBO ICS NEC.

E. Energy storage modules or units must be rack mounted or installed in cabinets, per manufacturer recommendations inside factory enclosure or container. Each module or unit must be arranged to maintain required spacing and materials complying with UL-9540A testing recommendations and OBO Fire Code.

F. Front**[and rear]** access: All serviceable subassemblies must be modular and capable of being replaced from the front**[and rear]** of the cabinet. Side**[or rear]** access for installation, service, repair, or maintenance of the system must not be required.

G. Cable entry: standard cable entry for the ESS must be through the enclosure bottom.

2.9 DATA ACQUISITION AND CONTROL

A. The ESS must include a monitoring and data acquisition system and must include, at a minimum, the following information in 15-minute intervals (unless otherwise noted):

1. Real-time ESS State of charge
2. System mode (charge, discharge, island, grid-tied etc.) and condition (normal, auto, manual, override, etc.)
3. System voltages, current, and power
4. Real-time connected generation source(s) power and connected load power consumption.
5. Enclosure Ambient temperature, hourly average at hourly intervals.
6. Energy and time remaining at current discharge or charge rate
7. Time until full charge at current recharge rate
8. Forecasted charge and discharge profile
9. Round-trip efficiency on daily, weekly, monthly, yearly basis
10. System fire protection and alarm condition
11. Notification when preventive maintenance is needed
12. System alarm and events:

    a. Major: system automatically disconnected due to over/under voltage, overcurrent or over temperature.
    b. Minor: voltage imbalance, voltage sensing error, under-temperature, temperature imbalance, overprotection device activation, communication failure, regular maintenance required (i.e., perform balancing charge sequence)

B. Data must be saved locally for a minimum of **[(30) days][enter number of days]** and backed up off-site with a minimum of **[(36) months][enter number of months]** of data.

C. Data transmission must be transferred to off-site storage via one of the following connections:

1. Cellular connection
2. WAN Internet Connection **[coordinate with site specific conditions]**

D. Remote connection must be for monitoring purposes only. No system or device must require internet connection to function.

E. Local display and control:

1. Local display must provide listed data monitoring in this specification.
2. Local control panel via interface or dedicated server must allow for local control and adjustments of setpoints and threshold values.
3. Local display may be visible without password protection. Local control must be password and user protected.
4. Local display must have touch screen interface.

F. Monitoring by Building Automation System (BAS):

1. The ESS must communicate with an external controller via MODBUS over TCP/IP.
2. The ESS must provide monitoring data and reporting to the BAS. The BAS must not have capability to modify or control the ESS remotely.

G. External remote monitoring using web-based service:

1. All data collected will be available in a web-based interface accessed via an internet connection.
2. The Contractor must ensure that data acquisition and monitoring solution complies with site specific US Government cybersecurity.
3. Access must be provided via secure login ID and password:

   a. There will be no user-based fee to access the data
   b. An unlimited number of users can access the data at the same time

4. The user interface must have the following functionality:

   a. A site summary which provides data on the overall performance of the entire site
   b. Detailed asset views on each individual piece of connected equipment
   c. The ability to create time-data trends for all collected data.

2.10 FIRE PROTECTION AND FIRE ALARM SYSTEMS

A. The ESS must include an integrated fire protection and fire alarm system in accordance with UL-9540A test report and hazard mitigation analysis. Fire protection system must be water-based suppression type system unless approved by the OBO Fire.

B. The system must communicate with the compound Fire Alarm System.

C. Fire Protection System design must consider that ESS will be unattended at most times.

D. Provide visual and audible alarm when a safety hazard exists.

2.11 SOURCE QUALITY CONTROL

A. Factory end of line tests before shipment:

1. Factory test ESS and other system components and accessories manufactured specifically for this Project. Perform tests at rated power and for modes of operations in this specification.
2. All test results must be documented including failed tests.
3. Re-test all failed tests until successful test is achieved.
4. Factory testing must be witnessed by the US Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. US Government representative must perform factory inspection at that time as well.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before ESS installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes, and locations, and electrical to verify actual locations, sizes and other conditions affecting performance, maintenance, and operations.

1. Final ESS locations indicated on Drawings are approximate. Determine exact locations before roughing-in for electrical connections.

B. Provide required clearances and clear installation area of flammable vegetation. Maintain adequate setback to other structures, vegetation, and other flammable materials.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. The ESS must be provided with foundations and structures that are designed by or under the supervision of a qualified registered engineer. All design must be in accordance with local project area seismic design requirements and as specified in the specifications for this project.

B. Install equipment in accordance with manufacturer's installation instructions and recommendations.

C. ESS location must be above the **[insert year]** flood plain and surge levels and must be elevated higher than any pull vaults and conduit not sloped toward any ESS electrical component to prevent equipment flooding. ESS must be located within a thermally conditioned enclosure.

3.3 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section **[260518 "Low-Voltage Electrical Power Conductors and Cables."][Division 26 Section on MV conductor and cables.]**

C. Tighten bus joints, electrical connectors, and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL-486A and UL-486B. Make a permanent mark on all joints, connectors, and terminals after they have been torqued to the proper value.

3.4 IDENTIFICATION

A. ESS signs must be clearly printed in English and in local language.

B. Identify components according to Division 26 Section on Identification for Electrical Systems and include the following:

1. Identification IAW OBO Electrical Code and OBO Fire Code referenced sections.
2. ESS electrical equipment and components must have clearly/visible markings that identify the manufacturer, size, type, rated input and output voltages, hazard warnings, frequency, number of phases (AC only), rating in kW or kVA, available fault current at ESS output terminals, maximum output and input current at terminals, maximum output and input voltage at terminals, and utility interactive capability.
3. Posted single line drawing (SLD), mimic bus, and instructions for tasks that site staff may need to perform, such as system shutdown during an emergency.
4. Clearly label all disconnects, indicating whether in the open (OFF) or closed (ON) position, the operating system voltage, available fault current, current, and system rating.
5. ESS disconnecting means must indicate whether ON or OFF and be marked “ENERGY STORAGE SYSTEM DISCONNECT.” Disconnecting means must also be clearly marked to indicate: (1) Nominal ESS voltage, (2) Available fault current, (3) Arc-flash label, (4) Date calculation performed.
6. Arc flash labels, per NFPA-70E.
7. Identification and location of each power source on a permanent plaque or directory. The plaque or directory must indicate the location of each power source disconnecting means and be grouped with other plaques or directories for other power sources.

C. Equipment markings must be permanent and must withstand the environmental conditions in which the equipment is installed. Provide “UV rated” for outdoor labels, or on an embossed steel placard, designed for outdoor use and fastened with adhesive and rivets.

D. Markings must be visible or easily accessible during and after installation. The Contractor must be responsible for all field-applied markings as required by local, state, and federal codes.

3.5 FIELD QUALITY CONTROL AND STARTUP

A. Provide the services of a qualified and certified factory-trained manufacturer’s representative for startup of the equipment specified under this section. The manufacturer’s representative must provide technical assistance to the contractor in general installation of the equipment, connections and adjustments, and testing of the assembly and components contained therein.

B. The manufacturer’s representative must provide inspection of the final installation, perform functional testing, and startup the ESS.

C. Startup acceptance test must be witnessed by the US Government representative. Provide notification to Project Director/COR within 30 calendar days of scheduled test. Contractor must be prepared at any time during this process to provide access to all portions of installation and must remedy any portion of system that is not in compliance with this specification, which does not perform to manufacturer's operating specifications, or that fails to operate due to poor workmanship.

D. Ensure there is written permission from local utility company for interconnection of the ESS with the utility grid. Local utility company may require that representative of the local utility be onsite during initial interconnection; Contractor must accommodate this requirement, if stated by utility.

E. Functional Testing must include the following, in addition to all tests required by manufacturer:

1. Pre-startup inspection of the ESS system.
2. Test in accordance with the approved operating scenarios.
3. Verify and test system alarms.
4. Test ESS with all power generating sources and loads as applicable.

F. Provide photo record of installation and major components, including ESS, MCS, and all display screens. Include photos showing connections within all installed enclosures. Provide electronic copies of photo record on compact disc and hard copy of the photo record (with labels for each photo) in Operation and Maintenance Manual identified in Article on SUBMITTALS.

3.6 COMMISSIONING

A. Third Party Commissioning Agent: Engage electrically qualified and factory approved third-party certified commissioning agent to inspect, field test, and document performance of components and equipment after installation. Commissioning agent must prepare written test results in report.

B. All test instruments must be identified in Report and listed by manufacturer, model number, serial number, date of calibration, and calibration authority. All test instruments must have been calibrated within past year. Test instruments must have attached calibration sticker that is traceable to NIST.

C. Contractor must obtain written commissioning procedures document. Procedure entries must include date; time; person taking data; recorded value of data; indication if recorded value is out of range of system and/or equipment tolerance. Each page of the procedures must have test name; equipment tested; location; date; time; person performing test; model number of equipment; serial number of equipment; manufacturer; tolerance ranges of equipment tested for reference.

D. Commissioning Agent must keep Commissioning Issues Log and include it as appendix to Report. Log must include, but not be limited to issue description; log tracking number; date; time; person investing issue; action taken; person acting; date of closure of issue. Include copy of Commissioning Issues Log in written procedures to Contractor.

E. Perform the following field tests and inspections, in addition to manufacturer recommended tests and inspections, as follows for test report:

1. Test insulation resistance and continuity for each DC circuits, AC feeders, grounding including ground fault protection, and control circuits. Disconnect all sensitive electronic equipment prior to testing. Visually and physically inspect all cabling, connections, and conduits. Verify color coding of conductors per OBO Electrical Code. Verify proper torque of termination connections with calibrated torque wrench.
2. Test ground fault protection of ESS (where required).
3. State of Health verification via coulomb counting.
4. Test proper operation of ESS for all operating scenarios. Set output voltage, as necessary. Verify that all local utility notifications and requirements have been incorporated.
5. Verify operation of all disconnect switches and proper sizing of all overcurrent protection devices (OCPD) in accordance with Division 26 Sections on enclosed switches and circuit breakers and on panelboards.
6. Verify that displays accurately represent output of ESS.
7. Power feedback controller: Monitor the utility power factor with the ESS functioning and with it disconnected. Identify the observed power factor. Verify the system modulates this power factor to not adversely affect utility billing.
8. Verify that remote data logging access has been established and is functioning. Provide all necessary data, IP addresses, login-ins, and passwords to post.

F. Contractor must remove and replace malfunctioning equipment. Retest ESS system as specified above.

3.7 DEMONSTRATION AND TRAINING

A. Comply with Division 01, Section 017905 *Demonstration and Training* for general requirements of demonstration and training documentation.

B. The manufacturer's representative must provide 'hands-on' training course for the US Government O&M personnel.

1. Schedule as follows:

   a. Two (2) eight (8) hour training sessions equally divided into in-class training and in the field training, for a total of sixteen (16) hours.
   b. Training must be completed within two (2) calendar weeks

2. Training must cover the following topics:

   a. Overall system description and theory of operation.
   b. Local displays and control interfaces.
   c. Operating scenarios.
   d. Automatic operation.
   e. Manual operation.
   f. Protective relaying.
   g. Recommended system checklists and log sheets.
   h. Recommended preventive maintenance and instructions to be performed by qualified staff.

i. Instruction on the operation of the assembly, and major components within the assembly.
j. Instruction on operation or maintenance that must be completed by factory authorized representative to maintain warranty and proper operation.
k. Fire protection and fire alarm system operation and procedures for the safe operation and actions during fire event or alarm.
l. Interactions with other systems.
m. Overview of relevant storage chemistry, internal thermal management system, and required ambient housing conditions to maintain required operating temperature range.
n. Identification of emergency disconnects.
o. Fire suppression system maintenance – pump and distribution system maintenance for dry standpipe systems.
p. Instruction on balancing cycle and state of charge tests to gauge state of health
q. Hazards and failure modes, including thermal runaway, off gassing, and stranded energy.
r. Mitigation / response measures for electrolyte releases, overheated batteries and fires.
s. Instruction in liquid-cooled system maintenance, including pump and coolant inspection, leak detection, visual inspection, and verification of pressure and gauge accuracy.
t. Power conversion system inspection and calibration.

C. The Contractor and Manufacturer's representative must coordinate with local fire marshals on ESS setback requirements, first responder training, and posted instructions for shutoffs:

1. The Contractor must provide training to local firefighters covering ESS operation and how to shut it down in an emergency event and form a fire suppression plan. Training must cover the main risks of storage systems, including electric shock, thermal runaway, battery reignition, and stranded energy. Training must include fire suppression tactics, including minimum water and time requirements, thermal imaging camera, vehicle tilt / lift, and battery box piercing, as well as extrication and transport.
2. The Contractor must coordinate with the fire marshal to determine where to post the permanent instructions and required markings.

D. The Contractor must provide a minimum four (4) hour online training to US Government O&M personnel, Government IT personnel, and OBO representative of the remote monitoring systems via online web services tools. The training must be recorded and remain available for ongoing access to training. The training must include:

1. Login credentials and request for additional users
2. Menu options and available information
3. Review of graphical displays, data, and components
4. Interpretation of presented data
5. Optional displays and updates

END OF SECTION 263313.13

SECTION 263354 – UNINTERRUPTIBLE POWER SUPPLY (UPS) FOR TELECOMMUNICATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. This specification describes operation and functionality of continuous-duty Uninterruptible Power System (UPS) used in in Telecommunications equipment spaces, and other incidental components to support a fully operational telecommunication system.

B. The Joint Unclassified Computer Room (JUCR) UPS shall utilize rack-mounted redundant, scalable array architecture, with hot-swappable/user-replaceable power modules. Major subcomponents include:

1. Input Power Converter.
2. Output Inverter.
3. Static Bypass Switch.
4. Maintenance Bypass Panel (MBP).
5. Power Distribution Unit (PDU).
6. Extended runtime cabinet.
7. Battery system.
8. Displays and Controls.

C. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety” for facility voltages.
2. Section 260573 “Overcurrent Protective Device Study.”
3. Section 270508 “Common Work Result for Telecommunications.”
4. Section 270526 “Grounding and Bonding for Communications Systems” for grounding bus bars and ground conductors.
5. Section 271116 "Communications Cabinets and Frames."

1.2 DEFINITIONS

A. “Joint Unclassified”: “Unclassified” in this context refers to the fact that “classified” systems are not permitted in the JUCR. While systems handling “Sensitive But Unclassified (SBU)” content is permitted in the JUCR, content that is SBU/NOFORN is also not permitted.

B. EMI: Electromagnetic interference.

C. LCD: Liquid-crystal display.

D. LED: Light-emitting diode.

E. THD: Total harmonic distortion.

F. UPS: Uninterruptible power supply.

1.3 STANDARDS

A. EMC Directive 89/336/EEC.

B. EMC Directive 73/23EEC.

C. EN/IEC 62040-1-1, EN/IEC/UL60950-1, UL 1778, UL1973.

D. EN 50091-2 / IEC 62040-2 (class A), FCC15A.

E. EN/IEC62040-3 (VFI-SS-111).

F. IEC 62040-2 / EN/IEC 61000-4:

1. 2 level 3.
2. 3 level 2.
3. 4 level 2.
4. Manufacturer-defined as 5 Level 3 in accordance with referenced standard.

1.4 SUBMITTALS

A. Product Data: Include data on features, components, ratings, and performance for each UPS component indicated.

B. Shop Drawings: Include partial enlarged floor plan to show access, workspace, clearance, and cable layout. Include enlarged equipment elevations at racks where UPS is located. Detail assemblies of equipment indicating dimensions, weights, components, and location and identification of each field connection. Show access, workspace, and clearance requirements; details of control panels; and battery arrangement.

1. Wiring Diagrams: Power, signal, and control wiring.

C. [Manufacturer Seismic Qualification Certification: Submit certification that UPS equipment will withstand seismic forces defined in Division 26 Section on vibration and seismic controls for electrical systems when anchored to concrete base. Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. Term "withstand" means "unit will remain in place without separation of any parts from device when subjected to seismic forces specified and unit will be fully operational after seismic event."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.]

D. Qualification Data: For Installer, power quality specialist, manufacturer and testing agency.

E. Manufacturer Certificates: For each product, signed by manufacturers.

F. Factory Test Reports: Demonstrating compliance with specified requirements.

G. Field Quality-Control and Performance Test Reports: Indicate test results compared with specified performance requirements and provide justification and resolution of differences if values do not agree.

H. Operation and Maintenance Data: For UPS units to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Systems Manual and O&M Data," include the following:

1. Lists of spare parts and replacement components recommended being stored at Project site for ready access.
2. Detailed operating instructions covering operation under both normal and abnormal conditions.

I. Warranties: Special warranties specified in this Section.

1. Special Installer Extended Warranty: Installer warrants that fabricated and installed UPS system performs in accordance with specified requirements and agrees to repair or replace components or products that fail to perform as specified within extended-warranty period.

   a. Extended-Warranty Period: **[Two]** years from date of Substantial Completion; full coverage for labor, materials, and equipment.

2. Special Manufacturer Extended Warranty: Manufacturer warrants that UPS system performs in accordance with specified requirements and agrees to provide repair or replacement of components or products that fail to perform as specified within extended-warranty period.

   a. Extended-Warranty Period: **[Two]** years from date of Substantial Completion; prorated coverage for labor, materials, and equipment.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who is authorized representative of UPS manufacturer for both installation and maintenance of units required for this project.

B. Manufacturer Qualifications: A firm who maintains service center capable of providing training, parts, and emergency maintenance and repairs for equipment at Project site, with 48 hours' maximum response time.

C. Source Limitations: Obtain UPS and associated components specified in this Section from single manufacturer with responsibility for entire UPS installation.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver equipment in fully enclosed vehicles after specified environmental conditions have been permanently established in spaces where equipment is to be placed.

B. Store equipment in spaces with environments controlled within manufacturers' ambient temperature and humidity tolerances for non-operating equipment.

C. Storage of UPS is limited to six months prior to final commissioning.

D. On-site and identified with labels describing contents.

1.7 WARRANTY

A. Warranties, General: Special warranties specified in this Article shall not deprive Government of other rights Government may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Special Battery Warranties: Written warranty, signed by manufacturer and Installer agreeing to replace UPS system storage batteries that fail in materials or workmanship within specified warranty period.

1. Warranted Cycle Life for Premium Sealed Lead-Acid Batteries: Equal or greater than that represented in manufacturer's published table, including figures corresponding to the values in Table 1.8, “Warranted Battery Cycle Life,” based on annual average battery temperature of 25 deg C:

TABLE 1.8
WARRANTED BATTERY CYCLE LIFE

Discharge Rate	Discharge Duration	Discharge End Voltage	Cycle Life
8 hours	8 hours	1.67	40 cycles
30 minutes	30 minutes	1.67	125 cycles
15 minutes	1 minute	1.67	750 cycles

C. Special UPS Warranties: Written warranties, signed by manufacturer and Installer agreeing to replace components that fail in materials or workmanship within special warranty period.

1. Special Warranty Period: Two years from date of Substantial Completion.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: One for every 10 of each type and rating, but not less than one of each.
2. Cabinet Ventilation Filters (if so equipped): One complete set.
3. One spare Power Module.
4. One spare Intelligence Module.

1.9 MAINTENANCE SERVICE

A. Commencing at the contract’s Substantial Completion date for a period of one calendar year provide system maintenance service based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. In addition to the initial year of maintenance service, provide a proposal for a renewable option year. The option year proposal shall be submitted 60 days prior to the end of the initial maintenance contract period.

B. The intent is to provide full maintenance service, including cooling system maintenance, load testing, firmware and software updates, cleaning, visual inspection, and environmental monitoring.

C. Maintenance service shall include preventive maintenance, repair or replacement of worn or defective components, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks shall also align with the manufacturer's recommended checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 JUCR UPS SYSTEM REQUIREMENTS AND CHARACTERISTICS

A. Coordinated System Performance: JUCR UPS and associated equipment shall operate in conjunction with primary power supply and output distribution system to provide quality uninterrupted power for mission critical, electronic equipment load.

B. Power Characteristics: **[380 or 400 volt, 50 Hz]**.

C. Project-Specific Design: Refer to Drawings and coordinate with the following:

1. Project-specific voltage and frequency utilized.
2. Rack layout.
3. UPS size and special accessories.
4. Circuit breaker sizes.
5. Cable lengths.

D. UPS Capacity: Size for 3.5 kW per cabinet for number of cabinets indicated on Drawings.

E. UPS Battery Capacity: Size to support continued operation of equipment on cabinet for **[30][60]** minutes.

F. Short Circuit Withstand Rating: Coordinate with analysis for Section 260573 “Overcurrent Protective Device Study” and with Drawings; minimum permissible rating is 30kA Symmetrical minimum with gL/gG fuse in front of system.

G. System Configuration: System shall be rated for full kW output in the following frame sizes:

1. Total scalable kVA/kW shall be based on design indicated on Drawings, and shall be configured using power modules in accordance with manufacturer’s standard system.

   a. Provide **[N+1]** Redundancy units.

2. Each scalable size varies by manufacturer, but scalable size shall not exceed **[16kVA/16kW]** power module shall contain a full-rated input rectifier and boost converter (Input Converter), full rated output inverter, and battery charging circuit.
3. System shall include the following module types which shall operate in parallel:

   a. User-replaceable continuous duty hot swappable bypass static switch modules.
   b. Hot-swappable/user-replaceable battery modules.
   c. Redundant control modules.

H. Housing: House system components in standard 600mm wide, 1070mm deep, 2000mm high equipment rack; see Section 271116 “Communications Cabinets and Frames.”

I. System Input:

1. AC Input Nominal Voltage: Site Distribution Voltage, with L1,L2,L3,N, and ground.
2. AC Input Voltage Window: 340 - 477 at 100 percent load and 200 - 477 at 50 percent load
3. Maximum Frequency Range: 40-70Hz (autosensing).
4. Input Power Factor: Greater than 0.99 at load greater than 25.
5. Input Current Distortion with no additional filters: Less than 5 percent at 100 percent load.
6. Soft-Start: Shall be linear from 0-100 percent input current and shall not exhibit inrush. Soft-start shall take place over 10 seconds time period.

J. Battery Characteristics:

1. Nominal Battery voltage: Plus/minus 192Vdc (2×96 cells at 2V)
2. Float voltage: Plus/minus 218Vdc (2×96 cells at 2.27V)
3. End of discharge voltage (full load): Plus/minus 154Vdc (2×96 cells at 1.6V)
4. End of discharge voltage (no load): Plus/minus 168Vdc (2×96 cells at 1.75V)

K. Battery Charging Characteristics:

1. 10 percent of output power at low input voltage and 100 percent load.
2. 20 percent of output power at nominal voltage and 100 percent load (optional).

L. UPS Output:

1. AC Output Nominal Output: Site Distribution Voltage, with L1, L2, L3, N, and ground.
2. Output frequency regulation: Synchronize frequency to bypass input when available over standard range of 47 to 53 Hz. Optional plus/minus 0.1 Hz and plus/minus 10 Hz setting from front panel. When no bypass input is present, output frequency shall be 50 Hz.
3. AC Output Voltage Regulation: Plus/minus 1percent for 100 percent linear load, plus/minus 3 percent for 100 percent non-linear load.
4. Voltage Transient Response: Plus/minus 5 percent maximum for 100 percent load step.
5. Voltage Transient Recovery within less than 50 milliseconds.
6. Output Voltage Harmonic Distortion:

    a. Less than 2 percent THD maximum for 100 percent linear load.
    b. Less than 5 percent THD maximum for 100 percent non-linear load as defined by EN50091-3/IEC 62040-3.

7. Overload Rating:

    a. Normal and battery Operation:

        1) 150 percent for 60 seconds in normal and battery operation.
        2) 125 for 10 minutes in normal and battery operation.

    b. Bypass Operation:

1) 125 percent continuous.
2) 1000 percent for 100 milliseconds.

8. System AC-AC Efficiency: Greater than 95 percent at 35–100 percent load.
9. Output Power Factor Rating: For loads exhibiting a power factor of 0.5 leading to 0.5 lagging no derating of the UPS shall be required.

M. Audible Noise Limitations: Nominal max at 1 meter from surface of unit.

1. Lesser than 57dBA at greater than 70 percent load.
2. Lesser than 63dBA at 100 percent load.

N. Altitude Adjustments: Maximum installation with no derating of the UPS output shall be 1000m above sea level.

1. 1500 m: 95 percent load.
2. 2000 m: 91 percent load.
3. 2500 m: 86 percent load.
4. 3000 m: 82 percent load.

2.2 MANUFACTURERS

A. Availability of Service Personnel: Manufacturers shall have worldwide service organization, with factory-trained service personnel available within 5000 kilometers to be able to provide support 24 hours a day, 7 days a week, 365 days a year.

B. Availability of Spare Parts: Manufacturers shall have worldwide component and system distributorships, with replacement parts available from manufacturer using their regularly available expediting delivery for receipt within 24 hours of request.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. APC Symmetra PX UPS
2. Chloride UPS
3. Eaton UPS

2.3 MODES OF OPERATION

A. Normal: Input converter and output inverter shall operate in on-line manner to continuously regulate power to critical load. Input and output converters shall be capable of full battery recharge while simultaneously providing regulated power to load for all line and load conditions within range of UPS specifications.

B. Battery: Upon failure of AC input source, critical load shall continue being supplied by output inverter, which shall derive its power from battery system. There shall be no interruption in power to critical load during both transfers to battery operation and retransfers from battery to normal operation.

C. Recharge: Upon restoration of AC input source, input converter and output inverter shall simultaneously recharge battery and provide regulated power to critical load.

D. Static Bypass: Static bypass shall be used to provide transfer of critical load from Inverter output to bypass source. This transfer, along with its retransfer, shall take place with no power interruption to critical load. In event of emergency, this transfer shall be automatic function.

E. Maintenance Bypass: Equip system with Maintenance Bypass Panel (MBP) used to electrically isolate UPS and supply load directly from mains supply, if UPS system has to undergo maintenance or service.

2.4 INPUT POWER CONVERTER

A. House converters within parallel connected, removable power modules. Converters shall constantly control power imported from mains input of system to provide necessary UPS power for precise regulation of DC bus voltage, battery charging, and Main Inverter regulated output power.

B. Input Current Total Harmonic Distortion: Hold input current THDI to 5 percent or less at full system, while providing conditioned power to critical load bus, and charging batteries under steady-state operating conditions. This shall be true while supporting loads of both linear or non-linear type, and shall be accomplished with no additional filters, magnetic devices, or other components.

C. Soft-Start Operation: UPS shall contain soft-start functionality, capable of limiting input current from 0-100 percent of nominal input over default 10 seconds period, when returning to AC utility source from battery operation. Change in current over change in time shall take place in linear manner throughout entire operation (di/dt= constant).

D. Magnetization Inrush Current: UPS shall exhibit 0 inrush current.

E. Input Current Limit:

1. Input converter shall control and limit input current draw from utility to 135 percent of UPS output. During conditions where input current limit is active, UPS shall be able to support 100 percent load, charge batteries, and provide voltage regulation.
2. In cases where source voltage to UPS is nominal and applied UPS load is equal to or less than 100 percent of UPS capacity, input current shall not exceed 110 percent of UPS output current while charging batteries.

F. Charging:

1. Battery charging circuit shall contain temperature compensation circuit which shall regulate battery charging to optimize battery life.
2. Battery charging circuit shall remain active when in requested Static Bypass and in Normal Operation.
3. Back-feed Protection: Use logic controlled contactor to provide back-feed protection.

2.5 BATTERY

A. Modular construction made up of user replaceable, hot swappable, fused, battery modules. Each battery module shall be monitored for voltage and temperature for use by UPS battery diagnostic, and temperature compensated charger circuitry.

B. Battery block housed within each removable battery module shall be of **[Valve Regulated Lead Acid (VRLA)][Lithium-ion]**.

C. UPS shall incorporate battery management system to continuously monitor health of each removable battery module. This system shall notify user in event that failed or weak battery module is found.

D. Battery management system shall monitor at the cell level to manage voltage for Lithium-ion batteries.

2.6 OUTPUT INVERTER

A. The UPS output inverter shall constantly recreate UPS output voltage waveform by converting DC bus voltage to AC voltage through set of IGBT driven bi-directional power converters. In both normal operation and battery operation, output inverters shall create an output voltage independent of mains input voltage. Input voltage anomalies such as brown-outs, spikes, surges, sags, and outages shall not affect amplitude or sinusoidal nature of recreated output voltage sine wave of output inverters.

B. Overload Capability: Steady-state overload conditions of up to 150 percent of system capacity shall be sustained by inverter for 60 seconds in normal and battery operation. Should overloads persist past outlined time limitation, critical load shall be switched to automatic static bypass output of UPS.

C. Output Contactor: Provide output inverter with output mechanical contactor to provide physical isolation of inverter from critical bus. With this feature, failed inverter shall be removed from critical bus.

D. Battery Protection: Provide inverter with monitoring and control circuits to limit level of discharge on battery system.

E. Redundancy: Configure UPS with redundant output inverters, each with semiconductor fusing, and logic controlled contactors to remove failed component from critical bus.

2.7 STATIC BYPASS

A. As part of UPS, provide system static bypass switch. System static bypass shall provide no break transfer of critical load from inverter output to static bypass input source during times when maintenance is required or when inverter cannot support critical bus (such times may be due to prolonged or severe overloads, or UPS failure). UPS and static bypass switch shall constantly monitor auxiliary contacts of their respective circuit breakers, as well as bypass source voltage, and inhibit potentially unsuccessful transfers to static bypass from taking place.

B. Static switch power path shall consist of Silicon Controlled Rectifiers (SCR) with continuous duty rating of 125 percent of UPS output rating.

C. Automatic Transfers: Automatic transfer of load to static bypass shall take place whenever load on critical bus exceeds overload rating of UPS. Automatic transfers of critical load from static bypass back to normal operation shall take place when overload condition is removed from critical bus output of system. Automatic transfers of load to static bypass shall also take place if for any reason UPS cannot support critical bus.

D. Manual Transfers: Manually initiated transfers to and from static bypass shall be initiated through UPS display interface.

E. Overloads: Static bypass shall be rated and capable of handling overloads equal to or less than 125 percent of rated system output continuously. For instantaneous overloads caused by inrush current from magnetic devices or short circuit conditions, static bypass shall be capable of sustaining overloads of 1000 percent of system capacity for periods of up to 100 milliseconds.

F. Static bypass switch shall be of modular design and hot swappable.

G. System Protection: Incorporate back-feed protection in static bypass circuit. To achieve back-feed protection, mechanical contactor in series with bypass SCR(s) shall be controlled by UPS/static switch to open immediately upon sensing condition where back-feeding of static switch by any source connected to critical output bus of the system is occurring.

2.8 DISPLAY AND CONTROLS

A. Control Logic: Control UPS by two fully redundant, user-replaceable/ hot-swappable control modules. These modules shall have separate, optically isolated, communication paths to power and static switch modules. Derive logic power for control modules from redundant power supplies, each having separate AC and DC input and output. Communication of control modules shall be of Controller Area Network (CAN Bus).

B. Display Unit: Locate microprocessor controlled display unit on hinged door in front of system. Display shall consist of alphanumeric display with backlight, four LEDs for quick status overview, and keypad consisting of pushbutton switches.

C. Metered Data: The following metered data shall be available on alphanumeric display:

1. Year, Month, Day, Hour, Minute, Second of occurring events
2. Source Input Voltage
3. Output AC voltage
4. Output AC current
5. Input Frequency
6. Battery voltage

D. Event log: Display unit shall allow user to display time and date stamped log of most recent status and alarm events.

E. Alarms: Display unit shall allow user to display log of all active alarms. Provide the following minimum set of alarm conditions:

1. Input Frequency outside configured range
2. AC adequate for UPS but not for Bypass
3. Low/No AC input, startup on battery
4. Intelligence Module inserted
5. Intelligence Module removed
6. Redundant Intelligence Module inserted
7. Redundant Intelligence Module removed
8. Number of Batteries changed since last ON
9. Number of Power Modules changed since last ON
10. Number of Batteries increased
11. Number of Batteries decreased
12. Number of Power Modules increased
13. Number of Power Modules decreased
14. Number of External Battery Cabinets increased
15. Number of External Battery Cabinets decreased
16. Redundancy Restored
17. Need Battery Replacement
18. The Redundant Intelligence Module is in control
19. On Battery
20. Shutdown or unable to transfer to battery due to overload
21. Load Shutdown from Bypass. Input Frequency Volts outside limits
22. Fault, Internal Temp exceeded system normal limits
23. Input Circuit Breaker Open
24. System level fan failed
25. Bad Battery Module
26. Bad Power Module
27. Intelligence Module is installed and failed
28. Redundant Intelligence Module is installed and failed
29. Redundancy has been lost
30. Redundancy is below alarm threshold
31. Runtime is below alarm threshold
32. Load is above alarm threshold
33. Load is no longer above alarm threshold
34. Minimum Runtime restored

35. Bypass is not in range (either frequency or voltage)
36. Backfeed contactor stuck in OFF position
37. Backfeed contactor stuck in ON position
38. UPS in Bypass due to Internal Fault
39. UPS in Bypass due to overload
40. System in Forced Bypass
41. Fault, Bypass Relay Malfunction
42. High DC Warning
43. High DC Shutdown
44. Low Battery Shutdown
45. Low Battery Warning

F. Controls: Accomplish the following controls or programming functions by use of display unit. Pushbutton membrane switches shall facilitate these operations.

1. Silence audible Alarm
2. Display or set the date and time
3. Enable or disable the automatic restart feature
4. Transfer critical load to and from static bypass
5. Test battery condition on demand
6. Set intervals for automatic battery tests
7. Adjust set points for different alarms
8. Program the parameters for remote shutdown.

G. Potential Free (Dry) Contacts: Provide the following potential free contacts on relay interface board:

1. Normal Operation
2. Battery Operation
3. Bypass Operation
4. Common Fault
5. Low Battery
6. UPS Off

H. Communication Interface Board: Board shall provide the following communication ports which can be used simultaneously:

1. RS232 Serial Port #1

2.9 MAINTENANCE BYPASS PANEL (MBP)

A. Maintenance bypass panel, housed within same UPS cabinet, shall enable UPS system to be transferred to maintenance bypass mode and to be isolated for essential maintenance. Maintenance bypass panel shall contain protection of all UPS/external static-switch feeder and outgoing busbars and all necessary ACB/isolating switch interlocking to allow fail-safe start-up, shutdown and transfer to maintenance bypass.

2.10 POWER DISTRIBUTION UNIT (PDU)

A. General:

1. House 100A rated Modular Power Distribution Unit within UPS frame.
2. Provide PDU with 18 pole positions available for installation of modular output distribution breakers. Provide feeds to server racks with single or three pole 16A or 32A circuit breakers. Channel power to cabinets from PDU via overhead power feeds exiting through top of PDU. Feeds shall lay across top of cabinets via overhead troughing system. These troughs shall sit on top of cabinets and shall be of tool-less installation. Provide PDU with branch circuit monitoring that links to management system interface.

B. Electrical:

1. House PDU functionality within same frame as UPS, with both in standard 600mm IT equipment rack.
2. Provide PDU with at least one 3-phase distribution panel. Feed panel by output of 3-phase Symmetra modular UPS system. Panel shall be rated for Site Distribution Voltage, L1, L2, L3, N, PE. Populate PDU with standard modular distribution breakers either as 1p (18) or 3p (6), or with RCD breakers either as 1p (9) or 3p (3).
3. Input and Output distribution for panel shall be from top, with power cables provided by UPS vendor connecting distribution breakers identified elsewhere in this Article to equipment rack. Provide each cable with IEC-309 plug that connects to rack PDU (outlet strip). Length of power cable shall be related to layout of IT room equipment racks.

2.11 BATTERY DISCONNECT BREAKER

A. Provide each UPS sized for system (e.g., 250A 500Vdc-rated) thermal-magnetic trip molded-case circuit breaker. Equip each circuit breaker with shunt trip mechanism and 1A/1B auxiliary contacts (1 AUX contact for the internal DC circuit breaker). Locate circuit breakers within UPS enclosure or as part of line-up-and-match type battery cabinet.

2.12 MAINTENACE BYPASS

A. Maintenance bypass shall provide power to critical load bus from bypass source during times when maintenance or service of UPS is required.

B. Provide sized for system in front of Mains input. For dual mains, provide 80A gL fuse on bypass input.

2.13 SOFTWARE AND CONNECTIVITY

A. Network Adaptor: Ethernet Web/SNMP Adaptor shall allow one or more network management systems (NMS) to monitor and manage UPS in TCP/IP network environments. Provide management information base (MIB) in DOS and UNIX "tar" formats.

B. Unattended Shutdown

1. UPS, in conjunction with network adaptor, shall be capable of simply, quickly, and reliably shutting down one or more operating systems.
2. UPS shall also be capable of using an RS232 port to communicate by means of serial communications to gracefully shut down one or more operating systems during an on battery situation.

2.14 REMOTE UPS MONITORING

A. Provide the following three methods of remote UPS monitoring:

1. Web Monitoring: Remote monitoring via web browser such as Internet Explorer.
2. RS232 Monitoring: Remote UPS monitoring via either RS232 or contact closure signals from UPS.
3. Simple Network Management Protocol (SNMP): Remote UPS Monitoring through standard MIB II compliant platform.

2.15 SOFTWARE COMPATIBILITY

A. UPS manufacturer shall provide software to facilitate simple, quick, and reliable attended and unattended shutdown and remote monitoring for the latest Microsoft Office version currently in use by Department of State. Verify with the Project Director/COR.

2.16 RACK-MOUNTED UNINTERRUPTIBLE POWER SUPPLIES AND BATTERY EXTENDERS (UPS)

A. Install UPS in every Contractor-furnished telecom cabinet and each section of a colocation cabinet except for the voice cabinets. Reserve 8 Rack Units in each voice cabinet in each telecom room for GFGI UPS; see Section 271116 “Communications Cabinets and Frames.”

1. Rack-mounted Smart UPS by American Power Conversion Corp. (APC). No substitutions are permitted. Rack Mounted Uninterruptable Power Supplies: Provide UPS units and accessories in the following configurations. Maximum power load for one UPS shall be half of the total rack load. Provide dedicated power strip for UPS.

B. APC UPS units for Telecom Cabinets:

1. Applicable to classified (See J.3.5) and unclassified networks to include, but not limited to (OpenNet, Spare 1 and Spare 2, RNER). Mount at bottom of each cabinet and in each section of colocation cabinet.
2. Provide 15 minutes of runtime capacity in telecommunications cabinets at **[xx]** watts per switch.
3. Calculate total UPS output required based upon manufacturer product data and use battery module(s) to extend runtime.
4. Provide one network card per UPS of this type.
5. Relay I/O Module: AP9610; provide for each UPS.
6. Rackmount Rails: APC 4-Post.
7. Rackmount Powerstrip.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install UPS components in accordance with manufacturer's instructions.

B. Provide one (1) dedicated 50A, 208Y/120V, 3-phase branch circuit from the JUCR electrical panel to a J-box mounted above the Owner Furnished Owner Installed (OFOI) Voice cabinet. The circuit shall include conductors rated for continuous duty and sized in accordance with OBO standards and adopted NFPA 70 modifications, including any applicable derating. The government (Diplomatic Technology (DT)) shall furnish and install the appropriate cord/cable and conduit from the OFOI voice UPS input to the J-box, including all final terminations**.**

C. Provide low-voltage control cabling (with a 4.5m / 15-foot service loop) from the Emergency Power Off (EPO) in the JUCR to a dedicated J-box above the OFOI voice cabinet. Terminate the cable on the EPO. The cabling shall meet the type and rating required for a UPS EPO input. DT shall connect the OFOI voice UPS to the EPO via the provided cabling. All work shall comply with manufacturer requirements, OBO standards, adopted NFPA 70 modifications, and shall be subject to inspection by the government.

3.2 FACTORY-ASSISTED START-UP FOR JUCR UPS

A. Factory trained service personnel shall perform inspections and test procedures identified in this Article, and on-site training required in this Section. Perform each visual and mechanical inspection and electrical test identified in NETA ATS. Certify compliance with test parameters.

B. Contractor shall perform start-up work in accordance with applicable construction security requirements identified in Division 01 Sections.

C. Visual Inspection:

1. Inspect equipment for signs of damage.
2. Verify installation in accordance with manufacturer's instructions.
3. Inspect cabinets for foreign objects.
4. Inspect Battery Units.
5. Inspect Power Modules.

D. Mechanical Inspection:

1. Check all UPS and external maintenance bypass cabinet internal control wiring connections.
2. Check all UPS and external maintenance bypass cabinet internal power wiring connections.
3. Check all UPS and external maintenance bypass cabinet terminal screws, nuts, and/or spade lugs for tightness.

E. Electrical Inspection:

1. Verify correct input and bypass voltage.
2. Verify correct phase rotation of all mains connections.
3. Verify correct UPS control wiring and terminations.
4. Verify voltage of all battery modules.
5. Verify neutral and ground conductors are properly landed.
6. Inspect external maintenance bypass switch for proper terminations and phasing.

F. Monitoring and Testing Schedule: Follow manufacturer's instructions, and document with appropriate dates and observations to preserve warranty.

1. Ensure proper system start-up.
2. Verify proper firmware control functions.
3. Verify proper firmware bypass operation.
4. Verify proper maintenance bypass switch operation.
5. Verify system set points.
6. Verify proper inverter operation and regulation circuits.
7. Simulate utility power failure.
8. Verify proper charger operation.
9. Document, sign, and date all test results.

3.3 TRAINING FOR JUCR UPS

A. Training During Startup: During JUCR UPS factory-assisted start-up, factory-trained technician shall provide 2-day operational on-site training for post personnel (as identified by Project Director/COR). Topics shall include keypad operation, LED indicators, start-up and shutdown procedures, maintenance bypass and AC disconnect operation, and alarm information.

B. Training Prior to Closeout: Factory-trained technician shall provide 2-day JUCR UPS service on-site training workshop for post personnel (as identified by Project Director/COR). Workshop format shall include combination of lecture and practical instruction with hands-on laboratory

sessions. Workshop content shall include instruction about safety procedures, UPS operational theory, sub-assembly identification and operation, system controls and adjustment, preventative maintenance, and troubleshooting.

END OF SECTION 263354

SECTION 263535 - POWER FACTOR CORRECTION EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes power and automatic power factor correction equipment rated 600 V and less.

B. Related Sections:

1. Division 26 Section on “Identification for Electrical Systems.”
2. Section 260915 “Electrical Power Monitoring.”

1.2 SUBMITTALS

A. Product Data: For each type of product indicated. Include dimensions, operating characteristics of multiple capacitor cells or elements, and data on features, ratings, and performance.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, method of field assembly, components, and location and size of each field connection. Show access and workspace requirements and required clearances.

1. Wiring Diagrams: Power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For equipment to include in emergency, operation, and maintenance manuals. Include the following:

1. Lists of spare parts and replacement components recommended for storage at Project site.
2. Detailed instructions covering operation under both normal and abnormal conditions.

1.3 QUALITY ASSURANCE

A. Testing Agency Qualifications: Testing agency as defined by OSHA in 29 CFR 1910.7 or a member company of the InterNational Electrical Testing Association and that is acceptable to authorities having jurisdiction.

1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.

B. Comply with IEEE 18 and NEMA CP 1.

C. Comply with requirements of the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100 by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.4 COORDINATION

A. Coordinate sensor-communication module package with data network and with monitoring equipment specified in Section 260915 "Electrical Power Monitoring" for successful transmission and remote readout of remote monitoring data specified in this Section.

1.5 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra materials to Government.

1. Fuses: One for every 10 of each type and rating, but not less than three of each.

PART 2 - PRODUCTS

2.1 CAPACITORS, GENERAL

A. Unusual Service Conditions: Capacitor equipment suitable for the following conditions:

B. Construction: Multiple capacitor cells or elements, factory wired in three-phase groups and mounted in metal enclosures.

C. Capacitor Cells: Dry, metallized-dielectric, self-healing type. Each cell shall be encapsulated in thermosetting resin inside plastic container.

D. Cell Rupture Protection: Pressure-sensitive circuit interrupter for each cell.

E. Capacitor-Bank Fuses: Where required, current-limiting, noninterchangeable type; factory installed in each phase and located within the equipment enclosure. Features include the following:

1. Interrupting Capacity: 200,000 A, minimum.
2. Fuse Ratings and Characteristics: As recommended by capacitor manufacturer.
3. Neon Indicator Lamp for Each Fuse: Connect to illuminate when fuse has opened, but is still in place, and locate so it is visible from outside the enclosure.

F. Discharge Resistors: Factory installed and wired. Resistors may be omitted if permitted by the OBO Electrical Code.

G. Enclosure: NEMA 250, steel or aluminum, arranged to contain the fluid leakage from capacitor cells; factory equipped with mounting brackets suitable for type of mounting indicated.

1. Indoor Enclosures: NEMA 250, Type 12 or as indicated.
2. Outdoor Enclosures: NEMA 250, Type 4, equipped with watertight conduit connections.

2.2 FIXED CAPACITORS

A. Description: Integrally fused, unless otherwise indicated.

B. Internal Wiring: Factory wired, ready for field connection to external circuits at a single set of pressure terminals.

2.3 AUTOMATIC POWER FACTOR CORRECTION UNITS

A. Comply with NEMA ICS 2.

B. Description: Capacitor banks, contactors, controls, and accessories factory installed in independent enclosures and motor-control center, with a connection to motor-control center bus. Units include a separately mounted current transformer to sense current in the power circuit being corrected and to provide input to unit controls.

C. Performance Requirements: Controls permit selection of a target power factor, adjustable to any value between unity and 0.95 lagging. Controls continuously sense the power factor on circuits being corrected and, when the power factor differs from the target setting for more than 10 seconds, operate a contractor to switch a capacitor bank into or out of the circuit. Contactors are opened or closed as required to bring the corrected circuit power factor closer to the target setting. Switch only one capacitor bank at a time.

D. Install the capacitive kVAR throughout the distribution system by placing capacitors at major load centers such as motor control centers or large motors, rather than to concentrate it all at the service entrance. The power factor shall be corrected to 0.95 lag unless a higher level of correction is required to avoid power factor charges by the power company.

E. Controls: Solid-state, microprocessor-based controls, including the following:

1. Undervoltage relay that interrupts capacitor switching and disconnects capacitors for power supply interruptions longer than 15 minutes.
2. "Advance" and "Retard" push buttons on the control panel to permit manually controlled capacitor-bank switching.

F. Contactors: Three pole; rated for the repetitive high-inrush-switching duty in the capacitor application.

G. Buses: Plated copper.

H. Fuses for Protection of Capacitor Banks: Rated to protect contactor, interconnecting wiring, and capacitors.

I. Inductors: Air-core-type, connected in capacitor circuits; rated to limit switching surges to within contactor ratings.

J. Precharge Capacitor Circuit: Resistive, precharge circuit to charge capacitors prior to switching and to limit switching surges to within contactor ratings.

K. Mechanical Bracing for Current-Carrying Parts: Adequate to withstand the maximum fault current to which they may be exposed.

L. Identification of Energized Capacitor Banks: LED indicating lamps on front panel.

M. Enclosure Access: Steel or aluminum, with hinged door and hand-operated catch. Door shall be interlocked with controls or main circuit breaker to de-energize capacitors when door is opened.

N. Local Display: LED or liquid-crystal digital type, mounted in door of enclosure, indicating the following:

1. Target and actual power factors accurate to plus or minus 1 percent of reading.
2. Steps energized.
3. Step reconnection delay.
4. Real and reactive currents.
5. Voltage THD.
6. Alarm codes.

O. System Alarms: Alarm relay and local display indication of the following conditions:

1. Low power factor.
2. Leading power factor.
3. Frequency not detected.
4. Overcurrent.
5. Overvoltage.
6. Overtemperature.
7. Excessive voltage THD.
8. Capacitor overload.
9. Loss of capacitance.

P. Current Transformer: Type, configuration, and ratio to suit sensing and mounting conditions.

Q. Main Circuit Breaker: Operable from outside the enclosure to disconnect the unit.

1. Operating handle can be padlocked.

R. Remote Monitoring Components: Sensors, associated communication modules, and network interface units, matched to and compatible with electrical power monitoring and control network.

Communication module shall have capability to transmit the following data to remote monitoring devices:

1. System in alarm.
2. Power factor set-point.
3. Corrected power factor.
4. Number of capacitor steps activated.

S. Surge Protective Devices: Provide surge protective devices with “sine wave tracking” capability to minimize equipment damage. Maximum lead length of surge protective device is 460 mm.

2.4 FACTORY FINISH

A. Manufacturer's standard enamel over corrosion-resistant treatment or primer coat.

2.5 SOURCE QUALITY CONTROL

A. Factory test power factor correction equipment before shipment. Comply with NEMA CP 1. Include the following:

1. Routine capacitor production tests, including short-time overvoltage, capacitance, leak, and dissipation-factor tests.
2. Functional test of all operations, controls, indicators, sensors, and protective devices.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install freestanding equipment on concrete bases. Cast-in-place concrete is specified in Section 033000 “Cast-in-Place Concrete.”

B. [Comply with mounting and anchoring requirements specified in Division 26 Section on Vibration and Seismic Controls for Electrical Systems.]

C. Maintain minimum workspace according to manufacturer's written instructions.

D. Connect remote monitoring communication module to electrical power monitoring and control data network through appropriate network interface unit.

E. Identify components according to Division 26 Section on Identification for Electrical Systems.

3.2 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each power factor correction capacitor element, bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following:

1. Inspect capacitors, wiring, components, connections, and equipment installation.
2. Assist in field testing of equipment including pretesting and adjusting of automatic power factor correction units.
3. Report results in writing.

C. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

D. Perform the following field tests and inspections and prepare test reports:

1. Perform each electrical test and visual and mechanical inspection, except optional tests, stated in NETA ATS, "Capacitors and Reactors - Capacitors." Certify compliance with test parameters.

E. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

3.3 ADJUSTING

A. Adjust for optimum automatic power factor correction.

3.4 CLEANING

A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean components internally, on completion of installation, according to manufacturer's written instructions.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Government's maintenance personnel to adjust, operate, and maintain automatic power factor correction units. Demonstrate method of determining optimum settings for system controls.

B. Conduct a minimum of two hours' training.

END OF SECTION 263535

SECTION 263552 – LOW-VOLTAGE AUTOMATIC VOLTAGE REGULATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes low-voltage (LV) Automatic Voltage Regulators (AVR).

B. Related Sections include the following:

1. Section 260508 "Common Work Results for Electrical Systems" for facility voltages.
2. Section 260518 "Low-Voltage Electrical Power Conductors and Cables."
3. Section 260525 "Grounding and Bonding for Electrical Systems" for personnel safety and to provide a low impedance path for possible ground fault currents.
4. Division 26 Section on raceways and boxes" for conduits and outlet boxes.
5. **[Division 26 Section on vibration and seismic controls for electrical systems.]**
6. Section 260573 "Overcurrent Protective Device Coordination Study."
7. Section 260815 "Field Testing and Inspection of Electrical Systems."
8. Section 260915 "Electrical Power Monitoring."

1.2 PERFORMANCE REQUIREMENTS

A. AVR system shall be commercially available. LV AVR shall be standard products of manufacturer and shall be manufacturer's latest design that complies with this Section. The automatic voltage regulators provided under this Section shall be products of the same manufacturer. Units with proprietary manuals or schematics that cannot be openly provided to the Government and any AVR maintenance firm selected to work on AVR system are not allowed.

B. Performance Characteristics:

1. Input Voltage: System voltage shall be typical of, but not limited to, the following: Site Distribution Voltage and frequency, three-phase, four wire, grounded. AVR shall produce rated output voltage when input voltage is varied plus **[XX]** or minus **[XX]** percent or greater.
2. Surge Protection: Protect AVR with surge suppressors rated for expected transients based on local conditions. <**Insert data from local power quality survey.**>
3. Input Current Distortion: AVR shall not produce negative effects on overall power system due to harmonic effects.
4. Output Voltage:

   a. Corrected voltage shall not exceed maximum of **[0.5]** percent of nominal voltage.
   b. AVR shall respond to any line voltage variation in less than 5.0 cycles and shall complete correction of voltage within 2 seconds while operating under any line or load condition and with any power factor.

5. Efficiency: Minimum efficiency of **[98]** percent.
6. Overload/Overcurrent: Units shall be capable of sustaining overload/overcurrent without damage.
7. Provide phase loss and phase rotation protection; this protection shall open output and bypass breakers. These breakers shall automatically reclose with time delay (adjustable 0-30 min) after phase correction or restoration.

C. Product Selection for Restricted Space: Drawings indicate maximum dimension for automatic voltage regulator, including clearances. Select product to conform to indicated minimum clearance dimension.

D. Qualification data for firms and persons specified in Article on QUALITY ASSURANCE.

1. Support Services Vendor: Identify vendor firm name and contact, location, distance from project, years and servicing product line.

E. Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:

1. The ratings for AVR and enclosures shall conform to local site ambient environment conditions. AVR shall operate satisfactorily from no load to rated full load. Provide all necessary heating, cooling, ventilation, air conditioning and thermostat systems necessary to facilitate full load operation of AVR.
2. Conditions:

a. Ambient Temperature: **[10 deg C to 50 deg C]**.
b. Altitude: Derating of equipment where and as required for altitude above sea level.
c. Relative humidity: Up to 100 percent non-condensing.

F. Corrosion Resistance: **[XX]**.

1.3 SUBMITTALS

A. Product Data - General: For each type of product indicated. Include rated capacities, operating weights, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings:

1. Scaled drawings of enclosure outline including front, top, side views, and overall dimensions. Indicate external power and control wiring and cable connections. Indicate conduit entry and exit locations.
2. Single line, schematic, and wiring diagrams.
3. Details of input and output circuit breakers, contactors, rectifiers, surge protectors, and control devices.

C. Product Certificates:

1. For surge protective devices, signed by product manufacturer certifying compliance with the following standards:

    a. UL 1449.

2. For AVRs:

    a. Document that AVRs are designed for connection to non-linear loads typically encountered in commercial buildings.

D. Calculations to determine if installation of individual cooling fans are required above each phase for enclosures in relation to environmental conditions identified in Article on PERFORMANCE REQUIREMENTS.

E. Qualification Data:

1. For testing agency.
2. For professional engineer for power quality analysis.
3. Certification of experience identified in Article on QUALITY ASSURANCE.

    a. Certification shall state that manufacturer is experienced in manufacturing and testing AVRs of equivalent kVA rating.
    b. Document experience with AVRs in various environmental conditions including exterior green space, warehouse, and environmentally enclosed spaces within buildings.

F. [Manufacturer Seismic Qualification Certification: Submit certification that voltage regulator, accessories, and components will withstand seismic forces defined in Division 26 Section on vibration and seismic controls for electrical systems when anchored to concrete base. Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. Term "withstand" means "unit will remain in place without separation of any parts from device when subjected to seismic forces specified and unit will be fully operational after seismic event."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.]

G. Field quality-control test reports, including the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Include voltage monitoring and adjusting.
4. Failed test results and corrective action taken to achieve requirements.

H. Operation and Maintenance Data:

1. Submit voltage regulator operation and maintenance manuals in accordance with Division 01 Section "Systems Manual and O&M Data."
2. In addition to general information manufacturer's information on operation and maintenance, include the following information on voltage regulator:

   a. "One-line diagram" from service entrance to low voltage utilization panel or point.
   b. Weatherproof, tear-resistant plastic data sheet with operating instructions for each unit including startup and shutdown procedures.
   c. Routine and field acceptance test reports.

3. Preliminary Operation and Maintenance Manuals: Prior to scheduling Field Performance Tests, submit two copies of Preliminary Operation and Maintenance Manuals as well as two complete sets of drawings and schematics, and obtain acceptance by Project Director/COR.
4. Spare Parts List: Furnish recommended manufacturer's spare parts list and schedule of prices for each type of AVR and other equipment specified in this section. This list shall include the following:

   a. Power semi-conductors.
   b. Power filter capacitors.
   c. Logic cards and boards.
   d. Output switching modules.
   e. Fuses.
   f. Indicator lamp/LED.
   g. Ventilation system filters.

I. Training Plan: Submit in accordance with Division 01 Section "Demonstration and Training."

1.4 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70 "National Electrical Code" as amended by OBO).

1. Electronic Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

B. Manufacturer Qualifications: Minimum of 15 years' experience in design, manufacturing, and testing of low-voltage automatic voltage regulators at the equivalent kVa and voltage ratings for direct connection to electrical systems based on local utility voltage and frequency.

1. The manufacturer shall be experienced in producing units for installation in permanent buildings in environmentally closed spaces and in weatherproof enclosures.

C. AVR shall be UL or CE certified.

D. Comply with FCC Regulations: Part 15, Subpart J, "Emission Limits for Class A Devices."

E. Support Service Capability: Manufacturer approved support services vendor to start-up AVR, and available to provide ongoing maintenance services. Vendor shall be located within 1500 km (1000 miles) of project site. Vendor shall have performed these services on this product line for at least five.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Shipping: Ship low voltage enclosure completely factory assembled with lifting provisions. Mount unit on steel channel skid with lifting provisions.

B. Temporary Heating: If applicable, apply temporary heating for associated storage area prior to installation. Apply temporary heat according to manufacturer's written instructions within enclosure of each ventilated-type unit throughout periods during which equipment is not energized and is not in a space that is continuously under normal control of temperature and humidity.

PART 2 - PRODUCTS

2.1 PRODUCTS

A. Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

1. ABB; PCS100 AVC (Active Voltage Conditioner).
2. Eaton – Culter Hammer; SRT2 (Sage Ride Through Voltage Conditioner).
3. Utility Systems Technologies, Inc.; Sure-Volt Power Conditioner (Voltage Regulator).
4. Omniverter **[Digital AVR][Digit@l-M+Voltage Stabilizer]**.

2.2 LOW-VOLTAGE AUTOMATIC VOLTAGE REGULATORS

A. Provide voltage regulator consisting of modular construction components to accomplish low voltage regulation, with input/output devices and ancillary control devices.

B. External Bypass Configuration: Provide components and configuration which will facilitate external bypass operation to supply load while enabling safe and complete inspection, maintenance, and removal of all AVR components during system’s lifetime.

C. Monitoring and Control Panel: Provide AVR with control panel equipped with the following controls, indicators, instrumentation, data logging, diagnostics, and alarm functions:

1. Controls:

   a. Lamp/ Light Emitting Diode (LED) Test: Push-to-test button or switch to test indicator lamps/LEDs.
   b. Alarm Silence: Switch that shall disable audible alarm.
   c. Alarm Reset: Pushbutton to silence audible alarms.
   d. Output voltage adjustment.

2. Indicators:

   a. Input Power Available: Lamp/LED shall indicate that supply voltage is available.
   b. Output Power On/Off: Lamp/LED shall indicate that AVR output voltage is available.
   c. System Alarm: Lamp/LED shall indicate that problem has been detected.
   d. Audible Alarm.
   e. Remote Alarm: AVR shall have remote alarm in area manned 24-hours.
   f. Instrumentation: Unit shall have true rms metering. Meter shall display all output phase-to-neutral voltages, all output phase-to-phase voltages, and all output per phase current. Meter shall display all output KW, kVA, and power factor.

3. Alarm Annunciator: Unit shall be capable of detecting the following abnormal condition, sounding audible alarm, and illuminating individual indicator lamp/LEDs that are clearly identified:

   a. Output overload.
   b. System alarm.
   c. Overtemperature.

D. Circuit Breakers: Conform to requirements of UL 489 and UL 1066. Units operating at 50 Hz shall be rated for 50 Hz operation, and units operating at 60 Hz shall be rated for 60 Hz operation.

1. Input Circuit Breaker: UL listed input circuit breaker with appropriate frame size. Circuit breakers shall have short-circuit current rating suitable for local system conditions. Input circuit breaker shall be rated to carry maximum rated current at minimum voltage.
2. Output Circuit Breaker: UL listed output circuit breaker with appropriate frame. Circuit breaker shall have short-circuit current rating suitable of **[__ kA]**.

   a. Output circuit breaker shall be mechanically interlocked with AVR external bypass circuit breaker. Interlock scheme shall not require AVR de-energizing to actuate external bypass.

3. Input and Bypass breakers shall be service rated.

   a. Mechanically interlock output circuit breaker with AVR external bypass circuit breaker. Interlock scheme shall not require AVR de-energizing to actuate external bypass.

4. Bypass Circuit:

a. External Bypass: External bypass circuit breaker shall be mechanically interlocked with AVR output circuit breaker. Interlock scheme shall not require AVR de-energizing to actuate external bypass.

5. Scenario with AVR as Part of Service Entrance Equipment: Provide with 4-pole main circuit breaker. This 4 pole main breaker shall be adjustable for under/over voltage, over/under frequency, loss of phase, and phase reversal sensing to trip this breaker when utility service is outside preset tolerance for preset adjustable time delays.
6. All Circuit breakers 1000A and larger shall include electronic LSIG trips.
7. Conform to analysis from Section 260573 "Overcurrent Protective Device Coordination Study."

E. Auto Restart: After total input power outage, unit shall automatically restart and re-energize loads upon restoration of normal power.

2.3 CONTROLS

A. Provide control panel and circuitry. Connect to clearly and permanently labeled terminal blocks located inside AVR's enclosure. Provide circuitry such that indicator lamp/LED information and can be extended from terminals to remote location in future. Control panels shall include the following as a minimum.

1. Indicator lamp/LED showing that unit status (energized or not energized).
2. Indicator lamp/LED showing external bypass status (On or Off).
3. Phase loss and phase rotation alarms.
4. Over temperature alarms.
5. Input and output voltages and currents.
6. System alarm.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Installation shall conform to manufacturer's instructions.

B. Clearances: Comply with the OBO Electrical Code.

C. Building Wiring and Conduit: Install wiring and conduit for circuits as specified in Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

D. Posted Instructions: Post startup and shutdown instructions on front of unit using engraved plastic plate. Provide plastic encapsulated schematic diagram attached to inside of unit in clear view of maintenance personnel.

3.2 GROUNDING

A. Comply with the National Electrical Code (NFPA 70) requirements for connecting to grounding electrodes and for bonding to metallic piping near the transformer.

B. Comply with Chapter 2 of the OBO Electrical Code. Refer to Section 260525 “Grounding and Bonding for Electrical Systems” for materials and installation requirements.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Representative: Engage factory-authorized service representative to inspect field assembly and connection of components, and to start up and commission unit.

B. Performance of Acceptance Checks and Tests:

1. Test Objective: To ensure voltage regulators and associated equipment are operational within specified tolerances, comply with Contract Documents, and are suitable for energizing.
2. Test Labeling: Upon satisfactory completion of tests for each unit, attach dated and signed "Satisfactory Test" label to tested component.
3. Schedule tests and provide notification to Project Director/COR at least seven days in advance of test commencement.

C. Checks and Tests: Perform those listed below and those recommended in manufacturer's written instructions. For transformer components of voltage regulators, perform tests according to manufacturer's written instructions and IEEE C57.12.91.

1. Inspect accessible components for cleanliness, mechanical and electrical integrity, damage, and deterioration. Verify that temporary shipping bracing has been removed.

   a. Include internal inspection through access panels and covers.
   b. Inspect bolted electrical connections for tightness according to manufacturer's published torque values or, if not available, those of UL 486A.

2. Perform functional tests of voltage regulators throughout their operating ranges. Check voltage tolerance, correction speed, and harmonic content of output. Test each monitoring and alarm function.
3. Test Failures: Correct deficiencies identified by tests and retest. Verify that equipment complies with specified requirements.

D. Initial Inspection and Tests:

1. Compare equipment nameplate information with specifications and approved shop drawings.
2. Inspect physical and mechanical condition.
3. Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrating torque-wrench method, or performing thermographic survey.

4. Perform specific inspections and mechanical tests as recommended by manufacturer.
5. Verify correct equipment grounding.
6. Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.
7. Verify proper secondary phase-to-phase and phase-to-neutral voltage after energizing and prior to connection to loads.

E. Voltage Monitoring and Adjusting: Perform the following voltage monitoring after Substantial Completion, but not more than six months after Final Acceptance of the Voltage Regulator.

1. During period of normal load cycles as evaluated by Project Director/COR, perform thirty days of three-phase voltage recording.
2. If tests results are unacceptable, perform corrective actions as appropriate.
3. After correction actions have been performed, repeat monitoring until satisfactory results have been obtained.
4. Prepare written report covering monitoring and corrective actions performed.

F. Power Quality: During installation of electrical service equipment, monitor and record power quality using PowerSight PS4000 at location to determine necessity, for a minimum of 30 days.

3.4 DEMONSTRATION

A. Engage factory-authorized service representative to train Government maintenance personnel to adjust, operate, and maintain voltage regulators.

B. Coordinate with Project Director/COR and post Facility Manger to identify staff, including locally employed staff (LES) maintenance personnel, who may access AVR.

C. Train Government maintenance personnel in the following:

1. Safety precautions.
2. Features and construction of project equipment.
3. Voltage adjustment procedures.
4. Routine testing and monitoring operations.
5. Interpretation of readings of indicating and alarm devices.
6. Routine inspection procedures.
7. Routine maintenance.
8. Access control panel to maintain an operations log as specified by OBO Facility Management.
9. Remove and replace control panel.
10. Bypass, isolate, de-energize, and lock-out the AVR. This will include an explanation and demonstration using the required safety equipment to isolate and de-energize the AVR and verify that it is de-energized.
11. Clean the connections and conductors on a basis approved by OBO Facility Management.
12. Review data in maintenance manuals, including written Standard Operating Procedures to (SOP) accomplish the above tasks.

D. Schedule training with Project Director/COR with at least seven days' advance notice.

END OF SECTION 263552

SECTION 263554 – MEDIUM-VOLTAGE AUTOMATIC VOLTAGE REGULATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes medium-voltage automatic voltage regulators (AVR).

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical Systems” for facility voltages.
2. Section 260525 on “Grounding and Bonding for Electrical Systems.”
3. **[Division 26 Section on vibration and seismic controls for electrical systems.]**
4. Division 26 Section on identification for electrical system.
5. Section 260573 “Overcurrent Protective Device Coordination Study.
6. Section 260815 “Field Testing and Inspection of Electrical Systems.”
7. Section 260915 “Electrical Power Monitoring.”
8. Section 264315 “Surge Protective Devices” for surge suppressors applied independent of voltage regulators and power distribution units.

1.2 SYSTEM DESCRIPTION

A. Medium Voltage AVR system consists of three units of automatic single phase step voltage regulators connected in delta bank configuration, installed in deadfront weather resistant pad mounted enclosure with insulated bus bars. AVR system shall provide minimum of plus/minus 15 percent regulation in the closed-delta configuration.

1.3 SUBMITTALS

A. Product Data - General: For each type of product indicated. Include rated capacities, operating weights, operating characteristics, furnished specialties, and accessories.

B. Product Certificates: For station-class surge arrestors, signed by product manufacturer certifying compliance with the following standards:

1. ANSI C62.11 (IEEE Std. C62.11).

C. Environmental Calculations: Submit calculations to determine if the installation of individual cooling fans above each phase for enclosures is required.

D. Qualification Data: For testing agency.

E. [Manufacturer Seismic Qualification Certification: Submit certification that medium voltage regulator, accessories, and components will withstand seismic forces defined in

Division 26 Section "Vibration and Seismic Controls for Electrical Systems" when anchored to concrete base. Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. Term "withstand" means "unit will remain in place without separation of any parts from device when subjected to seismic forces specified and unit will be fully operational after seismic event."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.]

F. Field quality-control test reports, including the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Failed test results and corrective action taken to achieve requirements.

G. Operation and Maintenance Data: For surge protective devices to include in emergency, operation, and maintenance manuals.

1. Include safety Standard Operating Procedures (SOP), including de-energization and isolation procedures.

1.4 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70 “National Electrical Code” as amended by OBO).

1. Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

B. Comply with IEEE C2.

C. Comply with FCC Regulations: Part 15, Subpart J, "Emission Limits for Class A Devices."

D. Comply with ANSI Standard C57.15.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Shipping: Ship pad-mounted medium voltage enclosure completely factory assembled with lifting provisions. Mount unit on steel channel skid with lifting provisions.

B. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within enclosure of each ventilated-type unit throughout periods during which equipment is not energized and is not in a space that is continuously under normal control of temperature and humidity.

1.6 PROJECT CONDITIONS

A. Product Selection for Restricted Space: Drawings indicate minimum clearance for construction, operation, and maintenance for automatic voltage regulator, including clearances. Select product to conform to indicated minimum clearance dimension.

B. Environmental Limitations: Voltage regulators shall withstand the environmental conditions identified below without mechanical or electrical damage or degradation of performance capability. Ratings for AVR and enclosure shall conform to local site ambient environment conditions. AVR shall operate satisfactorily from no load to rated full load based on local site conditions. Provide all necessary heating, ventilation, and thermostat systems necessary to facilitate operation of AVR.

1. Ambient Temperature: **[10 deg C to 50 deg C.]**
2. Altitude: Derate equipment where and as required for altitude above sea level.
3. Relative humidity: Up to 100 percent non-condensing.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, products that may be incorporated into the work include, but are not limited to, the following:

1. Cooper Industries; Cooper Power Systems Division.
2. GE Electrical Distribution & Control.
3. Siemens Energy & Automation, Inc.

2.2 MEDIUM VOLTAGE SINGLE-PHASE AUTOMATIC VOLTAGE REGULATOR (AVR)

A. General

1. This specification covers electrical, mechanical and safety features and characteristics of outdoor, medium voltage single-phase, oil-immersed, step-type automatic voltage regulators.
2. Voltage regulators shall be completely self-contained and provide plus or minus 10 percent in 32 steps of approximately 5/8 percent each. Forced air (FA) ratings are not acceptable.
3. Regulators furnished under this specification shall be designed, manufactured and tested in accordance with ANSI Standard C57.15.
4. Nominal voltage rating shall match host country voltage.

5. Furnish unit with ANSI Type II mineral oil per ASTM D-3487, or furnish with less-flammable type, fire-resistant biodegradable seed oil; Basis of Design, Envirotemp FR3. Oil shall contain less than one part per million PCBs at time of manufacture; this shall be so stated on regulator nameplates.

B. Construction:

1. Design regulators such that they can be partially or completely untanked for inspection and maintenance without disconnecting any internal electrical or mechanical connections. Provide military specification-style quick disconnect with solid-state automatic current transformer shorting device.
2. Tap-Changing Mechanism: Motor-driven, quick-break type, completely oil-immersed.
3. Regulator shall be of sealed-tank construction to permit operation at 65 deg C rise without increasing oxidation rate of oil. Provide pressure-relief device which vents at approximately 27.5 kiloPascals.
4. Paint external parts of tank and control enclosure ANSI #70 gray. Prime or paint inside of tank and bottom of cover.
5. Provide regulator coil with thermally upgraded insulation to permit operation of regulator up to 65 deg C rise without loss of life to insulating system. At 65 deg C rise, regulator shall provide 12 percent extra current capacity over base current rating. Use suitably patterned, epoxy-coated insulation paper in winding. Prior to assembly of core and coil assembly, bake winding with sufficient mechanical pressure exerted on winding to assure complete bonding of insulation to improve its short-circuit current withstand capabilities.
6. Series winding may be aluminum. Shunt winding shall be copper.

C. External Features:

1. BIL rating of bushings shall be compatible with BIL of regulator. Mark bushing designations (S, L and SL) on regulator cover adjacent to bushings. S, L and SL bushings shall be interchangeable with each other.
2. Provide each bushing with deadbreak elbow rated at system voltage.

   a. Elbow is required on each side of cable from regulator bushing to each bypass and on each phase disconnect switch.

2. Provide regulators with external metal oxide varistor (MOV) bypass arrester connected across series winding.
3. Provide external oil sight gauge which indicates oil level at 25 deg C ambient temperature.
4. Provide external position indicator to indicate tap changer position. Mount position indicator above oil level, and slant downward at 45-degree angle for ease of reading from below when regulator is pole mounted.
5. Unit shall be capable of additional current carrying capabilities at reduced regulation as indicated in Table 2.2, “Current Carrying Capabilities”:

TABLE 2.2: CURRENT CARRYING CAPABILITIES

REGULATION (Percent)	CURRENT (Percent of 55 deg C Rating)

±10.0	100
±8.75	110
±7.5	120
±6.25	135
±5.0	160

6. Provide mounting bosses for addition of lightning arresters adjacent to source (S), load (L) and source-load (SL) bushings. Fully weld bosses around their circumference; spot welding is not acceptable.
7. Provide all regulators with 25 mm drain valve having sampling device and 25 mm upper filter press connection.
8. Provide handhole with cover on top of regulator for inspection purposes and for access to terminals used for reconnection of regulators for lower-voltage operation.
9. Provide each unit with base suitable for securing them to concrete pad. Provide each unit with two ground pads located diagonally opposite from each other. Each pad shall have two 16 mm ground provisions. Locate grounding provisions near or on the base of unit.
10. Provide each regulator with two laser-etched nameplates, one mounted on control enclosure and other mounted on regulator tank. Nameplates shall have manufacturer code and serial number barcoded with "3 of 9" coding, using 6 mm minimum height.
11. Input switches shall consist of 3 pole fused and 3 pole un-fused disconnect switches to provide input power to AVRs and output/by-pass switches as depicted in AVR system connection diagram.
12. Output-by-pass switches shall consist of 3 pole fused and 3 pole un-fused disconnect switches which shall be interlocked to allow operator to bypass AVR bank but still provide utility power to site.

D. Regulator Control:

1. Mount regulator control panel in weather-resistant enclosure capable of being padlocked. Provide control enclosure with external 13 mm - 13 UNC welded ground boss.
2. Locate control panel in location near regulator enclosure but away from any arc fault hazards.
3. Control panel shall be hinge-mounted and designed for easy inspection and replacement. Construct front panel assembly to provide direct control interchangeability without requiring removal of control enclosure. Provide visible means to de-energize control and to short current transformer prior to control testing or removal.
4. Install accessory doors for control panels on short and long boxes; open boxes with exposed components or wiring are not acceptable.
5. Color code or label all leads in control for easy identification.
6. Conformal coat printed circuit boards for fungi and moisture protection.
7. Provide ratio correction transformer inside control enclosure for easy access to fine voltage adjustment. Clearly identify ratio correction taps and corresponding system voltage on regulator nameplates.
8. Regulator control panel shall include the following items:

a. Three-position voltage source switch, labeled INTERNAL-OFF-EXTERNAL, which allows regulator to be operated from internal potential source, operated from external source, or de-energized.
b. Three-position AUTOMATIC-OFF-MANUAL control switch, which allows automatic or manual operation of regulator, or allows control to be turned off. Supervisory motor control shall be permitted only when switch is in AUTOMATIC position.
c. Spring-loaded three-position manual RAISE-LOWER toggle switch, which shall only be active when AUTOMATIC-OFF-MANUAL switch is in manual position.
d. Position indicator drag hand reset switch, located on front panel.
e. Neutral indicating light which is actuated via tap changer to provide neutral indication.
f. Six-digit operations counter which counts every tap change.
g. Separate motor and panel fuses which are replaceable from front panel. Clearly mark fuse size below each fuse. Provide one set of spare fuses in control enclosure.
h. Provide means to indicate whether voltage is inside or outside set voltage band.
i. Voltage test terminals which connect to load side (L bushing) of regulator.
j. External voltage source terminals which allow control and tap changer operation from external 240 vac source. Provide means to prevent energizing high voltage bushings from external source.
k. Control knob locking devices which prevent inadvertent adjustment of settings. Locking device shall be operable with flat head screwdriver.

9. Control shall have provisions for setting the following parameters:

a. Set voltage shall be adjustable from 210 to 270 volts in increments no larger than 2 volts.
b. Set voltage bandwidth shall be adjustable from 1 to 6 volts in increments no larger than 0.5 volts.
c. Time delay shall be adjustable from 10 to 120 seconds in increments of 10 seconds.
d. Line drop compensator settings consisting of resistance and reactance that shall be individually adjustable from 0 to 24 volts. A means shall be provided to set polarity of these settings.

10. Control shall have provisions to allow remote override of regulator operation via discrete (analog) supervisory control. Terminals shall be provided on back panel as follows:

a. For motor raise: Two terminals for normally-open, momentary-close contacts.
b. For motor lower: Two terminals for normally-open, momentary-close contacts.
c. For auto inhibit: Two terminals for normally-closed, latch-open contacts.

E. Series Surge Arresters

1. Equip each regulator with a bypass arrester connected across series winding between source (S) and load (L) bushings. Bypass arrester shall limit voltage developed across series winding during lightning strikes, switching surges, and line faults.
2. Provide station class lightning arresters with adequate ratings for voltage application.

F. Shunt Arresters

1. Equip each regulator with shunt arresters for protection of shunt winding. Mount shunt arrester directly on tank and connect between load bushing and ground.
2. Provide shunt arrester between each source bushing and ground.
3. Provide station class lightning arresters with adequate ratings for voltage application.

G. AVR Configurations: Without exception, all medium voltage automatic voltage regulators shall be delta connected.

H. General Accessories:

1. Manual disconnect and bypass switch.
2. Thermostatically controlled heater assembly to reduce moisture in areas of high humidity. Heater assembly shall include an ON-OFF switch. In ON position, thermostat in heater assembly shall activate heater at approximately 30 deg C and turn it off at approximately 40 deg C.
3. Series and shunt arresters.
4. Fiber optic interface board for digital communication.
5. Internal differential potential transformer for complete power flow with metering, provide appropriate control module.
6. Data reader.
7. 240 volt external source connections
8. Cooling fans.
9. Elevating structure.
10. Extra long control cables.

2.3 SAFETY ACCESSORIES

A. Supply the following accessories to assist in safely de-energizing AVR and transformer:

1. Two live–line tools conforming to ASTM F711; one 1200 mm (4 foot) and one 1800 mm (6 foot) in length.
2. Non-contact voltage proximity detector. Detector shall have both audio and visual alerts and warning indicators. Detector shall be instrument rated for AVR and transformer voltages. Detector shall be compatible with live-line tool.
3. Two pair voltage-rated (VR) gloves and leather protectors conforming to ASTM D120 Class 2 (voltage rating of 17,000 AC and 25,500 DC); one pair glove size 8.5, and one pair glove size 9.5. Provide canvas bags for glove storage.
4. Two sets VR rubber sleeves similar voltage rating as VR gloves, with canvas storage bags.
5. ASTM F1506 approved arc flash suit NFPA Hazard class 4, size large.
6. Two sets safety grounds capacity rated for application conforming to ASTM F855. Ground cluster connectors shall acceptably secure clamp onto phase conductor and ground conductor.
7. Retrieval stick conforming to ASTM F711; 1800 mm (6 foot) in length.

2.4 PAD MOUNTED MEDIUM-VOLTAGE ENCLOSURE

A. Construction:

1. Enclosure Sections:

   a. Input Section: Section shall contain fused disconnect switch to serve as AVR system incoming/disconnect switch, and unfused disconnect switch for AVR system by-pass power.
   b. Output Section: Section shall contain disconnect and by-pass switches for each of single phase step voltage regulators; refer to Paragraph on "External Features" within Article on MEDIUM VOLTAGE SINGLE-PHASE AUTOMATIC VOLTAGE REGULATORS for requirements on these switches. Section shall also contain AVR system by-pass disconnect and output overcurrent protection.

2. Tamper resistant and weather resistant, with no exposed screws or bolts.
3. Enclosure Material: Minimum 3 mm mild steel.
4. Bolted construction rather than welded construction, such that enough of roof and walls of enclosure can be easily unbolted and removed to allow for use of overhead lifting device to un-tank each regulator for inspection and for replacement of internal contacts and parts. Follow manufacturer's recommendations for manner of implementing these features.
5. Enclosure shall utilize welded spreader frames at top and bottom.
6. Panels and doors: Formed edges.
7. External fasteners: Stainless steel.
8. Roof: Domed to shed water.
9. Infrared Windows: Viewing windows for infrared inspections, with doors and enclosure closed, of cable connections, bus bar connections, and control or switch devices and connections.

   a. Construct in accordance with IEEE C.37.20.2 a.3.6 for Viewing Panes in MV Equipment, Greater than NEMA 4 open. Conform to NFPA 70E, arc flash, and safe and efficient thermography practices.
   b. Coordinate IR Window installation with arc flash hazard at equipment.
   c. Size and location of IR window shall ensure maximum coverage and therefore maximum efficiency to inspect through window.

B. Doors:

1. Provide doors for each of section of enclosure and one door for each voltage regulators. Size doors to allow for removal of switches, fused and the single phase voltage regulator.
2. Door Hinge: Minimum 9.5 mm diameter stainless steel.
3. Each door shall have positive three-point latching mechanism.
4. Door Handles: Capable of accepting a padlock handle.
5. Provide features to preclude accidental contact of live parts when doors are open.

C. Venting:

1. Provide adequate venting to dissipate the heat of enclosed regulator equipment.

a. Fused transfer/bypass switches do not require ventilation and shall be in non-ventilation section to prevent entrance of dust.

2. Cover vent openings on inside with perforated aluminum screen or filters to mitigated dust from migrating into equipment.

2.5 SOUND LEVEL

A. General: Fully assembled products in this Section have a minimum of 3 dB less than maximum sound levels prescribed for transformers of corresponding ratings when factory tested according to IEEE C57.12.91.

2.6 FINISHES

A. Outdoor Units: Comply with ANSI C57.12.28, "Enclosure Coating System" Article.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Arrange equipment to provide adequate spacing for access and for cooling air circulation.

B. Clearances: Comply with the OBO Electrical Code. Locate medium voltage regulator equipment to provide minimum of 3 meter (10-ft) clearance space between enclosure cabinet access panel and doors, and enclosing security fence or other equipment.

C. Identify equipment and install warning signs according to Division 26 Section on identification for electrical systems.

D. Allow sufficient pad or ground space near medium-voltage AVRs to permit placement of temporary lifting device required for un-tanking.

3.2 GROUNDING

A. Separately Derived Systems: Comply with Chapter 2 of the OBO Electrical Code requirements for connecting grounding and conform to grounding design indicated on Construction Drawings.

1. Voltage Regulator: Connect neutral conductor of voltage regulator output to local grounding electrode.

B. Comply with Section 260525 “Grounding and Bonding for Electrical Systems” for materials and installation requirements.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage factory-authorized service representative to inspect field assembly and connection of components.

B. Test Objective: To ensure voltage regulators and associated equipment are operational within specified tolerances, comply with Contract Documents, and are suitable for energizing.

C. Test Labeling: Upon satisfactory completion of tests for each unit, attach dated and signed "Satisfactory Test" label to tested component.

D. Schedule tests and provide notification to Project Director/COR at least seven days in advance of test commencement.

E. Inspections and Tests: Perform those listed below and those recommended in manufacturer's written instructions. For transformer components of voltage regulators, perform tests according to manufacturer's written instructions and IEEE C57.12.91. Apply safety requirement principles and guidance of NEMA Standard SG-2008 during inspection and testing efforts.

1. Inspect accessible components for cleanliness, mechanical and electrical integrity, damage, and deterioration. Verify that temporary shipping bracing has been removed.

   a. Include internal inspection through access panels and covers.
   b. Inspect bolted electrical connections for tightness according to manufacturer's published torque values or, if not available, those of UL 486A.

2. Perform functional tests of voltage regulators throughout their operating ranges. Check voltage tolerance, correction speed, and harmonic content of output for stepped changes in source voltage at 35, 70, and 100 percent of rated load. Test each monitoring and alarm function and coordinate with electrical power monitoring system. Include as minimum the following points to monitor.

   a. All load and source power meter data including load voltage, current, and power
   b. Load tap contact position
   c. Load and source voltage THD
   d. Load current THD
   e. Load tap contact operational counter
   f. Manual – automatic tap contact position
   g. Preventive maintenance tapping (PMT) by automatically operating the tap-changer based on user-configured parameters. The duty cycle monitor calculates the amount of life used for each arcing surface contact on the AVR tap changer to assist in scheduling preventative maintenance

F. Test Failures: Correct deficiencies identified by tests and retest. Verify that equipment complies with specified requirements.

3.4 CLEANING AND ADJUSTING

A. On completion of installation, cleaning, and testing, touch-up scratches and mars of finish to match original finish.

B. Adjust voltage regulators to provide optimum voltage at equipment served throughout normal operating cycle of facility. Record input and output voltages and adjustment settings for submission with test results.

3.5 DEMONSTRATION

A. Engage factory-authorized service representative to train Government maintenance personnel to adjust, operate, and maintain voltage regulators.

B. Coordinate with Project Director/COR and post Facility Manger to identify staff, including locally employed staff (LES) maintenance personnel, who may access AVR.

C. Train Government maintenance personnel in the following:

1. Coordinate training on safety precautions and use of medium-voltage safety accessories with requirements in Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety,” and Section 260573 “Overcurrent Protective Device Coordination Study.” Apply safety requirements of NEMA standard SG-2008 during all instruction on, and demonstration of, supplied equipment.

    a. De-energizing procedures to safely de-energize, isolate and lock-out the regulators prior to any maintenance or repair work. Standard Operating Procedures described in O&M Data Manual.

2. Features and construction of project equipment.
3. Voltage adjustment procedures.
4. Routine testing and monitoring operations.
5. Changing to AVR bypass configuration.
6. Interpretation of readings of indicating and alarm devices.
7. Routine inspection procedures.
8. Access control panel to maintain an operations log in accordance with procedures of OBO/OPS/FAC.
9. Remove and replace control panel or components.
10. Clean connections and conductors on basis identified by OBO/OPS/FAC considering input from manufacturer.
11. Review data in maintenance manuals, including written Standard Operating Procedures (SOP) to accomplish the above tasks.

D. Schedule training with Project Director/COR with at least seven days' advance notice.

END OF SECTION 263554

SECTION 263600 – TRANSFER SWITCHES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes transfer switches rated 600 V and less, including the following:

1. Automatic transfer switch.
2. Remote annunciation system.

B. Related Sections include the following:

1. Section 213115 "Fire Pump Assemblies" for automatic transfer switches for fire pumps.
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety,” including electrical safety accessories.
3. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
4. Section 260525 “Grounding and Bonding for Electrical Systems.”
5. Section 260573 “Overcurrent Protective Device Coordination Study.”
6. Section 260815 “Field Testing and Inspection of Electrical Systems.”
7. Section 260915 “Electrical Power Monitoring.”
8. Section 262325 “Power Sequence of Operation.”
9. Section 263214 “Engine Generators.”

1.2 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, weights, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: Dimensioned plans, elevations, sections, and details showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.

1. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.

C. Manufacturer Seismic Qualification Certification: Submit certification that transfer switches accessories, and components will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Qualification Data: For manufacturer and testing agency.

E. Field quality-control test reports: Indicate and interpret test and inspection results for compliance with.

F. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Features and operating sequences, both automatic and manual.
2. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.
3. Include safety Standard Operating Procedures (SOP), including de-energization and isolation procedures.

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: Maintain a service center capable of providing emergency maintenance and repairs.

B. Manufacturer approved support services must be provided within [24][48] hours.

C. Testing Agency Qualifications: Testing agency as that is member company of the InterNational Electrical Testing Association (NETA), or a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA, the NRTL, or the National Institute for Certification in Engineering Technologies (NICRT), to supervise on-site testing specified in this Section.

D. Source Limitations: Obtain automatic transfer switch, bypass/isolation switch, nonautomatic transfer switch, remote annunciators, and remote annunciator and control panels through one source from a single manufacturer.

E. Comply with NEMA ICS 1.

F. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

G. Comply with NFPA 99.

H. Comply with NFPA 110.

I. Comply with UL 1008, unless requirements of these Specifications are stricter.

PART 2 - PRODUCTS

2.1 AUTOMATIC TRANSFER SWITCHES (ATS)

A. Open-transition transfer switch operation is the OBO standard. Use of closed-transition transfer switch is not permitted.

B. [Comply with Level 1 equipment according to NFPA 110.]

C. [Comply with NEMA 250, type 12 default enclosure for generally dusty environments.]

D. Switching Arrangement: Double-throw type, incapable of pauses or intermediate position stops during normal functioning, unless otherwise indicated.

E. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is the same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.

F. Signal-before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval is adjustable from 1 to 30 seconds.

G. Digital Communications Interface: Matched to capability of remote annunciator or annunciator and control panel.

2.2 AUTOMATIC TRANSFER-SWITCH FEATURES

A. Undervoltage Sensing for Each Phase of Normal Source: Senses low phase-to-ground voltage on each phase. Pickup voltage is adjustable from 85 to 100 percent of nominal, and dropout voltage is adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent. Provide over/under voltage and frequency sensing for all generator transfer switches to initiate generator start and transfer of power.

B. Time delay for override of normal-source voltage sensing delays transfer and engine start signals.

C. Voltage/Frequency Lockout Relay: Prevents premature transfer to generator set. Pickup voltage is adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency is adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.

D. Time Delay for Retransfer to Normal Source: Adjustable from 0 to 30 minutes; factory set for 10 minutes. Provides automatic defeat of delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.

E. Test Switch: Simulates normal-source failure.

F. Switch-Position Pilot Lights: Indicate source to which load is connected.

G. Source-Available Indicating Lights: Supervise sources via transfer-switch, normal- and emergency-source sensing circuits.

1. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."
2. Emergency Power Supervision: Red light with nameplate engraved "Emergency Source Available."

H. Unassigned Auxiliary Contacts: Two normally open single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.

I. Transfer Override Switch: Overrides automatic retransfer control so automatic transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.

J. Engine Starting Contacts: One isolated, normally closed and one isolated, normally open, rated 10 A at 32-V dc minimum.

K. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine-generator set and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods are adjustable from 10 to 30 minutes. Factory settings are for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:

1. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
2. Push-button programming control with digital display of settings.
3. Integral battery operation of time switch when normal control power is not available.

2.3 REMOTE ANNUNCIATOR SYSTEM

A. Functional Description: Remote annunciator panel annunciates conditions for indicated transfer switches. Annunciation includes the following:

1. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
2. Switch position.
3. Switch in test mode.
4. Failure of communications link.
5. Remote control.

B. Annunciator Panel: LED, LCD or vacuum fluorescent type with audible signal and silencing switch.

1. Indicating Lights: Grouped for each transfer switch monitored.
2. Label each group indicating transfer switch it monitors, location of switch, and identity of load it serves.
3. Mounting: Flush, modular, steel cabinet, unless otherwise indicated.
4. Lamp Test: Push-to-test or lamp-test switch on front panel.
5. Remote control.

2.4 AUTOMATIC TRANSFER SWITCHES

A. General Purpose Automatic Transfer Switch: (GP-ATS): Automatic Transfer Switch (GP-ATS) shall be 4-pole bypass isolation type transfer switch and have a continuous current rating equal to or greater than the prime current rating of the genset. Switch configuration shall “break” before “make” arranges such that all four poles open and close simultaneously and shall be mechanically interlocked to prevent simultaneous closing of normal and emergency contacts. The main switch contacts shall be long life, high pressure, silver alloy, and have separate arcing contact areas. There shall be two sets of form "C" auxiliary contacts (one for each source) rated at 10 amps continuous and [250 V]. The three leads from each set of contacts shall be wired to six terminals on the consumers terminal strip (see subpara. below on "Terminals (ATS)"). The ATS components shall be in a NEMA 1 enclosure arranged for wall mounting.

1. Sequence of operation (ATS):

a. When the voltage on any phase of the normal source (commercial power) is reduced to 80 percent of rated voltage (adjustable from 75 percent to 98 percent of pickup voltage) for more than 30 seconds (adjustable 0 to 60), the starting contacts shall close.
b. When the genset has started and obtained 90 percent of rated voltage (adjustable 85-100 percent) on all phases and rated frequency, the load shall be transferred to the genset after 30 seconds (adjustable 2 to 120).
c. When the normal source has been restored and the voltage of all phases has been within 90 percent of rated voltage (adjustable 85-100 percent) for 15 minutes (adjustable 0 - 30), the load shall transfer to normal power.
d. The genset shall continue to run for 10 (adjustable 1 to 10) minutes before it automatically stops. The system shall now be ready for another failure cycle.

2. Neutral bus (ATS): The neutral bus shall be electrically isolated from the ATS enclosure and shall be rated at full capacity of the switch. There shall be sufficient terminals to

accommodate the load neutral, the normal source neutral, the emergency source neutral, ground electrode conductor, and an equipment bonding jumper.

3. Equipment Ground Bus (ATS): The equipment ground bus shall be electrically bonded to the ATS enclosure. It shall have one terminal sized to accommodate the equipment bonding jumper, and a second terminal sized to accommodate the equipment grounding conductor.
4. Lugs (ATS): All cable terminations for genset (source two), load and normal (source one) power shall have tinned copper lugs sized to accept a conductor one size larger than required for the current rating.
5. Manual Operation (ATS): The ATS shall have a permanently mounted handle capable of operating the switch mechanism to accomplish both a transfer and retransfer of rated load.
6. Controls (ATS): There shall be a three position, key operated switch labeled "TEST", "NORMAL" and "RETRANSFER" located on the enclosure door.

    a. Test position (ATS): In the "TEST" position the genset shall automatically start come up to rated speed and rated voltage, but the ATS shall not transfer the load to the genset.
    b. Normal position (ATS): In the "NORMAL" position the ATS functions in the completely automatic mode.
    c. Retransfer position (ATS): In the "RETRANSFER" position the ATS immediately transfers the load to commercial source bypassing any preset transfer delays.

7. Indicators (ATS): There shall be four indicator lights, properly labeled as to function mounted on the enclosure door. Two of the indicator lights are to be labeled to show the position of the main switch. The other two indicating lights are to be labeled to show the status of the two sources.
8. Terminals (ATS): A terminal strip(s) for customers use, located inside the ATS enclosure, shall be provided to facilitate the interconnection between the transfer switch and the genset. There shall be a minimum of twenty terminal points available for customer use. Three of these terminals shall be wired to each of the two sets of form C contacts from the main switch auxiliary relays; one terminal shall be wired to accept the genset battery B+; one terminal shall be wired to accept the genset battery (B-); and one terminal shall be wired to serve as the remote start signal source for the genset. The remaining terminals will be unused spares.
9. ATS shall be bypass-isolation type for ease of maintenance and testing purposes.

    a. ATS 4-pole: The 4-pole ATS shall have four poles and shall meet all preceding requirements for GP-ATS.
    b. [ATS mounted battery charger where required: There shall be a static battery charger mounted inside the ATS enclosure. This battery charger shall be the temperature compensated constant voltage type rated to match the battery voltage of the genset, with over-current control to limit the output current to 10 amps even when connected to a dead battery. The charger output shall be pre wired to the B+ and B- terminals of the customer terminal strip.]

B. MGP-ATS with Remote Control /Monitor and Mode Selection: Shall be used for the NOB generator. The MGP-ATS shall meet all of the requirements for GP-ATS above except regarding "Configurations," in addition to the requirements of the following paragraphs.

1. Additional Operational Modes: The MGP-ATS shall be a modified GP-ATS. The modification shall include a remote control panel, and provide a means for the operator to select the following operational modes:

    a. Manual mode: In this mode the transfer switch shall not operate automatically. It shall be controlled only by manual operators located on the MGP-ATS local panel or on the MGP-ATS remote control panel.
    b. Semi-automatic mode: In this mode and with "normal" power being of unacceptable quality, the genset shall automatically start and switch the load from "normal" power to "emergency" power. Switching the load back to "normal" from "emergency" and stopping the genset shall be accomplished by manual control from the MGP-ATS or from the MGP-ATS remote control panel.
    c. Automatic mode: In this mode the transfer switch shall be fully automatic. The transfer switch shall be set for this mode. When "normal" power is of unacceptable quality, the genset shall automatically start, and the load shall be automatically switched to the genset. When the normal power returns to acceptable quality, the load shall be automatically switched to the normal power source.

2. MGP-ATS Remote control/monitor panel: The remote control/monitor panel shall be totally enclosed, NEMA 12 gasketed, and have predrilled wall mounted brackets. It shall be capable of satisfactory operation at any distance up to 300 meters (1000 feet) from the MGP-ATS/genset. All indicating light shall have a means to test for illumination. All devices mounted on the remote control panel shall be properly identified. The panel shall contain, but not be limited to the following:

    a. Genset running light.
    b. Genset failure light and audible alarm (common for all genset failures). After being illuminated, this light shall remain illuminated until it is manually reset at the genset. The audible alarm shall automatically silence after 15 seconds.
    c. A light to indicate that the transfer switch is in the "normal" position.
    d. A light to indicate that the transfer switch is in the "emergency" position.
    e. Remote START-STOP switch to manually START-STOP the genset.
    f. A three position switch (spring return to center "OFF") to effect the operation of the transfer switch to transfer the load from "normal" to "emergency" and from "emergency" to "normal."
    g. Voltmeter, 0 to 600 volt AC (digital or analog, as used on genset control panel).
    h. Seven position voltmeter selector switch connected, identified, and labeled to permit the voltmeter to display the genset phase-to-phase voltage, commercial power phase-to-phase voltage. The seventh position shall turn the voltmeter OFF.
    i. Terminal connection points shall be provided to facilitate interconnection between the MGP-ATS/genset.
    j. Frequency meter to read the frequency of the voltage selected.

3. Changes to genset and GP-ATS: When the MGP-ATS is specified, the genset and GP-ATS shall have interface connections as necessary to accommodate the remote control/monitor and MGP-ATS.

2.5 FINISHES

A. Enclosures: Manufacturer's standard enamel over corrosion-resistant pretreatment and primer.

2.6 SOURCE QUALITY CONTROL

A. Factory Test Components, Assembled Switches, and Associated Equipment: Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

PART 3 - EXECUTION

3.1 APPLICATION

A. Four-Pole Switches: Where four-pole switches are indicated, install neutral switching.

3.2 INSTALLATION

A. [Comply with mounting and anchoring requirements specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."]

B. Floor-Mounted Switch: Anchor to floor by bolting.

1. Concrete Bases: 100 mm (4 inches) high, reinforced, with chamfered edges. Extend base no more than 50 mm (2 inches) in all directions beyond the maximum dimensions of switch, unless otherwise indicated. Cast anchor-bolt inserts into bases. Comply with Section 033000 "Cast-in-Place Concrete."

C. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.

D. Identify components according to Division 26 Section "Identification for Electrical Systems."

3.3 WIRING TO REMOTE COMPONENTS

A. Match type and number of cables and conductors to control and communications requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Government if necessary to accommodate required wiring.

3.4 CONNECTIONS

A. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, pretest, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Testing Agency: Engage a qualified testing and inspecting agency to perform the following field tests and inspections and prepare test reports.

1. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.
2. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Section 7.22.3. Certify compliance with test parameters.
3. Measure insulation resistance phase-to-phase and phase-to-ground with insulation-resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.

    a. Check for electrical continuity of circuits and for short circuits.
    b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
    c. Verify that manual transfer warnings are properly placed.
    d. Perform manual transfer operation.

4. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.

    a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
    b. Simulate loss of phase-to-ground voltage for each phase of normal source.
    c. Verify time-delay settings.
    d. Verify pickup and dropout voltages by data readout or inspection of control settings.
    e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
    f. Perform contact-resistance test across main contacts and correct values exceeding 500 microohms and values for 1 pole deviating by more than 50 percent from other poles.
    g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

5. Ground-Fault Tests: Coordinate with testing of ground-fault protective devices for power delivery from both sources.

   a. Verify grounding connections and locations and ratings of sensors.
   b. Observe reaction of circuit-interrupting devices when simulated fault current is applied at sensors.

C. Coordinate tests with tests of generator and run them concurrently; see Section 263214 “Engine Generators.”

D. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.

E. Remove and replace malfunctioning units and retest as specified above.

3.6 CLEANING

A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean equipment internally, on completion of installation, according to manufacturer's written instructions.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Government maintenance personnel to adjust, operate, and maintain transfer switches and related equipment as specified below.

B. Coordinate with Project Director/COR and post Facility Manger to identify staff, including locally employed staff (LES) maintenance personnel, who may access transfer switches.

C. Coordinate this training with that for generator equipment.

D. Train Government maintenance personnel in the following:

1. Coordinate training on safety precautions and use of medium-voltage safety accessories with requirements in Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety” and Section 260573 “Overcurrent Protective Device Coordination Study.”

   a. De-energizing procedures to safely de-energize, isolate and lock-out the transfer switches prior to any maintenance or repair work. Standard Operating Procedures described in O&M Data Manual.

2. Features and construction of project equipment.

3. Routine testing and monitoring operations.
4. Interpretation of readings of indicating and alarm devices.
5. Routine inspection procedures.
6. Access control panel to maintain an operations log in accordance with procedures of OBO/OPS/FAC.
7. Remove and replace control panel or components.
8. Clean connections and conductors on basis identified by OBO/OPS/FAC considering input from manufacturer.
9. Review data in maintenance manuals, including written Standard Operating Procedures to (SOP) accomplish the above tasks.

E. Schedule training with Project Director/COR with at least seven days' advance notice.

END OF SECTION 263600

SECTION 264115 - LIGHTNING PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes lightning protection for all buildings on the site.

B. Related Sections include the following:

1. Section 260525 “Grounding and Bonding for Electrical Systems.”
2. Section 270526 “Grounding and Bonding for Communications Systems.”
3. Section 282305 "High-Definition Video System (HDVS)” for exterior mounted elements of the system.

1.2 SUBMITTALS

A. Product Data: For air terminals and mounting accessories.

B. Shop Drawings: Detail lightning protection system, including air-terminal locations, conductor routing and connections, and bonding and grounding provisions. Include indications for use of raceway, data on how concealment requirements will be met, and calculations required by NFPA 780 for bonding of grounded and isolated metal bodies.

C. Qualification data of Installer and of Special Inspector for firms and persons specified in the Article on QUALITY ASSURANCE to demonstrate their capabilities and experience. Include data on certification.

D. Rolling Sphere: Demonstrate (e.g., via computer model or calculations) compliance with NFPA 780 rolling sphere method. This requirement applies regardless of building height. Demonstrate that lightning protection is properly located to protect building.

E. Field inspection reports from Special Inspector indicating compliance with specified requirements.

F. Completion Certificate: UL Master Label Certificate.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: UL-listed installer, category OWAY.

B. Special Inspector: Experienced in performing special inspections for UL Master Label Certificate.

C. Certified System: System shall conform to complete design of UL Master Label Certified System.

D. Listing and Labeling: In accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input form OBO/PDCS/DE/EE, and marked for indicated use and installation conditions.

E. Lightning Protection shall conform to the requirements of the OBO Electrical Code.

1. System design shall be in accordance with NFPA 780, "Standard for the Installation of Lightning Protection Systems."
2. Conform to UL 96, "Standard for Lightning Protection Components."
3. Conform to UL 96A, "Installation Requirements for Lightning Protection System."

1.4 COORDINATION

A. Coordinate installation of lightning protection with installation of other building systems and components, including electrical wiring, supporting structures and building materials, metal bodies requiring bonding to lightning protection components, and building finishes.

B. Coordinate installation of air terminals attached to roof systems with roofing manufacturer and Installer.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. East Coast Lighting Equipment Inc.
2. ERICO International Corporation.
3. Harger
4. Heary Bros. Lightning Protection Co. Inc.
5. Independent Protection Co.
6. Preferred Lightning Protection
7. Robbins Lightning Inc.
8. Thompson Lightning Protection, Inc.
9. <**Insert manufacturer's name.**>

2.2 LIGHTNING PROTECTION SYSTEM COMPONENTS

A. Roof-Mounting Air Terminals: NFPA Class I, copper, solid or tubular, unless otherwise indicated.

B. Stack-Mounting Air Terminals: Stainless steel.

C. Ground Rods, Ground Loop Conductors, and Concrete-Encased Electrodes: Comply with Section 260525 "Grounding and Bonding for Electrical Systems" and with standards referenced in this Section.

D. Aluminum Conductors: Aluminum conductors are not permitted except at aluminum clad buildings, where applicable.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install lightning protection components and systems according to NFPA 780. Install conductors with direct paths from air terminals to ground connections. Avoid sharp bends and narrow loops.

B. Conductors Concealment:

1. Conceal the following conductor:

   a. System conductors.
   b. Down conductors.
   c. Interior conductors.
   d. Conductors within normal view from exterior locations at grade within 60 m of building.

2. Do not embed conductors in concrete surrounding PCC.
3. Notify Project Director/COR at least 48 hours in advance of inspection before concealing lightning protection components.

C. Cable Connections: Use approved exothermic-welded connections for all conductor splices and connections between conductors and other components, except those above single-ply membrane roofing.

D. Bond lightning protection components with intermediate-level interconnection loop conductors to grounded metal bodies of building at 18-m intervals.

3.2 CORROSION PROTECTION

A. **[XX]**.

B. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.

3.3 FIELD QUALITY CONTROL

A. Special Inspections: Engage qualified special inspector to perform the following special inspections:

1. Perform inspections as required to obtain a UL Master Label for system.
2. Special inspector shall prepare report and Certification.

END OF SECTION 264115

SECTION 264315 – SURGE PROTECTIVE DEVICES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes Surge Protective Devices (SPD) for low-voltage power, control, and communication equipment.

1. Transient Voltage Surge Suppression (TVSS) nomenclature has been superseded in industry and standards organizations by term Surge Protective Device (SPD). Therefore, throughout this specification, terminology will be displayed as SPD.

B. Provide SPD at each building service entrance switchgear, switchboard and at other panelboard locations as indicated on Drawings.

C. Related Sections include the following:

1. Section 260508 "Common Work Results for Electrical, Communications and Electronic Safety" for facility voltages.
1. Section 260518 "Low-Voltage Electrical Power Conductors and Cables."
2. Section 260525 "Grounding and Bonding for Electrical Systems."
3. Division 26 Section on raceways and boxes.
1. Section 260815 "Field Testing and Inspection of Electrical Systems."

1.2 REFERENCES

A. ANSI C84.1, "Electric Power Systems and Equipment – Voltage Ranges."

B. IEEE C62.41.1, "IEEE Recommended Practice for Surge Voltages in Low-Voltage AC Power Circuits."

C. IEEE C62.41.2, "IEEE Recommended Practice on Characterization of Surges in Low-Voltage (1000 V or less) AC Power Circuits."

D. IEEE C62.45, "IEEE Guide on Surge Testing for Equipment Connected to Low-Voltage Power Circuits."

E. IEEE Standard 1100 (Section 8.6.1), "IEEE Recommended Practice for Powering and Grounding Electronic Equipment."

F. UL 1283, "Electronic Interference Filters."

G. UL 1449, "Standard for Surge Protective Devices."

1.3 DEFINITIONS AND ACRONYMS

A. LED: Light Emitting Diode

B. TVSS: Transient Voltage Surge Suppressor

C. SPD: Surge Protective Device

D. VPR: Voltage Protection Ratings (UL 1449)

E. LTV: Let-Through Voltage

F. L-L: Line to Line

G. MCOV: Maximum Continuous Operating Voltage

H. In: Nominal Discharge Current. Peak value of current, selected by manufacturer, through SPD having current waveshape of 8/20 where SPD remains functional after 15 surges (UL 1449).

I. NRTL: Nationally Recognized Test Laboratory

J. Modes of Protection: Electrical paths where SPD offers defense against transient overvoltages (i.e., each line to neutral (L-N), line to ground (L-G), line to line (L-L), and neutral to ground (N-G)).

K. Type 2 SPD: Permanently connected SPDs intended for installation on load side of service equipment overcurrent device, including SPDs located at the branch panel (UL 1449).

1.4 SUBMITTALS

A. Product Data: List of SPD Models/Part Numbers submitted, including dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, finishes, and mounting arrangements.

B. Design Data: Report documenting line-by-line compliance with requirements of this Section.

C. NRTL file numbers that demonstrate listings/certification to UL 1449.

D. Certified test data documenting IEEE C62.41.2 performance, and ability of device to meet all requirements of this specification.

E. Laboratory test data, including actual test graphs, showing that maximum let through voltage does not exceed values shown in Table 2.2 on “SPD Ratings” in this Section. Submittals shall include test results as required in the Table.

F. Warranties: Special warranties specified in this Section.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: At least 10 years of engineering experience in design and manufacture of permanently connected SPD devices.

B. Manufacturer shall operate facility that is Quality System Certified manufacturing facility as ISO 9001 Compliant.

C. Installer Qualifications: Experienced installer of surge protective devices.

D. SPD devices shall be listed/certified in accordance with UL 1449 and shall have the UL Mark.

E. Source Limitations:

1. All SPD devices at service entrance shall be provided by same manufacturer.
2. All SPD devices at distribution panels shall be provided by same manufacturer.
3. All SPD devices at branch-panels shall be provided by same SPD manufacturer.

1.6 WARRANTIES

A. Manufacturer shall provide unlimited free replacement of the entire SPD (not just modules, components or sub-assemblies) for all SPD which cease to properly function (becomes inoperable, including LED outage) as a direct result of any electrical anomaly during the warranty period.

1. Warranty Period: 5 years from Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. AC Data Solutions
2. Advanced Protection Technologies
3. Control Concepts (IslaGuard Series) (Liebert Corporation)
4. Current Technology
5. Eaton Corporation
6. EFI Electronics Corporation (Square D)
7. Siemens
8. Surge Suppression Incorporated
9. Thor Systems

2.2 GENERAL REQUIREMENTS

A. For 3-phase, 4-wire, wye connected systems, both seven mode or ten mode devices are acceptable when conforming to all requirements of this Section. Ten mode with L-L protection is optional. If L-L directly connected suppression elements are provided, manufacturer shall provide L-L kA value in Table 2.2, "SPD Ratings."

B. SPD devices shall be designed for AC power systems with minimum of AC follow current after operation. These devices are listed/certified as stand-alone Type 2 SPDs that may be installed internal or external to electrical panel they are intended to protect. In addition, whether installed or external to panel, connect SPDs to a dedicated multi-pole circuit breaker. SPDs shall be of non-modular design.

C. Service ratings: Maximum continuous operating voltage shall be capable of sustaining 115 percent of RMS Site Utilization Voltage continuously without degrading.

D. SPD Ratings: SPD devices shall not exceed ratings listed in Table 264315 - 2.2 according to location category in which SPD is to be installed.

TABLE 2.2

SPD RATINGS

	SERVICE ENTRANCE >800 AMP	DIST. PANELS ≤800 AMP & >225 AMP	BRANCH PANELS ≤225 AMP
Peak Surge Current (kA Per Phase) Defined as: 7 mode: Sum of L-N plus L-G 10 mode: Sum of L-N plus L-G plus L-L	240kA (200kA Residential)	160kA (150kA Residential)	120kA (80kA Residential)
UL 1449 I nominal	20kA	10kA	10kA
UL 1449 SCCR	100kA	100kA	100kA
UL 1449 VPR L-N (230/400V)	1200V	1200V	1200V
UL 1449 VPR L-G (230/400V)	1200V	1200V	1200V
UL 1449 VPR N-G (230/400V)	1200V	1200V	1200V
UL 1449 VPR L-L (230/400V)	2500V	2500V	2500V

E. Modes:

1. SPD system shall provide protection circuitry for all modes found in electrical distribution system at point of SPD application. (e.g., 400/230V, 3-phase Wye, 4-wire plus ground system has ten distinct modes requiring protection). These modes are each line to neutral,

each line to ground, each line to line and neutral to ground. Protect minimum of seven of these modes using independent and dedicated suppression elements (i.e., L1-N, L2-N, L3-N, L1-G, L2-G, L3-G, N-G). The ten mode protection SPD shall employ independent and dedicated suppression elements to protect additional modes of L1-L2, L2-L3, L1-L3. For three phase Delta systems, there are six modes requiring protection. These modes are each line-to-line and each line-to-ground. Provide minimum of three dedicated, independent, distinct protection modes (L1-G, L2-G, L3-G).

F. Fusing:

1. SPD shall provide, as minimum, over-temperature protection in form of component-level thermal fusing to ensure safe failure and prevent thermal runaway. Surge protective devices shall contain short circuit current safety protection within each device, for over-current requirements of the OBO Electrical Code.
2. Fusing mechanisms employed shall effectively coordinate their performance in conjunction with Limited Current, Intermediate Current and Sort Circuit Current testing under UL 1449.
3. SPD shall be listed/certified at or above available fault current level at point of SPD application in accordance with UL 1449. SPD shall be marked with short circuit current rating. SPD short circuit rating shall be, as minimum, same rating as power distribution equipment to which it is connected.

G. Features:

1. Surge protective devices shall provide on-board visual status of their operational readiness by LED indicator lights. Indicator lights shall be visible from front of panelboard, switchboard, or switchgear without opening of enclosure or door.
2. Provide label, on either exterior of unit or on interior of unit enclosure door, that lists required safety agency listing information including but not limited to the following ratings:

   a. Short Circuit Current Rating.
   b. VPR Ratings.
   c. MCOV Ratings.
   d. In Ratings.
   e. Type 2 SPD.

H. Maintenance Restrictions:

1. Do not provide SPD suppression units which require scheduled preventive- maintenance or replaceable modules. Units requiring functional testing, special test equipment, or special training to monitor surge protective device (SPD) status are not permitted. SPD devices shall require no routine maintenance.

I. Enclosures:

1. Unless otherwise noted, SPD enclosure type shall match or exceed NEMA enclosure rating of equipment to which it is connected. Minimum NEMA 1 for indoor installations and NEMA 3R for exterior locations.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install surge suppressor to be installed at each building service entrance gear, at other locations (service entrance) where service encounters as it enters facility, and as otherwise indicated on Drawings. Install SPD devices at all distribution, branch and panelboard locations as indicated on Drawings. Conductor lead length shall not exceed 500 mm.

B. Surge protection devices shall be Type 2. Connect surge protection devices on load side of over-current protective device to which they are connected, in accordance with UL 1449. To comply with UL 96 Lightning Protection Master Label, Type 2 SPD for service entrance equipment are required to be rated minimum 20 kA nominal discharge current, irrespective of amperage categories listed in Table for "SPD Ratings" above.

C. Multi-Section Panelboards: In instances where there are multi-section panels located in a facility, panelboards shall conform to the following:

1. Two section panels shall receive one SPD device located in Section 1 of two section panel.
2. Three section panels shall receive two SPD devices, one in Section 1 and one in Section 3. This is only acceptable if panels are immediately adjacent from each other and are sub-fed from previous section.
3. Any panels 1, 2, or 3 sections that have direct feeders tapped before panels, or do not meet criteria above, shall have their own SPD device.

D. SPD marked L1, L2, L3, N, and GND, as applicable, shall be connected respectively to phases, neutral, and ground.

E. For mandatory disconnect purposes, connect SPD device via dedicated branch multi-pole, circuit breaker rated in accordance with requirements of the OBO Electrical Code for protection of conductors, unless noted otherwise. Use of bus-bar connected SPDs is prohibited. Accomplish device over-current protection in accordance with internal fusing requirements indicated above.

F. Location of SPD, whether internal or external to panelboard shall be chosen to minimize lead lengths between SPD and circuit breaker including neutral and ground to which it is connected. Route SPD device leads which are mounted external to panel within metal conduit when necessary (rigid nipple if possible), and keep as short and straight as possible and as close as possible to neutral bar, ground bar and circuit breaker lugs. Install the SPD on the load side of the main breaker to the first breaker(s) after the incoming main breaker. Wire size for leads shall be as specified by manufacturer, minimum size 6mm^2 (#10 AWG), maximum size 35mm^2 (#2 AWG). Wire length shall not exceed 500 mm unless approved in writing by Project Director/COR based on input from OBO/PDCS/DE electrical engineer.

G. Mount surge protective devices as follows:

1. Mount permanently-connected devices parallel to service, distribution, and sub panels.
2. Mount series-connected devices as required for individual equipment protection, and as indicated on Drawings.
3. Panelboards: SPD shall not be mounted above or below panelboards. Mounting shall be either integral to panelboard assemblies or mounted to side with minimal conductor length.

H. Visibility: Indication lighting (LED) shall be visible from front of panelboard, switchboard, or switchgear without opening of enclosure or door.

I. Install surge protective devices neatly. Bind phase, neutral, and ground conductors tightly over entire run, from suppressor to service panel, and use shortest length of connecting cable possible. Twisting (braiding) of conductor cables is required to reduce wire impedance.

J. Connect surge protector to grounding system.

K. Electrical installer shall verify proper application of SPD (e.g., voltage, phases). Electrical installers shall assure that all Neutral conductors are bonded to system ground at service entrance or serving isolation transformer prior to installation of associated SPD. Electrical installer shall ensure that neutral-to-ground bonds do not exist at locations that are not service entrances or newly derived power sources.

L. All labor required for, and incidental to, installation of SPD system components performed by electrical installer.

M. To ensure proper operation of SPD, connect devices to system with breaker in “OFF” position. Do not energize until approval of neutral and ground bonding is received from Project Director/COR based on input from OBO/PDCS/DE electrical engineer. Devices are frequently damaged during construction, and replacement of damaged devices that were energized without approval is at Contractor’s expense.

3.2 FIELD QUALITY CONTROL

A. Refer to Section 260815 “Field Testing and Inspection of Electrical Systems.”

3.3 DEMONSTRATION

A. Contractor shall train Government maintenance personnel in use and maintenance of SPD. Training may be performed by electrical subcontractor; it is not required that manufacturer’s representative perform training.

END OF SECTION 264315

SECTION 265105 - INTERIOR LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Interior LED lighting fixtures and LED Drivers.
2. Lighting fixtures mounted on exterior building surfaces.
3. Emergency lighting units.
4. Exit signs.
5. Accessories.

B. Related Sections include the following:

1. **[Division 23 Section on "Air Diffusers" for air handling light fixtures.]**
2. Division 26 Section “Vibration and Seismic Controls for Electrical Systems.”
3. Section 262725 "Wiring Devices" for manual wall-box dimmers for LED lamps.
4. Section 260924 "Lighting Control Devices" for automatic stand-alone control of lighting, including photoelectric relays, in-wall occupancy sensor switches, and multipole lighting relays and contactors.
5. Section 260934 "Centralized Dimming Controls" for architectural dimming systems, including occupancy sensors, multiple lighting controllers, and lighting control system software.

1.2 DEFINITIONS

A. CRI: Color rendering index.

B. CCT: Correlated color temperature.

C. CU: Coefficient of utilization.

D. DALI: Digital Addressable Lighting Interface

E. LER: Luminaire efficiency rating, which is calculated according to NEMA LE 5. This value can be estimated from photometric data using the following formula:

1. LER is equal to the product of total rated lamp lumens times BF times luminaire efficiency, divided by input watts.

F. LED: Light Emitting Diode

G. Lumen: Measured output of lamp and luminaire, or both.

H. Luminaire: Complete lighting unit, including lamp, reflector, and housing

I. RCR: Room cavity ratio.

J. RoHS: Restriction of Hazardous Substances Directive

K. CWA: Constant Wattage Autotransformer

1.3 PROHIBITED FIXTURE TYPES

A. The following fixture types are prohibited:

1. Incandescent fixtures.
2. Fluorescent fixtures.
3. High Intensity Discharge (HID) fixtures.

1.4 TECHNOLOGY RESTRICTIONS

A. In accordance with Chapter 1 of the OBO Electrical Code, LED drivers using Near Field Communication (NFC) for configuration is prohibited.

1.5 SUBMITTALS

A. Product Data: For each type of lighting fixtures, arranged in order of fixture designation. Include data on features, accessories, finishes, and the following:

1. Arranged in order of luminaire designation
2. Material and physical (configuration) description of lighting fixture including dimensions.
3. Include data on features, accessories, and finishes.
4. Emergency lighting units including battery and charger.
5. Energy-efficiency data.

6. [Air-Handling Lighting Fixtures:

a. Air and Thermal Performance Data: Furnish data required in Article on SUBMITTALS in Division 23 Section on "Air Diffusers."
b. Sound Performance Data: Indicate sound power level and sound transmission class in test reports certified according to standards in Article on SUBMITTALS in Division 23 Section on "Air Diffusers."]

7. General Data: Life expectancy, output (lumens, CCT, and CRI), and Color Temperature (Kelvin).
8. Photometric data, in IESNA format, based on certified results of laboratory tests of each lighting fixture type, outfitted with light bars, drivers, and accessories identical to those indicated for the lighting fixture as applied in this Project.

a. For indicated fixtures, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining fixtures shall be certified by the manufacturer in accordance with IES LM-79 and LM-80 for solid state lighting.

9. Low Voltage Transformers.
10. LED power supplies.

B. Shop Drawings:

1. Show details of nonstandard or custom lighting fixture.
2. Indicate dimensions, weights, methods of field assembly, components, features, and accessories.
3. Mounting details and seismic bracing
4. For modified luminaries or linear luminaries mounted in continuous rows, submit scaled drawings prepared by the manufacturer showing details if construction, lengths in runs, pendant or power feed locations, accessories, finishes, and lists of materials.
5. Include wiring Diagrams: Power and control wiring.

C. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Lighting fixtures.
2. Suspended ceiling components.
3. Structural members to which suspension systems for lighting fixtures will be attached **[including seismic strengthening]**.
4. Other items in finished ceiling including the following:

a. Air outlets and inlets.
b. Speakers.
c. Sprinklers.
d. Smoke and fire detectors.
e. Occupancy sensors.
f. Photosensors
g. Access panels.
h. **[Insert item.]**

5. Perimeter moldings.

D. Samples for Verification: Interior lighting fixtures designated for sample submission in Interior Lighting Fixture/Luminaire Schedule. Each sample shall include the following:

1. LED Driver.
2. Accessories: Cords and plugs.

E. Product Certificates: For each type of LED driver, signed letter on company letterhead stating that NFC is not used or has been permanently disabled by product manufacturer.

F. Seismic Qualification Data: For luminaires, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Qualification Data: For agencies providing photometric data for lighting fixture.

H. Field quality-control test reports.

I. Warranties: Submit two copies of each warranty conforming to warranty requirements of this Section.

J. Operation and Maintenance Data: For lighting equipment, controls and fixtures, including emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA, and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or the National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

C. [FMG Compliance: Fixtures and electrical devices for hazardous locations shall be listed and labeled for indicated class and division of hazard by FMG.]

D. Mockups: Provide lighting fixtures and mounting mockups, with one mockup for each combination of fixture and mounting. Install fixtures for mockups with power and control connections.

1. Obtain Project Director/COR’s approval of fixture for mockups before starting installations.
2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
3. Approved fixtures in mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 COORDINATION

A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

B. Recessed lighting fixtures shall have frames that are compatible with ceiling system indicated on Architectural drawings.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. LED Fixtures: 10 for every 100 of each type and rating installed. Furnish at least one of each type.
2. Diffusers and Lens: One per every 100 of each type and rating installed. Furnish at least one of each type.
3. Batteries: Five for every 100 of each type installed.
4. Chargers: One for every 100 of each type installed.
5. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least one of each type.

1.9 WARRANTY

A. Warranty for Fixtures and Drivers:

1. Manufacturer’s standard form in which manufacturer agrees to repair or replace fixtures or components that fail in materials or workmanship within specified warranty period.
2. Failure includes:

   a. Substantial deterioration such as blistering, cracking, peeling, chalking, or fading.
   b. Operational failure of LED drivers.
   c. Defective or non-starting of more than 10 percent of LED sources in individual lightbar or subassembly(s); lightbar or subassembly(s) shall be replaced.

3. Warranty Period: 10 years from date of Substantial Completion.

B. Special Warranty for Emergency Lighting Batteries. Manufacturer's standard form in which manufacturer of battery-powered emergency lighting unit agrees to repair or replace components of rechargeable batteries that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Self-Powered Exit Sign Batteries: Five years from date of Substantial Completion. Full warranty shall apply for first year and prorated warranty for the remaining four years.

PART 2 - PRODUCTS

2.1 FIXTURES AND COMPONENTS, GENERAL

A. Furnish fixtures of type, kind, and with the type of LED driver as indicated in Lighting Fixture/Luminaire Schedule, on Drawings, and as specified herein.

B. Lighting fixtures shall be free of light leaks, warps, dents, or other irregularities. Lenses shall be free of cracks, chips, or discolorations.

C. Metal surfaces of lighting fixtures shall be bonderized, galvanized, or sheradized after fabrication and treated to provide rust inhibiting and finish coat adherence properties.

D. Fixtures installed where exposed to weather and/or cold temperatures shall be weatherproof and suitable for efficient operation at temperatures and conditions encountered.

E. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.

F. LED Fixtures:

1. Comply with UL 1598. Color temperature shall match all interior spaces (plus or minus 200K).
2. LED Cove Light Fixtures: Fixtures shall be designed to house LEDs and optical assembly as well as to provide required thermal management properties for highest wattage solution available. Junction temperature shall not exceed 80 degrees C. These light fixtures shall be pre-wired and pre-assembled. Electronic drivers (power supplies) shall be integral within sheet metal wireway housing. Power consumption for standard LED is 12 watts/ft maximum, and for high output LED is 17.8 watts/ft maximum.
3. Tunable White LED fixtures: Use DALI Addressable LED drivers to control CCT and intensity separately. CCT should be between 2700K to 5000K at a minimum.

G. Metal Parts: Free of burrs, sharp corners, and edges. Intersections and joints shall be formed true and of adequate strength and structural rigidity to prevent any distortion after assembly.

H. Sheet Metal Components: Steel, unless otherwise indicated. Form and support to prevent warping and sagging. Fixtures to be painted after fabrication.

I. Doors, Frames, and Other Internal Access: Smooth operating, and free of light leakage under operating conditions. Design to permit relamping without use of tools. Design to prevent doors, frames, lenses, diffusers, and other components from falling accidentally either during relamping and or when secured in operating position. Safety devices shall be detachable if necessary and shall not interfere with fixture performance, maintenance or the seating of any lighting element, nor shall it be visible during normal fixture operation and from normal viewing angles.

J. Lighting fixtures provided shall have means for disconnection from power source during service, as required in NEC Article 410.

K. Lighting fixture drivers shall meet NEMA 410 (current revision) requirements for the Performance Testing for Lighting Controls and Switching Devices with Electronic Drivers and Discharge Ballasts.

L. Reflecting surfaces shall have minimum reflectance as follows, unless otherwise indicated:

1. White Surfaces: 85 percent.
2. Specular Surfaces: 83 percent.
3. Diffusing Specular Surfaces: 75 percent.
4. Laminated Silver Metallized Film: 90 percent.

M. Plastic Diffusers, Covers, and Globes:

1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

   a. Lens Thickness: At least 3.2 mm minimum unless different thickness is scheduled.
   b. Lenses shall have uniform brightness throughout the entire visible area without LED pixilation.
   c. UV stabilized.

2. Glass: Annealed crystal glass, unless otherwise indicated.

N. Damp or Wet listing as applicable

O. [Air-Handling LED Fixtures: For use with plenum ceiling for air return and heat extraction and for attaching an air-diffuser-boot assembly specified in Division 23 Section on "Air Diffusers."

1. Air Supply Units: Slots in one or both side trims join with air-diffuser-boot assemblies.
2. Heat Removal Units: Air path leads through lamp cavity.
3. Combination Heat Removal and Air Supply Unit: Heat is removed through lamp cavity at both ends of fixture door with air supply same as for air supply units.
4. Dampers: Operable from outside fixture for control of return-air volume.
5. Static Fixture: Air supply slots are blanked off, and fixture appearance matches active units.]

2.2 LED LIGHTING FIXTURES AND DRIVERS

A. All LED lighting fixtures:

1. Comply with IES LM-79-08, Approved method for measuring lumen maintenance of LED light sources.
2. Comply with IES LM-80-08, Approved method for electrical and photometric measurement of SSL product.
3. Fixtures shall comply with RoHS restrictions.

4. LED arrays shall be sealed, high performance, long life type; minimum 70 percent rated output at 50,000 hours in accordance with IES L70.
5. Fixtures shall deliver minimum of 80 lumens per watt.

    a. LEDs shall be “Bin No. 1” quality.

6. Fixtures shall have internal thermal protection.
7. Fixtures shall not draw power in off state. Fixtures that are individually addressable with external control and intelligence (DALI) are exempt from this requirement; however, power draw for these cannot exceed 0.5 watts when in off state.
8. Indoor fixtures shall have minimum CRI of 85.
9. Fixtures shall be fully accessible from below ceiling plane for changing drivers, power supplies and arrays.

B. Power Supplies and Drivers

1. Designed for 10 year operational life while operating at maximum case temperature and 90 percent non-condensing relative humidity.
2. Comply with RoHS restrictions.
3. Power Factor: 0.90 or higher
4. Maximum driver case temperature shall not exceed driver manufacturer recommended in-situ operation.
5. These components shall be designed and tested to withstand electrostatic discharges without impairment; testing shall be in accordance with IEC 61000-4.2.
6. UL 8750 recognized or listed as applicable.
7. Surge Tolerance: Designed and tested to withstand surges of 4,000V in accordance with to IEEE C41.2 without impairment of performance.
8. Class A sound rating; inaudible in a 27 dBA ambient.
9. Interference: EMI and RFI shall conform to FCC 47 CFR Part 15.
10. Total Harmonic Distortion Rating: Less than 20 percent; comply with ANSI C82.11.
11. Conform to electrical and thermal conditions as described in IES LM-80 Section 5.0.
12. Fully Dimmable: Refer to Fixture Schedule on Drawings for required dimming range.
13. No visible change in light output shall be evident with variation of plus or minus 10 percent line voltage input.
14. Drivers shall track evenly across multiple lamp lengths and all light levels.
15. Refer to Article on TECHNOLOGY RESTRICTIONS regarding prohibition of NFC for driver configuration.

2.3 LED ARRAYS

A. All LEDs of same type shall be provided by same manufacturer.

B. Equip each lighting fixture with proper LED array of type indicated or specified in Fixture Schedule.

2.4 EXIT SIGNS

A. Description: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, conform to Codes of OBO.

B. Internally Lighted Signs:

1. Lamps for AC Operation: LEDs, 70,000 hours minimum rated lamp life.
2. Self-Powered Exit Signs (Battery Type): Integral automatic charger in a self-contained power pack.

a. Battery: Sealed, maintenance-free, nickel-cadmium type, two hour capacity sealed.
b. Charger: Fully automatic, solid-state type with sealed transfer relay.
c. Operation: Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
d. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
e. LED Power Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.

1) Remote Test Capability: To facilitate Code required testing of exit signs, provide switch in hand-held remote device which can be aimed in direction of tested unit to initiate coded infrared signal. Factory install infrared receiver inside fixture. Signal reception by infrared receiver in tested unit shall trigger simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response. Basis of Design: Bodine RCT series.

f. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and flashing red LED.

3. Master/Remote Sign Configurations:

a. Master Unit: Comply with requirements above for self-powered exit signs, and provide additional capacity in LED power supply for power connection to remote unit.
b. Remote Unit: Comply with requirements above for self-powered exit signs, except omit power supply, battery and test features. Arrange to receive full power requirements from master unit. Connect for testing concurrently with master unit as a unified system.

2.5 EMERGENCY LIGHTING UNITS

A. Description: Self-contained units complying with UL 924.

1. Battery: Sealed, maintenance-free, lead-acid type.
2. Charger: Fully automatic, solid-state type with sealed transfer relay.
3. Lamping: LED
4. Operation: Relay automatically turns lamp on when power supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep-discharge level. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
5. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
6. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.

7. Wire Guard: Heavy-chrome-plated wire guard protects lamp heads or fixtures.

2.6 LIGHTING FIXTURE SUPPORT COMPONENTS

A. Comply with Division 26 Section "Vibration and Seismic Control for Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.

B. Single-Stem Hangers: 13-mm (0.5 inch) steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.

C. Twin-Stem Hangers: Two, 13-mm (0.5 inch) steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.

D. Wires:

1. ASTM A 641/A 641M "Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire, Class 3, soft temper, zinc-coated steel**,** 2.7 mm (12 gage).
2. BS EN 10244-2:2001 "Steel Wire & Wire Products- Non-Ferrous Metallic Coatings on Steel Wire – Part 2 Zinc or Zinc Alloy."
3. ISO 7989:1988 "Zinc Coatings for Steel Wire."

E. [Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 2.7 mm (12 gage).]

F. Rod Hangers: 5-mm (3/16 inch) minimum diameter, cadmium-plated, threaded steel rod.

G. Hook Hangers: Integrate assembly matched to fixture and line voltage, and equip with threaded attachment, cord, and locking-type plug.

H. Aircraft Cable Support: Use cable, anchorages, and intermediate supports recommended by fixture manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General

1. Completely connect and securely mount lighting fixtures. Provide supports and hangers as necessary to securely fasten and support lighting fixtures.

   a. Confirm weight and mounting method of all lighting fixtures prior to ordering fixtures and ensure suitable support. Coordinate with General Contractor for lighting fixtures that require additional blocking support.
   b. Where conflicts are identified in the field, refer to coordination drawings (see Article on SUBMITTALS) and architectural reflected ceiling plans for coordination of lighting fixture locations with mechanical, fire protection, lighting controls, and fire safety equipment. Coordinate through General Contractor with Architect, Engineer, and Lighting Designer, and submit proposed resolutions to Project Director/COR prior to installing any of the Systems.

2. Install lighting fixtures plumb and true, and square with ceilings and walls, and secure in accordance with manufacturer's written instructions and approved submittal materials, unless otherwise indicated. Install continuous rows of fixtures such that rows appear as continuous system without visible vertical or horizontal undulation.
3. Hang pendant fixtures plumb, and with no "kinks" in pendants or cable.
4. Verify the types needed for various ceiling conditions. Provide plaster rings where necessary for installation.
5. Piercing of metal decking for lighting fixture support is not permitted.
6. Securing fixtures to ductwork or other systems is not permitted.
7. Wire in accordance with requirements of branch circuit installation. Properly ground each lighting fixture.

B. Support for Lighting Fixtures in or on Grid-Type Suspended Ceilings: Use grid for support.

1. Install minimum of four ceiling support system rods or wires for each lighting fixture. Locate supports not more than 150 mm from fixture corners.
2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each lighting fixture corner with clips that are UL listed for the application.
3. Lighting Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans, or otherwise center in acoustical panel, and support fixtures independently with at least two 20-mm metal channels spanning and secured to ceiling tees. In addition, provide slack earthquake safety wire hangars secured diagonally from opposite fixture corners to structural members, or structural slab, above suspended ceiling.

4. [Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of lighting fixture at safety factor of 3.]

C. Suspended Lighting Fixture Support:

1. Pendants and Rods: Where longer than 1200 mm, brace to limit swinging.
2. Stem-Mounted, Single-Unit Lighting Fixture: Suspend with twin-stem hangers.
3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of lighting fixture chassis, including one at each end.
4. Do not use grid as support for pendants. Connect support wires or rods to building structures.
5. All power feeds shall originate from the same location/end of each run.
6. Where pendants or rods are longer than 122cm (42in), brace to limit fixture swinging.

D. Air-Handling Lighting Fixtures: Install with dampers closed and ready for adjustment.

3.2 FIELD QUALITY CONTROL

A. Inspect each installed fixture for damage. Replace damaged fixtures and components.

B. Verify normal operation of each fixture after installation. Ensure dimming is from 100 percent to minimum lighting intensity as defined on the Fixture Schedule. Dimming shall be continuous and flicker-free.

C. Replace all inoperable LED arrays at the end of construction prior to OBO beneficial occupancy.

D. Malfunctioning Lighting Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.

E. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify normal transfer to battery power source and retransfer to normal.

F. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.3 CLEANING AND ADJUSTING

A. Remove protective plastic covers from lighting fixtures and fixture diffusers only after construction work, painting, and clean-up are completed. Remove, clean, and reinstall all dirty reflectors and diffusers.

B. Adjust aimable lighting fixtures to provide required light intensities. Securely lock aimable lighting fixtures in place after acceptable aiming.

C. Clean lighting fixtures internally and externally after installation. Remove construction dirt, dust, paints, and otherwise leave fixtures and lamps in clean and ready condition upon project closeout. Use methods and materials recommended by manufacturer for cleaning Alzak reflectors and other surfaces.

D. Lighting fixtures, reflectors, louvers, and accessories which are damaged, blemished, or impregnated with fingerprints shall be replaced at this Contractor's expense. All finishes shall be unmarred upon Project completion.

END OF SECTION 265105

SECTION 265554 – UNDERCARRIAGE VEHICLE INSPECTION LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Resin-encased linear light emitting diode (LED) lighting system, installed as in-ground uplighting within vehicle traffic lane, to assist with undercarriage inspection.

1.2 SUBMITTALS

A. Product Data: For lighting system specified in this Section, including associated components and accessories. Include data on features, accessories, finishes, and the following:

B. Shop Drawings: Submittals shall contain sufficient installation and schematics to clearly describe system apparatus and installation procedures. Clearly identify all conduit runs, LED lengths, and power supply locations based on Construction Documents.

1. Wiring Diagrams: Power and control wiring.
2. Load Profile: Instantaneous and continuous loads at high/low output.
3. Lumen output: Identified light output at measured distances.

C. Installation Manuals: For lighting and associated power supply.

D. Operation and Maintenance Data: For lighting system and associated power supply. Include emergency, operation, and maintenance procedures.

E. Warranty: Special warranty specified in this Section.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100 by testing agency acceptable to Project Director/COR and marked for intended use.

B. Engage a company that specializes in manufacturing of lighting system identified in this Section with a minimum of three years' experience.

C. Installer: Minimum of five years installation experience of similar equipment such as up-lights in vehicle traffic areas.

D. Comply with IEEE C2, "National Electrical Safety Code."

1.4 DELIVERY, STORAGE, AND HANDLING

A. Store lighting system components in manner to prevent distortion, damage or discoloration to lighting strips.

B. Retain factory-applied wrappings on LED components until immediately before installation.

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of lighting system, including power supply, that fail in materials or workmanship; corrode; or fade, stain, or chalk due to effects of weather or solar radiation within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.
2. Warranty excludes lamps, ballast, and fuses. Warranty excludes lightning damage, hail damage, solar flares, acts of war, vandalism, abuse, and unauthorized repairs or alterations.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Permanently installed in-ground uplighting system using resin-encased linear light emitting diodes (LED).

B. Illumination: Provide 120 deg. Output patter with uniform light devoid of obscuring shadows and capable of delivering minimum 654 lux (60 foot candles) at 300 mm (12 inches) above road surface. Length of lighting section shall approximately match length of sally port. Provide two settings of light levels, with one higher than the minimum levels identified above.

C. Color Temperature: 6000-7000 deg. K.

D. Environmental Resistance: Utilize flexible resin material to provide U.V. and oxidation resistance, natural hydrophobic and weather resistance, while keeping present water clear to prevent loss of illumination.

1. Encasement: Encase ground level lighting system components with cast flexible resin.

E. Low Voltage Wiring: Provide minimum 15 meters (50 ft) length from lighting to power supply, including portions embedded within resin casing. Include redundancy in wiring to prevent outages.

2.2 BASIS OF DESIGN

A. Resin-Encased Linear Light Emitting Diodes (LED): Delta Scientific UVLS100.

2.3 LED SYSTEM

A. Provide system conforming to requirements identified in Article on SYSTEM DESCRIPTION.

2.4 POWER SUPPLY

A. Power supply shall be sized to provide power for light output requirements identified in Article on SYSTEM DESCRIPTION.

B. Enclosure: Rigidly formed enclosure that will not warp, sage, or deform in use. NEMA Type 4 enclosure.

C. Power System: Universal power supply, 100-240 VAC, 50/60 Hz input at 2 amps, **[277 VAC at 0.68 amps.]**

2.5 ACCESSORIES

A. Installation Accessories:

1. Sealant: Lighting manufacturer recommended outdoor-rated, self-leveling sealant.

B. Inspection Accessories:

1. Two trapezoidal-shaped under-vehicle search mirrors with replaceable mirror face.
2. One linear over-vehicle extension search mirror with LED strip illumination.
3. One fiber-optic hand-held inspection wand with 360 degree illumination capability.

2.6 FACTORY QUALITY CONTROL

A. LEDs and power supply shall pass full functionality inspection by lighting manufacturer prior to shipment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check critical dimensions for accuracy against accepted shop drawings.

3.2 PREPARATION

A. Site Preparation: Saw cut area or block out area in concrete construction for lighting system prior to installation of lighting system components.

3.3 INSTALLATION

A. General Installation: Comply with manufacturer's installation instructions.

B. Install two LED lighting strips and one power supply as indicated in Drawings and conforming to requirements in Article on SYSTEM DESCRIPTION. Center lighting system in sallyport. Provide 800 millimeter (31.5 inch) center-to-center spacing between two lighting strips.

C. Place underground and above-grade conduits prior to installation of lighting system components. Seal conduit to prevent entrance of water, and to prevent passage of air and thus prevent condensation.

3.4 FIELD QUALITY CONTROL

A. Inspection: Prior to field testing, Contractor shall inspect the following, and perform field adjustments accordingly consistent with requirements of this Section:

1. Inspect each installed fixture for damage. Replace damaged fixtures and components.
2. Inspect LEDs for light output, and evenness of light throughout its length.
3. Inspect quality of resin pour encasement.
4. Inspect Operations: Verify high/low operation of lighting units after installing encased LEDs and energizing circuits with normal power source. Verify operation of photoelectric controls.

B. Field Testing: Upon completion of construction, Contractor shall field test each traffic lane lighting system. Test shall include electrically turning system on/off and testing two levels of lighting. Contractor shall furnish all test equipment, make necessary corrections and adjustments prior to test witnessed by Project Director/COR.

1. Include measurement of light intensities at night. Use lux/foot candle meter or equivalent with calibration referenced to NIST standards. Light system must provide minimum of 645 lux (60 foot candles) of evenly distributed light at 300 mm (12 inches) above vehicle undercarriage.
2. Any conditions that interfere with proper operation of lighting system disclosed by test shall be corrected at no additional cost to the Government. After adjustments are made to assure correct functioning of components, applicable tests shall be completed, including repeating previous tests where test results require adjustments.

3.5 DEMONSTRATION

A. General: Factory-authorized representative shall train Government maintenance personnel to adjust, operate, and maintain lighting system devices and associated power supply.

END OF SECTION 265554

SECTION 265600 - EXTERIOR LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Exterior luminaires with lamps and ballasts but not mounted on exterior surfaces of buildings.
2. Luminaire-mounted photoelectric switches.

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete.”
2. Section 265105 "Interior Lighting" for exterior luminaires normally mounted on exterior surfaces of buildings.
3. Section 265554 “Undercarriage Vehicle Inspection Lighting” for separate exterior lighting system.
4. Section 282305 “Security Video System (SVS).”

1.2 DEFINITIONS

A. CRI: Color rendering index.

B. HID: High-intensity discharge.

C. LED: Light-Emitting Diode.

D. Luminaire: Complete lighting fixture, including ballast housing if provided.

E. Pole: Luminaire support structure, including tower used for large area illumination.

F. Standard: Same definition as "Pole" above.

1.3 SUBMITTALS

A. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, finishes, and the following:

1. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters.
2. Details of attaching luminaires and accessories.
3. Details of installation and construction.
4. Luminaire materials.

5. Photometric data based on laboratory tests of each luminaire type, complete with indicated lamps, ballasts, and accessories.

    a. For indicated luminaires, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining luminaires shall be certified by manufacturer.
    b. Photometric data shall be certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.

6. TM-21 report data.
7. Photoelectric relays.
8. Ballasts, including energy-efficiency data.
9. Lamps, including life, output, and energy-efficiency data.
10. Materials, dimensions, and finishes of poles.
11. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
12. Anchor bolts for poles.
13. Manufactured pole foundations.

B. **[Manufacturer's standard color chart for aluminum finishes.]**

C. Shop Drawings:

1. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
2. Design calculations, certified by a qualified professional engineer, indicating strength of screw foundations and soil conditions on which they are based.
3. Wiring Diagrams: Power and control wiring.
4. **[Seismic restraints.]**

D. Factory Test Data:

1. Manufacturer shall submit proof of IK10 rating for housing assembly.
2. Manufacturer shall submit proof of IK10 rating or greater for optics against mechanical impact (excluding decorative post top fixtures)

E. **[Seismic Design: Qualification data, design data, and calculations.]**

F. Soil tests reports for lighting poles.

G. Pole and Support Component Certificates: Signed by manufacturers of poles, certifying that products are designed for indicated load requirements in AASHTO LTS-4-M and that load imposed by luminaire has been included in design.

H. Field quality-control test reports.

1. Photometric test reports to demonstrate conformance with Appendix B of the Zoning Code of Overseas Buildings Operations. Submit separate report for LED lamps.

I. Operation and Maintenance Data: For luminaires poles to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

B. FMG Compliance: Fixtures for hazardous locations shall be listed and labeled for indicated class and division of hazard by FMG.

C. Comply with IEEE C2, "National Electrical Safety Code."

D. Manufacturer Qualifications: Luminaire manufacturer needs to demonstrate in excess of 30 years of experience in manufacturing outdoor luminaires and 10 years of experience in manufacturing LED luminaires and controls.

1.5 DELIVERY, STORAGE, AND HANDLING

A. **[Package aluminum poles for shipping according to ASTM B 660.]**

B. Store poles on decay-resistant-treated skids at least 300 mm (12 inches) above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

C. Retain factory-applied pole wrappings on metal poles until right before pole installation.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Lamp Fixture: Ten for every 100 of each type and rating installed. Furnish at least one of each type.
2. Glass and Plastic Lenses, Covers, and Other Optical Parts: One for every 100 of each type and rating installed. Furnish at least one of each type.
3. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
4. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.
5. Batteries: Five for every 100 of each type installed.
6. Chargers: One for every 100 of each type installed

PART 2 - PRODUCTS

2.1 PERFORMANCE STANDARDS OF SITE LIGHTING

A. Site lighting shall conform to requirements in Chapter 8 of the Zoning Code of Overseas Buildings Operations.

B. Corrosion Resistance for Lighting Poles:

1. Low or Moderate Atmospheric Corrosivity: Steel or aluminum poles.
2. Extreme Atmospheric Corrosivity: Prestressed concrete poles
3. Wood poles are not permitted.

2.2 STRUCTURAL ANALYSIS CRITERIA FOR POLE SELECTION

A. Dead Load: Weight of luminaire and its horizontal and vertical supports, and supporting structure, applied as stated in AASHTO LTS-4-M.

B. Live Load: Single load of 2200 N (500 lbf), distributed in accordance with AASHTO LTS-4-M.

C. **[Ice Load: Load of 0.15 kN/m^2 (3 lbf/sq. ft.), applied in accordance with AASHTO LTS-4.]**

D. Wind Load: Pressure of wind on pole and luminaire, calculated and applied as stated in AASHTO LTS-4 and as determined by analysis of local conditions.

1. Wind speed for calculating wind load for poles exceeding 15 m in height is **[50 m/s (110 mph)]**.
2. Wind speed for calculating wind load for poles 15 m in height or less is **[50m/s (110 mph)]**.

E. **[Seismic Resistance: Poles installed in areas requiring seismic bracing shall have bracing designed in accordance with the Building Code of Overseas Buildings Operations. Seismic restraints shall be designed by a professional engineer.**

1. **Seismic Influences: Increase the strength of mounting or supporting components or add seismic restraints, or both, to improve resistance to failure due to flexure, separation of poles from foundations, or separation of lighting fixtures from mountings.]**

2.3 PERFORMANCE REQUIREMENTS OF LIGHTING POLES

A. Delegated Design: Engage a qualified professional engineer, to design pole foundation and pole power system.

B. **[Seismic Performance: Foundation and pole shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.]**

1. The term "withstand" means "the system will remain in place without separation of any parts when subjected to the seismic forces specified."
2. Component Importance Factor: **[1.0]**.

3. <**Insert requirements for Component Amplification Factor and Component Response Modification Factor**>.

C. Structural Characteristics: Comply with AASHTO LTS-6-M.

D. Dead Load: Weight of luminaire and its horizontal and vertical supports, lowering devices, and supporting structure, applied according to AASHTO LTS-6-M.

E. **[Ice Load: Load of 145 Pa (3 lbf/sq. ft.), applied according to AASHTO LTS-6-M for applicable areas on the Ice Load Map.]**

F. Wind Load: Pressure of wind on pole and luminaire, calculated and applied according to AASHTO LTS-6-M.

1. Basic wind speed for calculating wind load for poles exceeding 15 m (50 feet) in height is **[45 m/s (100 mph)][40 m/s (90 mph)] Insert value from AASHTO LTS-6-M for this Project>.**

   a. Wind Importance Factor: [**1.0**] <**Insert value from AASHTO LTS-6-M**>.
   b. Minimum Design Life: 50 years.
   c. Velocity Conversion Factor: [**1.0**] <**Insert value from AASHTO LTS-6-M**>.

2. Basic wind speed for calculating wind load for poles 15 m (50 feet) high or less is [**45 m/s (100 mph)**] [**40 m/s (90 mph)**] <**Insert value from AASHTO LTS-6-M for this Project**>.

   a. Wind Importance Factor: [**1.0**].
   b. Minimum Design Life: 50 years.
   c. Velocity Conversion Factor: [**1.0**] <**Insert value from AASHTO LTS-6-M**>.

G. Strength Analysis: For each pole, multiply the actual Effective Projected Area (EPA) of luminaires and brackets by a factor of [**1.1**] <**Insert number**> to obtain the EPA to be used in pole selection strength analysis.

H. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.

2.4 NON-LED LUMINAIRES, GENERAL REQUIREMENTS

A. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.

B. Comply with IES RP-8 18 for parameters of lateral light distribution patterns indicated for luminaires.

C. Metal Parts: Free of burrs and sharp corners and edges.

D. Sheet Metal Components: Corrosion-resistant aluminum, unless otherwise indicated. Form and support to prevent warping and sagging.

E. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.

F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions. Design to prevent doors, frames, lenses, diffusers, and other components from falling accidentally either during maintenance or when secured in operating position. Design to disconnect ballast when door opens.

G. Exposed Hardware Material: Stainless steel 316 SS minimum.

H. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

I. Light Shields: Metal baffles, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.

J. Reflecting surfaces shall have minimum reflectance as follows, unless otherwise indicated:

1. White Surfaces: 85 percent.
2. Specular Surfaces: 83 percent.
3. Diffusing Specular Surfaces: 75 percent.

K. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.

L. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or SSPC-SP 8, "Pickling."
2. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.

a. Color to match poles.

M. **[Factory-Applied Finish for Aluminum Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.**

1. **Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.**
2. **[Class I, Clear-Anodic Finish: AA-M32C22A41 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker), complying with AAMA 611.]**
3. **[Class I, Color-Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker), complying with AAMA 611.]**

    a. **Color to match poles.]**

2.5 FLUORESCENT BALLASTS AND LAMPS

A. Low-Temperature Ballast Capability: Rated by its manufacturer for reliable starting and operation of indicated lamp(s) at temperatures minus 30 deg C and higher.

B. Ballast Characteristics:

1. Power Factor: 90 percent, minimum.
2. Electromagnetic Ballasts: Comply with ANSI C82.1, energy-saving, high power factor, Class P, automatic-reset thermal protection.
3. Case Temperature for Compact Lamp Ballasts: 65 deg C, maximum.
4. Transient-Voltage Protection: Comply with IEEE C62.41 and IEEE C62.41.2 Category A or better.

C. Low-Temperature Lamp Capability: Rated for reliable starting and operation with ballast provided at temperatures minus 30 deg C and higher.

D. Fluorescent Lamps: Low-mercury type. Comply with the EPA's toxicity characteristic leaching procedure test; shall yield less than 0.2 mg of mercury per liter when tested according to NEMA LL 1.

E. Compact Fluorescent Lamps: CRI 80 (minimum), color temperature 3500 K, averaged rated life of 10,000 hours at 3 hours operation per start, unless otherwise indicated.

1. T4, Double-Twin Tube: Rated 18 W, 1200 initial lumens (minimum).
2. T4, Double-Twin Tube: Rated 26 W, 1800 initial lumens (minimum).

2.6 HIGH-INTENSITY-DISCHARGE LAMP BALLASTS

A. General: Comply with NEMA C82.4 and UL 1029. Shall include the following features, unless otherwise indicated:

1. Type: Constant-wattage autotransformer or regulating high-power-factor type.
2. Minimum Starting Temperature: Minus 30 deg C for single-lamp ballasts.
3. Normal Ambient Operating Temperature: 50 deg C.

4. Open-circuit operation will not reduce average life.
5. Ballast Fuses: One in each ungrounded power supply conductor. Voltage and current ratings as recommended by ballast manufacturer.

B. Auxiliary, Instant-On, Quartz System: Automatically switches quartz lamp on when fixture is initially energized and when momentary power outages occur. Automatically turns quartz lamp off when high-intensity-discharge lamp reaches approximately 60 percent light output.

C. High-Pressure-Sodium Ballasts: Solid-state igniter/starter with an average life in pulsing mode of 10,000 hours at an igniter/starter-case temperature of 90 deg C.

1. Instant Restrike Device: Solid-state potted module, mounted inside high-pressure-sodium fixture and compatible with high-pressure-sodium lamps, ballasts, and sockets up to 150 W.

a. Restrike Range: 200 to 260 V ac.
b. Maximum Voltage: 440 V peak or 260 V ac RMS.

2. Single-Lamp Ballasts: Minimum starting temperature of minus 50 deg C.
3. Open-circuit operation will not reduce average life.

2.7 HID LAMPS

A. High-Pressure Sodium Lamps: ANSI C78.42, CRI 21 (minimum), color temperature 1900 K, and average rated life of 24,000 hours, minimum.

1. Dual-Arc Tube Lamp: Arranged so only one of two arc tubes is lighted at one time and, when power is restored after an outage, the cooler arc tube, with lower internal pressure, lights instantly, providing an immediate 8 to 15 percent of normal light output.

B. Metal-Halide Lamps: ANSI C78.43, with a minimum CRI 65, and color temperature 4000 K.

1. Metal halide lamps shall be ceramic and shall be Type T, self-extinguishing within 15 minutes when the outer envelope of the lamp breaks. **[If the wattage needed is not available in a type T, use a lamp other than metal halide.]**
2. Metal halide lamps shall be color matched.
3. Metal halide sources shall only be operated in lighting fixtures designed for that use and in specified position.
4. To minimize lamp breakage, protect envelope from direct contact with water during operation.
5. Provide phosphor-coated lamps in wattages and envelope sizes unless otherwise indicated on Drawings in Lighting Fixture/Luminaire Schedule for non-PAR Metal Halides.

2.8 LED LUMINAIRES

A. General:

1. Except as otherwise indicated, provide LED luminaires, of types and sizes indicated on fixture schedules.
2. Each Luminaire shall consist of assembly that utilizes LEDs as light source. In addition, complete luminaire shall consist of housing, LED array, and electronic driver (power supply).
3. Reported lumen maintenance (using U.S. Dept. of Energy (DOE) Energy Star TM-21 Calculator) shall be greater than 95 percent per TM-21-11 after 78,000 hours of luminaire operation in an ambient environment of 40 deg C (104 deg F). This data must be TM-21 compliant and derived from the EnergyStar.gov TM-21 Calculator.
4. Fabricate luminaire such that LED modules may be replaced or repaired without replacement of luminaire.
5. Each luminaire shall be listed with Underwriters Laboratory, Inc. under UL1598 for luminaires, or approved equivalent standard from nationally recognized testing laboratory.

    a. Luminaire shall be DLC approved.
    b. Country of manufacture shall be TAA compliant

B. Electrical Requirements:

1. Operation Voltage: Fluctuations of line voltage shall have no visible effect on luminous output. Luminaire shall operate at 50/60 HZ ±3 HZ AC line over a voltage ranging from 108 VAC to 305 VAC.
2. Power Factor: The luminaire shall have power factor of 0.9 or greater.
3. THD: Total harmonic distortion (current and voltage) induced into an AC power line by a luminaire shall not exceed 20 percent.
4. Surge Suppression: Luminaire circuitry shall include surge protection devices (SPD) to withstand high repetition noise transients as a result of utility line switching, nearby lightning strikes, and other interference. SPD shall be field-replaceable. SPD shall operate as below:

    a. SPD protects luminaire from damage and failure for common and differential mode transient peak currents up to 10 kA (minimum). SPD shall conform to UL 1449 and have been tested using procedures in ANSI/IEEE C62.41-2:2002 category C high exposure and ANSI C136.2 10kV BIL to enhanced test level SPD shall fail in such a way that luminaire will no longer operate.

5. RF Interference testing shall conform to Class A emission limits referred in Federal Communications Commission (FCC) Title 47, Subpart B or C, Section 15 regulations concerning emission of electronic noise for entire luminaire construction.
6. Driver shall have load regulation: +/- 1 percent from no load to full load.
7. Driver shall output Ripple of less than 10 percent.
8. Driver output shall be isolated.
9. Driver case temperature shall be rated for -40 deg C to 80 deg C.
10. Driver shall be fully encased and IP65 rated.
11. Driver shall include protection for: overheat, self-limited short circuit, and overload.
12. Luminaire shall provide a 0-10V dimming driver with minimum 10 percent dimming.
13. Luminaire shall include all the following as options: NEMA 3-PIN, NEMA 7-PIN, and Zhaga 4-PIN receptacle.

14. Luminaire shall have configuration which offers capability to incorporate an integrated security camera and all associated network hardware capable of communicating using ethernet/fiber optic.

C. Electrical Safety: Wet listed and listed for operation in high ambient temperatures in either U.S., Canada, ENEC, CE, ROHS, or EMI.

D. Driver:

1. Load Regulation: +/- 1 percent from no load to full load.
2. Output Ripple: Less than 10 percent.
3. Output shall be isolated.
4. Case Temperature: Rated for -40 deg C through +80 deg C.
5. Power Supply Enclosure: Fully encased and potted, IP65.
6. Protection: Overheat, self-limited short circuit, and overload.

E. Optical Requirements:

1. Optical Assemblies: LEDs shall be provided with discrete over optical elements to provide IES Type II, III, IV or V distribution. Optical assemblies shall have minimum efficiency of 85 percent regardless of distribution type. All LEDs and optical assemblies shall be mounted parallel to ground. All LEDs shall provide same optical pattern such that failure of individual LEDs will not constitute loss in distribution pattern.
2. Luminaire manufacturer shall provide House Side Shield option to be field or factory installed. House Side Shield shall not affect luminaire EPA nor protrude from luminaire more than 25 mm (1/4 inch) below bottom plane of fixture.
3. Light Color/Quality: Luminaire shall have correlated color temperature (CCT) of 4,000 deg K +/-275 deg K. Color rendition index (CRI) shall be minimum 70.
4. Individual LEDs shall be constructed such that failure of one LED will not result in loss of entire LED module.
5. Optic assembly shall be protected against dust and moisture intrusion in accordance with IP-66 (minimum) to protect all internal components.
6. Optic assembly shall be protected against mechanical impact and be IK10 rated.
7. Each refractor or lens shall be made from UV inhibited high impact optical grade polycarbonate and be resistant to scratching.

F. Thermal Management:

1. Rated operating temperature range shall be -40 deg C (-40 deg F) to +40 deg C (104 deg F) with option of a +50 deg C (122 deg F) configuration.
2. Thermal management (of heat generated by LEDs) shall be sufficient capacity to assure proper operation of luminaire over expected useful life. Demonstrate using TM-21 Calculator that LED will not exceed max operating temperature with outdoor ambient at 50 deg C.
3. Electrical compartment temperatures shall not exceed 85 deg C in any configuration. These tests need to be performed assuming inclusion of all possible options and accessories in driver compartment with ambient at 50 deg C.

4. Thermal management shall be passive by design. Use of fans or other mechanical devices is not allowed.
5. When conducting testing required for TM-21 Calculator, demonstrate that case temperature for LED was taken at hottest point on surface.
6. TM-21 Calculator report data shall either represent exact configuration of fixture or a configuration of maximum LEDs at highest drive current.
7. Driver shall be thermally protected such that fixture will go into protective mode if operating temperatures exceed rated parameters. Fixture shall maintain full output at 50 deg C ambient condition.

G. Physical and Mechanical Requirements

1. Heavy-wall die-cast aluminum housing. Design housing to allow water runoff on top of housing when mounted horizontally.
2. Protect housing assembly against mechanical impact.
3. Protect optics against mechanical impact.
4. Housing shall conform to NEMA/UL wet location and shall be UL 1598 listed.
5. Protect luminaire against dust and moisture intrusion in accordance with IP-66 (minimum).
6. Assembly and manufacturing process for LED luminaire shall be designed to assure all internal components are adequately supported to withstand mechanical shock and vibration. Luminaire shall withstand vibration, conforming to ANSI C136.31 American Standard for Roadway and Area Lighting Equipment – Luminaire Vibration for normal and bridge operation (3G minimum in all 3 planes tested in heaviest configurations, 1.5G for decorative post to fixtures).
7. Housing shall be aluminum and suitable for coastal condition. It shall be finished with a nominal 2.5 mil thick TGIC Polyester Powder Coat finish able to withstand a 5,000-hour salt spray test per ASTM B117, with a scribe rating of 9 at 2000 hours per ASTM D1654.
8. Luminaire to be packaged in a suitable carton that withstands ISTA-1A Drop testing requirements. Packaging: Vibration, Shock (Drop) and Compression testing (reference ISTA 1C procedure) luminaires and components to be packaged in a way to avoid breakage, bending and scoring finishes.

2.9 POLES AND SUPPORT COMPONENTS, GENERAL REQUIREMENTS

A. Structural Characteristics: Comply with AASHTO LTS-4-M.

1. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of speed indicated in the Part 2 Article on STRUCTURAL ANALYSIS CRITERIA FOR POLE SELECTION," with a gust factor of 1.3.

2. Strength Analysis: For each pole, multiply the actual equivalent projected area of luminaires and brackets by a factor of 1.1 to obtain the equivalent projected area to be used in pole selection strength analysis.

B. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts, unless otherwise indicated.

C. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components. Hot-dip galvanized in accordance with ASTM A153, Class C.

1. Materials: Shall not cause galvanic action at contact points.
2. Mountings: Correctly position luminaire attachment to provide indicated light distribution.
3. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication, unless stainless-steel items are indicated.
4. Anchor-Bolt Template: Plywood or steel.

D. Handhole: Oval-shaped, with minimum clear opening of 65 by 130 mm (2-1/2 by 5 inches), with cover secured by stainless-steel captive screws.

E. Mast Arms: **[Single-arm] [Truss] [Davit]** type**[, continuously welded to pole attachment plate]**. Material and finish same as pole.

F. Concrete Pole Foundations: Cast in place, with anchor bolts to match pole-base flange. Concrete, reinforcement, and formwork are specified in Section 033000 "Cast-in-Place Concrete."

G. Breakaway Supports: Frangible breakaway supports for indicated poles, tested by an independent testing agency acceptable to authorities having jurisdiction, according to AASHTO LTS-3.

H. Touch up finishes as required to inhibit corrosion where welding is involved.

2.10 STEEL POLES

A. Poles: Comply with ASTM A 500, Grade B, carbon steel with a minimum yield of 320 MPa; 1-piece construction up to 12 m in height.

1. Shape: Round, tapered.

2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.

B. Metal Pole Brackets: Cantilever brackets without underbrace, with straight tubular end section to accommodate luminaire. Match pole finish.

C. Brackets for Luminaires: Detachable, cantilever, without underbrace.

1. Adapter fitting welded to pole and bracket, then bolted together with stainless -steel bolts.
2. Cross Section: Tapered oval, with straight tubular end section to accommodate luminaire.
3. Match pole material and finish.

D. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

E. Steps: Fixed steel, with nonslip treads, positioned for 380-mm (15-inch) vertical spacing, alternating on opposite sides of pole; first step at elevation 3 m (10 feet) above finished grade.

F. Grounding and Bonding Lugs: Welded 13-mm (1/2-inch) threaded lug, complying with requirements in Section 260525 "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.

G. Cable Support Grip: Wire-mesh type with rotating attachment eye, sized for diameter of cable and rated for a minimum load equal to weight of supported cable times a 5.0 safety factor.

H. Platform for Lamp and Ballast Servicing: Factory fabricated of steel with finish matching that of pole.

I. Factory-Painted Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or SSPC-SP 8, "Pickling."
2. Interior Surfaces of Pole: One coat of bituminous paint, or otherwise treat for equal corrosion protection.
3. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.

a. Color: Match Project Director/COR’s custom color.

2.11 ALUMINUM POLES

A. **[Poles: Seamless, extruded structural tube complying with ASTM B 429, 6063-T6 alloy.]**

B. **[Poles: ASTM B 209M, 5052-H34 marine sheet alloy.]**

1. Shape: Round, tapered.

C. Pole-Top Tenons: Fabricated to support fixtures or fixtures/brackets indicated, and securely fastened to pole top.

D. Grounding and Bonding Lugs: Welded 12 mm threaded lug, complying with requirements in Section 260525 "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.

E. Fasteners: Stainless steel, size and type as determined by manufacturer based upon corrosion risk identified for the project. Corrosion-resistant items compatible with support components.

1. Materials: Compatible with poles and standards as well as to substrates to which poles and standards are fastened and shall not cause galvanic action at contact points.
2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.

F. Brackets for Luminaires: Detachable, with pole and adapter fittings of cast aluminum. Adapter fitting welded to pole and bracket, then bolted together with stainless-steel bolts.

1. Tapered oval cross section, with straight tubular end section to accommodate lighting fixture.
2. Finish: Same as pole.

G. **[Aluminum Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.**

1. **Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.**
2. **[Class I, Clear-Anodic Finish: AA-M32C22A41 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I clear coating of 0.018 mm or thicker), complying with AAMA 611.]**
3. **[Class I, Color-Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: Medium; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I integrally colored or electrolytically deposited color coating 0.018 mm or thicker), complying with AAMA 611.]]**

H. **[Powder-Coat Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.**

1. **Surface Preparation: Clean surfaces to comply with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair powder coat bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, according to SSPC-SP 5/NACE No. 1 or SSPC-SP 8.**
2. **Powder coat shall comply with AAMA 2604**

a. **Electrostatic applied powder coating; single application with a minimum 64- to 89-um (2.5- to 3.5-mils) dry film thickness; cured according to manufacturer's instructions. Coat interior and exterior of pole for equal corrosion protection.**
b. **Color: As selected by Architect from manufacturer's full range.**]

2.12 POLE ACCESSORIES

A. Duplex Receptacle: 120 V, 20 A in a weatherproof assembly complying with Section 262725 "Wiring Devices" for ground-fault circuit-interrupter type.

1. Recessed, 300 mm (12 inches) above pole base.
2. Nonmetallic polycarbonate plastic or reinforced fiberglass cover, color to match pole**,** that when mounted results in NEMA 250, Type 3R enclosure.
3. With cord opening.
4. With lockable hasp and latch that complies with OSHA lockout and tag-out requirements.

B. Minimum 1800-W transformer, protected by replaceable fuses, mounted behind access cover.

C. Base Covers: Manufacturers' standard metal units, arranged to cover pole's mounting bolts and nuts. Finish same as pole.

D. Transformer Type Base: Same material and color as pole. Coordinate dimensions to suit pole's base flange and accept ballast(s) and other specified accessories.

PART 3 - EXECUTION

3.1 LUMINAIRE INSTALLATION

A. Install lamps in each luminaire.

B. Fasten luminaire to indicated structural supports.

1. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.

C. Adjust luminaires that require field adjustment or aiming. Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources.

D. Locate override controls for exterior site lighting for access by Marine Security Guard immediately adjacent to SVS (Security Video System) control racks such that lighting controls can be operated while directly viewing SVS monitors. See Section 282305 “Security Video System (SVS).”

3.2 POLE INSTALLATION

A. Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.

B. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features, unless otherwise indicated on Drawings:

1. Fire Hydrants and Storm Drainage Piping: 1500 mm (60 inches).
2. Water, Gas, Electric, Communication, and Sewer Lines: 3 m (10 feet).
3. Trees: 5 m (15 feet).

C. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Section 033000 "Cast-in-Place Concrete."

D. Poles and Pole Foundations Set in Concrete Paved Areas: Install poles with minimum of 150-mm (6-inch) wide, unpaved gap between the pole or pole foundation and the edge of adjacent concrete slab. Fill unpaved ring with pea gravel to a level 25 mm (1 inch) below top of concrete slab.

E. Raise and set poles using web fabric slings, not chain or cable.

3.3 PHYSICAL SECURITY INSTALLATION REQUIREMENTS FOR POLES

A. Foundations for light poles shall not protrude above the finished grade more than 150 mm.

3.4 BOLLARD LUMINAIRE INSTALLATION

A. Align units for optimum directional alignment of light distribution.

B. Install on concrete base with top 100 mm (4 inches) above finished grade or surface at bollard location. Cast conduit into base, and shape base to match shape of bollard base. Finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 033000 "Cast-in-Place Concrete."

3.5 INSTALLATION OF INDIVIDUAL GROUND-MOUNTING LUMINAIRES

A. Install on concrete base with top 100 mm (4 inches) above finished grade or surface at luminaire location. Cast conduit into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 033000 "Cast-in-Place Concrete."

3.6 CORROSION PREVENTION INSTALLATION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.

B. Steel Conduits: Comply with Division 26 Section "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.25-mm (0.010-inch) thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

3.7 GROUNDING

A. Ground metal poles and support structures according to Section 260525 "Grounding and Bonding for Electrical Systems."

1. Install grounding electrode for each pole.
2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.

B. Ground nonmetallic poles and support structures according to Section260525 "Grounding and Bonding for Electrical Systems."

1. Install grounding electrode for each pole.
2. Install grounding conductor and conductor protector.

3. Ground metallic components of pole accessories and foundations.

3.8 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.9 FIELD QUALITY CONTROL

A. Inspect each installed fixture for damage. Replace damaged fixtures and components.

B. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.

1. Verify operation of photoelectric controls.

C. Illumination Tests:

1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards.
2. Comply with one of the following set of testing guide(s):

a. IES:

1) [IES LM-5, "Photometric Measurements of Area and Sports Lighting."]
2) IES LM-50, "Photometric Measurements of Roadway Lighting Installations."
3) IES LM-52, "Photometric Measurements of Roadway Sign Installations."
4) IES LM-64, "Photometric Measurements of Parking Areas."
5) IES LM-72, "Directional Positioning of Photometric Data."

b. British Standard:

1) BS EN 13032-2, “Light and Lighting Measurement and Presentation of Photometric Data of Lamps & Luminaires – Part 2 Presentation of Data for Indoor and Outdoor Workplaces.”

D. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.10 [REPAIRS

A. **Steel Lighting Poles: Repair minor dents. Touch-up paint at repaired surfaces and where finish has been scratched or chipped.]**

END OF SECTION 265600

SECTION 270508 – COMMON WORK RESULTS FOR TELECOMMUNICATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the common requirements associated with providing the telecommunications system.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety,” including on common work results for electrical and communications supports and anchors.
2. Section 270526 “Grounding and Bonding for Communications Systems.”
3. Section 270528 “Surface-Mounted Raceways for Communications Systems.”
4. Section 270553 “Identification for Communications Systems.”
5. Section 270645 “Schedules for Audiovisual Systems.”
6. Section 271113 “Communications Entrance Protection.”
7. Section 271116 “Communications Cabinets and Frames.”
8. Section 271119 “Communications Terminations Blocks and Patch Panels.”
9. Section 271123 “Communications Cable Management and Ladder Rack.”
10. Section 271305 “Communications Backbone Cabling.”
11. Section 271505 “Communications Horizontal Cabling.”
12. Section 271543 “Communications Faceplates and Connectors.”
13. Section 272129 “Data Communications Switches and Power Supplies.”
14. Section 274100 “Audiovisual Systems General Requirements.”
15. Section 274114 “Architecturally-Integrated Audiovisual Elements.”
16. Section 274117 “Projection Screens and Projector Lifts.”
17. Section 275105 “Audio Systems for Consular Services.”
18. Section 275118 “Sound Masking.”
19. Section 275405 “Consular Queue Management System Infrastructure and Displays.”

1.2 REFERENCE STANDARDS

A. American National Standards Institute/ Telecommunications Industry Association/ Electronic Industries Alliance (ANSI/TIA):

1. ANSI/TIA Standard 526-7: Measurement of Optical Power Loss of Installed Single- Mode Fiber Cable Plant.
2. ANSI/TIA Standard 526-14: Optical Power Loss Measurement of Installed Multi-Mode Fiber Cable Plant.
3. ANSI/TIA Standard 568.0: Generic Telecommunications Cabling for Customer Premises.

4. ANSI/TIA Standard 568.1: Commercial Building Telecommunications Infrastructure Standard Part 1: General Requirements.
5. ANSI/TIA Standard 568.2: Balanced Twisted-Pair Telecommunications Cabling and Components Standard.
6. ANSI/TIA Standard 568.3: Optical Fiber Cabling and Components Standard.
7. ANSI/TIA Standard 569: Telecommunications Pathways and Spaces.
8. ANSI/TIA Standard 570: Residential Telecommunications Infrastructure Standard.
9. ANSI/TIA Standard 598: Optical Fiber Cable Color Coding.
10. ANSI/TIA Standard 606: Administration Standard for Commercial Telecommunications Infrastructure.
11. ANSI/TIA Standard 758: Customer-Owned Outside Plant Telecommunications Infrastructure Standard.

B. American National Standards Institute Joint Technical Committee (ANSI/JTC):

1. ANSI/TIA Standard 607-D including 607-D-1 Addendum (or later editions): Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

C. American National Standards Institute/ Building Industry Consulting Service International (ANSI/BICSI):

1. ANSI/BICSI N1: Installation Practices for Telecommunications and ICT Cabling and Related Cabling Infrastructure.

D. Building Industry Consulting Service International (BICSI):

1. BICSI Telecommunications Distribution Methods Manual.

E. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE C2: National Electrical Safety Code.

F. International Organization for Standardization/ International Electrotechnical Commission (ISO/IEC):

1. ISO/IEC-11801 Information Technology: Generic Cabling for Customer Premises (and all addenda)

G. National Fire Protection Association (NFPA):

1. NFPA 70: National Electrical Code. Refer to Article on QUALITY ASSURANCE for applicable OBO amended version, the OBO Electrical Code.

1.3 SUBMITTAL

A. This Section only identifies those construction submittals that are required to be submitted for the telecommunications system as a whole. Refer to individual Division 27 Sections for those submittals such as Product Data that is related specifically to the work of individual Sections

B. Shop Drawings:

1. General: Shop drawings depict means and methods for installation. Coordinate shop drawings with other disciplines.
2. Grounding and Bonding Plans: Plans at 1:20 scale. Based on Field Quality Control Testing, provide drawings locating each ground rod and ground rod assembly and other grounding electrodes, identify each by letter in alphabetical order, and key to record of tests and observations. Indicate number of rods driven, their depth at each location, and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results. Maximum valve of ground resistance is 10 ohms. Refer to Section 270526 "Grounding and Bonding for Communications Systems."
3. Cable Routing Schematics: Schematic Section. Refer to Section 271305 "Communications Backbone Cabling."

    a. Indicate general routing of each cable type from termination point to termination point. Identify type and number of strands/pairs for each cable.

4. Telecom Outlet Floor Plans: Plans at 1:20 scale. Refer to Section 271505, "Communications Horizontal Cabling."

    a. Plans for all floors indicating all telecom outlets, including information provided in Preliminary submittal identified below. Each outlet shall be labeled with same identifications as labeled on actual faceplate. As applicable, identify specific areas of floors that are served by individual telecommunications equipment spaces.
    b. Preliminary Submittal: Submit accurate draft of this plan prior to PBX (Telephone Equipment Room) installation showing telecom outlets with final jack numbers at all floors; this draft may be hand-written as long as it is legible.
    c. Coordinate telecom furniture in-feeds with OBO Interiors, the general contractor's interiors discipline, and the installer. In-feed locations shall be unobstructed and accessible.

5. Wireless Plans:

    a. Preliminary Submittal: Submit accurate draft of the WLAN plan prior to installation showing WAP/WAP outlets with final jack numbers on all floors.
    b. Shop drawings shall have a report (showing signal strength) along with propagation drawings showing locations of outlets for WAP's with anticipated signal strength.

6. Layout Plans for Telecommunications Equipment Spaces (e.g., TRs, JUCR): Plans at 1:10 scale. Refer to Section 270528 "Surface-Mounted Raceways for Communications

System," Section 271119 "Communications Termination Blocks and Patch Panels," and Section 271113 "Communications Entrance Protection."

a. Plans for each telecommunications equipment space. Indicate required clearances and accessories, and relationship with adjacent materials.
b. Layout for service entrance spaces where entrance protection will be installed.

7. Cabinet Elevations: Elevations at 1:10 scale. Refer to Section 271116 "Communications Cabinets and Frames," Section 271123 "Communications Cable Management and Ladder Rack," Section 271505 "Communications Horizontal Cabling," and Section 272129 "Data Communication Switches and Power Supplies."

a. Detailed elevation drawings of each equipment cabinet in telecommunications equipment spaces.

8. Wall Elevations: Elevations at 1:10 scale. Refer to Section 271119 "Communication Termination Blocks and Patch Panels," Section "Communications Backbone Cabling," and Section 271505 "Communications Horizontal Cabling."

a. Detailed elevations of wall field terminations and block/wire management for each backboard in each of the telecommunications equipment spaces.

9. Materials Schedule: Refer to Section 271123 "Communications Cable Management and Ladder Rack," Section 271505 "Communications Horizontal Cabling," and Section 272129 "Data Communication Switches and Power Supplies."

a. Identify telecom equipment that will be used at each telecommunications equipment space including manufacture, part number, name, quantities, and function.

C. Qualification Documents: Documentation in support of qualifications identified in Article on QUALITY ASSURANCE. Submit qualification documents concurrently with Product Data and Shop Drawings submittals.

1. Submit copies of required RCDD, BICSI, and original equipment manufacturer (OEM) certifications.
2. Submit list identifying Installation Technicians. Sort list according to those with BICSI or OEM certification, and those who will receive Contractor-managed training.
3. Identify BICSI certified individual on Installer's staff that will manage and monitor Contractor-managed training of Installation Technicians.
4. Submit copies of the required Avixa Certifications for Certified Technology Specialist Designer (CTS-D) and Certified Technology Specialist-Installation (CTS-I), and Original Equipment Manufacturer (OEM) certifications.
5. Submit copies of documentation confirming Ekahau Designer (ECSE) experience as required in the Article on QUALITY ASSURANCE.
6. Submit list identifying Installation Technicians. Sort list according to those with CTS-D, CTS-I or OEM certification, and those who will receive Contractor-managed training.

7. Identify the Avixa certified individual on Installer's staff who will manage and monitor Contractor-managed training of Installation Technicians.

1.4 QUALITY ASSURANCE

A. Installer Qualifications:

1. Telecom Layout Responsibility: Preparation of Shop Drawings shall be under direct supervision of Registered Communications Distribution Designer (RCDD) with a minimum of ten years of experience designing cabling systems; the ten years shall be within the last fifteen years. Shop drawings shall be prepared in accordance with ANSI/TIA or ISO/IEC standards.
2. Telecom Installation Supervision: Installation shall be under the direct supervision of BICSI Registered Technician who shall be present at all times when Work of this Section is performed at Project site.
3. Telecom Installation Technicians: Fifty percent of installation technicians assigned to this project shall be certified by BICSI or Original Equipment Manufacturer (OEM) at Installer Level Copper (INSTC) or Installer Level Fiber (INSTF). Untrained technicians assigned to this project shall receive Contractor-managed training for skill sets associated with their specific telecommunications work at no cost to Government; management of this training shall be performed by individual on Installer's staff with BICSI certification at Registered Technician or Installer INSTC /INSTF level.
4. Audio Visual (AV) Layout Responsibility: Preparation of Shop Drawings shall be under direct supervision of Avixa Certified Technology Specialist - Designer (CTS-D) with a minimum of ten years designing AV systems; the ten years shall be within the last fifteen years. Shop drawings shall be prepared in accordance with ANSI/TIA or ISO/IEC standards.
5. Preparer of Wireless Drawings and Reports: Preparation of Shop Drawings shall be under the direction of an Ekahau Designer (ECSE) or higher with a minimum 5 years' experience with installation and analyzing wireless network infrastructure using Ekahau Pro.
6. AV Installation Supervisor: Installation shall be under the direct supervision of Avixa Certified Technology Specialist-Installation (CTS-I).
7. AV Installation Technicians: Fifty percent of installation technicians assigned to this project shall be certified by Avixa or Original Equipment Manufacturer (OEM). Untrained technicians assigned to this project shall receive Contractor-managed training for skill sets associated with their specific AV work at no cost to the Government. Management of this training shall be performed by an individual on the installer staff with Avixa CTS-D or CTS-I certification.

B. Comply with the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO."

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver assemblies, components, and accessories to job site in undamaged factory packaging.

B. Inspect all items upon delivery to job site.

C. Storage of active equipment, including but not limited to OpenNet switches:

1. Do not deliver to site more than six months prior to final commissioning.
2. Store in temperature-controlled room or container in accordance with manufacturer's recommendations.

D. Store fiber optic cabling, fiber consumables, electronics, and batteries away from moisture, dust, and static electricity.

1. Store these items in location that maintains temperature between 10 deg C (50 deg F) and 30 deg C (85 deg F), and humidity between 30 and 70 percent.

1.6 PROJECT CONDITIONS

A. Due to the sensitive nature of telecommunications components, telecommunications items identified above as requiring environmentally controlled storage shall only be installed when environmental controls and power are operational to maintain those environmental conditions in spaces where those items are installed, and other work in those spaces is approximately 90 percent complete.

1.7 COORDINATION

A. Coordinate layout and installation of voice and data communication cabling with Government-Furnished telecommunications equipment and furniture installation. In-feed locations shall be unobstructed and accessible.

B. Adjust arrangements and locations of distribution frames, cross-connects, UPS, client switches and patch panels in each telecommunications equipment space to accommodate and optimize arrangement and space utilization as approved by Project Director/COR based upon input from OBO/PDCS/DE/EE/CBT.

C. Coordinate the work in this section with other sections as required ensuring that the entire work will be carried out in orderly, complete, and organized fashion.

PART 2 - PRODUCT

2.1 BLUETOOTH FUNCTION IN TELECOMMUNICATION EQUIPMENT

A. Near field communication technologies (e.g., Bluetooth) are prohibited.

PART 3 - EXECUTION

3.1 WLAN FUNCTION IN TELECOMMUNICATION EQUIPMENT

A. Disable WLAN (WiFi), auto answering, and far end remote control on all telecommunications equipment and devices prior to installation.

END OF SECTION 270508

SECTION 270526 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes grounding of telecommunications systems components and equipment. Grounding requirements specified in this Section may be supplemented by special requirements of systems described in other Sections.

B. Related Sections include the following:

1. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
2. Section 260525 “Grounding and Bonding for Electrical Systems.”
3. Section 264115 “Lightning Protection.”
4. Section 270508 “Common Work Results for Telecommunications.”
5. Section 271113 “Communications Entrance Protection” for additional communications grounding and bonding.
6. Section 337105 “Underground Ducts and Raceways” for ground test wells.

C. REFERENCE STANDARDS

D. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Qualification Data: For testing agency and testing agency’s field supervisor.

C. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

D. Operation and Maintenance Data: For grounding to include the following in emergency, operation, and maintenance manuals:

1. Instructions for periodic testing and inspection of grounding features at test wells based on NFPA 70B, “Recommended Practice for Electrical Equipment Maintenance.”

a. Tests shall be conducted in accordance with section 260252 to determine if ground resistance or impedance values remain within specified maximums, and instructions shall recommend corrective action if they fail to conform.
b. Identify recommended testing interval periods.

1.3 QUALITY ASSURANCE

A. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

B. Comply with the OBO Electrical Code; see Section 270508 “Common Work Results for Telecommunications.”

C. Comply with UL 467.

D. Comply with IEEE C2 for overhead-line construction and medium-voltage underground construction.

E. Comply with NFPA 780, “Standard for the Installation of Lightning Protection Systems” and UL 96 when interconnecting with lightning protection system.

F. Comply with ANSI/ TIA Standard 607-D including the 607D-1 and all addendums.

PART 2 - PRODUCTS

2.1 GROUNDING CONDUCTORS

A. For insulated conductors, comply with Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”

B. Material: Copper.

C. Equipment Grounding Conductors: Insulated with green-colored insulation.

D. Grounding Electrode Conductors: Stranded copper cable.

E. Copper Bonding Conductors for Communications: As follows:

1. From Primary Bonding Busbar (PBB) to service equipment ground (power): Minimum 95 mm^2 insulated copper conductor.
2. Telecommunications Bonding Backbone (TBB): Minimum 70 mm^2 insulated copper conductor.
3. Bonding Backbone Conductor (BBC): Minimum 35 mm insulated copper conductor.
4. Telecommunications Equipment Bonding Conductor (TEBC): TEBC connects the PBB/SBB to equipment racks/cabinets within the same room. TEBC shall be continuous copper conductor and shall not be less than #6AWG (18mm) with green insulated jacket.

F. PBB/SBB Bare, annealed copper bars of rectangular cross section, with insulators as shown on drawings.

2.2 CONNECTOR PRODUCTS

A. Comply with IEEE 837 and UL 467; listed for use for specific types, sizes, and combinations of conductors and connected items.

B. Compression Connectors: Do not use bolted-pressure type; use only permanent and irreversible compression type.

C. Welded Connectors: Exothermic-welded types, in kit form, and selected per manufacturers written instructions.

PART 3 - EXECUTION

3.1 APPLICATION

A. Use only copper conductors for both insulated and bare grounding conductors.

B. In raceways, use insulated equipment-grounding conductors.

C. Equipment Grounding Conductor Terminations: Use bolted pressure clamps.

D. Primary and Secondary Bonding Busbar (PBB and SBB) for Communications: Install in telecommunications equipment rooms, telecommunications rooms, telecommunications spaces, and elsewhere as indicated.

1. Use insulated spacer; space 25 mm from wall and support from wall 150 mm above finished floor, unless otherwise indicated.
2. At doors, route bus up to top of doorframe, across top of doorway, and down to specified height above floor.
3. Maintain a bending radius of no less than 10 x Diameter of cable.
4. Cabinets, Racks, and other enclosures shall have their own dedicated bonding conductor to the SBB, PBB or Telecommunications Equipment Bounding Conductor (TEBC).

5. Bonding Backbone Conductor (BBC) shall be green and yellow in color and bonded together with TBB at top floor and at lower level.
6. Install TBB and BBC without splices unless prior written approval is obtained through the COR from OBO/PDCS/DE/EE. When splices are necessary, they shall be minimal in quantity, accessible, and located in telecommunications spaces.
7. Size the PBB and SBB to include attachment spare capacity for four (4) future attachments by the government.
8. Install a minimum 100 mm x 600 mm x 6.4 mm (4” x 24” x ¼” (.25”)) Primary Bonding Busbar (PBB) in Telecommunications Service Entrance Facility (TSEF) such that it is accessible to telecommunications and building facilities personnel.
9. Install a minimum 100 mm x 300 mm x 6.4 mm (4” x >12” x 0.25”) Secondary Bonding Busbar (SBB) with grounding conductor that is not less than 70 mm2 (#2/0) in cross sectional area.
10. The Secondary Bonding Conductor (SBC) and the BBC shall be the same size and type as the TBB. The Telecommunications Bonding Conductor (TBC) shall be at a minimum, the same size as the TBB.
11. Routing shall be continuous, short, and as straight as possible.
12. Install a minimum 19.1 mm x 508 mm x 4.763 mm (.75” x 19” x 3/16” (0.1875”)) busbar at the base or top of each Cabinet/Rack and each CO-Location cabinet compartment for consolidating equipment bonding conductors.
13. Homerun the Bonding Conductor from each Cabinet/Rack Busbar to the closest PBB/SBB or TEBC. Connect with 2-hole lugs on all PBB, SBB, and Rack mounted Busbars (RBB).
14. The minimum size for the TEBC, rack bonding conductor, telecommunications raceways, or any other telecom equipment shall be 6 AWG.
15. Exposed Building Structural Steel in the Telecom Room shall be connected to the Telecommunications Grounding/Bonding Infrastructure with exothermic welded connections. Mechanical and compression connections are not permitted to the exposed structural steel in the Telecom Rooms.
16. Do not use interior water piping system, metallic cable shield, metallic conduit, trunking, cable tray, or cable ladder as a BBC. BBC shall be a dedicated conductor.

E. Underground Grounding Conductors: Use bare-copper conductor, 95-mm^2 minimums. Bury at least 600 mm below grade or bury 300 mm above duct bank when installed as part of the duct bank.

3.2 EQUIPMENT GROUNDING CONDUCTORS

A. Comply with Article 250 of the model NFPA 70 for types, sizes, and quantities of equipment grounding conductors, unless specific types, larger sizes, or more conductors than required by Code are indicated.

B. Comply with TIA Standard 607-D including the 607D-1 and all addendums

C. For alarm, voice, data, and other communication systems, provide insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, telecommunications rooms, equipment rooms, and central equipment location.

1. Terminate grounding conductor on a minimum 6.4-by-100-by-300-mm grounding bus.
2. Terminal Cabinets: Terminate grounding conductor on cabinet grounding bus bar/terminal.

D. Common Ground Bonding with Lightning Protection System: Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor with same size as system grounding electrode conductor and install in conduit.

3.3 INSTALLATION

A. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

B. Bonding Straps and Jumpers: Install so vibration by equipment mounted on vibration isolation hangers and supports is not transmitted to rigidly mounted equipment. Use exothermic-welded connectors for outdoor locations, unless a disconnect-type connection is required; then, use a bolted clamp. Bond straps directly to basic structure taking care not to penetrate any adjacent parts. Install straps only in locations accessible for maintenance.

C. Metal Water Service Pipe: Do not connect to communications ground system.

D. Water Meter Piping: Do not connect to communications ground system.

3.4 CONNECTIONS

A. General: Make connections so galvanic action or electrolysis possibility is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.

1. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer to order of galvanic series.
2. Make connections with clean, bare metal at points of contact.
3. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

B. Exothermic-Welded Connections: Comply with manufacturers written instructions. Welds that are puffed up or that show convex surface indicating improper cleaning are not acceptable. Refer to Section 260525 “Grounding and Bonding for Electrical Systems” for acceptable locations for exothermic-welded connections.

C. Equipment Grounding Conductor Terminations: Use pressure-type grounding lugs; winged pressure-type connectors shall not be used.

D. Noncontact Metal Raceway Terminations: If metallic raceways terminate at metal housings without mechanical and electrical connection to housing, terminate each conduit with grounding bushing. Connect grounding bushings with bare grounding conductor to grounding bus or terminal in housing. Bond electrically non-continuous conduits at entrances and exits with grounding bushings and bare grounding conductors, unless otherwise indicated.

E. Tighten screws and bolts for grounding and bonding connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

F. Compression-Type Connections: Use hydraulic compression tools to provide correct circumferential pressure for compression connectors. Use tools and dies recommended by connector manufacturer. Provide embossing die code or other standard method to make visible indication that connector has been adequately compressed on grounding conductor. Refer to Section 260525 “Grounding and Bonding for Electrical Systems” for acceptable locations for compression-type connections.

G. Use only two hole lugs for connections to Secondary Bonding Busbar (SBB), Primary Bonding Busbar (PBB), Rack Bonding Busbar and ladder racks.

H. Moisture Protection: If insulated grounding conductors are connected to ground rods or grounding buses, insulate entire area of connection and seal against moisture penetration of insulation and cable.

3.5 UNDERGROUND DISTRIBUTION SYSTEM GROUNDING

A. Duct Banks: Install 16 mm^2 (#6 AWG) copper ground wire, run parallel to conduit within concrete encasement.

B. Manholes and Hand-holes: Install driven ground rod close to wall and set rod depth so 100 mm will extend above finished floor. If necessary, install ground rod before manhole is placed and provide 70mm^2 bare, tinned-copper conductor from ground rod into manhole through waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with double wrapping of pressure-sensitive tape or heat-shrunk insulating sleeve from 50 mm above to 150 mm below concrete. Seal floor opening with waterproof, non-shrink grout.

C. Connections to Manhole Components: Connect exposed-metal parts, such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or hand-hole, to ground rod or grounding conductor. Make connections with 25 mm^2 minimum, stranded, hard-drawn copper conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields as recommended by manufacturer of splicing and termination kits.

3.6 FIELD QUALITY CONTROL

A. Engage qualified testing agency to perform the following field quality-control testing:

B. Perform the following field quality-control testing:

1. After installing grounding system but before permanent electrical circuitry has been energized, test for compliance with requirements. The maximum resistance at any point in the system shall be 5 ohms or less.
2. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, and at ground test wells. Measure ground resistance not less than two full days after last trace of precipitation, and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance. Perform tests by fall-of-potential method in accordance with IEEE 81.
3. Excessive Ground Resistance: If resistance to ground exceeds specified values, drive additional ground rods until resistance meets specified values.
4. Provide test results to OBO/PDCS/DE/EE via the COR in a table format for each of the following locations:

    a. Roof grounding system of the office building, East, West, North and South.
    b. Telecom Rooms (TR) each TR on the compound, Test PBB/SBB and each cabinet RBB.
    c. Telecom Equipment Room/Systems Room, on the compound, Test PBB/SBB and each cabinet RBB.

END OF SECTION 270526

SECTION 270528 – SURFACE-MOUNTED RACEWAYS FOR COMMUNICATION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies raceway and wiring distribution systems, including the following:

1. Surface raceways.

B. Related Sections: Other Specification Sections which directly relate to the work of this Section include, but are not limited to, the following:

1. Division 07 Section on penetration firestopping.
2. Section 260525 “Grounding and Bonding for Electrical Systems.”
3. Division 26 Section on raceways and boxes.
4. Section 270508 “Common Work Results for Telecommunications.”
5. Section 270526 “Grounding and Bonding for Communications System.”
6. Section 270553 “Identification for Communications Systems.”
7. Section 271305 “Communications Backbone Cabling.”
8. Section 271505 “Communications Horizontal Cabling.”
9. Section 271543 "Communications Faceplates and Connectors.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's product data including specifications and installation instructions for each item. Include methods of installation and requirements for substrate preparation. Include data substantiating that materials comply with specified requirements.

B. Samples: Submit 150 mm (6 inch) lengths of exposed type surface raceways with required color and finish. Show standard color ranges available.

C. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

D. Maintenance Data: Provide manufacturer's maintenance data for all components of system.

E. Qualifications Documents: See Section 270508 “Common Work Results for Telecommunications.”

1.4 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of raceway systems, boxes and fittings of types and sizes required, whose products have been in satisfactory use in similar service for not less than ten years.

B. Standards Compliance: Comply with requirements of applicable local codes, UL, and NEMA Standards pertaining to raceways, boxes and fittings. Provide raceways, boxes and fittings which have been UL listed.

C. Installer Qualifications: See Section 270508 “Common Work Results for Telecommunications.”

D. Comply with the OBO Electrical Code; see Section 270508 “Common Work Results for Telecommunications.”

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 “Common Work Results for Telecommunications.”

1.6 COORDINATION

A. See Section 270508 “Common Work Results for Telecommunications.”

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURER

A. Wiremold 4000 Series Steel Raceway.

2.2 SURFACE RACEWAYS

A. General:

1. System: Provide surface raceway systems for communications and low voltage wiring where indicated on drawings and in criteria. Surface raceway system shall consist of

raceway bases, covers, appropriate fittings and device mounting plates necessary for complete installation.

2. Configuration: Raceways shall be one- or two-piece design with base and snap-on cover, or three-piece design with base and two snap-on covers which snap side by side on common base. Base shall be dividable with fixed barrier for up to four compartments. Raceway shall be available in widths of 19 mm (3/4 inch) to 250 mm (10 inch), and depths of 13 mm (17/32 inch) to 125 mm (5 inch). Provide raceways from company which can provide custom sizes if required. Raceway covers shall be available in tamper-resistant form with screws on access plates and covers of fittings, but not on standard cover lengths.
3. Fittings: Fittings shall include flat, internal and external elbows, couplings for joining raceway sections, wire clips, blank end fittings, and device mounting brackets and plates as applicable. Where required, provide tamper-resistant form, dividable with barriers and matching the size of the accompanying raceway base. Provide full capacity corner elbows and tee fittings to maintain controlled 50 mm (2-inch) cable bend radius, meeting the specification for communications horizontal cabling and communications backbone cabling and exceeding ANSI/TIA Standard 569.
4. Device Brackets and Plates: Provide in sizes to match the raceway width and with mounting holes located to ensure proper mounting of devices in up to four compartments. Device plates shall be available in any length from 150 mm (6 inch) to 1500 mm (60 inch), with cutouts to accommodate various combinations of power and communications devices in up to four compartments. Provide 150 mm (6 inch) and 300 mm (12 inch long) device plates with flange to overlap joint of adjacent cover as applicable.
5. Communications Devices and Accessories: Raceway shall accommodate complete line of connectivity outlets and modular inserts for copper UTP, fiber optic, coaxial, and other cabling types with matching faceplates and bezels to facilitate mounting. Where indicated, provide connectivity outlets and modular inserts.

B. Classification and Listing:

1. Raceway and system components shall be UL and CUL listed.
2. Surface raceways shall be suitable for use in dry interior locations only, in accordance with requirements for surface metal raceways in the OBO Electrical Code.
3. Surface metal raceways and fittings shall be listed by Underwriters Laboratories under File Number E4376, Listing and Classification Number RJBT and File Number E41751, Listing and Classification Number RJPR respectively.
4. Systems shall comply with UL Standard UL5 for Surface Metal Raceways.

C. Surface Mounted Steel Raceways:

1. Material: Galvanized steel, minimum thickness 1 mm (0.040 inches).
2. Finish: Basis of Design is Manufacturer's standard ScuffCoat. Gray or ivory color, as approved by Project Director/COR.
3. Steel Device Brackets and Plates: Steel overlap device plate for horizontal installation of devices. Plate shall overlap cover to conceal seam.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions under which raceways, boxes, distribution systems, accessories, and fittings are to be installed and substrate that will support raceways. Notify the Project Director/COR in writing of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Strictly comply with manufacturer's installation instructions and recommendations and approved shop drawings. Coordinate installation with adjacent work to ensure proper clearances and to prevent electrical hazards.

1. Mechanical Security: : Raceway systems shall be mechanically continuous and connected to all outlets, boxes, device mounting brackets, and cabinets, in accordance with manufacturer’s installation sheets.
2. Electrical Security: Metal raceway shall be electrically continuous and bonded in accordance with the OBO Electrical Code for proper grounding.
3. Raceway Support: Raceway shall be supported at intervals not exceeding 1500 mm (5 feet) or in accordance with manufacturer’s installation sheets.
4. Accessories: Provide accessories as required for a complete installation, including insulated bushings and inserts where required by manufacturer.
5. Unused Openings: Close unused raceway openings using manufacturer's recommended accessories.

3.3 CLEANING AND PROTECTION

A. Fiber Optic Termination Points: Install warning notice about risk of eye damage.

B. Protect raceways and boxes until acceptance.

END OF SECTION 270528

SECTION 270553 – IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the furnishing and installation of all necessary materials and services required for proper labeling of telecommunications cabling systems.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications and Electronic Safety” for supports, anchors, and identification products.
2. Division 26 Section on cable trays.
3. Section 270508 “Common Work Results for Telecommunications.”
4. Section 270526 “Grounding and Bonding for Communications Systems.”
5. Section 270528 “Surface-Mounted Raceways for Communications Systems.”
6. Section 271113 “Communications Entrance Protection.”
7. Section 271116 “Communications Cabinets and Frames.”
8. Section 271119 “Communications Terminations Blocks and Patch Panels.”
9. Section 271123 “Communications Cable Management and Ladder Rack.”
10. Section 271305 “Communications Backbone Cabling.”
11. Section 271505 “Communications Horizontal Cabling.”
12. Section 271543 “Communications Faceplates and Connectors.”
13. Section 272129 “Data Communications Switches and Power Supplies.”
14. Section 337105 “Underground Ducts and Raceways.”
15. Section 275105 “Audio System Consular.”
16. Section 275405 "Consular Queuing System.”
17. Section 275118 “Sound masking.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTALS

A. Product Data: For all identification materials.

B. Samples: For all identification materials. Sample shall include alphanumerical characters on label ID that contractor proposes to use. Character on label ID shall be as large as practical without need of using magnified glass to read. Provide reference scale with each sample.

C. Qualification Documents: See Section 270508 "Common Work Results for Telecommunications."

D. Cable Administration Record:

1. Provide in MS Excel Spreadsheet format.
2. Printed copy shall be in separate binders for each system located in telecommunications equipment spaces.
3. Locate binders within cabinets and attach them with lightweight metallic chain for each corresponding system.
4. Post in prominent location in each telecommunications equipment spaces.
5. List incoming and outgoing cables and their designations, origins, and destinations.
6. Protect each sheet in plastic sheet protector.
7. Provide at least five additional sheet protectors in each binder.
8. Furnish electronic copy or final comprehensive schedules for Project, in MS Excel format.

E. Cable Administration Drawings:

1. Show building floor plans with cable administration point labeling. Identify labeling convention and show labels for telecommunications equipment spaces, backbone pathways and cables, entrance pathways and cables, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors. Follow convention or ANSI/TIA Standard 606. Furnish electronic record of all drawings, in software and format selected by Project Director/COR.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 "Common Work Results for Telecommunications."

B. Comply with the OBO Electrical Code; see Section 270508 "Common Work Results for Telecommunications."

C. Each outlet on the as-built drawings shall be labeled with the same identification as labeled on the actual faceplate.

PART 2 - PRODUCTS

2.1 LABELING SYSTEM FOR EQUIPMENT, CABLES, PATCH PANELS AND OUTLETS

A. Basis of Design: Products from the following manufacturer represent the Basis of Design; Equivalent products from other manufacturers may be used, as approved by the Project Director/COR.

1. Tyton.
2. Brady.

B. Labels:

1. Self-laminating, smear resistant, permanent, and machine lettered (not handwritten) shall be used for all telecommunications and audio/visual systems described in division 27.

C. Labeling convention shall be in accordance with ANSI/TIA Standard 606.

2.2 COLOR CODED IDENTIFICATION SYSTEM

A. OSP Fiber Optic Distribution (Backbone) Cabling Identification:

1. Finished fibers shall be color-coded by Manufacturer for identification.

B. OSP UTP Copper (Backbone) Cabling Identification:

1. Identify binder groups and individual pairs using industry standard color codes.
2. Cable shall comply with ANSI/ICEA S-80-576 for standard U.S. color codes and binder color-code integrity.

C. Inside Building Copper Backbone/Riser Cable Identification:

1. Cable shall comply with ANSI/ICEA S-80-576 color for standard U.S. color codes and binder color code integrity.

D. Inside Building Fiber Optic Backbone/Riser Cable Identification:

1. Cable shall comply with ANSI/TIA Standard 598. Finished fibers shall be color-coded by Manufacturer for identification.

E. Horizontal Fiber Optic Cable Identification:

1. Different color sheaths are required for horizontal fiber optic cables. Refer to separate contract attachment J.3.5 for color code requirement for each type of network that requires fiber optic cables at faceplate. Use white color for all unclassified horizontal cables,

F. UTP Horizontal Distribution Cable Identification:

1. Different color sheaths shall distinguish Cables for voice, data, spare, CATV, and AV. Voice (telephone) cable shall be blue. OpenNet cable shall be orange. Spare 1 cable shall be green, CATV cable shall be purple, AV cable shall be gray, and WLAN shall be yellow for outlets outside the CAA. For outlets inside the CAA: Voice cable shall be blue, OpenNet cable shall be orange, Spare 1 cable shall be green, Spare 2 cable shall be yellow, CATV cable shall be purple, and AV cable shall be gray.
2. WLAN outlets above the ceiling shall be identified with the ceiling grid. Provide labels on the architectural ceiling directly below the wireless outlet. Ceiling grid label color shall be yellow, self-laminating, smear resistant, permanent, and machine lettered.
3. All cables for Audio/Visual (A/V) system shall be gray.

G. F/UTP Horizontal Distribution Cable Identification:

1. At the TV outlet, F/UTP cable shall be purple .

H. Modular Jack Identification:

1. Modular jack connectors for voice shall be blue.
2. Modular jack connectors for OpenNet shall be orange.
3. Modular jack connectors for Spare 1 shall be green.
4. Modular jack connectors for WLAN shall be yellow outside the CAA.
5. Modular jack connectors for Spare 2 shall be yellow inside the CAA.
6. Modular jack connectors for Television shall be purple.
7. Modular jack connectors for A/V shall be gray.

I. Grounding conductor and busbar:

1. Outer jacket for grounding conductor shall be green. For large conductor, where green jacket is not available, use green tape wrapping at both ends of cable.
2. Warning Label: Provide yellow warning label at telecom grounding busbar in telecom rooms and equipment rooms. Label shall include the following information below:

FIGURE 2.2 – BUSBAR WARNING LABEL

IF THIS CONNECTOR OR CABLE IS LOOSE OR MUST BE REMOVED, PLEASE CONTACT IMO/ISO

PART 3 - EXECUTION

3.1 INSTALLATION

A. In addition to requirements in this Article, comply with applicable requirements in Division 26 Section on identification for electrical systems and ANSI/TIA Standard 606.

B. Cabinets and Frames: Label each unit and field within that unit.

C. Within Connector Fields in Telecommunications Equipment Spaces: Label each connector and each discrete unit of cable-terminating and connecting hardware. Where similar jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.

D. Cables:

1. General: Label each cable within 100 mm of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated. Include alphanumeric labeling for designation, origin, destination, and cable type.
2. Exposed Cables, and Cables in Cable Trays and Wire Troughs: Label each cable at each end.
3. Workstation: Label cables within outlet boxes.

E. Warning Notices:

1. Fiber Optic Termination Points: Install warning notice about risk of eye damage.
2. Provide placards for RF hazard on rooftop access doors, hatches, and at a safe distance from ground mounted RF systems.

END OF SECTION 270553

SECTION 270645 – SCHEDULES FOR AUDIOVISUAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes schedules for audiovisual (A/V) systems identified in other Sections.

B. Related Sections include the following:

1. Section 274100 “Audiovisual Systems General Requirements.”
2. Section 274114 “Architecturally-Integrated Audiovisual Elements.”
3. Section 274117 “Projection Screens and Projector Lifts.”

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 SCHEDULE

A. The Schedules in this Section identify typical space types which incorporate specific types of A/V item; the project-specific presence of these space types or the presence of other space types with A/V components is identified elsewhere.

1. Item names correlate with paragraph headings within referenced A/V specification sections.
2. Items identified within schedules as Contractor-Furnished Contractor-Installed (CFCI): Contractor shall provide both scheduled A/V components and associated infrastructure to that location. Where scheduled element is an operational (e.g., flat panel display), provide all components necessary for functioning element.
