3. Items identified within schedules as Government-Furnished Government-Installed (GFGI/OFOI): Contractor shall only provide associated infrastructure for scheduled A/V system (e.g., cable pathway, associated A/V and power outlets); Government will furnish and install scheduled A/V system itself, including A/V cabling.

B. Schedules for A/V systems in Outdoor Compound Event Areas: The specific areas (e.g., play fields, pool deck area) with A/V system components are identified elsewhere.

1. CFCI Components: Loudspeaker and A/V connection, A/V controls, amplifiers, and all components necessary for a completely functional system.

a. Provide empty 50-mm conduit from location serving outdoor events to nearest Telecom Room (TR).

C. Schedules for A/V Systems in Outbuildings: A/V components are associated only with outbuildings which include space types such exercise or activity spaces. For example, those scenarios are present within expanded Recreational Facilities (i.e., facilities that are not limited to Cabana/Rec function), and within common spaces of Community Center buildings (e.g., lounges, game rooms).

1. CFCI Components: Wall mounting device to receive flat panel displays, and A/V connection, flat panel displays, A/V controls and amplifiers.

D. Schedules for A/V Systems in Residential Buildings/Spaces:

1. MSGR:

a. Living/Meeting Room CFCI Components: Wall mounting device to receive flat panel displays, and A/V connection, Flat panel displays, A/V controls, amplifiers, and other A/V devices necessary for a completely functional system.
b. Patio CFCI Components: Floor box above ground level (e.g., attached on post), loudspeakers, and A/V connection, A/V Controls

1) Provide empty 50-mm conduit from patio to MSGR Telecom Room (TR).

2. Non-representational Residences (SDA/Housing) Dwelling Unit Spaces: In Living Room, Den, and each bedroom:

a. CFCI Components: A/V connection.
b. GFGI Components: Furniture-mounted flat panel displays, A/V controls, and other A/V devices (e.g., multi-format disk players).

3. Non-representational Residences (SDA/Housing) Common Area Spaces: In spaces such as Recreation Room, Lounge, Game Room, and TV Room.

a. CFCI Components: Wall mounting device to receive flat panel displays, amplifiers, and A/V connection Wall-mounted flat panel displays, controls, and other A/V devices necessary for a completely functional system.

4. Representational Residences like CMR and DCMR: In Reception Room, Salon, Library, Parlor, Social Secretary's Office, Family Room, Study, and each bedroom.

a. CFCI Components: Wall mounting device to receive flat panel display in Reception Room. A/V input/output/Bluetooth connection plates. Wireless microphone system and ceiling or wall mounted speakers for Reception/Salon area. Provide 1 coax and 1 CAT X for all TV locations in addition to voice, data, and Wi-Fi (WLAN) cabling throughout each residence.

b. CFCI Components (except bedrooms): Wall-mounted or furniture mounted flat panel displays, A/V controls, and other A/V devices necessary for a completely functional system in each room.
c. All headend hardware shall be mounted in designated A/V rack
d. Outdoor garden speakers shall be provided.
e. Two background music media players shall be installed in A/V rack
f. Pavilion and rest rooms shall be getting ceiling speakers for background music.

E. Schedules for A/V Systems in Office Buildings:

1. Attachment A “Schedule of Audiovisual Infrastructure in Office Buildings.”
2. Attachment B “Schedule of Audiovisual Display Equipment in Office Buildings.”
3. Attachment C “Schedule of Audio Systems in Office Buildings.”
4. Attachment D “Schedule of Audiovisual Presentation Source and Transmission Equipment in Office Buildings.”

SECTION 271113 – COMMUNICATIONS ENTRANCE PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

A. The work covered in this section consists of furnishing and installation of all necessary labor, supervision, materials, equipment, tests, and services to install complete cable protection system.

B. Related sections include the following:

1. Division 07 Section on penetration firestopping.
2. Section 260525 “Grounding and Bonding for Electrical Systems.”
3. Section 262725 “Wiring Devices” for devices installed in boxes.
4. Section 264115 “Lightning Protection.”
5. Section 270508 “Common Work Results for Telecommunications.”
6. Section 270526 "Grounding and Bonding for Communications Systems."
7. Section 271305 “Communications Backbone Cabling.”
8. Section 337105 “Underground Ducts and Raceways.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTALS

A. Product Data: Submit manufacturers’ data for entrance protection including but not limited to: entrance protector panels, entrance protectors, termination fields.

B. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

C. Qualifications Documents: See Section 270508 “Common Work Results for Telecommunications.”

1.4 QUALITY ASSURANCE

A. Comply with the OBO Electrical Code; see Section 270508 "Common Work Results for Telecommunications."

B. Comply with NFPA 780, "Standard for the Installation of Lightning Protection Systems."

C. Comply with ANSI/ TIA Standard 607-D including the 607D-1 and all addendum.

D. Panels and protectors must be UL listed.

E. Obtain all components of entrance protection system through one single manufacturer. Match components and interconnection for optimum future performance.

F. Installer Qualifications: See Section 270508 "Common Work Results for Telecommunications."

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.6 PROJECT CONDITIONS

A. See Section 270508 "Common Work Results for Telecommunications."

1.7 COORDINATION

A. Coordinate with electrical power installation for location of the service entrance.

B. Coordinate with local utility for installation of equipment belonging to access and/or service provider.

C. See Section 270508 "Common Work Results for Telecommunications" for additional coordination.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Manufacturers: Provide equipment from one of the following manufacturers, or manufacturer approved by the Project Director/COR and coordinated with OBO/PDCS/DE/EE.

1. Tii Technologies
2. Approved equal

2.2 PROTECTOR PANELS FOR UTP CABLE

A. Basis of Design: Tii Technologies 24 Series.

B. Protector Panels:

1. Provide protection for communication equipment and circuits exposed to overvoltage and sneak current protection.
2. Utilize 110-type for both input and output cable termination.
3. Size in accordance with incoming and outgoing pair counts.
4. Provide hinged cover with lock to limit access and mechanical protection.
5. Design for use with 5-pin insertion protector unit.
6. Include in-service test points.

2.3 PROTECTOR UNITS FOR UTP CABLE

A. Basis of Design: Tii Technologies 115 Series or equivalent.

B. Max Trip Current: 1.0A within 5 seconds.

C. General Design:

1. Individual with 5-pin plug-in unit.
2. Solid state type to provide overvoltage and sneak current protection.

D. Provide protector units with a clamping time less than 5 nanoseconds.

E. Protector unit shall be able to engage at multiple DC holdover currents and multiple sneak currents.

F. Minimal DC Holdover: 52 V with response time of less than 20 milliseconds.

G. Surge endurance shall be 100A per side.

H. Fast Response Secondary Protectors: UL497A.

2.4 PROTECTOR UNITS FOR COAXIAL CABLE

A. Provide surge protectors with operating temperature from minus 40 deg C to plus 100 deg C.

1. Protectors shall be bi-directional with no signal loss.

B. Provide in-line protectors.

C. Maximum Power at 50 Ohms: 500 watts.

D. Breakdown Voltage at 100 Volts per Second: 200-300 Volts.

E. Residual Voltage at 1 kVolt (U.S.): Less than 600 volts.

F. Power Handling: 10kA at 10 shocks, and 20kA at 1 shock.

G. Return Loss for N Connectors at 1 GHz: Less than minus 25 dB.

H. Insertion Loss for N Connectors at 1 GHz: Less than 0.03 dB.

I. Housing: Copper alloy with CuZnSn finish.

J. Insulation: Teflon per ASTM D-170.

K. Contact Shocks: Gold plated copper alloy or beryllium copper.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check raceways, cable, and other elements for compliance with space allocation, installation tolerances, hazards to cable, and other conditions affecting installation. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Route associated ground as straight as possible directly to PBB.

B. If protectors are installed in metal box, bond box with approved grounding conductor directly to protector ground.

C. Verify there are no obstructions around or in front of protectors.

D. UTP Protectors:

1. Allow at least 3200 mm^2 per circuit pair for installation of protector units.
2. Install protectors immediately adjacent to exposed cable plant point of entry.
3. Bond the metal sheath of UTP backbone cable with approved grounding conductor to grounding busbar.

E. Coaxial Protectors:

1. Assign maximum voltage according to power rating of equipment.
2. For coaxial protectors, choose appropriate connector type according to application.

END OF SECTION 271113

SECTION 271116 – COMMUNICATIONS CABINETS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

A. The work covered in this section consists of communications cabinets and frames.

B. Related Sections:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
2. Division 26 Section on cable trays.
3. Division 26 Section on vibration and seismic controls for electrical systems.
4. Section 270508 “Common Work Results for Telecommunications.”
5. Section 270526 "Grounding and Bonding for Communications Systems."
6. Section 270553 "Identification for Communications Systems."
7. Section 272129 "Data Communications Switches and Power Supplies."

1.2 REFERENCE STANDARDS:

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Equipment frames shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified.”

1.4 SUBMITTALS

A. Product Data: Provide manufacturer’s literature of telecommunications installation materials.

B. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

C. Qualification Documents: See Section 270508 "Common Work Results for Telecommunications."

1.5 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 "Common Work Results for Telecommunications."

1.6 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.7 COORDINATION

A. See Section 270508 "Common Work Results for Telecommunications."

PART 2 - PRODUCTS

2.1 GENERAL

A. Open freestanding equipment rack is not permitted.

2.2 EQUIPMENT CABINETS

A. General: Equipment cabinet shall be either freestanding or wall mounting equipment cabinet and size as indicated in Drawings. Equipment cabinet shall be modular steel unit and equipped with the following:

1. Fans for ventilation. Minimum airflow shall be 190 L/s (400 cfm) unless noted otherwise (with concurrence of OBO/PDCS/DE project engineer).
2. Hinged doors with reversible swing and lock for protection.
3. Rails conforming to EIA 310-D standard for mounting standard 482-mm equipment with cage nut style and square hole equipment mounting rails.
4. Grounding busbar kit inside equipment cabinet.
5. Transparent front door and vented rear door.
6. Power strip with surge protection and receptacle outlets on the power strip; minimum of 6 for wall mounted and Co-Location Cabinet sections and 12 for floor mounted cabinets.
7. Vertical wire management extending full height of cabinet including both sides, as well as front and back.
8. Knockouts for cable accessed along top, bottom, or rear panels.
9. Wall-Mounted Cabinets: Provide dual locking hinges for front and back access.
10. Freestanding Cabinets: Accessible from both front and back.

11. Finish: Manufacturer's standard gray if available; otherwise, manufacturer's standard black.

B. Cabinets:

1. Basis of Design:

a. TRs/CAER/CTSEF/RNER/CTF: 2100 mm high x 750 mm wide x 900 mm (84" x 30" x 36").
b. TRs/RNER Colocation (Colo): Two door, 2100 mm high x 750 mm wide x 900 mm deep (84" x 30" x 36").
c. JUCR: 2100 mm high x 750 mm wide x 1067 mm deep (84" x 30" x 42").
d. JUCR Colo: Two door, 2100 mm high x 750 mm wide x 1067 mm deep (84" x 30" x 42").
e. MTER (PBX)/Main CAA voice server cabinet: 2100 mm high x 750 mm wide x 1050 mm (84" x 30" x 42"). PBX cabinet/s shall have minimum usable front to back internal rail depth of 914 mm (36").

2. Perforated reversible front and back door with approximately 63 percent opening,
3. 3-digit combination handle.
4. Lift-off side panels.
5. Finish: Manufacturer's standard **[white][gray][black]**.
6. Seismic Bracing: Provide as required by site-specific seismic rating.
7. Colo Cabinets:

a. Each section shall have locking 3-digit combination handle.
b. Provide fans in all sections of Colo Cabinets.

PART 3 - EXECUTION

3.1 PREPARATION

A. Verify manufacturer's installation methods prior to installation; installation shall conform to those methods.

B. Ensure cabinets will fit footprint allocated prior to attempting installation.

C. Plan for space needed for installation of both equipment and cable.

D. Plan equipment installation into cabinet/rack. Ensure that open space recommendations are adhered to for airflow between electronic equipment. Ensure there is adequate space for cable so that bend radius and separation requirements are met.

3.2 INSTALLATION

A. Connect ground busbar in cabinet/rack to SBB or PBB. Cabinets, Racks, and other enclosures shall have their own dedicated bonding conductor to the SBB, PBB or Telecommunications Equipment Bonding Conductor (TEBC).

B. Securely fasten floor mounted cabinets/racks to floor with anchors, expansion bolts, or other suitable anchorage devices. Coordinate with structural engineer for proper type and use of bolts. Do not install concrete bases for communications cabinets and frames.

C. Support top of floor mounted cabinet/rack by bracing it to the wall, support barrier, or ladder rack. Consult seismic engineer when seismic bracing is required.

D. Main Telephone Equipment Room: Remove side panels from cabinets before installation.

E. Telecommunications Room: Where there is more than one voice cabinet in a TR, remove side panels between cabinets before installation.

END OF SECTION 271116

SECTION 271119 – COMMUNICATIONS TERMINATION BLOCKS AND PATCH PANELS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes materials but not limited to wires, connecting devices, and miscellaneous items associated with the work of this Section for a fully operational, compliant with applicable codes and standards telecommunication cabling systems.

B. Voice Over Internet Protocol (VoIP): This section has been adapted to accommodate the Department's VoIP.

C. Related Sections include the following:

1. Section 270508 "Common Work Results for Telecommunications."
2. Section 270526 "Grounding and Bonding for Communications Systems."
3. Section 270553 "Identification for Communications Systems."
4. Section 271116 "Communications Cabinets and Frames."
5. Section 271543 "Communications Faceplates and Connectors."
6. Section 272129 "Data Communications Switches and Power Supplies."

1.2 STANDARDS

A. See Section 270508 "Common Work Results for Telecommunications" for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTAL

A. Product Data: Submit manufacturers' data for entrance protection: including but not limited to entrance protector panels, entrance protectors, and termination fields.

B. Shop Drawings: See Section 270508 "Common Work Results for Telecommunications."

C. Installer Qualifications Documents: See Section 270508 "Common Work Results for Telecommunications."

1.4 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 "Common Work Results for Telecommunications."

B. Source Limitations: Obtain telecommunication cabling system such as cable, jack, termination blocks, patch panels, path cords etc. through one single manufacture. Match components and interconnection for optimum future performance.

C. Comply with the OBO Electrical Code; see Section 270508 "Common Work Results for Telecommunications."

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.6 PROJECT CONDITIONS

A. See Section 270508 "Common Work Results for Telecommunications."

1.7 COORDINATION

A. See Section 270508 "Common Work Results for Telecommunications."

1.8 EXTRA MATERIAL

A. Furnish extra materials identified below that match products installed. Package with protective covering for storage and identify with labels describing contents.

1. Patch-Panel Units: Two of each type for every 6 installed, but no less than 1.
2. Connecting Blocks: Two of each type for every 25 installed, but no less than 1.

PART 2 - PRODUCT

2.1 SYSTEM REQUIREMENT

A. General: Equipment and components shall not be intermixed between different manufactures.

B. Allowance for change and expansion:

1. Horizontal Distribution Expansion: Provide 25 percent minimum for termination devices in TR.

2.2 MOUNTING ELEMENT

A. Backboards: A-C grade, fire-retardant treated plywood, 19-mm thick, 2440mm high unless otherwise noted, capable of supporting attached equipment. Paint backboard in light color matching with other walls, except portions with stamps indicating fire rating on plywood; stamps shall remain visible at all times.

2.3 TERMINATION EQUIPMENT

A. Fiber Optic Patch Panel:

1. Provide fiber patch panels as indicated in Construction Drawings. Fiber patch panels shall be 2 RU minimum. 1RU fiber patch panel is not allowed unless approved by OBO/PDCS/DE/EE-Telecom.
2. Provide pullout splice trays within cabinets suitable to house required number of pigtail splices if required by termination method used. Each fiber optic interconnect center shall consist of sufficient number of splice trays and splices (if required), interconnection sleeves, and connectors to minimally terminate specified number of fiber strands.
3. Equip fiber termination panels to provide slack and fiber management.
4. Furnish fiber termination panels with fully populated pre-assembled non-angled multi-mode duplex LC style adapter plates.
5. Provide two rack unit of horizontal cable management for every two rack units of patch panel height.

B. Data Patch Panel for UTP (Copper) Cables:

1. Modular patch panels shall be either 24 or 48-port as indicated on Drawings. Each modular patch panel shall contain quantity of CAT6 8-position/8-conductor (RJ-45) connector. RJ-45 connectors shall be color coded to match with the CAT6 cables installed (i.e., orange, green, yellow, purple, and gray.)
2. Modular patch panels shall be 483mm rack mountable units.
3. Modular patch panels shall be used to terminate all OpenNet, SPARE/Tenant, CATV. SPARE 2 applies to CAA spaces only.
4. Provide dust covers for connectors to protect from dust and debris.
5. Provide two rack unit of horizontal cable management for every two rack units of patch panel height.

C. Voice, and WLAN Patch Panel for UTP (Copper) Cables:

1. Modular patch panels shall be either 24- or 48-port as indicated on the drawings. Each modular patch panel for voice horizontal cables shall contain the quantity of CAT6 8-position/8-conductor (RJ-45) connectors as required plus 25 percent spare. Terminate all 4-pairs using T568A wiring scheme. RJ-45 connectors shall be blue.
2. For intrabuilding and on-compound interbuilding voice backbone cabling, terminate one pair per port on pins 4&5. Patch panels for backbone cabling shall be 25-port RJ-45 patch panels. The only exception to this is for primary incoming service. A separate 110-style

termination field shall be installed adjacent to primary protection panels (for LSP copper-based service only) for cross-connects to LSP circuits in the CMPD TSEF.

3. WLAN networks shall have dedicated modular patch panels. Patch panel for WLAN shall be installed in voice cabinet. Connectors at patch panels shall be RJ45 CAT 6A, terminated WLAN cables using T568A wiring scheme. CAT6A connectors for WLAN shall be yellow.
4. Modular patch panels shall be 483mm rack mountable units.
5. Modular patch panels shall be used to terminate all Voice and WLAN cables.
6. Provide dust covers for connectors to protect from dust and debris.
7. Provide two rack unit of horizontal cable management for every two rack units of patch panel height. Provide one rack unit of cable management for every one unit of patch panel height.
8. Do not terminate cabling supporting CAA and non-CAA in the same termination field (patch panel). See separation requirements in the Drawings.
9. Install blanks between termination fields supporting CAA and non-CAA.
10. Voice termination fields shall not share cabinets with other systems.

D. Television Patch Panel for F/UTP (Copper) Cables:

1. Modular shielded patch panels shall be either 24 or 48-port as indicated on Drawings. Each modular shielded patch panel for horizontal shall contain quantity of CAT6a 8-position/8-conductor (RJ-45) connector. RJ-45 connector for CATV shall be purple.
2. Modular shielded patch panels shall be 483mm rack-mountable units.
3. Use modular shielded patch panels to terminate television and to provide spare capacity for future expansion.
4. Provide dust covers for connectors to protect from dust and debris.
5. Provide two rack unit of horizontal cable management for every two rack units of patch panel height.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL

A. Make terminations only at indicated outlets, frames, and cross-connect and patch panels.

B. Group connecting hardware for cables into separate logical fields.

3.2 INSTALLATION IN TELECOMMUNICATION EQUIPMENT SPACES

A. Patch Panels:

1. Use patch panels to terminate cables entering telecommunication equipment spaces (e.g., TRs), and additional locations shown on Construction Drawings, unless otherwise indicated.

2. Install patch panels within cabinets.

3.3 GROUNDING

A. Comply with Section 270526 “Grounding and Bonding for Communications Systems.”

END OF SECTION 271119

SECTION 271123 – COMMUNICATIONS CABLE MANAGEMENT AND LADDER RACK

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes cable management materials, equipment, and installation practices required for a fully operational, certified telecommunication cabling system compliant with all applicable codes and standards.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety” for supports and anchors.
2. Division 26 Section on raceways and boxes for pathways containing telecommunications cabling.
3. Division 26 Section on cable trays for pathways containing telecommunications cabling.
4. Division 26 Section on vibration and seismic controls for electrical systems.
5. Section 270508 “Common Work Results for Telecommunications.”
6. Section 270526 “Grounding and Bonding for Communications Systems.”
7. Section 271116 “Communications Cabinets and Frames.”
8. Section 271119 “Communications Termination Blocks and Patch Panels.”

1.2 STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508

1.3 SUBMITTAL

A. Product Data: Submit manufacturers’ data.

B. Shop drawings: Section 270508 “Common Work Results for Telecommunications.”

C. Qualifications Documents: See Section 270508 “Common Work Results for Telecommunications.”

1.4 QUALITY ASSURANCE

A. Contractor Qualifications: See Section 270508 "Common Work Results for Telecommunications."

B. Obtain cable management and ladder rack and all associated accessories through one single manufacturer.

C. Match components and interconnection for optimum future performance.

D. Comply with the OBO Electrical Code; see Section 270508 "Common Work Results for Telecommunications."

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.6 COORDINATION

A. See Section 270508 "Common Work Results for Telecommunications."

PART 2 - PRODUCT

2.1 CABLE MANAGEMENT AND LADDER RACKS

A. Basis of Design: Provide equipment and components from the following manufacturer or manufacturer approved by Project Director/COR:

1. Chatsworth

B. Ladder Racks:

1. Racks shall have maximum load with minimal deflection is 200 kg/m when supported every 1500 mm.
2. Construct of rectangular steel tubing.
3. Field constructed accessories such as transitions, splices, bends are prohibited.
4. Provide manufactured junction splices to join pieces of ladder rack.
5. Ladder rack assembly shall be UL listed.

C. D-Rings: Metal

1. Size: 50 mm minimum.
2. Corrosion-resistant and fire-resistant.

D. Cable Straps: Velcro; manufactured for specific use of bundling cable.

E. Cable tie mounting pads: Metal screw must be installed in each mounting pad. Pads installed utilizing only adhesive backing are not permitted. Exception: metal, glass, or granite surfaces. All other applications must receive prior approval from OBO/PDCS/DE/EE.

2.2 J-HOOKS

A. Provide equipment from the following manufacturer or manufacturer approved by the Project Director/COR:

1. ERICO Caddy Cable Cat Support System

B. Base: Wide.

C. Finish: Galvanized.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Inspect pathway elements intended for cables. Verify raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with ANSI/TIA Standards 568 and 569.

B. Provide sufficient support for ladder racks and installed cables. Ladder racks shall extend in straight line from wall to wall, be supported at wall attachments, and at every 10 feet.

C. J-Hooks:

1. Use of J-hooks is limited to transitions from cable tray to conduit drops. J-hooks are not permitted in new construction of office buildings; any other application must be approved by Project Director/COR based upon input from OBO/PDCS/DE/EE.
2. Install at 1.22 meter or 1.52 meter interval.

D. D-rings: D-Rings may be used at backboards to route and cable inside telecommunications equipment spaces.

E. Bridle Rings: Use is not permitted.

F. Junctions:

1. Junctions for ladder rack shall be used to allow transitions in various directions.
2. Junctions for ladder rack shall be constructed of solid tubular steel.

G. Expansion Capacity:

1. Horizontal Distribution Expansion: Provide 25 percent minimum for pathways, number of outlets and termination devices in telecommunication equipment spaces.
2. Backbone Expansion: Provide 50 percent minimum of pathways.

H. Provide horizontal cable management and cable management covers above and below each copper and fiber patch panel and switches.

I. Provide horizontal cable management on back of each copper patch panel.

J. For equipment cabinets/enclosures, provide vertical cable management and cable management covers extending full height of rack, including both sides.

K. Radii and Bends:

1. Provide radii and bends for smooth cable transitions for turns and drops.
2. Radii and bends shall be constructed of the same material as the ladder rack.

L. Install cable ties loosely so that they do not damage or deform cable. Ties shall be able to spin around bundled cable.

M. Cables shall not be bundled with tape, rope, rubber bands, or similar fashion.

N. Cable Straps: Use in telecommunications equipment spaces for telecom from entry into room to cabinet or to termination point.

3.3 GROUNDING

A. Bond all ladder rack and other metallic hardware used for communication distribution to nearest grounding busbar. Ensure that bonding breaks through paint to bare metallic surface of all painted metallic hardware. Refer to Section 270526 “Grounding and Bonding for Communications Systems.”

END OF SECTION 271123

SECTION 271305 – COMMUNICATIONS BACKBONE CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes backbone cabling for fully operational telecommunication system.

B. Related Sections include the following:

1. Section 270508 “Common Work Results for Telecommunications.”
2. Section 270533 “Identification for Communications Systems.”
3. Section 271116 “Communications Cabinets and Frames.”
4. Section 271543 “Communications Faceplates and Connectors.”
5. Section 272129 “Data Communications Switches and Power Supplies.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer’s literature and sample of telecommunications installation materials.

B. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

C. Installer Qualification Document: See Section 270508 “Common Work Results for Telecommunications.”

1.4 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 “Common Work Results for Telecommunications.”

B. Source limitations: Obtain telecommunication cabling system such as cable, jack, termination blocks, patch panels, and path cords through one single manufacturer. Match components and interconnection for optimum future performance.

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.6 PROJECT CONDITIONS

A. See Section 270508 "Common Work Results for Telecommunications."

1.7 COORDINATION

A. See Section 270508 "Common Work Results for Telecommunications."

B. Coordinate with other trades for installation of backbone cabling such as mechanical, electrical, and structural.

PART 2 - PRODUCTS

2.1 GENERAL

A. All cables in this Section shall conform to TIA standards cited in Section 270508 "Common Work Results for Telecommunication."

2.2 OUTSIDE PLANT OPTICAL FIBER DISTRIBUTION CABLE

A. Fiber Construction:

1. Multimode: OM4 (50/125 micron laser-optimized) loose tube, fiber optic backbone cable shall be used for voice and data connectivity.
2. Single-Mode: OS2 (8.3/125 micron) loose tube, fiber optic backbone cable shall be used where required for voice and data connectivity.

B. Core shall consist of loose tubes around central dielectric strength member.

C. Cable shall contain water-blocking yarns wrapped with water swellable tapes.

D. Jacket shall be medium density PE jacket.

2.3 OUTSIDE PLANT COPPER DISTRIBUTION CABLE

A. Distribution cable for telephone system connectivity throughout campus shall be multi-pair OSP PE-39 or PE-89 unshielded twisted pair (UTP) within single sheath. See drawing riser diagram for required pair counts and category required for OSP UTP copper backbone.

B. Conductors: Solid 0.5 mm, annealed bare copper.

C. Insulation: Either solid polyolefin or foamed polyolefin with solid covering of polyolefin.

D. Fill cable core with waterproofing gel filled compound and wrap in non-hygroscopic core tape.

E. Shielding: Steel Aluminum black Polyethylene (STALPETH).

F. Cable Jacket: Black polyethylene with sequentially printed metal markers at regular intervals.

G. Air-filled cables are not permitted.

H. Cables shall comply with ANSI/ICEA S-80-576 for standard US color codes and binder color code integrity.

I. All cables shall be American Standard type.

2.4 INSIDE/OUTSIDE OPTICAL FIBER DISTRIBUTION CABLE

A. Cable shall be UL listed.

B. Cables shall be OFNx (optical fiber nonconductive riser or plenum) and comply with NFPA 262 and NFPA 70.

C. Fiber Construction:

1. Multimode: OM4 (50/125 micron laser-optimized) Interconnected tight buffered or loose tube, fiber optic backbone cable.
2. Single-Mode: OS2 (8.3/125 micron) Interconnected tight-buffered or loose tube, fiber optic backbone cable,

D. Core shall consist of tight buffered or loose tubes around central dielectric strength member.

E. Cable shall contain water-blocking yarns wrapped with water swellable tapes.

F. Jacket shall be flame-retardant and UV resistant.

2.5 INSIDE BUILDING OPTICAL FIBER DISTRIBUTION CABLE

A. Cable shall be UL listed.

B. Fiber Construction:

1. Multimode: Interconnected tight-buffered, OM4 laser optimized with core/cladding size of 50/125 microns.
2. Single-Mode: Interconnected tight-buffered, OS2 with core/cladding size of 8.3/125 microns.

C. Core shall consist of tight buffer around central dielectric strength member. Cable shall contain strength members to satisfy mechanical and environmental specifications provided herein.

D. All finished fibers shall be color coded by manufacturer for identification. Provide field terminations or spliced pigtails to terminate fibers.

E. Nominal insertion loss shall not be greater than 0.75 dB per mated pair for MM.

F. LC Mechanical Connectors:

1. Corning UniCam.
2. Commscope Pre-Radiused.
3. Other comparable manufacturer as approved by the Project Director/COR.

2.6 INSIDE BUILDING COPPER BACKBONE CABLE

A. Backbone Cable: Copper unshielded twisted pair, refer to riser diagram for pair counts and category required.

B. Backbone Cable for Data: Copper unshielded twisted pair, Category 5E minimum.

C. Cable shall be UL listed.

D. Conductors: 0.5 mm solid bare copper-paired thermoplastic insulated conductors, formed into binder groups of 25 pairs and assembled to form single compact cored covered by protective sheath.

E. Sheath: Underlying metallic shield, with one or more layers on dielectric materials applied over core.

F. Cable shall comply with NSI/ICEA S-80-576 color for standard US color codes and binder color code integrity.

2.7 COAXIAL BACKBONE CABLE

A. Coaxial cable elements shall have 75-ohms nominal impedance. Coaxial cable shall bear plenum- or riser-rated markings for environment in which they are installed.

B. CATV Indoor Trunk Cable: RG-11/U, cellular-polyethylene dielectric, bare-copper braid shield with 100 percent minimum shielding factor, 2.5 mm, solid bare-copper conductor.

C. CATV Outdoor Trunk Cable: Coaxial cable for incoming services; with concurrence of Project Director/COR based upon input from OBO/PDCS/DE/EE project telecom engineer, single-mode optic cable may be used instead.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install equipment according to manufacturer’s directions, approved shop drawings, and referenced standards identified in this Section.

B. Install cables using techniques, practices, and methods that are consistent with rating of components, and that ensure performance of completed and linked signal paths, end-to-end.

C. Install cables without damaging conductors, shield, or jacket. Install all fiber backbone cables inside innerduct.

D. Do not bend cables, in handling or in installing, to smaller radius than minimums recommended by manufacturer’s installation recommendation.

1. Outside Plant Optical Fiber Distribution Cable: Minimum static or no load-bending radius for cable shall be no greater than 10 times the outside diameter of the cable.
2. Inside Optical Fiber Distribution Cable:

a. Minimum static or no-load bending radius shall be less than 10 times the outside diameter of the cable.
b. Minimum dynamic or loaded bending radius shall be less than 20 times the outside diameter of the cable.

E. Pull cables without exceeding cable manufacturer's recommended pulling tensions. Pull cables simultaneously if more than one is being installed in same raceway.

1. Use pulling compound or lubricant if necessary. Use compounds that will not damage conductor or insulation. Lubricant shall be viscous gel or colorless liquid with no odor. Use lubricants which deter rodents and insects.
2. Use pulling means, including fish tape, cable, rope, and basket weave wire or cable grips, which will not damage media or raceway.

3. Remove cable from pathways that has been damaged (tears in cable sheath) during installation. Replace damaged cable with new cable within same raceway.

F. Outside Plant Optical Fiber Distribution Cable Installation:

1. Connect fibers utilizing field-installed terminations or spliced pigtails.
2. Only fusion splicing is permitted.
3. WLAN networks shall share the voice/PBX fiber optic backbone.

G. Outside Plant Copper Distribution Cable Installation:

1. Configure cable groups in separate color-coded binder groups. Identify binder groups and individual pairs using industry standard color codes.
2. Do not splice cables.

H. Inside Building Optical Fiber Distribution Cable Installation:

1. Use either plenum- or riser-rated cabling as required by installation environment and model NFPA 70. Use plenum-rated cable within areas designated as air plenums.
2. Connect fibers utilizing field-terminated LC, or mechanical LC connectors.
3. WLAN networks shall share the voice/PBX fiber optic backbone.

I. Inside Building Copper Backbone Cabling Installation:

1. Do not splice cable.
2. Use either plenum- or riser-rated cabling, as required by installation environment and model NFPA 70. Use plenum-rated cable within areas designated as air plenums.
3. Copper riser cables shall only be installed within building. Outside plant (OSP copper cable is not permitted for use as riser cable.
4. Copper backbone cables for voice shall not connect CAA and non-CAA Telecom rooms. Route copper backbone so the cables enter each CAA floor at one location.

3.2 FIELD QUALITY CONTROL

A. Pre-Qualification Tests: Recommend contractor performs pre-qualification tests prior to Government acceptance testing.

B. Acceptance Testing: Government may procure services of independent test firm to perform acceptance testing of each section or infrastructure, and to inspect installation to ensure work has been performed in accordance with contract requirements.

1. Acceptance testing shall not begin until all work is completed. No construction which limits access or which produces adverse conditions that can adversely affect test result are permitted. For example, all finish work on floors walls and ceilings which produces dust shall be completed prior to testing. Contractor shall have completed all work on cable plant or in telecommunications spaces prior to acceptance.

2. Testing parameters are as follows:

   a. Copper cable plant will use Level IV tester for conformance with performance requirement of ANSI/TIA 568.2 for all category levels including CAT3 UTP cable. UTP copper backbone/riser cables testing will be for continuity, length, polarity, and wire map. Coax cables testing will be for continuity and length.
   b. Multimode Fiber optic cable plant testing will use instrumentation based on ANSI/TIA 526-14, Method B (one jumper method), for Multimode fiber cable testing, and ANSI/TIA 526-7 one jumper method for single mode cable. Testing will be bi-directional at both operating windows using power optical loss test equipment set such as Fluke DSX-5000. OTDR traces of fiber optic cables may be performed.
   c. Marginal test results (sometimes shown as PASS*) are not acceptable and are considered a failed test result.

3. Contractor shall be present during acceptance testing to replace/repair all work that fails.
4. Contractor is financially responsible for all costs associated with repair or replacement of cable, terminations, equipment, and other associated items which are identified as failing during acceptance testing.

END OF SECTION 271305

SECTION 271505 – COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes UTP, F/UTP cabling, fiber cabling, coaxial cabling, and terminating devices, required for a fully operational, telecommunication system conforming to referenced standards.

B. Related Sections include the following:

1. Division 07 Section on penetration firestopping for materials and installation at penetrations through walls, ceilings, and other fire-rated elements.
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety” for supports and anchors.
3. Section 262725 “Wiring Devices” for devices installed in boxes and for floor-box service fittings.
4. Division 26 Section on raceways and boxes for electrical systems for pathways containing telecommunications cabling.
5. Division 26 Section on cable trays for pathways containing telecommunications cabling.
6. Section 270508 “Common Work Results for Telecommunications.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTAL

A. Product Data: Provide manufacturer’s literature and sample of telecommunications installation materials.

B. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

C. Qualification Documents: See Section 270508 “Common Work Results for Telecommunications.”

1.4 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 "Common Work Results for Telecommunications."

B. Source limitations: Obtain telecommunication cabling system such as cable, jack, termination blocks, patch panels, and path cords through one single manufacturer. Match components and interconnection for optimum future performance.

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.6 PROJECT CONDITIONS

A. See Section 270508 "Common Work Results for Telecommunications."

1.7 COORDINATION

A. See Section 270508 "Common Work Results for Telecommunications."

1.8 EXTRA MATERIAL

A. Furnish extra materials described below to the Project Director/COR that match products installed and are packaged with protective covering for storage and identified with labels describing contents:

1. Extra Materials:

a. Cable: 300 meters of each type used for Project. Furnish on separate reels for each type/color.
b. One complete set of termination tools for cabling types included in this Section. Furnish in single carrying case.

1.9 CONTRACTOR-FURNISHED GOVERNMENT-INSTALLED (CFGI) MATERIAL

A. Furnish the materials identified below as CFGI materials. Most of this material will be installed by the Government as part of the Project, though some of it (as determined by the Government and identified through the Project Director/COR) will be kept by the Government as extra material.

1. Patch Cords:

a. Electrical performance of LAN and voice patch cords shall equal electrical performance of cable used within system being patched interconnected, or cross-connected.
b. Fiber Patch Cords: OM4 conforming to cable transmission performance standards in ANSI/TIA/EIA 568.3; see Table 1.9, "Patch Cords."
c. Same manufacturer furnishing UTP and F/UTP jacks and cable shall furnish UTP and F/UTP patch cords.
d. Same manufacturer furnishing fiber optic connections shall furnish fiber optic patch cords.
e. Furnish in quantities for different types and colors as identified in Table 1.9, "Patch Cords." Furnish cords in separate boxes for each cord type/length/color. Patch cord quantities shall not be changed without prior written approval of OBO/PDCS/DE/EE.
f. Provide fiber patch cords for terminations between MTC and JUCR cabinets for each network (i.e., OpenNet, Spare, and Spare2) in the following quantity. Provide three (3) duplex patch cables for every 12 strands of fiber optic cable installed. Connectors shall be compatible with the termination at the panel(s). Provide patch cables for each type of fiber cable(s) installed (i.e., Singlemode and Multimode).

TABLE 1.9 – PATCH CORDS

LOCATION	LENGTH	TYPE [A B] UTP & F/UTP (copper)
TR	0.45 m (1-1/2 ft)	orange – 50% blue – 50% green – 25% yellow – 25% purple – 25% WLAN yellow CAT6A-50%
	1.0 m (3 ft)	orange – 50% blue – 50% green – 25% yellow – 25% purple – 25% WLAN yellow CAT6A- 50%
Work Area	2.0 m (7 ft)	orange – 50% blue – 50% green – 25% yellow – 25% purple – 50%
	3.0 m (10 ft)	orange – 50% blue – 50% green – 25% yellow – 25% purple – 50%
	5.0 m (15 ft)	WLAN yellow CAT6A- 100%
LOCATION	**LENGTH**	**[C D] FIBER**
TR	0.45 m (1-1/2 ft)	[E] 150%
	1.0 m (3 ft)	[E] 150%
Work Area	2.0 m (7 ft)	50%
	4.5 m (15ft)	[E] 50%

[A] TR UTP & F/UTP: Percent in relation to patch panel capacity.

[B] Work Area outlets (WAO) and wall phones UTP & F/UTP: Percent in relation to Work Area outlets and wall phones count.

[C] TR Fiber LC-to-LC OpenNet and Voice Patch Cords: Provide minimum two each of one-meter duplex length patch cords per client switches for both voice and data.

[D] TR Fiber LC-to-LC Patch Cords: Additionally, for each TR furnish 10 of this type of fiber patch cord at 1-m length.

[E] Fiber patch cable color shall match color of horizontal fiber. Refer to set B document for additional color code required for fiber. Percent in relation to Work Area outlet count.

1.10 ELECTRIC VEHICLE (EV) CHARGING STATION PATCH CABLES

A. Patch cables shall be CFCI, one (1) per charging station plus two (2) additional spares.

B. 100% of the patch cables shall be supplied by the Contractor.

C. Patch cables shall be CAT6 (or EV manufacturer recommended) and OSP-rated.

D. Patch cable length shall be long enough to connect between the EV charger and NEMA enclosure and will be site-specific to be determined by the Contractor.

PART 2 - PRODUCT

2.1 SYSTEM REQUIREMENT

A. General: Equipment and components shall not be intermixed between different manufactures.

B. Expansion Capacity:

1. Horizontal Distribution Expansion: Provide 25 percent minimum for pathways, number of outlets and termination devices in Telecommunications Room (TR) and other equipment rooms for telecom.

2.2 TELECOMMUNICATION CABLE

A. Fiber Optic Horizontal Distribution Cable: As indicated on Drawings.

1. Fiber optic station cables shall be rated OFNP (optical fiber nonconductive plenum) per installation environment as defined by model NFPA 70.
2. Fiber construction shall be tight-buffered multi-mode 850nm OM3 laser-optimized with core/cladding size of 50/125µm.
3. Fiber construction shall consist of two fibers in single jacket, duplex tight-buffered cables with outer jacket around full fiber jacket.
4. Maximum Cable Attenuation:

a. 850 nanometers: 3.0 dB/km.
b. 1300 nanometers: 1.5 dB/km.

5. Minimum overfilled modal bandwidth-length product:

   a. 850 nanometers: 1500 MHz-km.
   b. 1300 nanometers: 500 MHz-km.

6. Refer to IFC drawings and/or J.3.5 document for color code of fiber jacket. Terminate fibers utilizing field-installed LC connectors or spliced pigtails. Nominal connector loss using either termination method shall not be greater than 0.75 dB per mated pair.
7. Fiber cable shall be able to withstand maximum tensile load of 220 N (50 lbf) during construction.

B. UTP Horizontal Distribution Cable for Voice, OpenNet, Spares, and WLAN.

1. Horizontal distribution cables for voice, OpenNet, and spares shall be UL Listed cable that meets or exceeds ANSI/TIA Standard 568.2 Category 6 specification for performance at 250 MHz.
2. Horizontal distribution cables for WLAN shall be two CAT6A UL Listed cable that meets or exceeds ANSI/TIA Standard 568.2.
3. Where required, horizontal cable shall be marked CMP for use within inside building return air plenum as defined by model NFPA 70. For CMP (plenum type) cable, all 4-cable pairs shall be insulated with FEP.
4. Cables shall be distinguished by different color sheaths for each purpose. Voice (telephone) cable shall be blue. OpenNet cable shall be orange. Spare 1 cables shall be green. WLAN cables shall be yellow CAT 6A outside the CAA.
5. Cables shall be distinguished by different color sheaths for each purpose. Voice (telephone) cable shall be blue. OpenNet cable shall be orange. Spare 1 cables shall be green. Inside CAA, Spare 2 cables shall be yellow Cat 6.

C. F/UTP Horizontal Distribution Cable for Television:

1. Horizontal distribution cables for television shall be UL Listed cable that meets or exceeds ANSI/TIA Standard 568.2 CAT 6A specification for performance at 250 MHz.
2. Where required, horizontal cable shall be marked CMP for use within inside building return air plenum as defined by model NFPA 70. For CMP (plenum type) cable, all 4-cable pairs shall be insulated with FEP.
3. F/UTP cables shall be purple.

2.3 COAXIAL TRANSMISSION COMPONENTS

A. Cable: Coaxial cable elements have 75-ohms nominal impedance. Coaxial cable shall bear plenum or riser rated markings for environment in which they are installed.

1. CATV Indoor Branch Cable: RG-6/U quad-shielded, cellular-polyethylene dielectric, bare-copper braid shield with 100 percent minimum shielding factor, 1.0 mm^2 solid copper-clad-steel conductor.

B. Coaxial Connector: Type F, 75-Ohms, unless otherwise noticed.

C. Signal Strength: Frequency range is 5 MHz to 1 GHz.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Installation Standards: ANSI/TIA 568 and 569, all sections and annex.

B. Wiring Method: Install wiring and optical fiber in raceway and cable tray except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Use UL-listed plenum cable in environmental air spaces, including plenum ceilings. Conceal raceway and cables except in unfinished spaces.

C. Install cables using techniques, practices, and methods that are consistent with Category 6 and 6A rating of components and that ensure Category 6 and 6A performance of completed and linked signal paths, end to end.

D. Install cables without damaging conductors, shield, or jacket.

E. Do not bend cables, in handling or in installing, to smaller radius than minimums recommended by manufacturer’s installation recommendation.

1. Fiber Optic Horizontal Distribution Cable: Minimum static or no-load bending radius for cable shall be no greater than 10 times outside diameter of cable. Minimum dynamic or loaded bending radius shall be no greater than 20 times outside diameter of cable.

F. Service Loop: Provide 300 mm-service loop in workstation outlet box or above ceiling at workstation location.

G. Cable Pulling: Pull cables without exceeding cable manufacturer's recommended pulling tensions. Pull cables simultaneously if more than one is being installed in same raceway.

1. Use pulling compound or lubricant if necessary. Use compounds that will not damage conductor or insulation. Lubricant shall be viscous gel or colorless liquid with no odor. Use lubricants, which deter rodents and insects.
2. Use pulling means such as fish tape, cable, rope, and basket weave wire or cable grips that will not damage media or raceway.
3. Cable that has been damaged (tears in cable sheath) during installation shall be removed from pathways. Replace damaged cable with new cable within same raceway.

H. Install exposed cables parallel and perpendicular to surfaces or exposed structural members and follow surface contours where possible.

I. Secure and support cables at intervals not exceeding 760 mm and not more than 150 mm from cabinets, boxes, fittings, outlets, racks, frames, and terminals.

J. Wiring within Telecommunications Equipment Spaces: Provide conductors of adequate length. Train conductors to terminal points with no excess. Use lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radius than minimums recommended by manufacturer.

K. Make splices, taps, and terminations only at indicated outlets, terminals, and cross-connect and patch panels. Cables shall be homerun to TRs and other equipment rooms for telecom; midspan splices are not permitted.

1. UTP and F/UTP Horizontal Distribution Cable for Voice, OpenNet, Spares, WLAN, and Television: Cable shall be home run to TRs and other equipment rooms for telecom; splices are not permitted.

3.3 IDENTIFICATION

A. Comply with applicable requirements in Section 270553 "Identification for Communications Systems" and ANSI/TIA Standard 606.

3.4 FIELD QUALITY CONTROL

A. Pre-Qualification Tests: Recommend contractor performs pre-qualification tests prior to Government acceptance testing.

B. Acceptance testing shall not begin until all work is completed. No construction which limits access, or which produces adverse conditions that can adversely affect test result are permitted. For example, all finish work on floors walls and ceilings which produces dust shall be completed prior to testing. Contractor shall have completed all work on cable plant or in telecommunications spaces prior to acceptance.

C. Testing: The Government may procure services of independent test firm to perform acceptance testing of each section of infrastructure and inspect installation to ensure work has been performed in accordance with contract requirements.

D. Contractor shall be present during acceptance testing to replace/repair all work that fails.

E. Testing parameters are as follows:

1. Copper cable plant will use Level IV tester for conformance with performance requirement of ANSI/TIA 568.2 for all category levels including CAT3 UTP cable. UTP copper backbone/riser cables testing will be for continuity, length, polarity, and wire map. Coax cables testing will be for continuity and length.
2. Multimode Fiber optic cable plant testing will use instrumentation based on ANSI/TIA 526-14, Method B (one jumper method), for Multimode fiber cable testing, and ANSI/TIA 526-7, one jumper method for single mode cable. Testing will be bi-directional at both operating windows using power optical loss test equipment set such as Fluke DSX-5000. OTDR traces of fiber optic cables may be performed.
3. Marginal test results (sometimes shown as PASS*) are not acceptable and are considered failed test result.

END OF SECTION 271505

SECTION 271543 – COMMUNICATIONS FACEPLATES AND CONNECTORS

PART 1 - GENERAL

1.1 SUMMARY

A. The work covered under this section consists of faceplates and connectors for telecommunications cabling systems.

B. Related Sections include the following:

1. Division 07 Section on penetration firestopping.
2. Division 26 Section on raceways and boxes.
3. Section 270508 “Common Work Results for Telecommunications.”
4. Section 270553 “Identification for Communications Systems.”
5. Section 271119 “Communications Termination Blocks and Patch Panels.”
6. Section 271305 “Communications Backbone Cabling.”
7. Section 271505 “Communications Horizontal Cabling.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTALS

A. Product Data: Provide manufacture’s product literature of faceplates and connectors.

B. Qualification Documents: See Section 270508 “Common Work Results for Telecommunications.”

1.4 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 “Common Work Results for Telecommunications.”

B. Comply with the OBO Electrical Code; see Section 270508 “Common Work Results for Telecommunications.”

C. Obtain faceplates and connectors from a single manufacturer.

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 “Common Work Results for Telecommunications.”

1.6 COORDINATION

A. See Section 270508 “Common Work Results for Telecommunications.”

1. In addition, coordinate locations of outlets power, and other utilities.

1.7 EXTRA MATERIAL

A. Furnish extra materials described below that match products installed. Package with protective covering for storage and identify with labels describing contents.

1. Outlet Assemblies: ten (10) percent of each type installed, but no less than one (1).

PART 2 - PRODUCT

2.1 GENERAL

A. Install dust covers to prevent dirt/debris from entering ports, modular jacks, adapters, and connectors.

2.2 FACEPLATES

A. Manufacturers: Provide faceplates by manufacturer approved by Project Director/COR.

B. Color and Finish Coordination: Provide telecommunication manufacturer’s standard faceplates. Selection of standard color shall be coordinated with architectural design and finishes specified by the A/E in consultation with the OBO Project Team interior designer.

C. Mounting Configurations:

1. Equip faceplates with screw holes with screw retention tabs spaced for single gang openings.

a. Each faceplate shall be supplied with minimum 25-mm (1-inch) long screws.

2. Building Interior Telephone Outlet: Wall-mounted assembly for wall-mounted telephone sets.

    a. Acceptable Products: Commscope 76100891/M10LW4SP, along with associated RJ45 CAT 6 jack or equivalent.

3. Building Exterior Telephone Outlet: Wall-mounted assembly.

D. Floor-mounted access box shall conform to the following:

1. Provision boxes as indicated on Construction Drawings.
2. Size floor box to maintain adequate working space within box.
3. Provide outlets as indicated on Construction Drawings. Connector colors shall be as follows:

    a. Modular jack connectors for voice (VoIP) shall be blue.
    b. Modular jack connectors for data (ULAN/OpenNet) shall be orange.
    c. Modular jack connectors for SPARE 1 shall be green.
    d. Modular jack connectors for SPARE 2/WLAN shall be yellow.
    e. Modular jack connectors for CATV shall be purple.
    f. Modular jack connectors for AV shall be gray.

E. Wireless Access Point (WAP) Terminations shall conform to the following:

1. WAPs shall be mounted below ceilings or on walls. Outlets for ceiling mounted WAPs may be located above the ceiling.
2. Mounts for WAPs mounted on the ceiling grid are contractor furnished government installed (CFGI).
3. WAPs shall be mounted at a maximum height of 3-m (10-feet) above the finished floor.
4. Restrictions near CAA spaces.

    a. WAPs shall not mount to or be constructed within CAA walls, floors, and ceilings. CAA boundaries will not be physically impacted by wireless design and installation effort,

2.3 CONNECTORS

A. Manufacturers: Provide connectors from manufacturer approved by the Project Director/COR in coordination with OBO/PDCS/DE/EE.

B. Copper Connectors:

1. Telephone Jack: Wall-mounted assemblies consisting of RJ-45 modular jack with 8-positions/8-conductors IDC utilize T568A wiring scheme for voice.
2. Modular Jacks: Jacks shall utilize T568A wiring and shall conform to ANSI/TIA Standard 568.2 CAT6 specifications for performance.

3. WLAN Jacks: 8-position/8-conductor for use in WLAN outlets or at modular patch panels in TR to terminate UTP CAT 6A cables.
4. IP Television Jacks: Shielded 8-position/8-conductors for use in wall plate outlets or at modular patch panels in TRs to terminate F/UTP CAT 6A cables.
5. Connector Colors:

    a. See paragraph 2.2.D.3 above for voice, data, spare1, and spare 2 requirements.
    b. Modular shielded jack connectors for television shall be purple.
    c. Modular shielded jack connectors for AV shall be gray.

C. Fiber Optic Connectors:

1. Fiber optic connectors shall be 568 LC type connectors. Connectors shall have an insertion loss of not greater than 0.75 dB per mated pair of connectors. Connector shall enclose outermost coating of single fiber strand and have capability of being mated or unmated without using any tool. Connector shall be field installable.
2. Fiber optic connector shall be rated by manufacturer to withstand at least 1,000 couplings with variance in insertion loss with plus or minus 0.75dB.
3. Provide white duplex LC style adapter insert (also referred to as 568 LC in ANSI/TIA Standard 568.3) at faceplate when indicated on drawings.
4. Mechanical type terminations such as Corning UniCam and Commscope Pre-Radiused are permitted.
5. Pigtail splice-type terminations are permitted, to include mass fusion spliced connectors.
6. Provide associated accessories, tools, and installation kits.

    a. Required modules/adapters; white for patch panel/outlet placement.
    b. Housing panels for termination cabinet placement.

D. Coaxial Connectors:

1. Type F, 75 Ohm unless stated otherwise.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, proper grounding/bonding techniques, and other conditions affecting installation. Proceed with installation only after unsatisfactory conditions have been corrected and shop drawings have been approved.

3.2 INSTALLATION

A. Install faceplates and connectors in accordance with referenced standards and manufacturer's recommendations.

B. Attach wall-mounted boxes to studs or to other support accessories or support.

C. Wall-Mounted Phones:

1. Building Interior: Install in single-gang electrical box.
2. Building Exterior:

a. Install 1200 mm (48 inches) above adjacent surface in flush-mount single-gang metal electrical box.
b. Provide one 4-pair UTP category 6 cable with 1 m (3 ft) pigtail. Terminate pigtail with category 6 RJ-45 jack for testing.
c. Weatherproof Telephone Enclosure: Provide Viking VE-9x12B-1P or equivalent, along with all necessary associated accessories.

END OF SECTION 271543

SECTION 272129 – DATA COMMUNICATION SWITCHES AND POWER SUPPLIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes materials but not limited to data communication switches, wires, and connecting devices in Telecommunications Rooms (TRs) and other telecommunications equipment spaces, and other incidental components to support a fully operational telecommunications and data network system.

B. OpenNet Backbone (Core) Switches: These switches will be furnished and installed by the Government (GFGI) in the Joint Unclassified Computer Room (JUCR), other Unclassified Computer Room (UCR), or in DOS designated server rooms.

C. Related Sections include the following:

1. **[Division 26 Section on cable trays for pathways containing telecommunications cabling.]**
2. Section 263354 “Uninterruptible Power Supply (UPS) for Telecommunications.”
3. Section 270508 “Common Work Result for Telecommunications.”
4. Section 270526 “Grounding and Bonding for Communications Systems” for grounding bus bars and ground conductors.
5. Section 270553 “Identification for Communications Systems.”
6. Section 271116 “Communications Cabinets and Frames” for cabinets.
7. Section 271505 "Communications Horizontal Cabling" for patch cords.

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 SUBMITTAL

A. Product Data: Manufacturer’s literature and product data sheet.

B. Shop Drawings: See Section 270508 “Common Work Results for Telecommunications.”

C. Qualification Documents: See Section 270508 "Common Work Results for Telecommunications."

D. Certification of Source: Documentation as required in the Part 1 Article on QUALITY ASSURANCE.

E. Product List: Documentation as required in the Part 3 Article on FIELD QUALITY ASSURANCE.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: See Section 270508 "Common Work Results for Telecommunications."

B. Comply with the OBO Electrical Code; see Section 270508 "Common Work Results for Telecommunications.

C. Substantiation of Product Source:

1. Provide exact match to products specified in this section.
2. Products shall be brand new, not gray market, and shall be in original packaging.
3. Provide products through Cisco authorized channels for new federal sales. Vendor shall have certification and specialization level required by Cisco to support product sale and product pricing in accordance with applicable Cisco certification and specialization requirements.
4. Certification of Source: Contractor shall require that the vendor confirm that it sourced all Cisco products from the manufacturer or through manufacturer authorized channels only, in accordance with applicable laws and policies at the time of purchase.

    a. The Department of State shall be listed as the owner/licensee of each product.

5. Third Party Components:

    a. Third party non-Cisco warranted products, used equipment, or "like new" equipment are prohibited.
    b. The government will perform random quality assurance to verify that third party components are not being incorporated.
    c. If it is determined that third-party components are used and warranties compromised, the contractor shall assume all cost to replace the items at no additional cost to the government.
    d. Infractions will be recorded in the contractor's performance evaluation.

1.5 DELIVERY, STORAGE, AND HANDLING

A. See Section 270508 "Common Work Results for Telecommunications."

1.6 PROJECT CONDITIONS

A. See Section 270508 "Common Work Results for Telecommunications."

1.7 COORDINATION

A. See Section 270508 "Common Work Results for Telecommunications" for additional coordination.

1.8 WARRANTY

A. Provide full Cisco warranties. Do not provide products that adversely affect warranties of associated system and components.

1. Provide five years warranty from date of Substantial Completion for each rack mounted UPS.

1.9 EXTRA MATERIAL

A. Furnish extra materials described below that match products installed, that are packaged with protective covering for storage and are identified with labels describing contents. Deliver extra materials to the Project Director/COR.

1. OpenNet Switches: For less than 400 connections, provide one client switch. For 400 or more connections, provide two client switches.
2. Media Converters: For installations with 10 or less EV charging stations, provide 2 spare media converters. For installations with 10 or more, provide 2 spares for each additional 10 charging stations.

PART 2 - PRODUCT

2.1 ACCEPTABLE PRODUCTS

A. Products that may be incorporated into the work are identified below. Unless noted otherwise, products are from Cisco Systems, Inc. No substitutions to listed products are permitted.

2.2 UNCLASSIFIED NETWORK SWITCHES

A. General:

1. Furnish Cisco Smart Licensing for all switches.

a. Direct Smart License Keys purchased to:

1) Smart Account: ea-002.cisco.com
2) Virtual Account: OBO GC-AE

2. Provide fiber backbone so that the government may link each client switch directly to core switch. Size client switches to accommodate all OpenNet outlets indicated on floor plan plus 30 percent spare ports for future growth.
3. Provide appropriate patch cords for each port of client switches and other additional hardware/IOS firmware as required by manufacturer for gigabit connectivity.

B. OpenNet Client Switches:

1. Catalyst C9200L-48T-4X-A++=

a. TAA Compliant.
b. C9200L-NW-A-48
c. CAB-TA-NA
d. PWR-C5-BLANK
e. C9200-STACK-BLANK
f. C9200-DNA-A-48
g. C9200-DNA-A-48-5Y
h. PI-LFAS-T
i. PI-LFAS-AP-5Y
j. NETWORK-PNP-LIC

2. Catalyst C9200L-24T-4X-A++=

a. TAA Compliant.
b. C9200L-NW-A-24
c. CAB-TA-NA
d. PWR-C5-BLANK
e. C9200-STACK-BLANK
f. C9200-DNA-A-24
g. C9200-DNA-24-5Y
h. PI-LFAS-T
i. PI-LFAS-AP-5Y
j. NETWORK-PNP-LIC

C. Connector Fiber Module:

1. TAA Compliant.
2. SFP/SFP+ shall be OEM from the network switch manufacturer.
3. Coordinate appropriate SFP module with network switch manufacturer.
4. Provide one SFP with each fiber module.
5. Quantity: Two per switch.

2.3 RACK-MOUNTED COMMUNICATIONS UNINTERRUPTIBLE POWER SUPPLY (UPS)

A. Install rack-mounted communication UPS in every contractor-furnished telecom cabinet; see Section 271116 “Communications Cabinets and Frames” and Section 263354 “Uninterruptible Power Supply (UPS) for Telecommunications.”

2.4 ELECTRIC VEHICLE (EV) CHARGING STATION MEDIA CONVERTERS

A. Media Converters are required for each EV charger, one in the MTC/JUCR and one in the NEMA enclosure.

1. Basis of Design:

a. Transition Networks 100BASE-TX to 100BASE-FX

2. LC connectors
3. Provide a shelf in the MTC/JUCR cabinet for the media converters.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with referenced standards and manufacturer’s instructions.

B. Handle assemblies and components with care.

3.2 FIELD QUALITY CONTROL

A. Product List: Prior to installation of any equipment, contractor shall submit medium access control (MAC) addresses and serial numbers of all acquired Cisco products.

END OF SECTION 272129

SECTION 274100 – AUDIOVISUAL SYSTEMS GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes general requirements for audiovisual (A/V) systems.

1. General systems components such as wire, cable, and racks.
2. Overall coordination of A/V system work and commissioning.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
2. Section 260525 “Grounding and Bonding for Electrical Systems.”
3. Section 262725 “Wiring Devices.”
4. Section 270508 “Common Work Results for Telecommunications.”
5. Section 270526 “Grounding and Bonding for Communications Systems.”
6. Section 270553 “Identification for Communications Systems.”
7. Section 270645 “Schedules for Audiovisual Systems” for location of A/V equipment and systems within various spaces.
8. Section 271305 “Communications Backbone Cabling.”
9. Section 271505 “Communications Horizontal Cabling."
10. Section 274114 “Architecturally-Integrated Audiovisual Elements.”
11. Section 274117 “Projection Screens and Projector Lifts.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications and A/V reference standards.

1. Each Division 27 Section may include citations to these references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

B. American National Standards Institute/ InfoComm International (AVIXA)(ANSI/INFOCOMM): Based upon the date of the design.

1. ANSI/AVIXA: A102.1:2022 "Measurement and Classification of Audio Coverage Uniformity in Listener Areas"
2. ANSI/AVIXA: D104.01:2023 "Documentation Requirements for Audiovisual Systems"
3. ANSI/INFOCOMM: 10:2013 "Audiovisual Systems Performance Verification"

C. International Electrotechnical Commission (IEC):

1. IEC 60268-16: Objective rating of speech intelligibility by speech transmission index.

1.3 PERFORMANCE REQUIREMENTS AND SYSTEMS DESCRIPTION

A. The work detailed within the Construction Documents is intended to meet certain requirements for performance and appearance. It is the responsibility of the Contractor to complete a translation of those requirements into a systems package containing all required parts, cable, software, and equipment to produce fully operational and operationally and functionally integrated audiovisual systems.

1. Any item not specifically shown on drawings or called out in the specifications but is required to produce the operational system and conform to the intent of A/V system is required to be included as part of the Work.
2. All equipment or systems are to be contractor furnished and contractor installed unless noted in the specification, drawing package, or other documents.

B. Optical Standards:

1. Total, average light output from projector (in lumens) shall be within plus or minus 15 percent of that specified by projector manufacturer.
2. Light fall-off from center of projected image to all four corners, as measured at projected image plane, shall not exceed 35 percent. Validation will be based on measuring light intensity at five positions of projected image after projector has been adjusted to provide light output as specified above. Light meter used for above measurements shall be properly calibrated lux (foot-candle) meter. It shall also be cosine corrected.

a. The “corner” location is defined as four points determined by intersecting lines drawn 5 percent of distance in from focused edges of image.

C. Control System User-Interface: Design control system user-interfaces pages for this project exclusively. The following are minimum requirements:

1. All panels shall have time and date as icons in same position on every page.
2. All panels shall have a title, indicating piece of equipment and/or functionality being controlled.
3. User interface design shall maintain continuity throughout compound to greatest extent practicable. The design shall take into account variations in system functionality from room type to room type.
4. Whenever the same button appears on more than one page, it shall be in the same position on each page.
5. Functions used during general presentation shall be accessible with minimal amount of button presses/page flips.
6. Implement multi-level access to controls.

7. There shall be a technical support page that shows the status of all devices connected to the control system.
8. The status shall be represented in a green or red light (button) format for quick trouble shooting.
9. Green represents that the device is online and active, communicating with the control system.
10. Red represents that the device is offline or is not communicating with the control system.

D. System Power: Provide power from rack-mounted uninterruptible power supply (UPS) for all programmed, software-based, or microprocessor-based control devices capable of providing 15 minutes minimum backup for those devices.

E. Electrical Characteristics: A/V equipment shall operate on 120 to 240 VAC at 50/60 Hz as appropriate to the host country.

1. Coordinate building NEMA receptacle types, 120 VAC (NEMA 5-20R) or 240 VAC (NEMA 6-20R) at 50/60 Hz as appropriate to the host country.

F. Operable Environmental Range: A/V equipment shall be capable of operating continuously for twelve hours over external ambient temperature range of 0 to 43 deg C (32 to 109 deg F), and 20 to 95 percent relative humidity without permanent damage or condensation.

1.4 SUBMITTALS

A. General: Technical submittals (e.g., product data, shop drawings, schedules) associated with all Division 27 A/V Specifications shall be submitted together with the submittals for this Section to facilitate coordination of systems.

B. The submittal package shall include all documents which support the A/V design and installation, at the minimum but not limited to the following:

1. Control system pages and flow diagram
2. Drawings – build to details
3. IP Information Sheet (which is a living document)
4. Data product sheets
5. Room and Equipment detail sheets
6. Cable Runs sheets
7. Finish Schedules for furniture:

C. The submittals shall be submitted in PDF.

1. The PDF documents shall be searchable.
2. The PDF documents shall utilize bookmarks for all major sections and details within the sections to facilitate quick switching between rooms and or other areas within the document.
3. Index listing all rooms in the project.

4. The first page of each manufacturer's PDF shall be bookmarked.

D. Within the manufacturer's PDF, the equipment relative to the project shall be highlighted or emphasized in a manner for quick reference.

1. Excessive pages from manufactures with no relation to project should be removed to reduce the size of the PDF document.

E. Control system pages and flow diagrams:

1. A/V contractor shall supply a page-by-page GUI submittal for review. The submittal must include a breakout showing each control panel page/sub-page and includes a list of all selectable buttons on that page and their function.

F. Shop Drawings: Submit the following A/V shop drawings and details as a separate package from any other submittal.

1. Detailed plan views and elevations of relevant telecommunications rooms and spaces that show raceway, sleeves, cable tray, cable paths, equipment racks, equipment cabinets, termination blocks, power receptacles, and grounding bus bars associated with A/V system.

G. Detailed drawings shall include all areas that will receive any A/V solution. The drawing set shall include at a minimum the following for each area:

1. An enlarged plan view for the facility requirements.
2. An enlarged plan view for the infrastructure requirements:

   a. A/V network drops
   b. A/V back boxes
   c. A/V conduit sizes and locations
   d. Wall boxes or screw cover (SC) boxes for racks or credenzas
   e. Cable tray and pathways
   f. Equipment rack locations for A/V and any other rack to support Telecommunications or other signals.
   g. Electrical connections locations
   h. Grounding bar connection locations

3. Elevation drawings for each A/V solution including but not limited to:

   a. Displays
   b. Wall mounted back boxes for displays
   c. In-Wall backing for displays
   d. A/V network drops "**"AFF
   e. Wall boxes or screw cover (SC) boxes for racks or credenzas "**"AFF
   f. Touch panels "**"AFF
   g. A/V conduit sizes and locations
   h. Any other devices locations "**"AFF

4. Consistent with Construction Drawings, detail installation of equipment and cable layout to further enhance operational efficiency and overall aesthetic factors.

    a. System-riser diagrams for each area with A/V components.
    b. System flow drawings with detailed wiring diagram input/output connections for each piece of equipment, interconnects, data flow, and other pertinent information.
    c. Wiring diagrams for each A/V subsystem that define interconnection of all inputs and outputs for all equipment.
    d. Power connection drawing for rack main power, UPS, rack power strips, power distribution units (PDU), equipment power connections.
    e. Grounding for racks
    f. Fabrication shop drawings for all custom equipment, as applicable.
    g. Plans and elevations of A/V equipment racks (including credenzas, consoles, desks and lecterns), quantifying all equipment to be mounted in each. The credenza, consoles, lecterns and A/V desks are supplied by the A/V contractor and coordinated with the interiors design team. If an A/V device is to be installed in a table or other furniture supplied by another source, the details shall be provided and noted as supplied by other (Company).

5. IP equipment information sheet with the following:

    a. Equipment manufacturer
    b. Model of the equipment
    c. A/V system Identifier
    d. Location of equipment
    e. Mac address
    f. IP address
    g. Wall plate connection number if applicable
    h. Patch panel number
    i. Network switch number
    j. Network switch port number

6. Product Data:

    a. Manufacturer’s product data sheets for all materials and equipment, sorted by room and indexed. Include available standard finishes for wall plates and floor boxes for selection by Project Director/COR. Mark each product data sheet to show applicable choices and options.
    b. Manufacturer's product data sheets for all associated fire-stopping materials.
    c. Manufacturer’s product data sheets for accessories, including technical panels, equipment racks, floor boxes and connection plates, escutcheons and trim components. Include fasteners and supports.

7. Room/Equipment detail sheet shall be broken out by equipment type sections in excel, each room should be on a separate tab within the excel workbook and printed out as such. The Room/Equipment detail sheet should be broken out as following per room:

a. Control
b. Display
c. Video
d. Audio
e. Collaboration
f. Racks, furniture, and other equipment

8. Cable run sheets (e.g., diagrams or spreadsheets) that denote cable type, signal type, termination type, cable number designation, start point, and end point.
9. Schedules:

a. List of finishes and sample graphics, including custom artwork and custom graphics per device, if applicable.

H. Spare Parts List: List of parts inventory to reflect manufacturer recommended service and maintenance of the work.

I. Qualifications:

1. A/V Installer Qualifications:

a. The installer firm shall have at least one out of four “Key People” on supervisory team which possess a CTS-D certification, from AVIXA or another recognized organization or institution providing formal training in audiovisual engineering and/or installation.
b. All employees of the contractor to install this system must be competent technicians who are experienced in the installation and interconnection of equipment in professional A/V environments and typical audiovisual systems.
c. All A/V engineering and project management is to be handled by a qualified, employee of the A/V contractor.
d. Key Personnel shall be identified as:

1) The Senior Project Manager
2) The Senior Engineer
3) The Senior Network Engineer
4) The Senior or Lead Tech

e. Resumes of the key personnel must be submitted with each submittal, replacement of the key personal must be submitted in writing to the COR along with the justification for the replacement. No outsourcing or sub-contracting of these tasks will be accepted.
f. Installer shall maintain an adequately equipped and staffed service department and shall regularly provide service for systems similar to this design. This shall include an office staffed with personnel at normal business hours, Monday through Friday, between the hours of 0800 and 1700. Answering services, cellular telephones, and call forwarding systems are helpful but do not meet nor comply with the intent of this specification.

g. The design will incorporate various types of A/V equipment, which includes displays, video distribution, processing and switching equipment; network design implementation, audio distribution and processing equipment; power amplifiers, speakers, etc.
h. Installer shall be currently authorized by the manufacturer of the major components of the system to sell their products and initiate warranty service on the same items.
i. Proof of certification and training on the products from the manufacturer is required. If a certification is not available, the proof of franchise shall be provided. This may be in the form of a letter from the appropriate manufacturer addressed to the COR stating that the contractor is currently authorized to sell their products. Letters from the sales representative (rep) shall not be accepted as proof.

J. Preconstruction Plan: Plan by qualified A/V subcontractor, no later than start of installation of infrastructure for A/V systems, for implementation that includes phased scheduling, staffing plan, and schedule for phased, testing, training, and project acceptance. In Plan, identify period of time during which this Onsite Factory-Trained Engineer will be onsite.

K. Field Quality Control Reports: Include field quality control reports and test results related to work of all A/V Specification Sections.

L. Factory Onsite Testing:

1. The A/V contractor shall provide Factory Onsite Testing (FAT) at their integration location.
2. The testing shall include operational system testing as the system will be installed.

a. The rack or credenza shall be built and tested; all testing shall be running off of these systems.
b. The display for each system or a typical representation for any video wall applications.
c. The control pages shall be active and loaded on the panel, if applicable.
d. Audio systems shall be represented in a manner which shows the functionality the DSP and other audio devices.

M. Pretesting Certification: Submit certification that audio signal lines have been pretested and verified. Include results in spreadsheet format.

N. Operations and Maintenance Manuals: Manuals shall apply to all A/V-related devices, equipment and software modules. Include, at a minimum, the following:

1. General:

a. Operational description of each subsystem.
b. Detailed programming descriptions for each subsystem.
c. Explanations of subsystem inter-relationships.
d. Electrical schematics for each piece of equipment specified.
e. Power-up and power-down procedures for each subsystem.

f. Description of all diagnostic procedures.
g. Menu tree for each subsystem.
h. Setup procedures for each component of the subsystems.
i. List of manufacturers, and their local representatives and subcontractors that have performed work on project.
j. Installation and service manuals for each piece of equipment.
k. Manufacturer's maintenance schedules for all installed components.
l. From Pretesting process in Article on FIELD QUALITY CONTROL, record normal settings for level controls.
m. Testing reports for all cables within the system.

O. Record Drawings:

1. Produce record files as required for the A/V systems.

a. Control system pages and flow diagram.
b. Drawings – as built with cable numbers and other identification information.
c. IP Information Sheet (which is a living document).
d. Data product sheets for any new equipment which were not part of the original submittal.
e. Room and Equipment detail sheets updated with any changes.
f. Cable Runs sheets.
g. Finish Schedules for furniture.
h. Spare parts list.

2. Provide all software control, user panels in an open and unlocked format and including both compiled and uncompiled versions.
3. Provide all configuration files for any equipment which had to be configured.

1.5 QUALITY ASSURANCE

A. Work specified for all A/V systems in this project shall be responsibility of single A/V systems contractor.

B. Single Source: Any given item of A/V equipment shall be the product of one manufacturer throughout the Project; multiple manufacturers of any one item is not permitted unless specifically noted otherwise.

C. Basis of Design: Within the A/V specifications, certain manufacturers and models have been listed. These manufacturers are listed for example purposes, unless followed by the term "no exceptions." Contractor may provide other manufacturers and models which meet or exceed specified functional, technical, and service support requirements.

D. On-site Factory-Trained Engineer: As part of installation and configuration activities, provide an onsite factory-trained engineer for the Digital Sound Processor (DSP) and A/V control products included in this project to facilitate coordination of performance of the systems for major spaces

such as Multi-Purpose Room, Gallery/Atrium, Large Conference Rooms, and Training Rooms. The Engineer shall be on-site for approximately one week at an optimum time as mutually determined by the Engineer and the Contractor based upon the status of the Work.

E. Provide CTS personnel assigned to project with CTS-D, certificate or equal NICET designation, with minimum of five years of industry experience.

1. If Contractor does not have certified engineers trained on a specified product, they must employ qualified engineer prior to preconstruction submission date and submit applicable certifications and training records.

F. Supervisors: Supervisory personnel shall be certified by Avixa (formerly InfoComm International) for type of work they oversee.

G. Installers: Installation of each item of A/V equipment shall be by installers certified by manufacturers for the specific equipment. Certified installers shall have attended training programs for each subsystem that prepared them to perform the work.

H. Technicians: Factory-certified to install and commission the work.

I. Manufacturer-Certified On-site Training Staff:

1. Certified on-site staff for specified remote-control hardware to provide product-line training, and service support training.

J. General Product Requirements:

1. Supplier Chain: Products shall be purchased from reputable supplier that has direct relationship with manufacturer's factory. Counterfeit devices are not permitted.
2. Listing: Underwriters Laboratories, Inc. (U.L.) or Technischer Überwachungs-Verein (TÜV) listed and approved where specifically specified or where normally subject to such U.L. or TÜV labeling and/or listing services.
3. Original Equipment Manufacturer (OEM): All accessories, including rack-mounting hardware and power supplies, shall be obtained from original equipment manufacturer. Third-party accessories are not permitted.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Space will not be provided at project site for purpose of pre-assembly and associated testing; any required pre-assembly and associated testing shall be conducted at facility supplied by Contractor.

1.7 COORDINATION

A. Coordinate with all trades to ensure electrical, telecom and any other unique requirements are completed.

B. The coordination shall include all backing and structures for displays, projectors, projection screens or other devices.

1. Coordinate with design to determine that appropriate raceways are in place.
2. Coordinate with related trades to schedule the Work and ensure complete and integrated installation.
3. Coordinate wall backing for wall-mounted elements to ensure adequate support.

C. A/V systems subcontractor shall identify cable types, quantities, lengths, and final locations to be terminated. That information shall be supplied to General Contractor and low-voltage cable subcontractor. It is Contractor's responsibility to ensure that this information is complete and accurate.

1.8 WARRANTY AND MAINTENANCE SERVICE

A. Commencing on the date of Substantial Completion, provide one year of warranty covering all work, systems, and subsystems against defects in materials and workmanship shall include the following:

1. When necessary, supply temporary loaner equipment that is fully compatible with A/V systems for any equipment not field-repairable and requiring replacement. Loaner equipment that shipped to/from the manufacturer or distributor shall be on site and operational within one week of component failure.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE FOR A/V SYSTEMS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Belden, Inc.
2. Gepco International.
3. Commscope, Inc.
4. West Penn Wire.

B. Cable Application: Signal type is indicated, on A/V schematic diagrams in Construction Drawings, at equipment input or output.

C. Cable Jacket: Plenum-rated.

D. Cable Types:

1. Microphone and line cable.

a. Plenum Configuration: Type CMP, 0.64mm (22/2 AWG) (7x30) stranded twisted shielded pair with overall shield.
b. Properties: 17 ohms /M'.
c. Size: 3.4 mm OD.

2. Speaker cable.

a. Speaker runs of over 25.4m (100')
b. Configuration: Type CMP, 2mm^2 (#12 AWG) stranded twisted pair
c. Properties: 1.7 ohms/254m (1000')
d. Size: 6.8mm OD
e. Speaker runs between 12.7m (50') and 25.4m (100')

1) Configuration: Type CMP, 1.6mm^2 (#14 AWG) stranded twisted pair
2) Properties: 2.66 ohms/254m (1000')
3) Size: 5.53mm OD

f. Speaker runs less than 12.7m (50')

1) Configuration: Type CMP, 1.5mm^2 (#16 AWG) stranded twisted pair
2) Properties: 4.38 ohms/254m (1000')
3) Size: 4.62mm OD

3. Video tie line cable.

a. RG6/U coaxial cable; see Section 271505, "Communication Horizontal Cabling."

4. HDMI (High-Definition Multimedia Interface)

a. Carries video, audio, and auxiliary data from source to display devices
b. Up to 18 Gbit/s in HDMI 2.0 via (TMDS) Transition-minimized differential signaling.
c. Connector types A-E
d. Based on EIA/CEA-861 standard

5. Digital video/audio (unbalanced) tie line cable one conductor.

a. RG6/U coaxial cable; see Section 271505, "Communication Horizontal Cabling."

6. Digital video F/UTP tie line cable.

a. Category 6 SHIELDED (F/UTP); see Section 271505, "Communication Horizontal Cabling."

7. Data tie line cable.

a. Category 6 (UTP); see Section 271505, "Communication Horizontal Cabling."

8. Control and communication cable, as required for DSP configuration:
9. Fiber optic cable (with media converters), single mode and multi-mode; see Section 271305 "Communications Backbone Cabling" and Section 271505 "Communication Horizontal Cabling."

2.2 TECHNICAL PANELS

A. Technical panels are any specialty panels which need to be designed and fabricated to support the A/V design and deployment. The panels could be custom panels for unique audio or video designs.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. RCI
2. Snyder Electronics
3. Wireworks

C. Configuration: As detailed on Construction Drawings.

D. Wall Box Cover Plates:

1. Material: Stainless steel.
2. Finish: Natural.
3. Engraving:

a. 3.5 mm letters with black fill paint.
b. Device numbering shall be as indicated on Construction Drawings.

E. Pull Box Cover Plates:

1. Material: 2 mm (14 gauge) steel with three-layer lamacoid engraved covering.
2. Finish: White.
3. Engraving:

a. Panel Title: 5 mm letters with yellow fill paint.
b. Device: 3.5-mm letters with white fill paint.

2.3 A/V EQUIPMENT FLOOR BOXES AND CONNECTION PLATES

A. Floor Boxes:

1. Coordinate floor box model with those selected for electrical systems in Section 262725 "Wiring Devices."
2. Size box for conduit by electrical subcontractor. Furnished by electrical subcontractor.

B. Internal A/V Connection Plates: Selected by A/V subcontractor.

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Custom AV Solutions.

2.4 EQUIPMENT RACKS AND CREDENZAS

A. Rack Frames for A/V, General

1. The A/V rack is different from the IT or Telecomm rack.

a. Provide a 45 RU (78.88"/200.36 cm) of mountable equipment space.
b. The height of the rack shall be 82.88"/2120.52 cm.
c. The depth of the rack shall be a minimum of 32"/81.28 cm.
d. The rack shall be black in color, unless otherwise noted by the customer.
e. The rack shall be seismic rated.

2. Cooling for the rack accessories:

a. Configuration: Top panel with fans, side panels, and blank/vent panels for proper forced cooling. Fan CFM properly sized to maintain an internal rack temperature of no more than 85°F [30°C]

3. Provide top panels for each rack with preconfigured fans and a controller. The fan volume shall be 552 CFM at 38 dBA.

B. Credenza Units:

1. The credenza units shall be custom built (free-standing or built-in) to include A/V integration provided Contractor.
2. A/V equipment and components within the credenza must be coordinated with the A/V Designer.
3. Built-in A/V credenza construction and materials shall adhere to Custom Grade requirements set forth in Architectural Woodwork Standards (latest edition).
4. The unit shall be sized for the space and coordinated with the design team.

a. The standard size shall be a 1 bay, 2 bay, or 3 bay credenza in width.
b. Each bay minimum 24"/60.96 cm depth, 32"/61.28 cm, the standard height, but it could vary based on A/V and Interiors design requirements.

c. Concealed heavy-duty recessed swivel casters with recessed, plinth base
d. Front and rear lockable doors
e. Doors that open in opposite directions to access sliding A/V racks.
f. Provide front and back-mounted rack rails for Rack Units
g. Ventilation fans and ventilation grilles on rear doors
h. Cable management throughout
i. Metal grommets (either at the top or within the cabinet base)

5. Additional Customizations if requested by Project Designer

a. Self-pull, integrated pull, tab pull, or handle pull for ADA accommodation (color to be selected)
b. Concealed integral trash receptacle
c. Concealed refrigerator
d. Drawers
e. Raised backstop at credenza top

6. Materials and Aesthetics

a. Case Material and Doors (Drawers if specified): Wood veneer, High-Pressure Plastic Laminate, or Painted finish (must match Project Designer's specification and control sample).
b. Top Material: Custom material and edge condition per Project Designer's specification. (Glass, Solid Surface, Quartz, Solid Wood, Natural Stone, High-Pressure Plastic Laminate).
c. Recessed Base (Toe Kick) Material: Wood Veneer or Metal Finish.
d. If wood veneer is selected for the case and door material, veneer direction will be provided by the Project Designer.
e. Door and cabinet thickness to be a minimum of 19 mm (¾") thick.
f. Hardware used for construction of the credenza shall adhere to the requirements set forth in applicable ANSI/BHMA Standards (latest edition).
g. Concealed door hinges shall be self-closing or provided with a catch.
h. Bumper pads shall be installed at the top and bottom of each hinged door.
i. Closing stops shall be provided at the rear of drawer sides unless the drawer slides contain integral stops that prevent the drawer face from impacting the cabinet body.
j. When design permits, and if stops are not integral to the drawer slides, a mechanism shall be provided to prevent the drawer from pulling out of the cabinet.
k. Drawer slides shall provide for a minimum extension of 75 percent of the length of the drawer box beyond the cabinet body.

C. Power Management Accessories:

1. Configuration: AC power.
2.

a. Provide rack-mounted power strips sized to power each device in the rack, plus 40 percent spare outlet quantity.

3. Product Types:

   a. Rack-mounted horizontal power distribution unit with multiple outlets, to include surge and spike protections and EMI filtering. One Rack Unit (RU) in height.
   b. Vertical power strip 60” (152cm) with twenty-eight outlets and digital current meter in amps.
   c. Wire Duct: Wide-slot wiring duct, sized as required.

4. Product Characteristics:

   a. Material: 1.6 mm (16 gauge) flanged steel panels.
   b. Finish: Textured black powder coat.
   c. Engraving:

      1) Panel Title: 5-mm letters with yellow fill paint.
      2) Device: 3.5-mm letters with white fill paint.

5. Device numbering as indicated on Construction Drawings.

   a. Configuration: As detailed on Construction Drawings.

6. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Middle Atlantic Products, Inc., BGR Series.
   b. Winsted Pro Series II.
   c. Atlas Sound FMA series.

2.5 ACCESSORIES

A. Connection Plate Receptacles:

   1. Audio (Microphone): XLR type.
   2. Audio (Line Level): 6 mm (¼ inch) diameter tip/ring/sleeve type, or as required by intercom system.
   3. Audio (Loudspeaker Level): Neutrik “Speak-On” Type.
   4. Video: BNC type.
   5. Display Port/Mini Display Port
   6. HDMI: HDMI jack.
   7. ACTXX/CAT (F/UTP)

B. Escutcheon and Trim Components:

1. A/V subcontractor shall furnish trim/escutcheon components where A/V components pass through finished ceilings. This includes, but is not limited to, video projector supports, flat-panel display supports, speaker mounts, and assistance listening devices, as applicable.

C. Cable Sheathing: Where cable will be visible in habitable areas, provide an expandable braided sleeving over the cable, the color shall match the environment where it is installed. The sleeving shall be cut cleanly and finished, with no open or loose strands protruding from the end.

D. Heat shrink tubing:

1. Where required on audio, control or other cables, the heat shrinkable tubing will be used on the cable near the connector to provide a clean finished product.
2. The heat shrinkable tubing colors shall be confirmed with the customer or technical representative before use.

E. Labels: all cables (audio, video, control, A/V network, power, grounding, etc.) in the A/V systems shall be labeled at both ends of each cable with the designated approved content.

1. Basis of Design: Pan-Code system by Panduit Corp. See Section 270553 "Identification for Communications Systems."
2. Permanent, self-laminating, wrap-around number or letter cable marker.
3. Label text and images shall be computer-generated for legibility.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Examine areas to receive the work and conditions under which the work will be performed. Remedy conditions detrimental to proper completion of the work. Do not proceed until unsatisfactory conditions have been corrected.

B. It is the responsibility of the contractor to confirm all dimensions, all quantities and the coordination of materials and products supplied by the contractor with other trades.

3.2 GENERAL INSTALLATION

A. Scope of System Installation: Installation shall include fastening A/V components and equipment to walls, floors, ceilings, counters or other structures as indicated on Construction Drawings or as otherwise required; interconnecting wiring of the system components, alignment and adjustment of systems, and related installation necessary to result in complete and fully operational systems.

B. Follow factory recommended termination of cabling to utilize best industry practices and provide acceptable connectivity to approved devices

C. Provide pathway from any audio video device (projector, flat panel, camera, speakers, I/O devices, control location) to the designated location on the contractor drawings to facilitate connectivity of each element to the A/V System and all its components.

D. Utilize front side serviceable pull-out wall mounts to ensure both serviceability to end users and ease of installation

E. Utilize in wall back boxes for all display locations, where applicable. The back boxes are to be specified within the A/V specifications, provided by the A/V contractor and installed by the General Contractor or other responsible representative; see Section 262725 “Wiring Devices.”.

F. Equipment and cable layout shall be given not only recognize operational efficiency, but also overall aesthetic factors.

G. Installation at Receptacles:

1. Audio (Line Level): Insulate jack from panel type.
2. DVI: Isolate jack from panel type with hex nuts.
3. HDMI: Isolate from panel.
4. BNC, RF: Insulate receptacles from panel type.

H. Equipment Racks:

1. All A/V equipment racks/cabinets shall be CFCI. Install equipment racks in suitable locations to support A/V use as identified in Construction Drawings and in accordance with TIA/EIA standards and model NFPA 70.
2. Ensure that placement of racks allow for adequate ventilation and access.
3. Ensure the front rack rails are moved backward in the rack, to accommodate the handles, patch cables or any other equipment. The equipment shall not protrude past the front of the rack.
4. Mount vertical power strips to rear rack rails in the rear of the rack as required to accommodate the power requirements.
5. Provide power requirements per rack, number of amps, and number of circuits.
6. Electrically bond power strips and conditioning devices to rack grounding lug.
7. Patch panels and terminations are required when terminating for respective equipment racks specifically for A/V and all CAT-X cables.
8. Equipment Cabinets shall be seismic rated as required in accordance with ASCE/SEI 7.

I. General Physical Installation of System.

1. Fastenings and supports shall be adequate to support their loads, with safety factor of at least three times total load.
2. Affix permanent engraved plaque on equipment, denoting its function.
3. Secure boxes, equipment, and similar items plumb and square.
4. Pull Box Cover Plates: Bevel and remove sharp edges.
5. Trim and escutcheon components.

a. Install trim/escutcheon components A/V components pass through finished ceilings. Finish trim components at ceiling plane to match accepted ceiling finish system.

6. Mounting Locations and Mounting Heights: Coordinate with Construction Drawings:

a. Technical Wall Plates:

1) A/V input/output connections.
2) Flat panel display panel connections.
3) Video projector connections.
4) Annotation panel connections.
5) Networked digital clocks.
6) Wall-mounted speaker boxes.
7) Device control locations.
8) Device lifts or other technical device locations.

b. Control panels.
c. Pull boxes.

1) Pull boxes are any location where a cable must be deployed and it ends or proceeds through the box to another location. An example would be the Screw Cover (SC) box associated with the rack or credenza locations. The wall (PAC) boxes behind displays, speaker boxes, and other locations.

3.3 CABLE INSTALLATION

A. General:

1. See Section 271305 “Communications Backbone Cabling” and Section 271505 “Communications Horizontal Cabling” for general cabling installation requirements.
2. Install cables with continuous lengths without splices from origination to rack.
3. System wire, after being cut and stripped, shall have wire strands twisted back to their original lay. Terminate wire by soldered or mechanical means.
4. Except where identified otherwise in Construction Specifications, no bare-wire terminations are permitted.
5. Insulate ground or drain wire with heat-shrink tubing.
6. Unused wires at end of cable shall remain unstrapped, be laid back, and held in place with wire ties.
7. Do not install cable with bend radius less than that recommended by cable manufacturer.
8. Cut cables to length dictated by run; the exception is video and pulse cables, which shall be cut to electrical length. Splices are not permitted in pull boxes.
9. For equipment mounted in drawers or on slides, install interconnecting cables with service loop of appropriate length.
10. Fiber Optic Cables: Route and terminate fiber optic cables in accordance with TIA/EIA standards.

B. Marking:

1. Mark cables, regardless of length, with permanent cable marker at both ends. Ensure that computer-generated markers are installed; temporary wire labels done by hand in field shall be replaced with computer-generated labels.
2. There shall be no unmarked cables at any place in system.
3. Marking codes used on cables shall correspond to codes shown on Construction Drawings and/or run sheets in construction submittals.
4. Wire markers shall face common direction.

C. Grouping:

1. Grouping by Signal Type: Group cables according to signals being carried. To reduce signal contamination, form separate groups for the following cable families:

   a. Power cables.
   b. Network/Control cables.
   c. Shielded CAT X/Video cables.
   d. CAT X/Audio cables carrying signals.

2. Arrangement of Groups: As general practice, arrange groups as follows:

   a. Run power cables, control cables, and high-level cables on left side of equipment rack as viewed from rear.
   b. Run other cables on right side of equipment rack, as viewed from rear.

D. Bundling:

1. Wire bundles shall be neat and combed free of cable crossovers.
2. CableVelcro Wraps: Place cables ties at appropriate intervals of no greater than 150 mm (6 inches) for vertical bundles, and 50 mm (2 inches) for horizontal bundles.
3. No cable ties are to be used for any cable bundling.

E. Cable Support:

1. Support in accordance with Section 260508 “Common Work Results for Electrical, Communications, and Electronic Security.”
2. Support of Individual Runs Support of Individual Runs:

   a. Support cable at 1500 millimeters on center and 750 millimeters at any change in direction with J-hooks.
   b. Support cable from building structure.
   c. Placing cables on top of ceiling panels and ceiling tiles is not permitted.
   d. Support of cable from ceiling grid support wires is not permitted.

3. Support of Cable Bundles:

   a. Where multiple cables combine, support at 1500 millimeters on center and 750 millimeters at any change in direction with J-hooks. Support from building structure.
   b. Placing cables bundles on top of ceiling panels and ceiling tiles is not permitted.
   c. Support of cable bundles from ceiling grid support wires is not permitted.

F. Cable Connections:

1. Solder Connections: Make solder connections with rosin-core solder using temperature-controlled solder stations. Take care to avoid cold or cracked solder joints. Any connections that do not appear to be clean and shiny, or which show signs of cracking, shall be re-soldered prior to final acceptance of system.
2. Crimp-Type Mechanical Connections: Bond mechanical connections that use insulated, crimp-type connectors to connector by soldering wire to metal part of connector.
3. Pressure-Type Mechanical Connections: Connections made with screw-actuated pressure-type terminal strips shall be made by stripping approximately 6 mm (¼ -inch) of insulation from stranded conductor. Then insert un-tinned wire into terminal and tighten screw, using secure fitting precision screwdriver.
4. Connector Housing: Connectors shall have proper connector housing.
5. Video Cables: Unless otherwise indicated on Construction Drawings, terminate analog video and computer video cables using 75-ohm connectors with captive center pin.

G. Cable Interfaces:

1. Terminal blocks, boards, strips or connectors shall be used for cable interface with racks, cabinets, consoles, and equipment modules.
2. No audio cables shall run directly to audio patch panel jacks.
3. Audio patch panel shall be installed using audio terminal block; audio cables to and from audio patch panel shall terminate on this block.

H. Installation at Racks and Credenzas:

1. Cables shall not protrude from back of racks.
2. Cable entry shall be through tops of racks or through entrance holes in base of rack. No cable shall enter racks through front, rear or side-panel openings.
3. Attach vertical cable bundles to rack frame.
4. Neatly train and lace cables.
5. Route cables from components to lacing bars that are installed on the rear rack rail.
6. Provide service loops for each cable.
7. Rack Cable Separation: Cable separation of cables for runs within equipment rack shall be per the AVIXA guidelines, as follows:

   a. Microphone Level: 50 mm from other circuits.
   b. Line Level and Control: 50 mm from circuit with signal of 20 dB or with signal greater than line level and control cables.
   c. Speaker Level Circuits: 50 mm from other circuits.

d. Video and Data: 50 mm from circuit with signal of 20 dB or with signal greater than video and data.
e. AC Power Circuits: 50 mm from other circuits.
f. 90 degree crossovers are permitted.

8. Plenum Areas: Cables running in plenum areas without conduit shall be plenum-rated cable and shall match cable specified in the Part 2 Article on WIRE AND CABLE FOR A/V SYSTEMS. Verify in what spaces plenum cable shall be used.
9. Architectural Niches: Cables shall be black, unless otherwise directed to reduce visibility by Project Director/COR.
10. Visible Installations in Habitable Areas: Sheath cables in color wrap as selected for each location.

I. Cable Separation: For runs greater than 7.5 meters provide the following separation:

1. Microphone Level: 300 mm from other circuits.
2. Line Level and Control: 300 mm from circuit with signal of 20 dB or with signal greater than line level and control cables.
3. Speaker Level Circuits: 300 mm from other circuits.
4. Video and Data: 300 mm from circuit with signal of 20 dB or with signal greater than video and data.
5. AC Power Circuits: 300 mm from all other circuits.
6. 90 degree crossovers are permitted.

3.4 WIRE TERMINATION

A. Solder connections for connectors utilizing solder cups.

B. Utilize terminal strip connectors for termination of blunt cut cables. Tin cable prior to termination.

C. Multi-Pin Connectors: Utilize connector manufacturer's crimper.

D. Crimp cap terminations for loudspeaker circuits at individual devices. Utilize terminal strip connectors for distribution cable termination.

E. Do not tin cable ends when using captive screw connectors.

3.5 GROUNDING OF A/V SYSTEMS

A. General: Because of great number of possible variations in grounding systems, it is responsibility of Contractor to follow good engineering practice, as outlined above, and to deviate from these practices only to minimize crosstalk and to maximize signal-to-noise ratios in the audio, video, and control systems. Comply with Section 270526 "Grounding and Bonding for Communications Systems and the requirements below"

B. System Grounds: Establish single primary "system ground" for systems in each particular area. Grounding conductors in that area shall connect to this primary system ground.

C. Install system ground in audio equipment rack for the area consisting of copper bar of sufficient size to accommodate all secondary ground conductors. Copper conductor having maximum of 0.1 ohms total resistance shall connect primary system ground bar to nearest approved electrical ground. Contractor is responsible for determining if metallic conduit is properly electrically bonded to building ground system.

D. Install secondary system grounding conductors from all racks, audio consoles, and grounding points for area. Each of these grounding conductors shall have a maximum of 0.1 ohms total resistance.

E. AC neutral conductor, either in power panel or in receptacle outlet, shall never be used for system ground.

F. Audio Cable Shields:

G. For ungrounded portable equipment, such as microphones, connect shield at both ends but grounded at only one end.

H. Video Receptacles: Insulate video receptacles from mounting panel, outlet box, and wireway. Unless otherwise detailed herein, this shall be accomplished by using insulated-from-panel type receptacles.

I. Audio Receptacles: Insulate audio receptacles mounting panel, outlet box, and wireway. Unless otherwise detailed herein, this shall be accomplished by using insulated-from-panel type receptacles.

3.6 FIELD QUALITY CONTROL

A. Pretesting: Before Acceptance Tests are scheduled, Contractor shall perform his own system check out. Contractor shall supply all necessary test equipment. Contractor shall perform work necessary to determine and/or modify performance of system to conform to requirements of this Section. This work shall include the following:

1. Test Equipment and Supplies: Utilize the test equipment and supplies identified below; adjust as necessary for project-specific design.

a. Audio Checking:

1) Audio generator, and measurement tool, Audio tools App or equal.
2) Audio cables.
3) Set of terminations, adapters, and similar items.

b. Video Checking:

1) 4K Video signal generator, Extron or approved equal.
2) Pre-recorded Media as appropriate to playback devices.
3) Video cable.
4) Set of terminations, 'T' pieces, and similar items.

2. Network Testing

a. Verify supplied cable test reports with Contractor supplied test equipment.

3. Controlling Functions: Check control functions from controlling devices to controlled devices for proper operations.
4. Whenever possible, include computer sources provided by USG at desired resolution in testing.
5. Adjustments:

a. In conjunction with pretesting process, adjust, balance and align A/V equipment for optimum quality and to align with manufacturers' published standards. Establish and mark normal settings for level controls.
b. Check and adjust optical projection images for average light level, light fall off, and image alignment, and size images to comply with performance standards and with design reflected in Construction Documents. Check that projectors, projector bases, carts, tables and mirrors are rigid and vibration-less in operation; adjust as necessary.

B. Systems Acceptance Testing:

1. A/V system Acceptance Tests will not be performed until Contractor's system pretesting has been completed, and pretesting results have been accepted. System Acceptance Tests will be supervised by USG representative identified by Project Director COR, based upon input from OBO/PDCS/DE/EE, and shall consist of the following:

a. Physical inventory of A/V equipment compared to Equipment Schedule from Construction Submittals.
b. Operation of system equipment demonstrated by factory-certified technicians or manufacturer-certified training staff.
c. Acceptance Testing shall provide documented results that provide proof of a fully functional system, with all functionality have demonstrated to USG representative and/ responsible end-user in person during Acceptance Testing.
d. All touchpanel Control functionality shall be demonstrated during the Acceptance Testing process.
e. Both subjective and objective tests are required to determine compliance with Contract Specifications. Contractor is responsible for supplying test equipment for these tests.
f. Record/Redline Drawings, run sheets, uncompiled set of source codes, O&M Manuals, Pretesting Results spreadsheets, and other required documents shall be on hand prior to scheduling Acceptance Tests, with one complete set delivered to USG representative prior to scheduling of tests, and one set to Project Director/COR.

g. During Acceptance Testing, in the event further adjustment is required to conform to specified performance requirements, or defective equipment requires repair or replacement, Acceptance Tests may be suspended or continued at discretion of Project Director/COR based upon input from OBO/PDCS/DE/EE.
h. Any charge for additional time incurred by USG representative required to oversee System Acceptance Tests, due to improper system installation or previous failed systems, is the responsibility of, and charged directly to, the Contractor.

3.7 CLEANING AND PROTECTION

A. Clean up and repair all areas affected by this work. Protect exposed surfaces with materials that are easily removed without marring finishes.

B. Contractor is responsible for protection of work from damage or loss due to either man-made or natural causes.

C. The work and storage areas are to cleaned daily of any trash or other debris, presenting a safe work environment.

3.8 DEMONSTRATION

A. Provide training in a two-session formats. The on-the-job training shall be by an instructor who is fully knowledgeable in design and operation of systems. Training shall take place after the systems are operational, but not before system acceptance has occurred. Training shall be for A/V systems in major spaces such as Multi-Purpose Room, Gallery/Atrium, Large Conference Rooms, and Classrooms. Training shall be for the following users as identified by the Project Director/COR:

1. Train system users and administrators.
2. Train technical-support personnel.

B. For each of these sets of trainees, provide minimum of eight hours of training provided in one-hour sessions. Training session set shall be recorded on video.

C. System user training shall include the following material and topics:

1. The operation of the total of audiovisual system and each sub system or room system.
2. Connection of source devices.

a. Microphones.
b. Computers
c. Control Panels
d. Audio devices
e. BYOD (bring your own device-if applicable)
f. Other devices as required per the system design

3. Run through of mock meeting/events based on room use cases.

D. Technical-support personnel training shall include the following material and topics:

1. Operation and replacement of common replacement items.
2. General care and systems maintenance.
3. Digital Audio configuration and switch settings.
4. Provide instruction on frequency of UPS battery replacement and replacement process.
5. Process for resetting system.
6. Hardware Chassis configuration, replacement of modules and chassis.
7. Software loading and configuration.
8. Support phone and e-mail contact information.

END OF SECTION 274100

SECTION 274114 – ARCHITECTURALLY-INTEGRATED AUDIOVISUAL ELEMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. The work of this section includes the integrated audiovisual (A/V) systems but is not necessarily limited to the following:

1. Video Displays.
2. Audiovisual (A/V) Mounting Devices.
3. A/V Cameras
4. Audio Systems.
5. Assisted Listening Systems.

B. Related Sections include the following:

1. Section 274100 “Audiovisual Systems General Requirements.”
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
3. Section 270645 “Schedules for Audiovisual Systems.”
4. Section 274100 “Audiovisual Systems General Requirements.”
5. Section 275105 “Consular Audio Systems for Consular Services;” those systems are not related to the work of this Section.
6. Section 275405, “Consular Queue Management Infrastructure and Displays;” those displays are not related to the work of this Section.

C. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

D. See Section 274100 “Audiovisual Systems General Requirements” for additional general A/V reference standards.

1.2 SUBMITTALS

A. Consolidate with submittals in Section 274100 “Audiovisual Systems General Requirements.”

B. The submittal package shall include all documents which support the A/V design and installation, at the minimum but not limited to the following:

1. Control system pages and flow diagram
2. Drawings – build to details
3. IP Information Sheet (which is a living document)
4. Data product sheets
5. Room and Equipment detail sheets
6. Cable Runs sheets
7. Finish Schedules for furniture:
8. Spare parts list

1.3 ADA COMPLIANCE

A. The AV systems shall be deployed in accordance with ADA standards, coordination between the design and integration teams will be required.

1.4 QUALITY ASSURANCE

A. Approvals: To ensure active equipment is in accordance with government policy, active equipment used for video teleconferencing must be approved through OBO/PDCS/DE/EE.

PART 2 - PRODUCTS

2.1 SAMPLE ROOM LARGE CONFERENCE – OBO DESIGN

A. Reference audiovisual Systems Drawings.

B. This room is a room which supports meetings or presentations and collaboration.

C. Single large display wall mounted on pop out mount.

D. Two table inputs and Collaboration system.

E. The Control Unit Interface (CUI) unit will incorporate the Collaboration control features and the room AV control features into a single panel.

F. Microphone arrays for audio pickup.

G. Playback and voice reinforcement system.

H. Control System

1. The Customer User Interface (CUI) panel will be a tabletop unit.

2. The CUI shall have tiered functions and rites and user controls configured as noted below.

    a. Display system: on / off
    b. The CUI shall be the main method for source selection and content management of the video display, not the manufacture software.
    c. The ability to select a source and send it to the display.
    d. Provide the capability to have all the computers, in room cameras, conferencing sources, CATV/IPTV, and other signals as sources.
    e. The ability to hit the “Sanitize” button and have a clean image routed to the displays.
    f. CATV/IPTV channel selection and controls, presets (6), up / down and number pad with network logos or local network identifiers, channel numbers will not be acceptable.
    g. Provide filters or other methods which reduce the effort and time required to find and or select a source.
    h. Provide technical user pages with all switch and device control capabilities, which provide the detailed information for each device and the health status using a (red, and green) format.
    i. Provide interaction with the room sensor for system startup and shut down, during normal working hours the system shall be in a suspended state for quick start up.
    j. Provide a system shutdown at a prescribed time each day for the A/V systems, the time will be selectable via the technical user pages on the CUI.
    k. Provide volume controls:

        1) The control shall be via a slider bar for the playback and reinforcement speakers with mute controls for each system.
        2) There shall be a limit set on the audio to limit the volume in the room.
        3) The playback and reinforcement speakers shall be on independent controls.
        4) The overall mute controls shall mute the complete room.
        5) All speaker zones shall be controllable.

    l. There shall be six (6) camera presets for each camera when it is selected via the control system. The presets shall be user defined as needed, not hard coded.
    m. Provide detailed user control functions for the collaboration unit on the CUI, the features of the manufactures control unit shall be integrated into the CUI. The detail shall include the following at a minimum but not all functions are listed:

        1) Call startup.
        2) Call hang-up.
        3) Last number dialed.
        4) Phonebook support if required.
        5) Multisite call support if required.
        6) Graphic content support.

3. Provide a table based, ten-inch customer user interface unit.

    a. 10” capacitive touchscreen with 1280x800 resolution and 24-bit color.
    b. Optically bonded glass.

c. Product is powered directly by a PoE+ switch or injector.
d. Ultra-fast quad-core processor.
e. Auto Brightness.
f. System connection status indicator provides visual feedback if the touch panel is not communicating with a control processor.
g. The unit will connect at the table modular unit and then to the floor box.

4. Provide an Ethernet-enabled control processor for the purpose of remotely controlling, monitoring, and troubleshooting connected AV equipment and AV systems.

a. Ethernet-enabled control processor
b. Six RS-232 ports on captive screw connectors located on the back of the processor that can be used for unidirectional or bidirectional control of AV system components.
c. Two RS-232/RS-422/RS-485 ports on captive screw connectors located on the back of the processor that can be used for unidirectional or bidirectional control of AV system components.
d. Eight IR/Serial ports on captive screw connectors located on the back of the processor. These ports shall allow the transmission of IR signals (using an IR emitter) or unidirectional RS-232 communications for control of AV system components.
e. Eight low voltage relays on captive screw connectors located on the back of the processor that can be used to control lighting, screens, or other device functions.
f. Four flex I/O ports on captive screw connectors located on the back of the processor that can be used as analog inputs in addition to digital input or a digital output that can be used to interface with devices such as sensors, switches, LEDs, and relays.
g. Four, independently switched 12-volt outputs on captive screw connectors located on the back of the processor that can provide a combined total of 40 watts of power for powering auxiliary devices.
h. Device shall have a female RJ-45 jacks located on the back of the enclosure that supports 10/100/1000Base-T, half/full duplex with auto-detect for connection to a LAN or WAN and includes link and activity LED indicators located on the left and right of the jack for troubleshooting network issues.
i. Device shall have a second female RJ-45 jack located on the back of the enclosure that supports 10/100/1000Base-T, half/full duplex with auto-detect for connection to a LAN or WAN and includes link and activity LED indicators located on the left and right of the jack for troubleshooting network issues, this port will be designated as an AV LAN port allowing for AV devices to be isolated from a corporate network.
j. Device shall include a multi-function button that allows for the reset of the device or its communication properties at minimum.
k. Supports a web-based AV resource management application that provides a means to manage, monitor, and control AV equipment.
l. Provide an internal real-time clock with backup battery that is used to keep track of the date and time.
m. Device shall provide the option to modify administrator and user credentials.
n. Device shall support security updates to maintain network health.

o. Device shall require that a Secure Socket Layer (SSL) Certificate is installed to maintain system confidentiality and data integrity.
p. There will be a control panel provided as part of the VTC/Collaboration unit, its functions will be integrated into the CUI for the AV system.

5. The system will activate when a computer is plugged in, the CUI is touched, or the room occupancy sensor is triggered.

I. Display Systems

1. Provide one (1) 98”, 16:9 aspect ratio UHD LCD units for the wall.

a. The unit shall have a no-glare commercial grade LCD panel.
b. The unit shall have a brightness of 500 nits.
c. The unit shall be rated for 24/7 operation.
d. The unit shall support AC power at 110-240V, 50/60 Hz.

2. The display shall be wall mounted utilizing a low-profile tilt mount on the display with mount wall pop out brackets. There shall be three mounting points for the display/wall pop out brackets.

a. Tilt mount unit:

1) Integrated teardrop design speeds up wall plate installation by allowing pre-installation of the bolts to the wall.
2) Centerless Shift provides up to 17.5" (445 mm) of post-installation lateral shift - 8.75" (222 mm) left/right of up rites - for limitless centering.
3) Low-profile tilt uses the center of gravity to balance the screen while maintaining a low profile.
4) Set screws keep the mount rigid, stable and secure throughout the life of the installation.
5) An audible click when the screen safely engages with the mount.
6) Built-in cable stand provides easy access under the screen

b. Pop Out brackets:

1) Up to 11.54” (293 mm) extension when combined with Fusion mount - great for recessed applications
2) Scissor assembly extends out up to 9.5"
3) Plumb adjust to keep display in line with the wall
4) Latch to secure mount in home position
5) Compatible with extra-large micro-adjustable fixed and tilt mounts for installation

3. The in-wall display support back box will incorporate the power and the AV connection plates, color of the box is to be confirmed before ordering.

a. The unit shall have overall dimensions of (HxWxD) 15.51 x 15.4 x 3.88” (394 x 391 x 98mm).
b. The units shall be equipped with a local power connection to support the display and other equipment.

4. Coordinate location of display in the room with the customer, to ensure proper mounting location.

J. Video and Data Systems

1. Provide VTC/Collaboration room kit consisting of a codec, camera, and CUI.
2. The codec unit shall be mounted in the equipment enclosure. The unit shall have the following features:

a. Minimum bandwidth for resolution/frame rate: H.264, 720p30 from 768 kbps, 720p60 from 1152 kbps, 1080p30 from 1472 kbps, 1080p60 from 2560 kbps
b. Video inputs:

1) One HDMI input supports formats up to maximum 1080p60
2) Two HDMI inputs support formats up to maximum 4K (3840 x 2160) at 30 fps including HD1080p60
3) Two HDMI outputs which support up to 3840 x2160.
4) Extended Display Identification Data (EDID)
5) Consumer Electronics Control (CEC) 2.0

3. There shall be a wall mounted camera unit mounted below the display with:

a. Video output at 1080p
b. Support up to 60 fps
c. 10 optical zoom, 2 x digital zoom, 20 x total zoom
d. 80° horizontal field of view; 548.8° vertical field of view
e. Auto focus, brightness, and white balance
f. Focus distance 1 m to infinity

4. The control function will be integrated in the main CUI in the control section.
5. The system shall have an auto wakeup feature when people walk into the room, the occupancy sensor shall work in conjunction with the A/V equipment.
6. Provide one camera control/video extension system with wall bracket:

a. The extension unit shall be based upon HDBaseT technology
b. Power, video and control over a single STP cable up to 328 ft. (100m)
c. Bridges audio and video for easy soft-client conferencing
d. Simultaneous HDMI, USB 3.0, and HD-SDI outputs
e. Up to 1080p/60 resolution available over uncompressed USB
f. Includes thin profile wall mount bracket -black

7. Provide a modular, configurable, and furniture-mountable enclosures that shall support a combination of AC power modules, A/V cables, and other plates, the unit shall be configured with:

    a. Provide one - AC-plus-USB power modules, the module shall provide two outlets AC and two USBA charging ports in a single module.
    b. USB power outlets shall provide 5 volts Direct Current and up to 2.1 amps, or 10.5 watts of power.
    c. Provide one HDMI female to female with a 10” pigtail on a single space plate, to be installed in the table box.
    d. Provide one DP to DP with a 10” pigtail on a single space plate, to be installed in the table box.
    e. Provide one RJ45 CATX punch down connector plate, to be installed in the table box for CUI connection.
    f. The table connections will connect to the switcher/transmitter unit.
    g. The modular table device shall have the following features:

        1) The device shall include modules and mounting frames to support AC or AC-plus-USB power, A/V cables and/or A/V connectivity plates.
        2) AC power modules shall be UL listed and CE compliant when installed within the enclosure. AC power modules shall include an attached AC power cord or IEC power inlet with detachable AC power cord, as required by local electrical power codes and conventions.
        3) Device shall include an attached and fully integrated, all metal lid and bezel assembly.
        4) The lid and bezel assembly shall be available in a black anodized or brushed aluminum finish, the finish shall be black as a default unless directed by the customer.
        5) Device lid shall fit entirely within the bezel, when closed, the lid shall provide a full width opening for cable pass-through. When open, the lid shall articulate such that it fits within the enclosure body. Device shall include a damper that controls the speed of the lid as it moves within the enclosure.
        6) The enclosure shall feature an integrated clamp system, the clamps shall be permanently affixed to the enclosure body. The clamps shall utilize a lever-and-cam mechanism.

8. Provide a 4K auto switcher/ transmitter extender over STP with a connection to a matrix switcher, to support each table box with the following features:

    a. Transmits DisplayPort (DP), HDMI, control and analog audio up to 330 feet (100 meters) over a shielded CATx cable.
    b. Inputs: two HDMI, one DP, one 3.5 mm stereo mini jack for audio.
    c. One STP transmitter output.
    d. Supports computer and video resolutions up to 4K/60 @ 4:4:4.
    e. Auto-switching between inputs.
    f. Analog stereo audio embedding.

g. Supports HDMI 2.0b - data rates up to 18 Gbps, High Dynamic Range (HDR), Deep Color up to 12-bit, 3D, and HD lossless audio formats.
h. Supports DisplayPort Single Stream Transport (SST) data rates up to 21.6 Gbps.
i. Support for HDR video.
j. Remote power capability.
k. 24 shielded twisted pair is recommended for optimal performance
l. Output is compatible with High Definition Base T (HDBaseT) -enabled devices — The STP output can be configured to send video and embedded audio, plus bidirectional RS 232, and IR signals to an HDBaseT-enabled display.
m. The unit will connect at the table and then to the floor box.

9. Provide a 4K HDMI receiver unit for the display at the backbox with:

a. Receives HDMI plus control and analog audio up to 230 feet (70 meters) over a shielded CATx cable.
b. Input: One twisted pair input on RJ-45
c. Outputs: One HDMI, stereo audio on captive screw.
d. Supports computer and video resolutions up to 4K/60 @ 4:4:4.
e. Supported HDMI 2.0b specification features include data rates up to 18 Gbps, HDR, Deep Color up to 12-bit, 3D, HD lossless audio formats, and CEC pass-through
f. Support for HDR
g. HDCP 2.3 compliant
h. Remote power capability
i. Bidirectional RS 232 and IR pass-through for AV device control.
j. Supports EDID and HDCP transmission.
k. 1” (2.5 cm) high, quarter rack width metal enclosure.

10. Provide a 10x8 scaling presentation matrix switcher to support the switching requirements within the space, the unit shall have the following features:

a. Provide six HDMI video input connections.
b. Four RJ-45 for video from STP twisted pair transmitters.
c. Support 4K and UHD signals at all inputs.
d. Provide image adjustments for the STP outputs, including brightness, contrast, color, tint, detail, H/V positioning, and sizing.
e. Automatic memories for each video input.
f. User presets may be saved and recalled electronically via Ethernet, RS-232, or USB connection.
g. Support HDMI specifications including data rates up to 10.2 Gbps, Deep Color up to 12-bit, 3D, and HD lossless audio formats.
h. Provides automatic cable equalization for each digital input to 100 feet (30 meters) at 1080p/60 with 8-bit color.
i. Provide automatic cable equalization for each digital input to 50 feet (15 meters) at 4K/30 and 2560x1600 @ 60 Hz resolutions.
j. Support video transmission over shielded CATx up to 330 feet (100 meters).
k. Video output connections six HDMI.
l. Two dedicated RJ-45 for video to STP twisted pair receivers.

m. Shall support up to 16 logo presets.

11. Provide an A/V network managed switch for the display control, audio, and other task, per the system drawings.

    a. The switch shall be deployed in the equipment enclosure.
    b. The switch is detailed on the budget sheet.
    c. The switcher shall support:
    d. Network ports 24 10/100/1000 Ethernet copper ports
    e. Network ports 2 10G SFP+ ports uplinks
    f. POE+ power on 24 ports
    g. The unit shall be provided with a three-year maintenance support contract to minimize any down time.
    h. The connections and locations shall be connected per the system drawings.

12. Provide and install all the distribution units, cables, shelves, and other equipment required to make a complete and working system per the drawings and equipment list.

K. Audio Systems

1. Provide a ceiling table microphone array unit.

    a. The ceiling array microphone shall consist of eight highly directional pickup lobes to capture individual talkers and deliver discrete audio signals over a single network cable.
    b. It shall support 10 total channels (8 independent transmit channels, 1 automatic mixing transmit channel, and 1 audio echo cancelation (AEC) Reference Input receive channel).
    c. Audio routing shall be controlled through a computer on the Dante™ or AES67 network.
    d. Browser-based control software shall provide steerable coverage with ability to aim individual lobes based on participant seating.
    e. Pickup lobe width shall be selectable, with narrow, medium, and wide settings.
    f. Mounting options shall include hard ceiling, suspension mounting, and VESA mounting options.

2. Provide a fixed audio Digital signal Processing (DSP) unit with:

    a. The unit shall support Dante™ digital audio networking that shall allow up to 32 x 32 channels. The Dante networking connection shall be implemented on a RJ-45 connector.
    b. The audio DSP shall include 4 channels of General-Purpose Input and Output connection (GPIO) for sending or receiving logic signals. The programming of the GPIO ports shall be software configurable.
    c. The audio DSP shall include a RS-232 connection for control data transmission into or out of the audio DSP and such operation shall be software programmable.

d. The audio DSP shall include a Universal Serial Bus (USB) connection on a standard USB-B type connector.
e. The audio DSP shall be software configurable to stream up to 8 channels of digital USB Class 1 Audio transmission either into or out of the audio DSP or simultaneous input and output.
f. The audio DSP shall provide 12 balanced input connections for receiving of microphone or line level analog audio signals on screw-down, removable connectors.
g. The input connections shall include Acoustic Echo Cancellation (AEC) hardware and firmware, the parameters, routing, and operation of which shall be software programmable.
h. The audio DSP shall provide 8 balanced output channels for the transmission of microphone or line level analog audio signals on screw-down, removable connectors.
i. Each individual channel shall have its own dedicated connection. The audio DSP shall integrate to Voice Over Internet Protocol (VoIP) systems on a RJ-45 connector for two lines of VoIP communication and shall support Session Initiation Protocol (SIP) v2.0 or later.
j. The audio DSP shall integrate to standard telephony communications on a RJ-11 connector for a single line of telephone communication.
k. The audio DSP shall provide front panel OLED identification of device power, status, alarm, and activity as well as system-wide alarm.
l. The audio DSP shall be rack mountable (1RU) and feature software-configurable signal processing, including but not limited to signal routing and mixing, equalization, filtering, dynamics, and delay, as well as control, monitoring, and diagnostic tools.
m. The audio DSP shall be CE marked, UL listed, and shall be compliant with the RoHS directive.

3. Provide ceiling mounted speakers for voice reinforcement and mix minus with the following features:

a. 6.5" (165 mm) long throw woofer
b. 3/4" (19 mm) ferrofluid-cooled dome tweeter
c. 4.2" (107 mm) deep low-profile composite back can
d. Frequency range: 85 Hz to 20 kHz
e. 95° conical dispersion
f. 65 watts continuous pink noise
g. 130 watts continuous program
h. Locking arms support ceilings up to 2.25" (57.1 mm) thick
i. UL 2043 plenum rated enclosure

4. Provide playback speakers mounted on the sides of the display.

a. The speaker shall be sized to match the height of the display.
b. The speaker shall be mounted to the display mounting bracket and the surface of the speaker is to be smooth with the display surface.

c. The speakers shall be no more than 2.75" deep
d. Ribbon high-frequency driver for superior speech clarity.

5. Provide amplifiers units for playback and voice reinforcement audio devices.

a. Playback unit with Dante' interface.
b. Receives audio from the Dante audio network and from analog mic/line level inputs
c. Selectable output power modes
d. Two 100-watt channels into 8 ohms or 4 ohms
e. ENERGY-STAR qualified amplifier with defeat able auto-standby and fast wake up
f. Voice reinforcement unit with Dante' interface
g. Receives audio from the Dante audio network and from analog mic/line level inputs
h. Two 100 watts rms output power per channel at 70/100V
i. ENERGY-STAR qualified amplifier with defeat able auto-standby and fast wake up

6. AV contractor shall coordinate the installation of all required software with the owner's representative.

L. Furnishings / Miscellaneous

1. Provide a custom AV designed Credenza unit which will serve as the A/V equipment enclosure and as storage for the space.

a. The color is to be confirmed and coordinated with the Interiors team.
b. The standard size shall be a 1 bay, 2 bay or 3 bay credenza in width with built in front mounted 14 space rack rails, rear, and front.
c. The unit shall have recessed swivel casters, locking removable front and rear doors, ventilation fans and cable management throughout.
d. The credenza units shall be custom built (free-standing or built-in) to include audio-visual integration provided by the awarded Contractor.
e. A/V equipment and components within the credenza must be coordinated with the A/V Designer.
f. Built-in A/V credenza construction and materials shall adhere to Custom Grade requirements set forth in Architectural Woodwork Standards (latest edition).
g. The unit shall be sized for the space and coordinated with the design team.
h. Each bay minimum 24"/60.96 cm depth, 32"/61.28 cm, the standard height, but it could vary based on A/V and Interiors design requirements.

1) Concealed heavy-duty recessed swivel casters with recessed, plinth base
2) Front and rear lockable doors
3) Doors that open in opposite directions to access sliding A/V racks.
4) Provide front and back-mounted rack rails for Rack Units
5) Ventilation fans and ventilation grilles on rear doors
6) Cable management throughout
7) Metal grommets (either at the top or within the cabinet base)
8) Additional Customizations if requested by Project Designer

9) Self-pull, integrated pull, tab pull, or handle pull for ADA accommodation (color to be selected)
10) Concealed integral trash receptacle
11) Concealed refrigerator
12) Drawers
13) Raised backstop at credenza top

i. Materials and Aesthetics

1) Case Material and Doors (Drawers if specified): Wood veneer, High-Pressure Plastic Laminate, or Painted finish (must match Project Designer's specification and control sample).
2) Top Material: Custom material and edge condition per Project Designer's specification. (Glass, Solid Surface, Quartz, Solid Wood, Natural Stone, High-Pressure Plastic Laminate).
3) Recessed Base (Toe Kick) Material: Wood Veneer or Metal Finish
4) If wood veneer is selected for the case and door material, veneer direction will be provided by the Project Designer.
5) Door and cabinet thickness to be a minimum of ¾" thick.
6) Hardware used for construction of the credenza shall adhere to the requirements set forth in applicable ANSI/BHMA Standards (latest edition).
7) Concealed door hinges shall be self-closing or provided with a catch.
8) Bumper pads shall be installed at the top and bottom of each hinged door.
9) Closing stops shall be provided at the rear of drawer sides unless the drawer slides contain integral stops that prevent the drawer face from impacting the cabinet body.
10) When design permits, and if stops are not integral to the drawer slides, a mechanism shall be provided to prevent the drawer from pulling out of the cabinet.
11) Drawer slides shall provide for a minimum extension of 75 percent of the length of the drawer box beyond the cabinet body.

2. Provide power surge and suppression unit.

a. The SEQ-1U shall be a one-rack-space unit in a magnetic shielding steel enclosure. It shall operate from 120/240volts AC and have a 9-foot, grounded, 3-wire #12-line cord.
b. There shall be 6 grounded AC receptacles in three banks of two on the rear panel, each bank sequenced from the previous bank by an adjustable 0 - 40 second delay, and two receptacles always on.
c. There shall be an LCD display that shows unit status and AC line voltage, and two
d. screwdriver adjustments to program the unit.
e. Overall dimensions shall be 1.75" H x 19" W x 12.25" D. Weight shall be 13 pounds.
f. The unit shall have remote turn-on capabilities enabled by wired connections to a terminal block.
g. Remote turn-on and turn-off shall be activated by either a contact closure or applied DC voltage.

h. There shall be an output voltage source for connection to a remote LED status indicator and a relay output for control and cascading.
i. The SEQ-1U shall have a load rating of 20 amps at 120 volts, a self-test circuit with visual indicator, and provide EMI/RFI filtering, inrush current elimination, zero-cross switching, and catastrophic over/under-voltage shutdown.
j. It shall withstand at least 1000 occurrences of surge pulse voltages up to 6000 volts.

3. Provide the horizonal power distribution units (PDU) as required to support the equipment in the credenzas as required.
4. Provide a wall mounted occupancy sensor connected to the master control unit.

   a. The exact location of the device is to be coordinated with the customer and or the design team. The device can be ceiling mounted if required.

5. All exposed cabling shall be enclosed in black or color appropriate nylon sleeving.
6. All audio, video, STP, fiber and any other specialty cables shall be plenum rated to include the jumpers.
7. Provide all connectors, cables, adapters, plates, panels, and power supplies as necessary to provide a complete and operating system as outlined in these documents and as drawn in the TA-series drawing package.

2.2 PRODUCTS/GENERAL

A. Near Field Communication Technologies (e.g., Bluetooth) if provided shall have the option to be turned off by end user and shall be installed within the GWA only.

B. Control Systems

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Crestron Electronics, Inc.
   b. Extron
   c. Utelogy

2. Large System Controller:

   a. Control system shall be fully compatible with room management software and third-party applications (e.g., e-Outlook, e-PowerPoint).
   b. Network Connections:
   c. Control system shall support 10/100/1000 BaseT Ethernet LAN.
   d. Add-on 10/100/1000 BaseT Ethernet Modules.
   e. TCP/IP communications.
   f. DHCP and DNS support.
   g. Native email client.

h. Remote diagnostics.
i. Remote program loading and administration.
j. Built-in web server.

3. Control system shall include the following hardware configuration:

a. Eight IR/serial/one-way RS-232 ports.
b. Eight digital/analog I/O ports – TTL In/Out & analog inputs 0 10V.
c. Eight isolated low-voltage relays – 30VDC @1A.
d. Six 2-way RS-232/422/485 ports.
e. Proprietary control port.
f. One compact flash memory upgrade slot.
g. Front and rear programming ports.
h. Internal power supply.
i. Front and rear programming ports.
j. Control system shall support optional add-on of control cards such as IR, RS-232/422/485, relay, digital I/O, analog input, volume, MIDI.
k. Chassis: 475 mm (19 inch) rack-mounted or shelf-mounted (removable rack ears).

4. Large-Wired Touch Panel:

a. Integrated unit.
b. Minimum Resolution: 800 by 600 pixels.
c. Panel Size: 256 mm (10.1 inch) minimum (diagonal).
d. Support graphic animation on a variety of object styles.

C. Displays

1. Large-Venue Video Projectors:

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Barco
2) Christie Digital Systems
3) Digital Projection Inc
4) Panasonic
5) Sony

b. Display Properties:

1) Resolution: Native UHD 4K (3840 x 2160) minimum.
2) Display Engine: Three-chip DLP, Laser and Laser RGB, three-element LCD or LCOS (liquid crystal on silicon).
3) SD/HD/UHD Video Signal Compatibility: 2160p/2160i, 1080p/1080i, 720p.

4) PC Signal Compatibility: WXGA, WXGA+, WSXGA, SXGA+, WUXGA (1920 x 1200), 4K UHD.
5) Brightness: ≥12,500 ANSI lumens, minimum.
6) Contrast Ratio: 2000:1.
7) Lens Shift: Vertical and horizontal.
8) Start-Up Screen: Programmable with menu mute/suppress and blue screen off settings, image adjusting/warping software available and included as necessary.
9) Power Supply: AC100-240V.
10) Noise: 50dBA maximum.
11) Inputs - Typical:
12) Control Terminals: Ethernet, RS232, USB.
13) System management and control via Ethernet LAN – TCP/IP (RJ-45 jack).
14) HDMI with HDCP and EDID.
15) Display Port
16) HDBase-T

c. Lens:

1) Size focal length so lens is zoomed no further than ± 20 percent from center focal length.
2) Interchangeable.
3) Powered focus.
4) Horizontal and vertical lens shift.

d. Accessories:

1) Power cord.
2) Wireless remote control.
3) Mounting/rigging cage and mounting hardware, eyebolts, and other attachment devices to interface with rigging grid or motorized lift system.

2. Flat-Panel Displays:

a. The displays shall have no Bluetooth, RF or other wireless interface method installed in the device. The display shall be a commercial series not a consumer series.
b. The designer shall ensure the display is appropriate for the mission task.
c. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Christie
2) LG Electronics
3) NEC/Sharp
4) Sony
5) Samsung

d. Operation: 16/7 minimum.
e. Display Viewable Image Sizes:

1) Lobby or information display: 1397-1651mm (55 to 65 inches).
2) Small display:1651 to 1750 mm (65 to 70 inches).
3) Medium display: 1750 to 2184 mm (70 to 86 inches).
4) Large display: 2184 to 2667mm (86 to 105 inches)

f. Video Properties:

1) Colors: 16.7 million minimum.
2) Native Resolution: Minimum 3840 x 2160 at 50/60Hz (analog/digital).
3) Maximum Digital: 2560 x 1600 at 60Hz.
4) Display Response Time: Eight-milliseconds.
5) Brightness: 350 cd/m2 (typical)

g. Display Properties:

1) Closed-caption decoder.
2) Minimum Viewing Angle: 177 deg horizontal, 177 deg vertical.
3) Anti-glare, anti-reflective screen treatment.
4) Operating temperature: 0 to 40 deg C (32 to 95 deg F).
5) Operating Humidity: 10 to 80 percent, non-condensing.
6) Power-save mode.
7) Power timer.
8) Internal power supply.
9) Power Characteristics: 100V - 240V AC, 50-60Hz.
10) System management and control via Ethernet LAN.
11) Audio Power: 20W (10W x 2) minimum.

h. Supported Formats:

1) HDTV Formats: 4K minimum.
2) NTSC, NTSC4.43.
3) SECAM.
4) PAL, PAL60, PAL-M, PAL-N.
5) VESA type graphics, up to 1920x1200 (WUXGA) minimum.

i. Digital Video Inputs:

1) HDMI.
2) HDCP2.2 compliant.
3) Version (v) 2.0 compliant minimum. Contractor shall provide and use the latest version at the time of purchase.
4) Display Port.
5) USB 2.0 (provide and use the latest version available at time of purchase.

j. Audio Inputs:

1) Stereo mini jack
2) HDMI
3) Audio (common)

k. Control Inputs:

1) Ethernet/TCP-IP (RJ-45).
2) RS232 control.
3) Infrared (IR).
4) Other inputs: USB 2.0

l. Accessories:

1) Setup/operation manual.
2) Power cord.
3) Wireless remote control.
4) Remote mouse receiver with batteries.

m. Certifications:

1) Energy Star

D. Mounting Devices:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Chief Manufacturing.
b. Omni Mount.
c. Peerless Industries, Inc.
d. Premier Audio Visual.

2. Projector Mounts:

a. Ceiling Mount:

1) Roll: +/- 3 degrees.
2) Pitch: +/- 20 degrees.
3) Yaw: 360 degrees.
4) Weight Capacity: 11 kg (25 lbs).

b. Security Mount:

1) Roll: +/- 4 degrees.

2) Pitch: +/- 25 degrees.
3) Yaw: 360 degrees.
4) Weight Capacity: 23 kg (50 lbs).

c. Short Throw Mount: Short throw single-stud wall arm.

1) Extension: 0 to 450 mm (0 to 18 inches).
2) Pitch: +/- 3 degrees.
3) Weight Capacity: 23 kg (50 lbs).

3. Flat Panel and Touchscreen Mounts:

a. Full-Swing Wall Mounts, dual-swing arm, 1390 mm to 1775 mm (55 inch to 71 inch) display:

1) Maximum extension: 925 mm (37 inches).
2) Tilt: + 5 degrees to -17 degrees.
3) Roll: +/- 2.5 degrees.
4) Swivel: 90 degrees.
5) Weight Capacity: 90 kg (200 lbs.).

b. Tilt Wall Mounts, 1675 to 2560 mm (55 to 98 inch) board/panel:

1) Depth from wall: 51 – 8.1cm (2 - 3.2 inches).
2) Weight Capacity: 34-115 kg (75 -250 lbs.).
3) Literal shift: 265 mm (10.4”).
4) Tilt: +2-5°
5) Certifications: OSHPD, TAA, TUV, UL Listed

c. Extra Large Pull Out Accessory, 2184 to 2667 mm (86 to 105 inch) panels:

1) Wall mounted unit, with up to three attachment devices.
2) The pull out accessory would attach to the tilt mount on the display.
3) The pull accessory allows the display to be extended 293 mm (11.54 inches) from the wall, for service.

E. Video Systems:

1. Extender Units

a. The extender units shall be a standard based product using STP cabling.
b. The extender deployed shall be of the same manufacturer, Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) ZeeVee
2) Crestron

3) Extron

c. Provide a 4K transmitter extender over STP with the following features:

1) Transmits DisplayPort (DP), HDMI, control and analog audio up to 330 feet (100 meters) over a shielded CATx cable.
2) Inputs: one HDMI or one DP, one 3.5 mm stereo mini jack for audio.
3) One STP transmitter output.
4) Supports computer and video resolutions up to 4K/60 @ 4:4:4.
5) Analog stereo audio embedding.
6) Supports HDMI 2.0b - data rates up to 18 Gbps, High Dynamic Range (HDR), Deep Color up to 12-bit, 3D, and HD lossless audio formats.
7) Supports DisplayPort Single Stream Transport (SST) data rates up to 21.6 Gbps.
8) Support for HDR video.
9) Remote power capability.
10) 24 shielded twisted pair is recommended for optimal performance
11) Output is compatible with High Definition Base T (HDBaseT) -enabled devices — The STP output can be configured to send video and embedded audio, plus bidirectional RS 232, and IR signals to an HDBaseT-enabled display.

d. A 4K receiver extender over STP with the following features:

1) Receives HDMI plus control and analog audio up to 330 feet (100 meters) over a shielded CATx cable.
2) Input: One twisted pair input on RJ-45
3) Outputs: One HDMI, stereo audio on captive screw.
4) Supports computer and video resolutions up to 4K/60 @ 4:4:4.
5) Supported HDMI 2.0b specification features include data rates up to 18 Gbps, HDR, Deep Color up to 12-bit, 3D, HD lossless audio formats, and CEC pass-through
6) Support for HDR
7) HDCP 2.3 compliant
8) Remote power capability
9) Bidirectional RS 232 and IR pass-through for AV device control.
10) Supports EDID and HDCP transmission.
11) 1” (2.5 cm) high, quarter rack width metal enclosure.

2. 10x8 scaling presentation matrix switcher to support the switching requirements, the unit shall have the following features:

a. Provide six HDMI video input connections.
b. Four RJ-45 for video from STP twisted pair transmitters.
c. Support 4K and UHD signals at all inputs.
d. Provide image adjustments for the STP outputs, including brightness, contrast, color, tint, detail, H/V positioning, and sizing.

e. Automatic memories for each video input.
f. User presets may be saved and recalled electronically via Ethernet, RS-232, or USB connection.
g. Support HDMI specifications including data rates up to 10.2 Gbps, Deep Color up to 12-bit, 3D, and HD lossless audio formats.
h. Provides automatic cable equalization for each digital input to 100 feet (30 meters) at 1080p/60 with 8-bit color.
i. Provide automatic cable equalization for each digital input to 50 feet (15 meters) at 4K/30 and 2560x1600 @ 60 Hz resolutions.
j. Support video transmission over shielded CATx up to 330 feet (100 meters).
k. Video output connections six HDMI.
l. Two dedicated RJ-45 for video to STP twisted pair receivers.
m. Shall support up to 16 logo presets.

3. A/V network managed switch for the display control, audio, and other tasks.

a. The switch shall be deployed in the equipment enclosure.
b. The switch is detailed on the budget sheet.
c. The switcher shall support:
d. Network ports 24 10/100/1000 Ethernet copper ports
e. Network ports 2 10G SFP+ ports uplinks
f. POE+ power on 24 ports
g. The unit shall be provided with a three-year maintenance support contract to minimize any down time.

4. Provide a modular, configurable, and furniture-mountable enclosures that shall support a combination of AC power modules, A/V cables, and other plates, the unit shall be configured with:

a. shall have the following features:

1) The device shall include modules and mounting frames to support AC or AC-plus-USB power, A/V cables and/or A/V connectivity plates.
2) AC power modules shall be UL listed and CE compliant when installed within the enclosure. AC power modules shall include an attached AC power cord or IEC power inlet with detachable AC power cord, as required by local electrical power codes and conventions.
3) Device shall include an attached and fully integrated, all metal lid and bezel assembly.
4) The lid and bezel assembly shall be available in a black anodized or brushed aluminum finish, the finish shall be black as a default unless directed by the customer.
5) Device lid shall fit entirely within the bezel, when closed, the lid shall provide a full width opening for cable pass-through. When open, the lid shall articulate such that it fits within the enclosure body. Device shall include a damper that controls the speed of the lid as it moves within the enclosure.

6) The enclosure shall feature an integrated clamp system, the clamps shall be permanently affixed to the enclosure body. The clamps shall utilize a lever-and-cam mechanism.

b. Devices to be installed inside of the modular table box.

1) Provide one - AC-plus-USB power modules, the module shall provide two outlets AC and two USBA charging ports in a single module.
2) USB power outlets shall provide 5 volts Direct Current and up to 2.1 amps, or 10.5 watts of power.
3) Provide one HDMI female to female with a 10” pigtail on a single space plate, to be installed in the table box.
4) Provide one DP to DP with a 10” pigtail on a single space plate, to be installed in the table box.
5) Provide one RJ45 CATX punch down connector plate, to be installed in the table box for CUI connection.
6) The table connections will connect to a switcher/transmitter unit.

5. Cameras:

a. Available manufacturers:

1) Cisco
2) Poly
3) Sony
4) Vaddio

b. Certifications/Compatibility:

1) Compatible with current collaboration systems, Team, Poly, Webex

c. Camera extension units:

1) Sound Control
2) Vaddio

d. Pan and Tilt:

1) Pan: +/- 100 degrees
2) Tilt: +/- 20 degrees

e. Resolution: 1920 x 1080 at 60 fps minimum.
f. Zoom:

1) Optical: 10x
2) Digital: 2x
3) Total: 20 x

g. Field of View:

1) Horizontal: 80
2) Vertical: 48.8

h. Camera Control: Ethernet, RJ45
i. Focus: 1 meter to infinity.
j. Video Interface: HDMI, 3G-SDI
k. Network Interface: RJ45
l. Operating Temperature: 0 to 40 degrees C, ambient temperature, 10 to 90 percent relative humidity.
m. Storage/Transport Temperature: -20° to 60°C (-4° to 140°F) at RH 10% to 90% (noncondensing).

6. All-In-One Videoconferencing Bar

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1) HP/Poly
2) Logitech

b. Minimum Features:

1) Integrated camera, stereo speakers, and microphones
2) 1920x1080 @ 30fps camera resolution
3) Wide angle horizontal field of view
4) Onboard AEC (Acoustic Echo Cancellation)
5) USB connectivity to PC/MAC
6) Teams and Zoom certified

7. Multi-Format Disk Player:

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Sony
2) Samsung
3) Panasonic

b. HDMI video output with multichannel audio stream (HDMI or SPDIF).
c. 4K output resolution.
d. Play video and images (jpg, jpeg, gif, png, and other common formats).
e. Memory card slot for standard SD memory card, compact flash, memory stick, multimedia card, and smart media.

f. Blu-Ray, DVD video, DVD-RAM, DVD-R, DVR-R/RW, audio CD, video CD, MP3, and MP4.

8. Collaboration Solutions:

a. A collaboration system uses software and technology to enable team members to communicate and share documents in a digital space. The purpose is to use collaboration systems to solve work-related problems such as chaotic communication, paper-heavy processes, or inability to offer workers telecommuting opportunities.
b. The systems range from desktop, laptop and room based systems, which can be deployed as required to support the mission.
c. The room-based systems have two major types:

1) Small/Medium room – all-in-one, (bar/camera under the display)
2) Larger rooms – codec hardware, camera units, microphones (ceiling and table).

F. Audio Systems:

1. Digital Signal Processors

a. Available manufactures, subject to compliance with requirements, manufacturers offering the products that may be incorporated into the work include, but not limited to the following:

1) Biamp Systems
2) QSC

2. Minimum functions:

a. Programmable and configurable to allow changes in system functions, features and control.
b. Digital Audio or other multi-channel digital buss option via F/UTP cable.
c. System management and control via Ethernet LAN.
d. The combination of inputs and outputs as required to support the design
e. Routing and mixing of audio signals.
f. Dynamic and spectral processing of audio signals.
g. Automatic echo canceling for conferencing
h. Automatic feedback eliminator.
i. Phantom power.
j. Provide 40 percent input/output spare capacity.

2.3 DIGITAL AUDIO NETWORKS:

A. Digital Audio Network can be hardware or software based, either as a standalone conversation unit or embedded in products

1. The digital network units shall support lossless audio 24-32 bit, with sample rates from 44.1 kHz to 192 kHz.
2. The digital network shall have the option of a control management software which could if deployed manage all of the devices remotely within a facility.
3. The devices shall be able to input an analog audio signal and output the digital format in a network protocol, this also applies for the reverse processing, the digital to analog conversation process.
4. The audio is packetized into a segments and wrapped in an Internet Protocol (IP), which allows it to be transported across a network using standard network equipment.
5. The devices may support multiple Input/Output (I/O)'s on or in a single device.
6. Digital Audio Network software and hardware is used across multiple platforms, audio, video and control, the devices should be installed as required to support the mission.

B. Digital Audio Console:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Yamaha.
   b. Allen Heath

2. Minimum functions:

   a. Minimum of 24 bit internal processing.
   b. Minimum of 44.1 KHz sampling frequency (internal/external clock).
   c. Minimum of eight balanced audio inputs.
   d. Stereo monitor, phones, aux outputs.
   e. Digital stereo output.
   f. Minimum of eight-track playback at 24 bit.
   g. Eight-bus master section.
   h. USB 2.0 connection.
   i. Digital Audio connections

C. Assisted Listening System:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Listen Technologies

2. Minimum Features:
3. Digital IR language Delivery system
4. A digital congress main station
5. 4 channel digital IR transmitter
6. 4 channel Digital IR Receiver unit, belt pack
7. Headphones for the belt pack receiver with sponge cover
8. Sponge ear pads - spare
9. Recharge batteries for belt packs, with charging cases
10. Fully Digital Congress Interpreter Unit, for 2 interpreters
11. Digital IR Radiator 25W, with wall mount
12. Digital conference master.
13. Interpreter set.
14. Gooseneck microphone for interpreter set.
15. Delegate microphone with fixed microphone and channel selector.
16. Audio output unit.
17. Conference management software.
18. Dual headphone.
19. Ear bud headphone option.
20. Inductive neck loop.
21. Coordinate signage with project signage for style and use dual language (including local language(s)); refer to project Construction Documents.

D. Power Amplifiers

1. Power amplifiers selection is based upon the required wattage required to support the design for each type of system. The unit if required to interface with other system components, it should have a Digital Audio Interface. The proper unit shall be utilized to support the following system allowing for 20 percent headroom above typical loads:

   a. Playback
   b. Voice Reinforcement
   c. Background or other informational systems.

2. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. QSC Audio.
   b. Ashly Audio.
   c. Lab.gruppen.
   d. Crown
   e. Crestron
   f. Extron.
   g. Biamp

3. Power amplifiers selection in the Construction Documents is based in part on load per channel. The Contractor may utilize different power amplifier configurations that meet the per channel requirements.

E. Loudspeakers.

1. Ceiling Loudspeaker:

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in to the Work include, but are not limited to, the following:

1) Tannoy
2) Biamp
3) JBL by Harmon.
4) QSC
5) Crestron
6) Extron
7) Atlas Sound.

2. Program/Playback Loudspeaker:
3. Program speakers for flat panels:

a. The speakers shall match the height of the display.
b. The speakers shall mount to the bracket on the back of the display.

4. Wall mounted speakers:

a. The speakers shall be secured to the wall with safety cables.
b. The units shall be color coordinated to match the room environment as close as possible.
c. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Tannoy
2) Leon
3) JBL by Harmon
4) Turbosound.
5) Atlas Sound.

d. Accessories.

1) Yoke or ball-and-socket mount.
2) Refer to mounting details for custom brackets.

e. Mounting brackets with attach to the display

F. Microphones and Accessories:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Beyerdynamic.
   b. Shure, Inc.
   c. Sennheiser.
   d. Clock Audio
   e. Biamp
   f. Audio-Technica

2. Lectern/Table-Mounted Gooseneck Cardioid Microphone:

   a. Cardioid pattern, condenser/capacitor element.
   b. Phantom power, 48 VDC.
   c. Mute switch (logic type) with separate output contact and LED indicator (red = mute, green = active or 'on').
   d. LED Color ring for status with Logic control.
   e. Digital audio interface if required per design.
   f. Shock mount base permanently mounted in lectern or table.

2.4 DIGITAL VIDEO TRANSMISSION SPECIALIZED ACTIVE CABLING:

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in to the Work include, but are not limited to, the following active cabling:

   1. Rapid Run.
   2. Hubble Premise Wiring.
   3. Video input (wall plate) and output (flying lead) signal properties:
   4. video.
   5. HDMI or DP

B. Maximum transmission distances passive: 10 meters.

C. Maximum transmission distances active: 30 meters.

D. Video Capture:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in to the Work include, but are not limited to, the following:

   a. Vaddio

b. Epiphan Video

2. HDMI, SDI, DisplayPort, video inputs.
3. 3840 x 2160 minimum resolution.
4. Digital and Analog Audio Inputs: IEEE 1394, XLR balanced stereo, RCA unbalanced stereo.
5. Webcast live/record on demand.
6. Simultaneous video, graphics, and audio capture.
7. 56 Kbps to 2 Mbps encoding.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

A. Refer to Section 274100 “Integrated Audiovisual Systems General Requirements” for general installation requirements.

3.2 CONTRACTOR’S FINAL CHECKOUT

A. Refer to Section 274100 “Audiovisual Systems General Requirements.”

END OF SECTION 274114

SECTION 274117 – PROJECTION SCREENS AND PROJECTOR LIFTS

GENERAL

1.1 SUMMARY

A. This Section the following video equipment: Note: The projection screen should only be deployed if the display requirement is over 105”/2667mm.

1. Front projection screens.
2. Motorized projector lifts.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
2. Section 270508 “Common Work Results for Telecommunications.
3. Section 274100 “Audiovisual Systems General Requirements.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to these references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

B. American National Standards Institute / Audiovisual and Integrated Experience Association (ANSI/AVIXA (formerly INFOCOMM))

1. ANSI/AVIXA V201.01:2021: Image System Contrast Ratio

C. Society of Motion Picture and Television Engineers (SMPTE):

1. SMPTE RP 94-2000 - Gain Determination of Front-Projection Screens

1.3 DEFINITIONS

A. Projection-Surface Gain: Indication of screen's luminance or brightness that is measured perpendicular of screen center and measured relative to block of magnesium carbonate, which serves as standard for 1.0 gain. Higher numbers indicate greater brightness. Gain shall be determined in accordance with SMPTE RP 94.

B. Projection-Surface Viewing Angle: Angle from perpendicular center of screen, where gain or brightness is decreased by 50 percent.

C. Keystone: Distortion of projected image when screen is not perpendicular with center line of projected image.

1.4 SUBMITTALS

A. General: Technical submittals (e.g., product data, shop drawings, schedules) associated with all Division 27 A/V Specifications shall be submitted together with the submittals for this Section to facilitate coordination of systems.

B. The submittal package shall include all documents that support the A/V design and installation at the minimum but not limited to the following if applicable:

1. Drawings – build to details
2. IP Information Sheet (which is a living document)
3. Data product sheets
4. Room and Equipment detail sheets
5. Cable Runs sheets
6. Finish Schedules for furniture:
7. Spare parts list

C. The submittals shall be submitted in a PFD format.

1. The PFD documents shall be searchable.
2. The PDF documents shall utilize bookmarks for all major sections, and details within the sections, this is to facilitate quick switching between rooms and or other areas within the document.
3. The first page of each manufacturer’s PDF shall be bookmarked.

   a. Within the manufacturer’s PDF, the equipment relative to the project shall be highlighted or emphasized in a manner for quick reference.

4. Excessive pages from manufacturers with no relation to project should be removed to reduce the size of the PDF document.

D. Product Data:

1. Manufacturer’s product data sheets for all materials and equipment, sorted by room and indexed.
2. Manufacturer's product data sheets for all associated fire-stopping materials.
3. Manufacturer’s product data sheets for accessories, including technical panels, escutcheons, and trim components. Include fasteners and supports.

E. Shop Drawings: Submit the following A/V shop drawings and details, they shall be submitted as a separate package from any other drawings:

1. Detailed drawings shall include all of the areas which will receive any Audiovisual solution. The drawing set shall include at a minimum the following for each area if applicable:

a. An enlarged plan view for the facility requirements
b. An enlarged plan view for the infrastructure requirements:

1) A/V network drop
2) A/V back boxes
3) A/V conduit sizes and locations
4) Cable tray and pathways
5) Equipment rack locations for A/V and any other rack to support Telecommunications or other signals.
6) Electrical connections locations

c. An elevation drawing for each A/V solution.

1) Which includes but is not limited to:

a) Projector Screen
b) Projector Lift
c) A/V network drops “**”AFF
d) A/V conduit sizes and locations
e) Any other devices locations “**”AFF

2) Consistent with Construction Drawings, detail installation of equipment and cable layout to further enhance operational efficiency and overall aesthetic factors.

d. System-riser diagrams for each area with Audiovisual components.
e. System flow drawings with detailed wiring diagram input/output connections for each piece of equipment, interconnects, data flow, and other pertinent information.
f. Wiring diagrams for each A/V subsystem that define interconnection of all inputs and outputs for all equipment.
g. Fabrication shop drawings for all custom equipment, as applicable.

F. Cable run sheets (e.g., diagrams or spreadsheets) that denote cable type, signal type, termination type, cable number designation, start point, and end point.

G. Finish Schedules for furniture:

1. List of finishes and sample graphics, including custom artwork and custom graphics per device, if applicable.

H. Spare Parts List: List of parts inventory to reflect manufacturer recommended service and maintenance of the work.

I. Samples:

1. Case, enclosure, and closure finishes for selection by Project Director/COR with input from OBO/PDCS/DE/AD.
2. Viewing surface material: 150 by 150 mm minimum size.

J. Manufacturer's installation instructions.

K. Operations and Maintenance Data: Include manufacturer's operation, maintenance, and cleaning instructions.

L. Field Quality Control Report.

1. Prepare spreadsheet-type of report documenting results of device checkout. List every device and circuit by function.

1.5 QUALITY ASSURANCE

A. Manufacturer qualifications: Firm with five years minimum of successful experience manufacturing electric projection screens and/or lifts.

B. Motors for electric screens and lifts shall be certified by Underwriters Laboratory (UL), Inc. and shall bear UL label.

C. Screens and lifts recessed and installed in return air ceiling plenums shall be certified by Underwriters Laboratory (UL), Inc. and shall bear UL label.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver projection-screen cases, frames, lift enclosures, and lifts to project site after building is enclosed and construction in rooms where devices will be installed is substantially complete.

B. Screen rollers and surface material shall be stored in protected “clean conditions” until ready for installation.

C. Deliver screens in manufacturer's undamaged, labeled packaging.

PART 2 - PRODUCTS

2.1 GENERAL ELECTRICAL REQUIREMENTS

A. Motors: 120 Volt 60 Hz; or 240 Volt, 50 Hz, Single-Phase fully insulated and grounded three-wire.

1. Equip with noise silencer, automatic thermal overload protection, integral gears, capacitor, and electric brake to prevent coasting.

B. Limit Switches: Pre-set, adjustable switches to automatically stop viewing surface or case closure door (as applicable) in up or down positions.

C. Low Voltage Controllers: 12-24 V DC contact closure, mounted to or within case. Provide low-voltage three-button Decora-style switch with single-gang cover plate.

2.2 MOTORIZED ELECTRIC PROJECTION SCREENS – RECESSED CEILING MOUNTS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include but are not limited to the following:

1. Da-Lite.
2. Stewart Filmscreen.
3. Draper, Inc.

B. Configuration as indicated on Construction Drawings.

C. Assembly: Motorized projections screen shall be complete and include case, roller/motor assembly, screen material, low-voltage controller, and switch.

D. Screen Materials:

1. Matte White: Flame-retardant, mildew-resistant, vinyl screen that can be rolled and can be cleaned with mild soap-and-water solution. Provide screen material with opaque black backing. Screen surface shall be unity-gain matte white and have black masking border.

a. Gain: 1.0.
b. Viewing Angle: 50 degrees.
c. Screen Aspect Ratio: 16:9 (1.778:1).

2. High-Gain White: Flame-retardant, mildew-resistant, vinyl screen that can be rolled, and can be cleaned with mild soap-and-water solution. Provide screen material with opaque black backing. Screen surface shall be high-gain pearlescent white and have black masking border.

a. Gain: 1.5.
b. Viewing Angle: 35 degrees.
c. Screen Aspect Ratio: 16:9 (1.778:1).

E. Housing and Finish:

1. House screen in extruded aluminum or formed sheet-steel case, ceiling-recessed, with end-bracket flanges for mounting on threaded rods.
2. Case: Plenum rated.
3. Screen Roller: Electrically operated, permanently mounted screen material.
4. Screen Finish: White or matte-black power coat in accordance with Construction Documents, or if not addressed there, as selected by Project Director/COR.

F. Screen Tensioning System: Adjustable tab-guide cable system to maintain even lateral tension and to hold viewing surface flat.

2.3 MOTORIZED, ELECTRIC PROJECTION SCREENS – SURFACE MOUNTS

A. Available Manufacturers. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include but are not limited to the following:

1. Da-Lite.
2. Stewart Filmscreen.
3. Draper, Inc.

B. Configuration as indicated on Construction Drawings.

C. Assembly: Motorized projection screens shall be complete and include case, roller/motor assembly, screen material, low-voltage controller, and switch. Provide screens with mounting brackets and hardware to allow mounting to vertical surfaces, rigid and suspended ceiling types.

D. Screen Materials:

1. Matte White: Flame-retardant, mildew-resistant, vinyl screen that can be rolled, and can be cleaned with mild soap-and-water solution. Provide screen material provided with opaque black backing. Screen surface shall be unity-gain matte white and have black masking border.

a. Gain: 1.0.
b. Viewing Angle: 50 degrees.
c. Screen Aspect Ratio: 16:9 (1.778:1).

2. High-Gain White: Flame-retardant, mildew-resistant, vinyl screen that can be rolled, and can be cleaned with mild soap-and-water solution. Provide screen material with opaque black backing. Screen surface shall be high-gain pearlescent white and have black masking border.

a. Gain: 1.5.
b. Viewing Angle: 35 degrees.
c. Screen Aspect Ratio: 16:9 (1.778:1).

E. Housing and Finish:

1. House screen in extruded aluminum or formed and rounded sheet-steel case.
2. Screen Roller: Electrically operated, permanently mounted screen material.
3. Screen Finish: White or matte-black power coat in accordance with Construction Documents, or if not addressed there, as selected by Project Director/COR.

F. Screen Tensioning System: Adjustable, tab-guide cable system to maintain even lateral tension and to hold viewing surface flat.

2.4 FIXED-PROJECTION SCREENS – SURFACE MOUNTS

A. Available Manufacturers. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Da-Lite.
2. Stewart Filmscreen.
3. Draper, Inc.

B. Configuration as indicated on Construction Drawings.

C. Type: Permanently tensioned projection screens fabricated by attaching viewing surface taut to perimeter frame for permanent wall installation.

D. Frame: Fabricated from 38-mm-square aluminum tube and equipped with snaps at 150 mm on center.

E. Provide L-shaped, wall-mounting brackets and frame projects 57 mm from wall.

F. Construction: Reinforce viewing surface with black webbing on four sides and snaps to fit base frame. Wrap viewing surface around to conceal frame and attach to rear side. Conceal webbing behind frame.

G. Screen Materials:

1. Matte White: Flame-retardant, mildew-resistant, vinyl screen that can be rolled, and can be cleaned with mild soap-and-water solution. Provide screen material with opaque black backing. Screen surface shall be unity-gain matte white and have black masking border.

a. Gain: 1.0.
b. Viewing Angle: 50 degrees.
c. Screen Aspect Ratio: 16:9 (1.778:1).

2. High-Gain White: Flame-retardant, mildew-resistant, vinyl screen that can be rolled, and can be cleaned with mild soap and water solution. Provide screen material with opaque black backing. Screen surface shall be high-gain pearlescent white and have black masking border.

   a. Gain: 1.5.
   b. Viewing Angle: 35 degrees.
   c. Screen Aspect Ratio: 16:9 (1.778:1).

2.5 MOTORIZED PROJECTOR LIFTS

A. Available Manufacturers. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   1. SVS Lifts.
   2. Display Devices.
   3. rp Visual Solutions.
   4. Audipack Verkoop B.V.

B. Configuration as indicated on Construction Drawings.

C. Assembly: Complete and include frame, enclosure, closure, roller/motor/scissors assembly, mount, low-voltage controller, and switch. Lift-lowering mechanism shall include wire way for management and protection of cables feeding down to projector. Provide lift with mounting brackets and hardware to allow mounting to deck above, to allow trim and closure materials to match, and to allow flush mounting in rigid and suspended ceiling types.

D. Screen Materials:

   1. Lifts for Large Projectors (Greater than 12,000 Lumen):

      a. Maximum weight capacity of up to 300 kilograms.
      b. Maximum lowering distance of 6850 millimeters (sized to allow projector to lower to within 1200 mm).
      c. Provide three positions, with adjustable, field programmable limits for the following positions:

         1) Storage: Flush in ceiling.
         2) Show: Projector in use.
         3) Service: Lowered to allow maintenance at maximum of 1200 mm AFF.

   2. Lifts for Small and Mid-Sized Projectors (Less than 12,000 Lumen):

      a. Maximum weight capacity of up to 180 kg.
      b. Maximum lowering distance of 3000 mm.

c. Provide three positions, with adjustable, field programmable limits for the following positions:

1) Storage: Flush in ceiling.
2) Show: Projector in use.
3) Service: Lowered to allow maintenance at maximum of 1200 mm AFF.

E. Housing and Finish:

1. House lift sheet-metal enclosure shall match lift size and model.
2. Enclosure Finish: Matte black to obscure view of interior.

F. Closure Panel:

1. Ceiling closure shall include outside and inside trim, Closure trim and support shall include fine adjustment to ensure flush appearance with surrounding trim and ceiling. Closure panel and trim shall be of type and finish in accordance with Construction Documents, or if not addressed there, as selected by Project Director/COR.as approved by the architect and consultant.

G. Lift shall have mechanism that locks lowering drum in position when lift is in position.

H. Lift shall maintain projector in stable, fixed position when in use, with negligible lateral movement or “sway.” Lift shall be rated for installation in seismic environments where applicable to location.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Installation of screen rollers and material rear-projection screen substrates shall not take place until spaces where devices will be installed are substantially complete and determined by Project Director/COR to be under “clean condition.”

3.2 INSTALLATION

A. Mounting Heights:

1. Coordinate the locations of screens and lifts with Construction Drawings and schedules.
2. Coordinate locations and mounting heights of junction boxes and outlet boxes, specified in Division 26 Section, with Construction Drawings.

B. Install all screens, screen enclosures and frames and lifts plumb.

C. For recessed front projection screens, coordinate:

1. Screen size.
2. Mounted depth.
3. Required edge tolerances with construction of wall recesses to house screens.
4. Requirements for blocking and structural supports to ensure adequate installation of screens.

D. Install in manner to facilitate adequate ventilation and maintenance access. Install electric screens and lifts to allow access to motors and control interface units.

3.3 PROJECTOR LIFT CABLING

A. Train and lace cables in a workman-like manner.

B. Provide service loops for each cable and cable bundle at each termination endpoint within lift enclosure and at projector. Install cable lengths sufficient to allow projector to be lowered to service position, while maintaining service loops and bend radii.

C. Secure cables within lift cable management devices. Install cables in manner that bend radium limits are not exceeded and cabling is protected from damage by lift scissors mechanisms.

D. Terminate cabling within lift enclosure with common connectivity to allow easy replacement of lift cabling without need to pull new cabling through ceiling space or ceiling raceway.

3.4 CABLE SEPARATION

A. Maintain separation of cable groups for runs greater than 7.5 meters.

B. Maintain separation of 300 millimeters from AC circuits.

3.5 WIRE TERMINATION

A. Acceptable wire termination means include the following:

1. Solder connections: For connectors utilizing solder cups.
2. Terminal-strip connectors: For termination of blunt cut cables, tin cable prior to termination.
3. Multi-pin connectors: Utilize connector manufacturer’s crimper.
4. Crimp cap terminations: Utilize the correct sized fork spade connector; part of the connector shall not be cut off or bent.
5. Strip terminations for signal extension: Utilize the correct sized fork spade connector; part of the connector shall not be cut off or bent.

3.6 FIELD QUALITY CONTROL

A. Contractor shall perform the following quality control activities prior to:

1. Devices are secured to structure, free from lateral movement and sway, and are supported as required by Code.
2. Motorized device limits are set for up/storage, down/show and service and stop positions (as applicable).
3. Tab tensioning cables are set in accordance with manufacturer instructions and as appropriate for screen drop.
4. Low-voltage interfaces are installed and integrated with controllers/control systems.
5. Screens and screen frames are installed level and plumb, are trimmed, and are free of scratches, blemishes and are cleaned.
6. Connections are tight, correctly soldered and correctly crimped.
7. Required labels are correct and in place.
8. Dust and construction debris have been removed from facility and from inside of enclosures.
9. Electronic devices have been correctly grounded.
10. Prior to energizing any electronic devices, test each and every AC circuit associated with systems with voltmeter and circuit checker to assure that voltage is correct and that hot, neutral, and ground conductors have been correctly connected.

3.7 SYSTEM ACCEPTANCE

A. Refer to Section 274100 “Audiovisual Systems General Requirements” for system acceptance of overall audiovisual system.

B. Contractor shall have copy of Field Quality Control Report available on site at time of USG representative system acceptance. See Articles on SUBMITTALS and on FIELD QUALITY REPORT.

END OF SECTION 274117

SECTION 275105 – AUDIO SYSTEMS FOR CONSULAR SERVICES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes audio communications systems for consular services, including intercommunications systems for consular teller window stations, and paging system for general consular waiting area and associated waiting area outside of building.

B. Related Sections:

1. Division 26 Section on raceways and boxes for conduit installed outside of building.
2. Section 270526 “Grounding and Bonding for Communications Systems.”
3. Section 275124 “General-Use Teller Window Intercommunications Systems” for teller window intercommunications at locations not associated with Consular Waiting Area. Those intercoms are not related to the work of this Section.
4. Section 275405 “Consular Queue Management System Infrastructure and Displays” for interfacing queue management system.
5. Other Division 26 and Division 27 sections for conduits, wire ways, connection boxes, pull boxes, junction boxes, electrical breaker panels required to power audiovisual systems, and outlet boxes permanently installed in walls, floors, and ceilings.

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to these references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

B. American National Standards Institute/ Audiovisual and Integrated Experience Association (ANSI/AVIXA (formerly INFOCOMM)):

1. ANSI/AVIXA: A102.1:2022 "Measurement and Classification of Audio Coverage Uniformity in Listener Areas"
2. ANSI/AVIXA: D104.01:2023 "Documentation Requirements for Audiovisual Systems"

1.3 FUNCTIONAL DESCRIPTION OF SYSTEM

A. General:

1. The intent is to provide a fully operational system with voice amplification to facilitate communication by both teller and applicant at each Consular Teller Window without requiring each to raise their voices, and to provide a clear audio experience of paging system for applicants in interior and exterior general consular waiting areas.

B. Audio Systems:

1. Audio Digital signal processor (DSP): Provides echo cancellation and audio processing for full duplex teller window communications, as well as in consular office and public area paging system. DSP shall include masking sound generator and filter set to allow producing and adjusting masking sound on Applicant side of Teller window as specified in this Section.
2. Audio speaker for teller side: Provide in-wall speaker or recessed-ceiling-mounted speaker as indicated on Drawings.
3. Audio speaker for applicant side: Provide in-wall speakers within each side wall or recessed ceiling-mounted speaker, as indicated on Drawings.
4. Teller Microphone: Provide 457 mm (18”) gooseneck tabletop microphone. Provide base with mute button for microphone and headset plug-in jack; coordinate with control panel.
5. Applicant boundary zone microphone: Provide wall mounted on public side with mounting to single gang wall plate. Place microphone to provide direct coverage of teller window glass surface to ensure adequate discrimination between applicant voice and waiting area noise.
6. Provide amplification for audio speakers at each teller window.
7. Waiting Area Loudspeakers: Place loudspeakers to serve paging zones in consular waiting area and in associated outdoor waiting area. Speaker indoor coverage shall conform to ANSI/AVIXA: A102.1:2022 "Measurement and Classification of Audio Coverage Uniformity in Listener Areas."
8. Produce volume-controlled masking sound through speakers on Applicant side.
9. Connections and Configurations:

    a. Provide connections and configuration to facilitate connection of headset by teller at A/V control panel. These connections shall be wired in standard fashion to facilitate use of commercial off-the-shelf (COTS) 4 or 5 pin XLR headphones with microphone boom.
    b. To facilitate paging announcements from queuing system processor, provide audio interface with consular queuing system; see Section 275405 “Consular Queue Management System Infrastructure and Displays.”

C. Remote Control Systems:

1. Provide integrated control system for control teller and public areas.

    a. Provide controls on teller-side countertop at each teller window location.
    b. A/V Control Panel: Provide paging and muting control, with limited volume, for teller via A/V control panel. Control functions shall include the following:

1) Display number of window being controlled.
2) Provide "Officer Microphone" volume control. This controls volume and muting of teller's speech being heard by applicant. Provide indicator that displays relative position of volume. Limit range to prevent excessive loudness and feedback.
3) Provide "Applicant Microphone" volume control. This controls volume and muting of teller's speech being heard by applicant. Provide indicator that displays relative position of volume. Limit range to prevent excessive loudness and feedback.
4) Provide "Mute" button on teller microphones. When this button is pushed, only the officer microphone is muted. When button is pushed again, microphone shall become operational again. Include visible indicator on teller microphone of mute status.
5) Provide "Mute" button on applicant microphones. When this button is pushed, only the applicant microphone is muted. When button is pushed again, microphone shall become operational again. Include visible indicator on teller microphone of mute status.
6) Provide "Mute All" button on A/V control panel and/or on microphone base unit. When this button is pushed, officer and applicant microphones shall be muted.
7) Provide "Paging Waiting Room" button. When this button is pushed, officer's microphone shall be routed the speakers in the waiting area for public announcements. The button should indicate that paging at this window is active. Control system should only allow for paging from one window at a time.
8) Number of programmed paging zones shall be as determined by Project Director/COR as indicated or based upon input from OBO/PDCS/DE/EE/CBT, and labeling nomenclature shall be provided for zones.

D. Network:

1. Device control and digital audio networks (see the Part 2 Article on DIGITAL AUDIO NETWORK COMPONENTS) shall be distributed separately from building network.
2. Use of intra-building optical fiber is indicated on Drawings, or if not, shall be coordinated with Project Director/COR based upon input from OBO/PDCS/DE/EE/CBT.
3. Digital audio networks shall link each audio processor frames to facilitate paging functions and interconnectivity.
4. Provide network switched to support digital audio network device connections.

1.4 SYSTEM PERFORMANCE REQUIREMENTS

A. General:

1. Provide equipment, components, software, accessories, and miscellaneous items necessary to achieve fully functioning audio systems for consular teller intercoms and consular paging.
2. System design shall conform to ANSI/AVIXA: D104.01:2023 "Documentation Requirements for Audiovisual Systems."

B. Audio Performance Characteristics:

1. Frequency Response: 30 Hz – 18 KHz, within 3.0 db
2. Signal to Noise Ratio: 55 dB minimum
3. Total Harmonic Distortion: 1 percent maximum from 30 Hz-15 Hz (THD)

C. Audio Intelligibility:

1. Consular intercom and paging systems shall achieve minimum performance for Speech Transmission Index (STI) exceeding the level of "Fair" quality (i.e., the STI level meets or exceeds 0.60 STI) identified in International Standard IEC 60286-16 (2003-05), "Objective Rating of Speech Intelligibility by Speech Transmission Index."
2. White noise or spoken word source within Consular Waiting Room shall be set to 65 dBA at 1M to simulate conversation level within Consular Waiting Room.
3. Noise source shall be positioned to emulate waiting applicants.

D. Paging Zone Amplifier Load: Provide 70V amplification for paging zones. Total of loudspeaker load presented to amplifier shall not exceed 80 percent of amplifier's wattage capacity.

E. Audio Video Bridging (AVB):

1. Transport: Conform to IEEE 802.1.

F. Dante audio

1. UDP PTPv1

G. [Seismic Performance: Equipment frames shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified.]

1.5 SUBMITTALS

A. Product Data: Manufacturer's product information and data sheets for all equipment items. Products and options selected in data sheets shall be clearly identified. Data sheets without identification of selections may be rejected.

B. Coordinate timing and content of submittals with those for Section 275405 "Consular Queue Management System Infrastructure and Displays" for output of paging and input for queueing system.

C. Shop Drawings: Signed and sealed by a qualified professional engineer. Complete system shop drawings depicting the following information:

1. All point-to-point wiring single-line diagrams, equipment interconnections, component values and showing complete letter and number identification of all wire and cable as well as jacks, terminals and connectors.
2. All panels, plates, and designation strips, including details relating to terminology, engraving, finish, and color.
3. Complete set of remote touch panel layouts, and brief functional description of programming depicting each button and it's description and function
4. All equipment modifications.
5. Cabling run sheets and field wiring details.
6. Wire specifications and assignment by use.
7. Elevation drawings of each equipment rack.
8. Complete and detailed schematic drawing including all items of equipment, and mounting heights.

D. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of items involved:

1. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

E. [Manufacturer Seismic Qualification Certification: Submit certification that central control cabinets, accessories, and components will withstand seismic forces applicable to the Project. Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.]

F. Qualification Data for Consular AV Installer:

1. Identify three similar projects of the same or greater magnitude and scope within last five years. Include statement that Consular A/V Installer was actively involved in those projects. Provide current contact names and telephone numbers, as well as job description.
2. Identify project team for Consular A/V Installer, including resumes demonstrating history with similar projects of similar or greater magnitude and scope.

3. Certificates: Factory-training certificates for Installers that correspond to work for this project.
4. Factory-trained and certified engineer for DSP Software and control product for product lines included in this project, including for training and service. Submit certificates and credentials.

G. Field quality-control test reports.

H. Closeout Submittals: At completion of installation, provide the following information:

1. Equipment inventory listing manufacturer, model number and serial number for all equipment items furnished.
2. Record drawings for each system installation, showing all equipment items, interconnection of equipment and all cable label designations.
3. Teller-Side User Guide: In addition to laminated guides identified in Article on IDENTIFICATION AND INSTRUCTIONS, provide editable version to facilitate updates to guides.
4. Functional Block Drawing: Identify all input and output circuit cable and terminal block numbers as well as all jack field circuit I.D. designations. Drawing shall be in readable logical format that is understandable to both technical and non-technical staff.

   a. Provide separate copy of this drawing; place under clear acrylic sheet, and mount on inner surface of A/V equipment rack door.

5. Un-complied DSP, Control processor and control touch panel code files
6. Hardware log in information (Admin passwords)

I. Operation and Maintenance Data: For intercommunication system to include in emergency, operation, and maintenance manuals. Provide hardcopy manual and electronic version.

1. The Operation section shall describe all typical procedures necessary to activate each system to provide for functional requirements as listed in this section.
2. The Maintenance section shall provide recommended maintenance schedule with reference to applicable pages in manufacturer's maintenance manuals. Where manufacturer provides inadequate information, Consular A/V Installer shall provide information necessary for proper maintenance.
3. Submit replacement parts lists in support of all items of equipment, either stock manufactured item or custom built.
4. Submit data on same electronic storage as with programming code and software for system.

1.6 OWNERSHIP OF PROPRIETARY MATERIAL

A. Government retains all rights to software and passwords used for this project.

B. Government will sign copy of manufacturer's standard software and firmware licensing agreement as condition of this contract. Such license shall grant use of all programs and application software to Government as defined by manufacturer's license agreement, but shall protect manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. Licensing agreement shall not preclude use of software by individuals under contract to Government for commissioning, servicing, or altering system in future. Use of software by individuals under contract to Government will be restricted to use on Government's computers, and only for purpose of commissioning, servicing, or altering installed system.

D. All project developed software, files and documentation shall become property of Government.

1.7 QUALITY ASSURANCE

A. Delegated Design Responsibility: Contractor shall retain Manufacturer's authorized representative. Representative shall possess the following qualifications:

1. Be trained and approved for design and installation of systems required for this Project.
2. Be Certified Technology Specialists (CTS-D).
3. Have minimum 10 years industry experience with design of similar systems with complex performance requirements.
4. Be acceptable to the Project Director/COR to perform responsibilities of Delegated Design for this Work.

B. Consular AV Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project and are Certified Technology Specialists (CTS and CTS-D), with minimum 10 years industry experience.

C. Qualification for Engineers for DSP Software and Control Products: Manufacturer-certified and factory-trained for product line training, software programming, and service.

D. Independent Testing Agency Qualifications: Testing agency that is member company of InterNational Electrical Testing Association (NETA), and that is acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE.

1. Testing Agency's Field Supervisor: Person currently certified by NETA or National Institute for Certification in Engineering Technologies (NICET) to supervise on-site testing specified in this Section.

E. Comply with the OBO Electrical Code; see Section 270508 "Common Work Results for Telecommunications."

F. Comply with National Fire Alarm and Signaling Code (NFPA 72).

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver equipment in fully enclosed vehicles after specified environmental conditions have been permanently established in spaces where equipment is to be placed.

B. Store equipment in spaces with environments controlled within manufacturers' ambient temperature and humidity tolerances for non-operating equipment.

1.9 COORDINATION

A. Coordinate layout and installation of ceiling-mounted speakers (if used) with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.10 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date for a period of one calendar year provide system maintenance service based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. In addition to the initial year of maintenance service, provide a proposal for a renewable option year. The option year proposal shall be submitted 60 days prior to the end of the initial maintenance contract period.

B. Maintenance service shall be performed by Consular A/V Installer, and shall inclusive of:

1. Telephone Assistance: Consular A/V Installer shall respond via telephone within one business day of notification. This first contact will be to outline nature of problem or functional anomaly. Consular A/V Installer shall make available an individual knowledgeable with installed system that can address specific system issues described by system operators.
2. On-Site Repair Assistance: Consular A/V Installer shall be available to provide capable technicians for on-site service of systems equipment or control software. Technicians dispatched shall be familiar with installed system with complete knowledge of products used in systems configuration. Technicians dispatched shall have complete ability to address nature of system anomaly or performance difficulty described. Provide on-site response within one week. Service shall be available during normal business hours of the facility, Monday through Friday, 8:00 am until 5:30 pm.
3. Consular A/V Installer shall provide two scheduled service visits to inspect, maintain, and adjust systems during each year of service. First visit shall occur approximately six months after installation, and subsequent visits shall occur near end of each six month period of the service.

    a. Adjustment: During first scheduled service visit provide on-site assistance in adjusting system to suit actual occupied conditions. Refer to Part 3 requirements for START-UP SERVICE in relation to initial adjustment prior to operation.

PART 2 - PRODUCTS

2.1 GENERAL

A. System manufacturer shall furnish all equipment. In addition, manufacturer shall furnish all accessory components to this system that are not identified in the Summary Article in RELATED SECTIONS.

2.2 AUDIO EQUIPMENT

A. Audio dynamic sound processor (DSP):

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products that may be incorporated into the Work include but are not limited to the following:

a. Biamp

B. Consular Side Speakers:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products that may be incorporated into the Work include but are not limited to the following:

a. Tannoy
b. JBL
c. Electro-Voice
d. Biamp
e. QSC

2. Speakers may be either recessed ceiling or surface mounted depending on ceiling architecture at the interview window.

C. Applicant Side Speakers:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products may be incorporated into the Work include but are not limited to the following:

a. Tannoy.
b. JBL,
c. Electro-Voice,
d. QSC
e. Biamp
f. Radio Design Labs (RDL)

D. Audio Amplifier: Provide amplification for speakers at each teller window.

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products may be incorporated into the Work include, but are not limited to, the following:

a. Biamp
b. QSC

E. Teller Gooseneck Microphone:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products may be incorporated into the Work include but are not limited to the following:

a. Audiotechnica
b. Clock Audio
c. Shure

F. Applicant Microphone:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products that may be incorporated into the Work include but are not limited to the following:

a. Crown
b. Audix
c. Clock Audio (CU-C012-RF-CP series)

G. Audio Connections:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products that be incorporated into the Work include but are not limited to the following:

a. Brahler
b. DIS

H. Waiting Area Speakers:

1. 70 V speaker distribution with volume control over entire coverage area on each speaker.

I. Teller headset:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products may be incorporated into the Work include but are not limited to the following:

a. Shure
b. Audio-Technica

2.3 REMOTE CONTROL SYSTEMS

A. A/V Function Control System:

1. Acceptable Manufacturers: Subject to compliance with functional description of system and other requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Creston
b. Biamp

2.4 DIGITAL AUDIO NETWORK COMPONENTS

A. Provide network connections: AVB, Dante, or approved equal.

B. Provide network switches to support digital audio network device connections.

2.5 MISCELLANEOUS EQUIPMENT

A. Consular Audio Equipment Rack: Provide racks for rack-mounted consular audio equipment. Included rack-mounted shelves for equipment which is not rack-mounted. Provide associated wire management.

B. AC Power Conditioning for Equipment Rack:

1. Provide power devices based upon host country power standards.

C. AC Power Uninterruptible Power Supply (UPS): Provide for all audio signal processor and control system equipment. Size to operate paging and intercom for minimum of 10 minutes.

D. Cables: The following represents Basis of Design unless indicated otherwise on Drawings:

1. Type 1: West Penn D25921 Audio (Mic/Line shielded plenum).
2. Type 2: West Penn D25924 Audio (for 16- and 8-ohm speakers shielded plenum).
3. Type 3: West Penn D25923 Audio (70-V speakers shielded plenum).
4. Type 4: West Penn D254246 Category 6.
5. Type 5: West Penn D25291 RS-232 Distribution.
6. Type 7: West Penn 254245 Category 6.

E. Connection Plate Receptacles: Unless otherwise detailed, provide the following types of panel receptacles on connection boxes, panels, plates, and wire ways:

1. Audio (microphone or line level): XLR or RJ45 type.
2. Audio (headset): XLR type
3. Network: RJ45 (8P8C) type.

2.6 SOFTWARE

A. Provide all programming and configuration necessary to provide a complete and working system conforming to functional and performance requirements identified in this Section.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Installation includes setting in place, fastening to walls, floors, ceilings, counters, or other structures where required, interconnecting wiring of system components, equipment alignment and adjustment, and other work whether or not expressly required herein which is necessary to result in complete operational systems.
2. Installation shall be performed by installers authorized by Manufacturers.
3. Installation shall provide system which conforms to functional and performance requirements of this Section.

B. Physical Installation:

1. Firmly secure equipment in place unless requirements of portability dictate otherwise.
2. Secure with fasteners adequate to support load from system with safety factor of at least three times total load.
3. Secure boxes, equipment, and similar components plumb and square.
4. Install equipment and cable in manner that facilitates operational efficiency and overall aesthetic factors.

C. Teller/Applicant Speakers: Refer to Drawings for mounting type.

1. Ceiling-Mounted Speakers: Speakers shall be ceiling-recessed. Center ceiling-mounted speakers over teller and applicant, as applicable.
2. Wall-Mounted Speakers: Place at or above height of teller window assembly, as indicated on Drawings. Provide adjustable mount to facilitate satisfying audio performance requirements. Refer to Drawings as to whether speakers are recessed or surface mounted.

D. Cable Installation:

1. Mark cables, regardless of length, with wrap-around number or letter cable markers at both ends. There shall be no unmarked cables at any place in the system. Marking codes used on cables shall correspond to codes shown on drawings or wire run sheets.

2. Neatly strap, dress, and adequately support inter-rack cabling.
3. Group cables according to signals being carried. To reduce signal contamination, form separate groups for the following cables:

    a. Power cables.
    b. Control, data cables, and Cat 6 UTP.
    c. Audio cables carrying signals less than -20 dBm.
    d. Audio cables carrying signals between -20 dBm and +20 dBm.
    e. Audio cables carrying signals above +20 dBm.

4. Do not allow audio cables to run in same raceway as video, computer video or power cables.
5. As general practice, run power cables, control cables, and high level cables on left side of equipment rack as viewed from rear. Run other cables on right side of equipment rack, as viewed from rear.
6. Cut cables to length dictated by run. Splices in pull boxes are not permitted without prior permission of Project Director/COR. For equipment mounted in drawers or on slides, provide interconnecting cables with service loop of appropriate length.
7. Do not install cable with bend radius less than that recommended by cable manufacturer.
8. Install cable in 50 mm below-grade conduit from Consular equipment room to locations of paging devices in outdoor Consular waiting area. See Division 26 section on raceways and boxes for installation of conduit outside of building.

3.2 GROUNDING

A. Procedures: To minimize problems resulting from improper grounding and to achieve maximum signal-to-noise ratios, adhere to the following:

1. General: Because of great number of possible variations in grounding systems, it is the responsibility of Contractor to follow practices below, and to deviate from these practices only when necessary to minimize cross talk and to maximize signal-to-noise ratios in the audio, video, and control systems. See Section 270526 “Grounding and Bonding for Communications Systems” for general requirements.
2. Install secondary system grounding conductors from all racks, audio consoles, and ungrounded audio equipment in each area to primary system grounding point for area
3. Do not use AC neutral conductor, either in power panel or in receptacle outlet, be used for system ground; no exceptions are permitted.
4. Audio Cable Shields: Ground audio cable shields at one point only; no exceptions are permitted. For inter and intra-rack wiring, shield be connected at one end only. For ungrounded portable equipment, such as microphones, connect shield at both ends but grounded at only one end.
5. Speaker Cable Shields: Ground all speaker cable shields at rack enclosure and bond to technical ground.

3.3 SYSTEM PROGRAMMING

A. Programming: Fully brief COR and OBO/PDCS/DE/EE/CBT on available programming options. Record COR's decisions and set up initial system program. Prepare a written record of decisions, implementation methodology, and final results.

1. Create a functional and intuitive GUI (Graphic User Interface) tailored to the specific needs and requirements of the project.
2. Incorporate key features as defined in the project specifications.
3. Provide a beta version of the GUI for review by the PD/COR with input from OBO/PDCS/DE/EE/CBT.
4. Make all necessary GUI revision based on feedback received by Post and OBO/PDCS/DE EE/CBT.
5. Submit the revised GUI for the final approval to Post and OBO/PDCS/DE/EE/CBT.
6. Ensure all issues or concerns raised during the review are addressed prior to the deployment.

3.4 IDENTIFICATION AND INSTRUCTIONS

A. Associated A/V Equipment Room: Provide wall-mounted, full-size system diagrams to facilitate system setup and troubleshooting. Mount diagrams under clear plastic for protection.

B. Teller-Side Window Station: Provide simplified user guide for tellers. Laminate each guide for durability.

3.5 FIELD QUALITY CONTROL

A. Contractor System Checkout: Before Acceptance Tests are scheduled, Consular A/V Installer shall perform their own system checkout as quality control procedure. They shall furnish all required test equipment and perform all steps necessary to determine performance of system to conform to requirements of this Section. This work shall include the following:

1. Checkout procedures shall be consistent with test standards identified under requirements for “System Acceptance Tests” below.
2. Test all audio and related systems for comply with System Performance Requirements.
3. Check all control functions, from controlling devices to controlled devices, for proper operation.
4. Perform preliminary adjusting, balancing, and alignment of system equipment for optimum quality and for conformance with manufacturer’s published specifications. Establish and mark normal settings for all level controls and record these settings in “Operation and Maintenance Data” submittal.
5. Maintain documentation on-site of all performance tests for reference by Project Director/COR and representative of independent testing agency during System Acceptance Tests.

B. Systems Acceptance Tests:

1. Contractor shall engage independent testing agency to perform tests identified below. System Acceptance Tests shall not be performed until Contractor's System Checkout has been completed. Project Director/COR or their representative may monitor System Acceptance Tests. These tests shall consist of the following:

    a. Testing Standards: International Standard IEC 60268-16, as identified in Article on SYSTEM PERFORMANCE REQUIREMENTS.
    b. Testing Equipment: Contractor is responsible for supplying test equipment required to perform tests.
    c. Two complete hardcopy sets of record drawings, run sheets, manuals, and other required pre-testing construction submittals shall be on on-site, delivered to Project Director/COR prior to scheduling of Acceptance Tests.
    d. Prior to commencing testing, Contractor shall perform physical inventory of installed equipment and components on site to confirm sufficient presence of items necessary to obtain acceptable test results.
    e. Consular A/V Installer shall demonstrate operation of all system equipment.
    f. Subjective and objective tests shall be performed to determine compliance with requirements of this Section. Confirm that sampling of 25 percent of teller windows and paging zones achieve required minimum STI.
    g. If further adjustment is required to conform to project requirements, or if equipment is defective and requires repair or replacement, tests may be suspended or continued at discretion of Project Director/COR. Acceptance testing shall then be continued once Consular A/V Installer has identified readiness of system. Costs associated with suspension of testing, including additional costs for testing representatives of Project Director/COR, are responsibility of Contractor.

2. Performance of test audio signal paths for Performance Standards Tests shall include, as an example but not limited to, the following:

    a. Audio:

        1) Communication of each teller window station. Test of levels shall include echo cancellation check.
        2) Paging capabilities from each teller window station.
        3) Monitoring station capabilities.
        4) Testing shall be from all source inputs (e.g., microphones, audio tape units) through all (e.g., mixers, ADA's, switchers) to all signal destinations.
        5) Test all switches, sound levels, and overall intelligibility.
        6) Test and adjust, as necessary, masking sound spectrum and levels at Teller window Applicant side at position of Applicant 1.5M (5 feet) above finished floor. Submit report of final spectrum and overall levels at each window and compare with levels required in the Part 1 Article on SYSTEM PERFORMANCE REQUIREMENTS.

7) Delineation of above signal paths does not exempt Contractor from responsibility of checking all paths and outlets for appropriate compliance with the Part 1 Article on SYSTEM PERFORMANCE REQUIREMENTS during prior Contractor System Checkout.
8) During Acceptance Testing, all equipment shall be operated under standard conditions recommended by manufacturer.

b. Control:

1) Audio volume, include inbound and outbound levels.
2) Mute inbound and mute outbound operations.
3) Paging selections.
4) Masking sound adjustment.

c. Miscellaneous:

1) Cable identification markings.
2) Cable routing integrity and neatness.
3) Location of speakers, microphones, and controls.

3.6 CLEANING

A. Upon completion of installation, clean equipment in accordance with manufacturer’s instructions.

3.7 STARTUP SERVICE

A. Engage factory-authorized service representative to perform startup service and initial system programming.

B. Adjust sound levels, resetting transformer taps, and adjusting controls to meet occupancy conditions.

C. Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements.

D. Complete installation and startup checks according to manufacturer's written instructions.

3.8 PROTECTION

A. During installation, and up to date of occupancy, protect finished and unfinished work against damage and loss. In event of such damage or loss, replace or repair such work at no cost to Government.

3.9 DEMONSTRATION

A. Comply with Division 01 Section 017905 "Demonstration and Training" for general requirement of demonstration and training documents.

B. A manufacturer's representative or system-certified instructor shall provide "hands-on" training sessions to individuals identified by Project Director/COR. All training shall take place after audio systems are operational, and after Government-Furnished Government-Installed (GFGI) components and software for Consular Queue Management System is operational; see Section 275405 "Consular Queue Management System Infrastructure and Displays."

1. System User Training:

a. Training Sessions:

1) On-site classroom instruction of 1-hour duration per session, with each session training tellers serving 10 windows. The number of class sessions shall be one for each 10 teller windows.
2) On-site field demonstration sessions of the same individuals that participated in classroom sessions, but on window-by-window basis. Sessions shall be ½-hour duration for each window, with two individuals being trained in each session.

b. Training Content:

1) Operation of teller window control panel, volume level, and paging area selection(s).
2) Microphone use and techniques for best intelligibility.

2. Technical Support Personnel Training; 8-hour session; classroom 2 hours and Field Demonstration 6 hours. The session shall include the following topics:

a. Operation of teller window control panel (conceptual design, configuration and normal use parameters).
b. Microphone use and techniques for best signal to noise ratio.
c. General Care and system maintenance.

END OF SECTION 275105

SECTION 275118 – SOUND MASKING SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Computer/DSP controlled sound masking generators.
2. Amplifiers.
3. Wiring.
4. Masking speaker assemblies.
5. Control and control software.

B. Related Sections include the following:

1. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
2. Section 270508 “Common Work Results for Telecommunications.”
3. Section 270526 “Grounding and Bonding for Communications Systems.”
4. Section 270533 “Identification for Communications System.”
5. Section 271116 “Communications Cabinets and Frames.”
6. Section 271505 “Communications Horizontal Cabling.”
7. Section 275105 “Audio Systems for Consular Services.”

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508.
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508.

1.3 DEFINITIONS

A. Covered Spaces: Spaces above which masking speakers are installed; refer to project Sound Masking system speaker layout drawings.

1.4 SYSTEM DESCRIPTION

A. Permitted Locations: Sound masking system shall be included within General Work Areas (GWA) but is not permitted within private offices or Controlled Access Areas (CAA). Sound masking is required in the Consular Work Area.

B. DSP-controlled sound masking system with individually controllable zones of speakers located above or within the ceiling as shown and indicated on drawings.

C. Support and bracing of loudspeakers suspended from structure above in conformance with OBO Building Code, including provisions for seismic restraint in locations where applicable.

D. Signal Levels: Individually adjustable for each of 14 one-third octave bands centered at 100 through 5000 Hz for sound-masking noise channels.

E. Sound-Pressure Level Produced by System: Match contour in Table 3.4, "Sound Pressure Level Contour," with smooth roll-off below 125 Hz and above 2500 Hz.

1. General overall level shall be as follows:

a. 45 dBA in open plan areas and Consular Teller Windows (Officer Side).
b. 47 dBA in interior Consular Waiting areas.
c. See Section 275105 "Audio Systems for Consular Services" for Consular Teller Windows (Applicant Side).

2. Measurements: Test under calibration conditions as identified in Article on FIELD QUALITY CONTROL.

F. Maximum Local Variance of Sound-Power Level: Overall 3 dBA throughout each open plan areas (away from diffusers or grilles).

G. Sound Quality: No audible hum or noise from this system when sound masking generator is turned off.

1.5 SUBMITTALS

A. Product Data: For each type of product installed. Include U.S. recognized testing laboratory listing data.

B. Shop Drawing: Dimensioned plans and elevations showing minimum clearances and installed features and devices for system components. Show types and locations of masking speakers and their wiring connections, channel and/or primary and secondary hub assignments, and axis orientations. Show ducts, beams, and other significant sound-reflecting and –absorbing elements in ceiling space and show locations of partitions below ceiling. Include a diagram showing

interconnection of major system components for each zone and channel and indicating grounding connections.

1. Wiring Diagrams: For power, signal, and control wiring including all devices.

C. Operation and Maintenance Data: For sound-masking equipment and components, including emergency, operation, and maintenance procedures.

D. Qualification data for firms and persons as required in Article on QUALITY ASSURANCE.

1. Installer.
2. Testing Agency.

E. Field Quality Control Reports: Include field quality control reports and test results for initial tests and inspections and for final acceptance testing.

F. Warranties: Submit two copies conforming to warranty requirements of this Section.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer trained and approved by manufacturer of sound-masking equipment. This installer shall produce shop drawings.

B. Testing Qualifications:

1. An independent agency with the experience and capability to conduct testing of sound-masking systems according to ASTM E 1130. Required experience includes having tested a minimum of five different projects involving sound masking systems within the last five years, each system similar in complexity to Project system.
2. A factory authorized representative.

C. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by qualified testing agency acceptable to Project Director based upon input from OBO/PDCS/DE/EE and marked for intended location and application.

D. Comply with the OBO Electrical Code; see Section 270508 “Common Work Results for Telecommunications.”

E. Comply with UL 813 “Standard for Commercial Audio Equipment” except where more stringent standards are identified in this Section.

1.7 COORDINATION

A. Coordinate quantity and arrangement of speaker assemblies with ceiling space configuration and with components occupying ceiling space such as structural members, pipes, air-distribution components, raceways, cable trays, and recessed lighting fixtures.

1.8 WARRANTY

A. Extended System Warranty: Manufacturer's standard form signed by the manufacturer in which manufacturer agrees to repair or replace system components that fail in materials or workmanship within specified warranty period.

1. Initial One-Year Warranty Period: Manufacturer shall repair or replace system components that fail and must restore operation of system.
2. Extended Warranty Period: Manufacturer shall respond to phone inquiries regarding failure within three days to provide guidance for restoring systems. Where components have failed, manufacturer shall provide replacement component to site within two weeks of inquiry. General adjustments and retuning of the system are not covered during extended warranty period.
3. Failure includes, but is not limited to, inability to generate sound masking, and relates to failure in materials or workmanship.
4. Warranty Period: Five (5) years from date of Substantial Completion.

1.9 EXTRA MATERIALS

A. Furnish the following extra materials that match products installed. Package extra material with protective covering for storage and identified with labels describing contents.

1. Sound-Masking Speaker Assembly Components:

a. Ten speakers.
b. Two primary hubs.
c. Three secondary hubs.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Logison.

2. Lencore Acoustics Corp.
3. Biamp (Cambridge Sound Management).

B. Basis-of-Design Product: The Basis-of-Design is the following system:

1. Biamp.

2.2 CONTROLS

A. Software Control Devices: System shall be controlled by manufacturer-specific software and/or controllers, with individually controlled zoned and/or individual speakers.

B. Control Software:

1. Software shall facilitate control of all adjustments for system, and of individual speakers and zones throughout entire system, from a computer and/or wall controller. Control capabilities shall include:

a. System setup.
b. Sound masking volume and equalization.
c. Report all system settings.
d. Perform network diagnostics for system.
e. Wall mounted controllers located within sound masking space for individual zone controls.

2.3 PRIMARY NETWORK HUB

A. Each Primary Network Hub shall include:

1. DSP-based masking sound generator.
2. An individual 1/3 of an octave, 23-band equalizer for masking.
3. Individual volume control for masking.
4. Network communication components.
5. Audio amplifier.
6. Approximate Dimensions: Diameter 125 mm (5 inches); Height less than 50 mm (2 inches).

2.4 SECONDARY NETWORK HUB

A. Each Secondary Network Hub shall include:

1. Loudspeaker connection.
2. Signal connections to other primary/secondary devices.

3. Approximate Dimensions: Diameter 125 mm (5 inches); Height less than 50 mm (2 inches).

2.5 LOUDSPEAKER ASSEMBLY

A. Each Loudspeaker Assembly shall provide:

1. Biamp speaker shall be Qt Active Emitter; they shall be type that is mounted in ceilings down-firing to occupied space.
2. Other manufacturer speakers shall be cone speaker 100-200 mm (4-8 inches) diameter within insulated housing; assembly shall comply with local codes and regulations.
3. Frequency Response: 100-8000 H +/-6dB.
4. Assembly: Specific to sound masking manufacturer.
5. Connectors: Connection to network devices.
6. A suspension chain as needed for suspension position and tool-less length adjustment clip
7. Acoustically damped enclosure.
8. Tool-less, on-site adjustment of upward/downward loudspeaker orientation in accordance with manufacturer's system design.

2.6 CABLE ASSEMBLIES

A. Assembly: Cable assemblies shall provide power, audio and control signals over a signal cable assembly.

B. Connectors: Over-molded micro-connectors.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Speaker Assemblies: Suspended from structure above.

B. [Install seismic restraints on speakers. Comply with OBO Building Code requirements for seismic-restraint devices associated with the project location.]

C. [Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters and unless otherwise indicated.

1. Except raceways are not required in accessible indoor ceiling spaces and attics.
2. Except raceways are not required in hollow gypsum board partitions.
3. Conceal raceways and wiring except in unfinished spaces.]

D. [Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors.

1. Install plenum cable in environmental air spaces, including plenum ceilings.
2. Comply with requirements in Section 271505 "Communications Horizontal Cabling," including requirements for cable trays.
3. Comply with requirements for raceways and boxes specified in Division 26 Section on raceways and boxes for electrical systems.]

E. Wiring within Assembly Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

F. Exposed Cable: Install parallel to building lines, follow surface contours, and support as recommended by manufacturer.

G. Grounding: As recommended by manufacturer unless more stringent requirements are indicated. Ground equipment and conductors to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments with a maximum of 5-ohm to ground at main equipment location. Measure, record, and report ground resistance.

H. Impedance Matching: For system components, including connecting cable, provide end-to-end level and impedance-matched signal paths. Use matching networks and balancing devices at connection where necessary to avoid mismatches.

I. Splices, Taps, and Terminations: Make splices, taps, and terminations on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.2 SYSTEM CONFIGURATION

A. Software Control Devices: Control Devices shall be as necessary to control individual speakers or zones of speakers.

B. Wall mounted control devices shall be necessary to control individual speakers or zones of speakers.

C. Power Supply:

1. Power network devices and control panels from controller served by a dedicated 20 amp quad outlet.
2. Locate power supplies within 200 feet maximum from speakers, or Power-Over-Ethernet (POE) switches nominal 76M (250 ft) from ceiling-plenum mounted remote-control units.

3.3 IDENTIFICATION

A. Use color-coded conductors and apply sire and cable marking tape to designate wires and cables so media are identified in coordination with system wiring diagrams. Comply with requirements for identification in Section 270533 "Identification for Communications Systems." Use white as coding for sound masking system CAT6 cabling.

B. Label speaker assemblies as to channel, zone, and address.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: During project warranty period, engage a factory-authorized service representative to perform initial inspections and tests identified in the following paragraph, and to adjust components, assemblies, and equipment installations, including connections.

B. Initial Tests and Inspections:

1. Operational Test: Start system to confirm proper operation. Remove malfunctioning units, replace with new units, and retest. Make initial sound-spectrum and –level adjustments for each zone.
2. Test and adjust controls and safeties.
3. Inspection of Proper Identification: Verify that installed units and controls, and installed interconnecting wires and terminals are identified in accordance with Article on IDENTIFICATION.
4. Pretesting: Tune, align, and adjust system and pretest components, wiring, and functions to verify that they comply with specified material, installation, and performance requirements.
5. Masking Sound-Pressure-Level Adjustments: Adjust systems to achieve specified sound levels.
6. Correction and Retest: Replace damaged and malfunctioning controls and equipment. Correct deficiencies and retest until satisfactory performance and conditions are achieved.

C. Final Acceptance Testing: Provide minimum of 30 days' notice to Project Director/COR and OBO/PDCS/DE/EE of acceptance test performance schedule. Schedule tests after pretesting has been successfully completed. This testing shall be performed by the independent testing agency or a factory authorized representative.

1. Tests and Calibration Conditions: Spaces shall be completely furnished but unoccupied; lights and HVAC systems shall be turned on; HVAC system testing and balancing shall be completed; and other sources of background noise such as electronic ballasts, lighting relay panels, and low voltage transformers shall be in installed.
2. Test Conditions: Complying with ASTM E 1130 and calculated according to ANSI S3.5.
3. Instrumentation: Use a professional-quality, sound-level meter with octave-band filters; reference documentation of recent calibration against recognized standards.

4. Record test observations, readings, and corrective actions.
5. System Tests: Include the following for each system zone:

   a. Ambient Sound-Level Tests: With system off, measure ambient sound level in one-third octave bands. Also measure ambient sound level as a single, wide-band, A-weighted reading.
   b. Frequency Response Adjustment and Test: Adjust one-third octave frequency bands and other unit filters to provide response. Adjust to meet requirement of sound spectrum in space. Comply with ANSI S3.2, ASTM E 1110, and Consumer Electronics Association CEA 426 "Loudspeakers, Optimum Amplifier Power."

6. Walk-through Test: People in covered spaces cannot discern speaker locations.

D. Retest: Correct deficiencies identified by tests and observations, and retest until conforming to requirements.

E. Recording Control Settings and System Adjustments: Save final control settings and programming to electronic file for archive by manufacturer's representative and the Government.

F. Acoustical Performance Requirements:

1. Sound-Masking Frequency Spectrum: Spectrum shall conform to shape described in Table 3.4, "Sound Pressure Level Contour" below:

TABLE 3.4

SOUND PRESSURE LEVEL CONTOUR

1/3 Octave Band Center Frequency (Hz - Cycles per Second)	**Sound Pressure Level** (dB re:20microPa)
100	47
125	46
160	45
200	44
250	43
315	41
400	40
500	39
630	37

TABLE 3.4

SOUND PRESSURE LEVEL CONTOUR

1/3 Octave Band Center Frequency (Hz - Cycles per Second)	**Sound Pressure Level** (dB re:20microPa)
800	35
1000	34
1250	31
1600	29
2000	27
2500	25
3150	22
4000	19
5000	16
100-5000 Hz dBA Level	45 dBA

2. Uniformity of Background Sound Coverage: Measure sound pressure level in each octave band from 125 Hertz to 4000 Hertz at each test location. Test locations shall be at least 1200 mm (4 feet) from any large sound reflecting objects (e.g., file cabinets and desks). Overall sound level variances shall be no greater than +/-3 dBA. To improve evenness of coverage, system installer shall perform adjustments such as adjusting loudspeaker transformer taps or gain controls and adding or relocating speakers.
3. If tests show that equipment is in any way defective or at variance with this Section, the system shall be adjusted at no cost to the Government, including expenses associated with subsequent testing required to demonstrate compliance with this Section and Construction Drawings.

G. Measured data of distribution of octave band random noise (center frequencies from 125 Hertz to 4000 Hertz) produced by loudspeakers shall be obtained for various positions within occupied spaces. This data shall be recorded on NC graph sheets.

3.5 DEMONSTRATION

A. Comply with Division 01, Section 017905 "Demonstration and Training" for general requirements of demonstration and training documentation.

B. Engage factory-authorized service representative to train Government O&M personnel to adjust, operate, and maintain the system.

END OF SECTION 275118

SECTION 275124 GENERAL-USE TELLER WINDOW INTERCOMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies intercommunication systems at teller windows other than those at Consular Waiting Area:

B. Related Sections:

1. Section 085652 "Aluminum Security Teller Windows" for coordination with those window units.
2. Other Divisions 26 and 27 sections for conduits, wire ways, connection boxes, pull boxes, junction boxes, and outlet boxes permanently installed in walls, floors, and ceilings, and for interface with panelboards to power each intercom.
3. Section 275105 “Audio Systems for Consular Services” for intercommunication systems serving consular teller windows, and for paging at general interior and exterior consular waiting areas.
4. Section 283325 “TSS Intercommunications Systems” for post security personnel communication with other security personnel, and post security personnel interface for remote access control.

1.2 SYSTEM DESCRIPTION

A. System Elements:

1. Master Station: Element used by personnel providing service or information. Located on “protected side” of FE/BR teller window.
2. Substation: Element used by individuals seeking service or information. Located on “attack side” of FE/BR teller window.

B. System Locations: Provide at the following locations as applicable:

1. Office Main Lobby: MSG interface at chancery or office annex at MSG booth (e.g., Post 1).
2. FM Cashier: FM cashier service with post staff and families within office General Work Area (GWA). Refer to Section 275105 “Audio Systems for Consular Services” for Cashier Booth within Consular Waiting Area.
3. CAC Guard Booths: For MSG interface with individuals seeking information/service at teller windows on the compound perimeter, within the CAC screening area, and with the CAC sallyport (where applicable).
4. Consular CAC Visa Passback: For Consular Affair staff interface with visa applications at compound perimeter.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data.

B. Shop Drawings:

1. Coordinated details for interface with FE/BR teller windows.

C. System Test Performance Confirmation: Provide notification that each system location has been tested in accordance with the Article on FIELD QUALITY CONTROL, and that each system location conforms to the requirements for function and performance identified in this Section.

D. Operations and Maintenance Data.

1.4 QUALITY ASSURANCE

A. Manufacturer and Supplier Qualifications:

1. The term "manufacturer" is defined as a firm regularly engaged in the manufacture and integration of intercommunication system components, of types and ratings specified and indicated, whose products have been in satisfactory use in similar services for not less than five years.

PART 2 - PRODUCTS

2.1 INTERCOMMUNICATIONS SYSTEM

A. Basis-of-Design System: The following system by Aiphone is the basis for design.

1. Master Station: LEM-1
2. Substation:

a. Indoor Units: Contractor’s option of either LE-A or LE-D.
b. Outdoor Units: LE-DA.

B. Components:

1. Master station: Provide desk or surface wall -mounted station with the following minimum features and characteristics:

a. Volume control: Independent regulation of incoming and outgoing calls.
b. Call announcements: Momentary audible signal for incoming calls.
c. Speaker sensitivity: Minimum 40 dB EIA.
d. Hands free operation.
e. Junction box separates from master for easy wiring connections.

2. Substations: Provide with the following minimum features and characteristics:

   a. Hand-free operation with handset. When handset is on hook, built-in speaker and microphone shall be active for hand-free conversation. When handset is off hook, built-in speaker and microphone shall be silent, allowing private conversation between master and remote through handset.
   b. Speaker sensitivity: Minimum 40 dB EIA.
   c. Call announcement: Monitor lamp or recurring momentary tone.
   d. Provide substations located outside of compound perimeter wall with vandal-proof cover.

3. Power supplies: Operate on input electrical service for both 110 volts, single phase, 60 hertz and 220 volts, 50 hertz through remote or built in transformer.
4. Miscellaneous features and requirements:

   a. Provide power switch near master station to turn system on and off.
   b. Provide pilot light at master station to indicate whether the system power is on or off.
   c. Legibly and permanently label equipment to indicate function and status. Label wiring connections and terminals.

5. Wiring:

   a. Master shall include factory wired cable for connection to remote.
   b. Provide 0.65 mm (22-AWG), solid copper/tin, 5-conductors: 1-twisted pair with Mylar shielded and drain wire, and 1-twisted pair without shield, plus an overall jacket, to connect between junction boxes of Masters and Interface Amplifier.
   c. Provide 0.65 mm (22 AWG) solid copper/tin, 3-conductors: 1-twisted pair with Mylar shielded and drain wire and overall jacket, 4.8 mm outside diameter, UL type Class 2, to connect Interface Amplifier and speaker.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install audio circuits ungrounded, except as provided by single-ended amplifier input, and where grounding of unbalanced circuits is required during system tests.

B. Terminate audio cable shields at one end only, at downstream equipment (where program source is considered upstream).

C. Exercise care in wiring to avoid damage to cables and equipment.

D. Where resistors are required to terminate audio circuit, install each resistor at end of line at input to transformer or amplifier.

E. Connections:

1. Make wire joints and connections in system with rosin core solder and small soldering iron, or with approved mechanical connectors. Solder neatly, with no cold solder joints.
2. Make connections to screw type terminals with mechanically connected appropriate spade type connectors selected for particular wire size in use.
3. Crimp crimp-and-spade type connectors (including spade type connectors and insulated butt type connectors for in-line loudspeaker circuit connections) with appropriate tool.
4. Crimp spade type connectors with notch on barrel opposite seam.
5. Perform cutting and stripping of audio cables using tools recommended by cable manufacturer.

F. Take precautions to guard against electromagnetic and electrostatic hum.

G. System Installation:

1. Install equipment so that components are securely attached to substrate or structure.
2. Substations: Connections in building-exterior locations and on Public Access Area (PAA) side of teller windows shall be with tamper-resistant or concealed fasteners.
3. Master Stations: Install amplifiers, junction boxes and controller components with undercounter mounting, not visible, and installed so as not to interfere with occupant use of space.

H. FE/BR Teller Window Interface: Coordinate interface of Master Station and Substation with teller windows; see Section 085652 “Aluminum Teller Security Windows.”

3.2 FIELD QUALITY CONTROL

A. Contractor shall perform tests to verify proper operation of master station and substation at all locations for these intercoms.

END OF SECTION 275124

SECTION 275405 – CONSULAR QUEUE MANAGEMENT SYSTEM INFRASTRUCTURE AND DISPLAYS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes requirements for infrastructure and displays supporting consular queue management system.

1. General system infrastructure and display components such as cables, media extender, equipment cabinet, UPS, and interface components such as flat panel displays in certain locations.
2. Coordination of integration with Government-Furnished consular queue management components.

B. Related Sections include the following:

1. Division 26 Sections for conduits, outlets, and other general electrical work.
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
3. Section 260525 “Grounding and Bonding for Electrical Systems.”
4. Section 270508 “Common Work Results for Telecommunications.”
5. Section 270526 “Grounding and Bonding for Communications Systems.”
6. Section 270553 “Identification for Communications Systems.”
7. Section 271116 “Communications Cabinets and Frames” and Section 275105“Audio Systems for Consular Services” for general requirements and telecom ground busbar (TGB) requirements of consular communications cabinets.
8. Section 271123 “Communications Cable Management and Ladder Rack.”
9. Other Division 27 Sections for general requirements of distribution cabling.
10. Section 272129 “Data Communications Switches and Power Supplies” for interface with OpenNet.
11. Section 275105 “Audio Systems for Consular Services” for associated paging and intercom systems.
12. Section 337105 “Underground Ducts and Raceways” for distribution of cable to outdoor consular waiting displays and for interface with Compound Access Control (CAC) for non-staff pedestrian use.

1.2 REFERENCE STANDARDS

A. See Section 270508 “Common Work Results for Telecommunications” for commonly applicable telecommunications reference standards.

1. Each Division 27 Section may include citations to those references identified Section 270508
2. In addition, each Division 27 Section may include citations to other reference standards not listed in Section 270508

1.3 SYSTEMS DESCRIPTION

A. Queue Management System - General:

1. The work detailed within the Construction Documents is intended to meet certain requirements for performance and appearance. It is the responsibility of the Contractor to complete translation of those requirements into a systems package necessary for operational and functionally queue management system.

   a. Any item not specifically shown on Drawings or called for in Specifications, but is normally required to conform to the intent, is required to be included as part of the Work.

2. The overall Consular Affairs Queue Management (CAQM) system is produced through coordinated effort between DOS Consular Affairs (CA), DOS Post,IRM, and work included as part of this Contract. The CAQM system is connected at various points (by USG Post IRM) to OpenNet. The Government-Furnished Government-Installed (GFGI) software system used by CA is QFlow Systems by QFlow Systems, LLC. The purpose of system is to provide:

   a. Check-in of consular applicants.
   b. Customer verification.
   c. General queue management by Consular Affairs, including wait time alerts.
   d. Customer tracking by Consular Affairs. Tracking may begin at Compound Access Control (CAC) facility for non-staff pedestrian use.
   e. Customer notification visually at progressive points, and audibly in waiting areas via connection with consular paging and intercom systems; see Section 275105 “Audio Systems for Consular Services.”
   f. Real time and historical reports produced by CA for DOS Consular headquarters, using data from system.

3. Contractor-Furnished Contractor-Installed (CFCI) Components: Components to be provided as part of this Contract.

   a. Signal and power cables.
   b. [Signal and power outlets for Self-Service Ticket Issuance kiosks (STI-Kiosk).]
   c. [Signal and power outlets for outdoor consular waiting area STI-Kiosk, when applicable.]
   d. Teller window flat panel displays and brackets at each teller window station.
   e. Large flat panel displays for outdoor and indoor consular waiting areas, and for Manager’s Dashboards inside Consular office area.

f. Supports for large flat panel displays. For indoor large displays, the supports shall be brackets, except that ceiling-mounted support shall be used in the Consular Section for displays that are intended to be suspended from above. For outdoor large displays, support type shall be coordinated with environmental enclosure (e.g., display pedestal with enclosure or display bracket with enclosure).
g. Equipment cabinets as indicated on Construction Drawings. Cabinets may be shared with consular paging and teller intercoms where there are ten windows or less and with concurrence of OBO/PDCS/DE/EE; see Section 275105 "Audio Systems for Consular Windows."
h. Media extender (Tx/Rx) for HDMI, and USB signals, KVM switch, shelves, and UPS.

4. Government-Furnished Contractor-Installed (GFCI) Components: Components to be provided as part of this Contract.

a. Teller window Set-Top Boxes (STB) and brackets.
b. STI-Kiosks.

5. Government-Furnished Government-Installed (GFGI) Components: Components acquired by CA using blanket purchase agreement with ACF Technologies for "QFlow" software platform, including the following:

a. QFlow software.
b. CAQM database server and web server.
c. Visitor Reception Point (see following paragraph): IT workstation equipment, software, ticket printers, and barcode scanners.
d. HDMI Splitter.
e. Media Player computer for managing large waiting room displays.
f. STI-Kiosk PC.
g. Manager's Dashboard PC.

B. Visitor Reception Points: Locations of reception points for queueing are indicated on Construction Drawings. There are two different reception point types, an STI-kiosk or a manned reception window. Each point will include IT workstation, with associated ticket printer and barcode scanner.

1. The STI-Kiosk cabling must include three CAT6 cables within 250 ft of the CAER. Applicants/users will receive their initial ticket from ticket issuance station in this location.
2. The STI-Kiosk shall reside in the CA Waiting Area. The STI-Kiosk shall be placed close to the entrance, should not impede the flow of traffic, and shall have at least 900 mm (three feet) behind the STI-Kiosk to open the back to change printer paper.
3. STI-Kiosk Reception Point are connected via HDMI and USB cables by a CAT6 extender to the workstation in the CAER.
4. Manned Reception windows are connected to OpenNet Consular signal. Refer to Construction Drawings for number and location of these reception points.

C. Waiting Area Displays: Refer to the Part 2 Article on FLAT PANEL DISPLAYS for size and characteristics of these CFCI displays.

1. Outdoor Displays: These display(s) are intended to alert users/applicants of their turn for service so that they can approach the Consular entrance door from outdoor Consular waiting area at the appropriate time. These displays shall be provided with appropriate weather and climate protection as identified in the Construction Documents, including compatible manufactured enclosure component. The number and location of these displays will vary depending upon size and configuration of the outdoor Waiting Area and are indicated on Construction Drawings.
2. Indoor Displays: These displays are intended to alert users/applicants of their turn for service and identifying the specific window where they are being served. The number and location of these displays will vary depending upon the size and configuration of the indoor Waiting Area and are identified on Construction Drawings.
3. Indoor and Outdoor Waiting Area Large Displays are operated from consular staff side of Consular Section at dedicated Media Player computer.

D. Manager's Dashboard Displays: Refer to the Part 2 Article on FLAT PANEL DISPLAYS for size and characteristics of these CFCI displays.

1. These displays facilitate overall management of the queue by Consular staff. Displays are located within the open-office area of the Section, as well as within enclosed offices of the heads of the Section. The number and location of these displays will vary depending upon the number of staff and configuration of the Section. The displays may be a combination of wall-mounted and suspended from overhead.

E. Teller Window Stations: Customer-side and secure-side of consular teller windows are connected through separating FE/BR hardline wall.

1. Customer-Side:

a. Flat panel display and bracket for each teller window location on customer side above each station. Displays require either HDMI input or DVI input with DVI-to-HDMI converter.

2. Secure-Side:

a. Set-Top Box (STB) and Bracket: Install on STB bracket on secure side below level of teller countertop.
b. Teller IT workstation installed on teller countertop.
c. Audio functionality of consular queuing system, including intercom and paging features, is performed via connection to consular audio system.

F. Consular Queuing System Cabinets:

1. Depending upon various factors such as number of windows and layout of Consular Waiting Area, queue management and consular audio system are normally placed in

separate cabinets dedicated to Consular services. Refer to section above for GFGI items inside queuing cabinet. Consular cabinets are placed in separate Consular Affairs Equipment Room(s) (CAER) within the Consular suite. Provide addition CAER if CA windows occupy more than one floors. Location and number of cabinet(s) is project-specific. Consolidate queue management system with consular audio system into single cabinet if there are less than four windows and indicated on Construction Drawings.

2. These cabinets serve as the central point for routing signal cable for indoor and outdoor large Waiting Area displays. Waiting Area displays must be within 75 meters (250 ft) of these system cabinets.
3. See Section 271116 “Communications Cabinets and Frames” and Section 275105“Audio Systems for Consular Services” for most requirements associated with these cabinets.
4. In addition to media PC, managers dashboards, and kiosk connections, provide a minimum of (6) OpenNet cables from the nearest TR to each CAER Cabinet. Terminate OpenNet cables on a patch panel.
5. Provide 4RU of rack space per waiting area Media PC. Provide (1) rack amount shelf per media PC. Provide (1) OpenNet cable from the nearest TR for each media PC. Terminate OpenNet cables on a patch panel. Coordinate with OBO/DE/EE/TEL and CA/CAEX to determine the number and location of waiting areas.
6. Provide 4RU rack space for each kiosk. 4RU: Provide (1) OpenNet cable from the nearest TR for each kiosk PC. Terminate OpenNet cables on a patch panel. Coordinate with OBO/DE/EE/TEL and CA/CAEX to determine the number of waiting areas.
7. Provide 4RU of rack space per Managers Dashboard PC. Provide (1) rack amount shelf per media PC. Provide (1) OpenNet cable from the nearest TR for each media PC. Terminate OpenNet cables on a patch panel. Coordinate with OBO/DE/EE/TEL and CA/CAEX to determine the number and location of Managers Dashboards.

G. Consular Server Cabinets:

1. Many items placed in these cabinets, such as EQM Database Servers, are GFGI items. These cabinets are typically placed in the Joint-Unclassified Computer Room (JUCR). Refer to the Construction Drawings for cabinet locations and layout of each cabinet.
2. See Section 271116 “Communications Cabinets and Frames” and Section 275105 “Audio Systems for Consular Services” for most requirements associated with these cabinets.
3. Provide a minimum of (6) OpenNet cables from the nearest TR to each Consular Server Cabinet. Terminate OpenNet cables on a patch panel.

H. System Power: Provide rack-mounted UPS for queue management system. Size UPS to support all queuing equipment, CFCI and GFGI at full load for 15 minutes backup.

I. Electrical Characteristics: System equipment shall operate on 120 to 240 VAC at 50/60 Hz as appropriate to the host country.

J. Structural Performance: Using appropriate fastenings and supports, adequately support system infrastructure and equipment with safety factor of at least three.

1.4 SUBMITTALS

A. General: Technical submittals (e.g., product data, shop drawings, schedules) associated with this Section shall be submitted together with the submittals for general Division 27 telecommunications sections to facilitate coordination of systems.

B. Coordinate timing and content of submittals with those for Section 275105 "Audio Systems for Consular Services."

C. Product Data:

1. Manufacturer's product data sheets for all materials and equipment. Mark each product data sheet to show applicable choices and options. Sheets containing more than one device or component model number shall be clearly marked to delineate items included in the work.
2. Accessories, including equipment racks, and trim components.
3. Provide one additional copy of sheets for displays and display brackets to facilitate review by Consular Affairs (CA).

D. Shop Drawings:

1. If not included in submittal for consular audio system, submit detailed plan views and elevations of relevant equipment rooms that show raceway, sleeves, cable tray, cable paths, equipment cabinets, termination blocks, power receptacles, and grounding bus bars and required clear space.
2. Consistent with schematic installation indicated in Construction Drawings, detail installation of equipment and cable layout to further enhance operational efficiency and overall aesthetic factors.
3. Cable run sheets that denote cable type, signal type, termination type, cable number designation, start point, and device endpoint.
4. Floor-plan drawings indicating device locations with device legends. Indicate locations of wall plates, and jack and outlet configuration.
5. Schematic block diagrams for consular queue management system that shows equipment, interconnects, data flow, and other pertinent information, and identifies GFGI and CFCI components.
6. Wiring diagrams for each subsystem that defines the interconnection of all inputs and outputs for system equipment.
7. Provide STI-Kiosk floor mounting template.

E. Plans and elevations of consular queue management equipment cabinet(s) quantifying all equipment to be mounted in each.

F. Qualifications:

1. Queue Management System Subcontractor Qualifications:

a. Subcontractor Team Member Resumes: Submit resumes for key subcontractor team members, indicating past similar A/V project experience.

G. Operations and Maintenance Manuals: Manuals shall apply for CFCI equipment.

1.5 QUALITY ASSURANCE

A. Work specified in this Section shall be responsibility of single systems contractor.

B. Single Source: Any given item for this system shall be the product of one manufacturer throughout the Project; multiple manufacturers of any one item is not permitted unless specifically noted otherwise.

C. Original Equipment Manufacturer: All accessories, including rack-mounting hardware and power supplies, shall be obtained from original equipment manufacturer. Unless otherwise noted or specified, third-party accessories are not permitted.

D. Basis of Design: For certain components of the consular queue management system, specific manufacturers and models have been identified as “Basis of Design” These manufacturers and models are listed for example purposes. Contractor may provide other manufacturers and models which meet or exceed specified functional, technical, and service support requirements.

E. Subcontractor Qualifications: Actively involved for at least five years in projects involving display technology of similar magnitude and scope.

F. Comply with requirements of the OBO Electrical Code (NFPA 70, “National Electrical Code” as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Space will not be provided at project site for purpose of pre-assembly and testing. Any required pre-assembly and testing shall be conducted at facility supplied by Contractor.

1.7 COORDINATION

A. Coordinate with general telecommunications and A/V design to determine that appropriate raceways are in place.

B. Coordinate with related trades to schedule the Work and ensure complete and integrated installation.

C. Coordinate with Project Director/COR for work of this Section in relation to Government-Furnished components

D. Coordinate with Project Director/COR for technology updates of Contractor-Furnished and Government-Furnished system components after notice to proceed for construction.

1.8 WARRANTY

A. The one-year project warranty commencing at the date of Substantial Completion shall include replacement of flat panel displays for any display not able to be repaired in the field.. Replacement equipment shall be on site and operational within two weeks of the component failure.

1.9 CONTRACTOR-FURNISHED GOVERNMENT-INSTALLED (CFGI) MATERIAL

A. Furnish the materials identified below as CFGI materials. Most of this material will be installed by the Government as part of the Project, though some of it as determined by the Government will be kept by the Government as extra material.

1. Patch Cords:

a. General:

1) Electrical performance of patch cords shall equal electrical performance of cable used within system being patched interconnected, or cross-connected.
2) Same manufacturer furnishing cable shall furnish patch cords.
3) Furnish cords in box.

b. Streaming Device: Furnish one 0.45 m (1-1/2 ft) yellow patch cord for each streaming device.

c. CAER Cabinet: Furnish one 1-meter RG6 coax patch cord with each cabinet for future connectivity. Furnish OpenNet patch cables per Specification 271505. Furnish all HDMI and USB patch cables required for a complete and functional system and where specified within this document.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE FOR QUEUE MANAGEMENT SYSTEM

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Belden, Inc.
2. Commscope, Inc.
3. West Penn Wire.

B. Cable Jacket: Plenum-rated.

C. Cable Type for Queue Management System:

1. Fiber Optic Cable: 50/125 micron OM4.
2. CAT6 cable.
3. HDMI cable.
4. USB cable.
5. Shielded CAT6 if recommended by hardware manufacturer.

D. Cable Accessories:

1. HDMI Converters/Extenders. Match resolution of connected monitors.

a. Basis of Design for Short Range: Crestron, Extron, or ZeeVee HDMI Extender over CAT6 with IR range extenders.
b. Basis of Design for Long Range: Crestron, Extron, or ZeeVee Long Range HDMI Extender over multimode fiber with IR/RS-232 and Ethernet for longer distances and outdoor displays
c. Standards: HDMI 1.3a and HDCP compliant.
d. Provides independent DDC channel.
e. Bandwidth: 10.2 Gb/s.
f. Distance: 70 m (230 feet) for 1080p.
g. Transmitter: V-Input shall be 1x HDMI (female, 19 pin). Output shall be 2x RJ-45 IR socket.
h. Power Supply: Output shall be 5V, DC, 4A. Input shall be 100-240 VAC, 50/60 Hz, 0.8A. Power consumption shall be 10 Watts max.
i. Receiver: Output shall be 1x HDMI (female, 19-pin). Input shall be 2x RJ-45.

2. USB Converters/Extenders: For each of Kiosk provide the following:

a. Basis of Design: USB2004EXTV by StarTech, ICRON (1) per kiosk
b. Patch Cables: USB 2.0 < 10m, USB 3.0/3.1 Gen1) < 5m, USB 3.1 Gen2 < 1m.

E. Receptacles: NEMA 6-20R or local standard.

F. KVM switch: shall be rack mounted, have HDMI and DVI input, with USB front input for card reader.

1. Basis of Design: Raritan T1700-LED.

2.2 FLAT PANEL DISPLAYS

A. General:

1. Basis of Design: Subject to compliance with requirements, provide products comparable to the models identified below for each application.
2. Displays shall be compatible with local voltage.
3. Displays shall be capable of being powered off via remote control.
4. Displays shall have HDMI input.
5. Displays shall be minimum of 4K resolution with commercial rating depending on use case.

B. Consular Window (Teller) Displays:

1. Basis of Design: Minimum of 800 mm (32 inch) display.
2. Approximate Size: 800 mm (32 inch) viewable display screen.
3. Minimum of 4K resolution.
4. VESA-mountable design for flexible mounting and tilting.
5. Built-in tuner and speakers on unit.

C. Indoor **[and Outdoor]** Consular Waiting Area Displays: Size as indicated on Construction Drawings:

1. Basis of Design: NEC displays.
2. Approximate Size: 1150-1375 mm (46-55 inches).
3. Minimum of 4K resolution.
4. VESA-mountable design for flexible mounting options and tilting.
5. Built-in tuner and speakers on unit and suitable for functioning.

D. Manager's Dashboard Displays:

1. Basis of Design: NEC 558 model or equivalent.
2. Approximate Size: Size as indicated on Construction Drawings. Baseline size of 1150-1375mm (46-55 inches).
3. Minimum of 4K resolution.
4. VESA-mountable design for flexible mounting options and tilting.
5. HDMI input.
6. Built-in tuner and speakers on unit and suitable for functioning.

2.3 INDOOR FLAT PANEL DISPLAY BRACKETS

A. Brackets shall conform to VESA standard.

B. Bracket shall permit downward tilting.

C. Brackets shall be for wall or overhead suspended mounting as indicated on Construction Drawings.

D. Weight Capacity: Coordinate with size of display.

2.4 [OUTDOOR FLAT PANEL DISPLAY ENCLOSURE AND SUPPORT

A. [Basis of Design for Display Enclosure: [Peerless FPE47F-S (cooling only)] [FPE47H-S (heating and cooling)].

1. Size for display.
2. Corrosion-resistant construction.
3. Security hardware
4. Shatter-resistant glass window.

B. Basis of Design for Display Pedestal: Peerless FPEPM-06.

1. Height: 1800 mm (6 ft).
2. Corrosion-resistant construction.
3. Tilt setting from 0 to 15 degrees.
4. Security hardware.]

2.5 CONSULAR QUEUING EQUIPMENT CABINETS

A. General: Refer to Section 271116 “Communications Cabinets and Frames” for general requirements for cabinet serving consular systems.

B. AC Power Uninterruptible Power Supply (UPS): Provide rack-mounted UPS power for queue management system. Size UPS to support all queuing equipment, CFCI and GFGI, inside queuing cabinet at full load for 15 minutes backup.

C. Configuration: As detailed on Construction Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Examine areas to receive the work and conditions under which the work will be performed. Remedy conditions detrimental to proper completion of the work. Do not proceed until unsatisfactory conditions have been corrected.

B. It is the responsibility of Contractor to confirm all dimensions and locations related to installation of system in the Work.

3.2 GENERAL INSTALLATION

A. Scope of System Installation: Installation includes fastening system components and equipment to walls, floors, ceilings, counters or other structures as indicated on Construction Drawings or as otherwise required; interconnecting wiring of the system components, alignment and adjustment of system components, and related installation necessary to result in complete and fully operational system.

1. Power outlets, penetrations, and conduits shall be installed by electrical subcontractor.
2. Refer to other Division 27 Sections on communications for general installation standards.
3. Detail of equipment and cable layout shall not only recognize operational efficiency, but also overall aesthetic factors.
4. Cable Application: On queue management system schematic diagrams in Construction Drawings, signal type is indicated at equipment input or output.

    a. Signal cable between teller set-top-box (STB) and teller window flat panel display.
    b. Signal cable between Indoor Consular Waiting large flat panel display and Consular Equipment Room cabinet.
    c. Signal cable between Indoor STI-Kiosks and the Consular Equipment Room cabinet.
    d. Signal cable between STI-Kiosks and OpenNet connection.
    e. Signal cable between Outdoor Consular Waiting and Consular Equipment Room cabinet.

B. Visitors Reception Points:

1. Outlets: Install four duplex power outlets or one quad power outlet at each reception point. Provide NEMA 6-20R receptacles.
2. OpenNet Connections: Provide Cat 6 connections at each reception point to CAER: Kiosks (Three-OpenNet connections), Manager's dashboards (Two-OpenNet connections). Coordinate with OBO/PDCS/DE/EE and Consular Affairs (CA) for exact locations. Cable color identification shall conform to OBO standards for UTP horizontal distribution in accordance with Section 270553 "Identification for Communications Systems." Use RJ-45 terminations.
3. Kiosk/Dashboard outlets: provide three CAT6 green color to each Kiosk location. Terminate cables with RJ-45 termination at the faceplate and on RJ-45 patch panel at the CAER.

C. Displays:

1. General – Flat Panel Large Displays: Install with sufficient space behind displays to facilitate placing HDMI components and TV power cord adaptors.
2. Indoor Flat Panel Large Displays: Install panel in bracket at wall, column cover, or ceiling, as indicated on Construction Drawings, using bracket size and configuration suitable for display and location.
3. Outdoor Flat Panel Displays: Install within manufactured enclosure component on support structure or bracket as indicated on Construction Drawings. Install cable in 50-100 mm

below-grade conduit from Consular equipment room to locations of large flat displays in outdoor Consular waiting area. See Division 26 sections for installation of conduit outside the building.

4. Power Outlets: Refer to Division 26 Sections for general requirements. Outdoor outlets shall be ground-fault circuit interrupt type.

D. Teller Window Station:

1. Customer Side:

a. Flat Panel Display and Bracket: Install wall-mount flat panel display bracket and flat panel display at each window; locate as indicated on Construction Drawings. Place bracket approximately 150 mm above bottom of teller window booth wall opening. Center bracket installation with associated teller window. Coordinate bracket elevation with electrical and signal outlet installation, and place so that outlets are not visible, and that outlets do not outlets do not impede ability of bracket to tilt display.
b. Provide black 450 mm (18 inch) HDMI connector cable with HDMI connectors at each end. Terminate cable in accordance with ANSI/TIA/EIA 568.2. Neatly coil HDMI patch cable, with radius bend no less than manufacturer's recommended minimum.
c. Power Outlets: Install receptacles next to flat panel signal, and position behind displays to generally conceal from view. If using two outlets, install in uniform manner with same elevation and equal distance between outlets in all teller window display locations.

2. Secure (Teller) Side: Install system components below countertop:

a. Install one Set-Top Box (STB) and bracket under each teller countertop as indicated on Construction Drawings.
b. Install STB within 300 mm (1 ft) of associated duplex power receptacle, OpenNet port, and HDMI Wall Plate. USG will connect STB to OpenNet. Group all the devices and align them on their centerlines horizontally.
c. Equipment Power Outlet: One 16 or 20A receptacle.
d. Workstation Outlet: Provide one additional CAT6 (orange) to the typical workstation outlet at Consular officer desk to support STB.
e. Orange: DOS OpenNet SBU data.
f. Label telecom ports and wall jacks in accordance with Section 270553 "Identification for Communications Systems."

3. Connecting Components: Connect STB with customer-side window flat panel display.

a. Provide connection through hardline walls using penetration protection on customer side as required; refer to Construction Drawings. Use the following cables for the connection:

1) Two solid conductor CAT6 cables. Install HDMI faceplate at each end of CAT6 cables using Crestron, Extron, or ZeeVee HDMI over CAT6 wall plate or equivalent.

E. Consular Equipment Cabinets:

1. Refer to Division 27 Sections for general installation requirements.
2. Install minimum six OpenNet drops from nearest TR to each CAER and JUCR Queuing cabinet. Install additional OpenNet connections as detailed in this specification. Quantity of OpenNet cables shall be increased based on quantity of Kiosks, Manager's Dashboard, and Media Player PC.
3. Terminate home run cables from Consular Waiting large displays to queuing cabinet on one 24/48 port CAT6 patch panel.
4. Install black one-meter HDMI connector cables, with factory-installed HDMI connectors at each end.
5. Install CAT6 to HDMI converter/extender within cabinet.
6. Install one horizontal cable TV RG6 cable from Telecom Room (TR) TV distribution field and terminate within this cabinet.
7. Install one 1-meter RG6 coax patch cord within cabinet for future connectivity.
8. Install in configuration identified in Construction Drawings.
9. Install Shelves to support CFCI media extender and GFGI equipment.
10. Install UPS.

F. CAQM Hardware Worksheet:

1. The system design shall comply with the hardware worksheet:

Component	GFGI	GFCI	CFCI	Requires UPS
Core Application				
Servers	x			
Software	x			
Hardware				
CAQM Large Monitors/TVs			x	
CAQM Large Monitors/TV Brackets			x	
Graphics Card				
CAQM Manager Dashboard Monitors				
CAQM Manager Dashboard TVs			x	
CAQM Manager Dashboard TV Brackets			x	
Teller Window Displays			x	
HDMI Splitter- DA			x	x
STI - Kiosks*		x		
STI - 508 Compliant Kiosks***		x		
USB Extenders			x	x
HDMI Extender Kit (Tx and Rx)			x	x
KVM (HDMI Compatible)			x	x
STI - Kiosk PC	x			x
MGR Dashboard PC outside CAER	x			
MGR Dashboard PC in CAER				x
Media PCs	x			x
Set Top Boxes (with brackets)*		x		
Thermal Printers	x			
Infrastructure				
Cat 6 Patch Cables			x	
HDMI Wall Plates			x	
HDMI Cables			x	
Power			x	
Rack RUs			x	
Wall/Floor Boxes (for kiosk installs only)			x	

3.3 GROUNDING OF CONSULAR QUEUE MANAGEMENT SYSTEM

A. General: Comply with Chapter 2 of the OBO Electrical Code. Refer to Section 260525 “Grounding and Bonding for Electrical Systems” and Section 270526 “Grounding and Bonding for Communications Systems.”

3.4 FIELD QUALITY CONTROL

A. After installation of cable, Queue Management System Infrastructure installer shall test cable prior to installation of displays and shall perform repairs or replacements until testing is successful.

B. After displays are mounted, infrastructure installer shall test continuity of Set-Top Box (STB) with teller window displays; blue display should show if continuity is present.

C. After installation of Government-Furnished Government-Installed (GFGI) components of queue management system, Government will perform testing of overall system, including cabling, all equipment incorporated in system, and all software associated with system, and will perform adjustments necessary for operational queue management system.

3.5 CLEANING AND PROTECTION

A. Clean up and repair all areas affected by this work. Protect exposed surfaces with materials that are easily removed without marring finishes.

3.6 DEMONSTRATION

A. Comply with Division 01, Section 017905 “Demonstration and Training” for general requirements of demonstration and training documentation.

B. The manufacturer’s representative or approved installing subcontractor shall provide ‘hands-on’ training sessions for the Government O&M personnel.

1. Schedule as follows:

   a. Classroom Instruction: Two (2) hours.
   b. Field Demonstration: Two (2) hours.

C. Training shall cover the following topics:

1. General purpose of this system or equipment (design intent).
2. Maintenance and repair including manufacturer’s data within the O&M manual (service sources, spare parts inventory, special tools, etc.).
3. Common troubleshooting issues and methods, control system warnings and error messages.
4. Monitoring requirements with appropriate/specified equipment and diagnostic analysis.

END OF SECTION 275405

SECTION 280508 – COMMON WORK RESULTS FOR TECHNICAL SECURITY SYSTEMS (TSS)

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes general requirements for full Technical Security System (TSS) and interaction of TSS with other building systems. In addition, the following technical security support system elements which serve a variety of TSS sub-systems are included in this Section:

1. TSS Itemizer supplies freezer.
2. TSS equipment racks.
3. TSS Uninterruptible Power Supplies (UPS).
4. TSS raceways and boxes.
5. TSS conduit identification.
6. TSS panelboards
7. TSS wiring devices.
8. TSS enclosed switches and circuit breakers.

B. Technical Security Sub-Systems: The requirements for individual TSS sub-systems are included in the sections identified below. Requirements for technical security support system elements (e.g., cable and power supplies) associated with each of these TSS sub-systems are included in each of these sections as applicable. Each TSS sub-systems is described in the SUMMARY Article of each of these sections:

1. Section 087155 “Security Door Hardware” for door closers at security doors.
2. Section 260508 “Common Work Results for Electrical, Communications, and Electronic Safety.”
3. Section 260525 “Grounding and Bonding for Electrical Systems.”
4. Section 262417 “Panelboards.”
5. Section 262725 “Wiring Devices.”
6. Section 270508 “Common Work Results for Telecommunications.”
7. Section 281005 “Technical Security Access Systems.”
8. Section 282305 “Security Video System (SVS).”
9. Section 283105 “Technical Security Intrusion Detection Systems.”
10. Section 283325 “TSS Intercommunications System.”
11. Section 283337 “Technical Security Duress Systems.”
12. Section 284705 “Mass Notification Systems.”
13. Section 285115 “Security Management System Enterprise (SMSe).”
14. Applicable Division 32 OBO Standards Sections on active vehicle barriers.
15. Section 337105 “Underground Ducts and Raceways.”

C. Standalone Equipment: Explosives detection equipment such as X-ray machines and Itemisers units are standalone items (thus labeled “equipment”) which are covered in Section 281805

"Technical Security Access Equipment." These are in contrast to access and detection "systems" that are not standalone, which are covered in Section 281005 Technical Security Access Systems and Section 283105 "Technical Security Intrusion Detection Systems." Technical security access "equipment" are not covered by provisions of this Section, " except in relation to use of "TSS QC Checklists" described in Article on QUALITY ASSURANCE, and for listing of DS approved products described in the GENERAL Article in Part 2 of this Section.

D. General TSS Support System Elements: General requirements for TSS support systems are further identified in Division 26.

E. PAA/Lobby Special System: The requirements for a special TSS system related to lobby areas will be identified on a project-specific basis.

1.2 SUBMITTALS

A. General: Refer to individual technical security system specification sections for additional submittals.

B. Product Data: Include components, furnished specialties, dimensions, finishes, and accessories for items identified in this Section. Submit to Project Director/COR for acceptance based upon OBO/CFSM/SM/TSB review prior to purchase and secure shipment of these components.

C. Shop Drawings: Details assemblies of standard components that are custom assembled for specific application on this Project. Refer to related TSS Sections for specific sub-system requirements.

1. Functional Block Diagram: Show single-line interconnections between all TSS subsystems identified in various TSS subsystem Sections. Indicate methods used to achieve systems integration. Indicate control, signal, and data communication paths and identify control interface devices and media to be used. Describe characteristics of network and other data communication lines.
2. TSS Panelboard Drawings: For each panelboard, provide drawing information.
3. TSS Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.
4. TSS Enclosed Switches and Circuit Breakers: Include diagram of power, signal, and control wiring.
5. Room Elevations: EC Room, Sub-EC Rooms, and TSS Riser Room elevations.

D. Qualification Data:

1. TSS Integrator Qualifications.
2. Technical Qualifications for each TSS subsystem Installer.
3. Testing Agency Qualifications for TSS panelboards and for TSS enclosed switches and circuit breakers.
4. Manufacturer Seismic Qualification Certification: Submit certification.

E. Contractor QC Pre-Check Certification:

1. Certification that each TSS sub-system pretest and check by Contractor against "TSS QC Checklists" identified in Article on QUALITY ASSURANCE, and against "Contractor Accreditation Worksheet" has been 100 percent successful.

F. Additional Field Quality-Control Test Reports. Submit to Project Director/COR for use in Accreditation review.

1. TSS Panelboards:

a. Test procedures used.
b. Test results that comply with requirements.
c. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

2. TSS Wiring Devices.

a. Fiber optic cable.
b. CAT 6 cable.

G. Operations and Maintenance Data.

H. Barcode Matrix: Submit in accordance with Article on FIELD QUALITY CONTROL.

1.3 QUALITY ASSURANCE

A. TSS Integrator Qualifications: An experienced supplier and installer with minimum 10 years of experience with OBO projects, and who has completed systems integration work for installations similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.

B. SVS Installation Supervision: During duration of security video system (SVS) installation, work must be under direct supervision of IP Network Systems Engineer for SVS system.

C. Comply with the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO.

1. Electrical Components, Devices, and Accessories: For general electrical items associated with TSS work, listed and labeled in accordance with Chapter 1 of the OBO Electrical Code by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE, and marked for intended use.

D. The Government will perform source and field quality assurance for all TSS sub-systems, including for portions identified in Division 26, 27 and 28 sections, in accordance with separate

contract attachments "TSS QC Checklists," and "Contractor Accreditation Worksheet." Contractor is responsible for performing quality control, including pre-testing and pre-checking of TSS sub-systems to ensure that each is at least 90 percent ready at the time of QA by the Government.

E. TSS Identification: In accordance with Chapter 2 of the OBO Electrical Code. Same requirements as for general electrical identification in Division 26 Section on identification for electrical systems.

F. TSS Panelboards:

1. Testing Agency Qualifications: Refer to qualification requirements in Section 262417 "Panelboards."
2. Comply with NEMA PB 1.

1.4 COORDINATION

A. Sequence, coordinate, and integrate installing TSS materials and equipment for efficient flow of the Work.

B. Installation of signal and audio pull boxes must be coordinated with other disciplines for accessibility by ladder during installation and future maintenance.

C. Where TSS devices are applied to field-finished surfaces, coordinate installation of devices with completion of finished surface.

D. Where electrical identification markings and devices will be concealed by acoustical ceilings and similar finishes, coordinate installation of these items before ceiling installation.

E. Consular/Pedestrian-Only CAC: Provide rack at security screening area when guard booth is not available. Coordinate millwork to accommodate TSS racks.

F. Provide coordination as required in the following Sections:

1. Division 26 Section on identification for electrical systems.
2. Section 262417 "Panelboards."
3. Division 26 Section on enclosed switches and circuit breakers.

1.5 DELIVERY AND STORAGE

A. Equipment delivered must be stored with protection from the weather, humidity, and temperature variation, dirt, and dust, or other contaminants.

B. Store and protect equipment identified for installation within Controlled Access Area (CAA) in the Secure Storage Areas as identified in Division 01 sections.

1.6 PROJECT CONDITIONS

A. Post 1 and Main EC Room: Do not install technical security systems and equipment located in either room until the following are in place:

1. Design temperature and humidity can be maintained using either temporary or final HVAC equipment.
2. Continuous temporary or permanent power is available for the installed systems in accordance with the requirements of each system.
3. Reasonably free of dirt and dust.

B. TSS Panelboards: Conform to requirements of Section 262417 “Panelboards.”

C. TSS Enclosed Switches and Circuit Breakers: Conform to requirements of Division 26 Section on enclosed switches and circuit breakers.

1.7 EXTRA MATERIALS AND INFRASTRUCTURE

A. General: Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

B. TSS Panelboards:

1. Keys: Six spares of each type of panelboard cabinet lock.

C. TSS Enclosed Switches and Circuit Breakers:

1. Spares: For the following:

a. Potential Transformer Fuses: Six.
b. Control-Power Fuses: Six.
c. Fuses and Fusible Devices for Fused Circuit Breakers: Six.
d. Fuses for Fused Switches: Six.
e. Fuses for Fused Power-Circuit Devices: Six.

2. Spare Indicating Lights: Six of each type installed.
3. Spare Fiber Optics:

a. Provide 12-strand /50 Micron Multimode fiber cables between the Main EC room and Sub-EC rooms located in all outbuildings.
b. Provide patch panel at each location. Fiber must be terminated and tested.

4. Infrastructure Dedicated for Future Access Denial System (ADS): Conduit must be labeled "Dedicated for Future ADS. Other Uses are not permitted."

   a. Conduit must be selected that is able to accommodate minimum static or no load-bending radius for multi-mode fiber optic cabling. Install pull string in all conduit runs:
   b. Provide building(s) interior with two 50mm conduits from a wall mounted junction box located in Main EC Room, and terminate conduit at lockable junction box that is sized accordingly. Locate junction boxes 100mm above finished ceiling and below other services with access (via panels, acoustical tiles, etc.) in the following areas:

      1) NOB/NOX Main Lobby.
      2) Consular Section Waiting Area.
      3) NOB/NOX Service Entrance Screening Area.

   c. Provide compound site with two 50mm conduits from a wall mounted junction box located in the Main EC Room that is sized accordingly. Conduit must terminate to a junction box located on wall of the following rooms:

      1) Each CAC Sub-EC Room.

PART 2 - PRODUCTS

2.1 GENERAL

A. Approved Products: All technical security products provided in this Section and other TSS subsystem Sections must be approved by Diplomatic Security (DS). See separate contract attachment, "DS TSS Equipment List" for a partial listing of products that have been approved for general use in DOS overseas facilities.

B. Refer to individual technical security system specification sections for signal support and power supply requirements.

C. The use of laptop computer will be necessary to implement installation when programming the TSS controllers. Contractor must provide suitable laptop for this purpose, and laptop will remain property of Government. Control of laptop must be in accordance with direction of Project Director/COR.

2.2 TSS ITEMIZER SUPPLIES FREEZER

A. Freezer Features:

1. Capacity: 130 L (30 gallons).

2. Cabinet Dimensions: Approximately 600 mm W x 600 mm D x 850 mm H.
3. Listed to NSF-7 commercial standards.
4. Stainless steel door with factory-installed lock, latch, and handle.
5. Sealed back.
6. Adjustable chrome shelves.
7. Frost-free operation with fan-forced cooling.
8. Digital thermostat.
9. Open door alarm.
10. High temperature alarm.
11. Recessed LED lighting.
12. Right angle plug; facilitates plugging unit flush against wall socket.
13. Two keys.

B. Basis of Design: Summit Appliances Model SCFF53BSS.

2.3 TECHNICAL SECURITY SUPPORT SYSTEMS

A. Refer to individual technical security system specification sections for signal support and power supply requirements.

B. TSS Equipment Racks:

1. Post 1 Racks: Provide 475 mm (19 inch) wide by 600 mm (24 inch) deep by 1.8 mm (14 gauge) thick EIA equipment racks to house most of TSS control equipment in operational configuration. Coordinate rack layout with Post 1 layout. Provide an unobstructed view of the lobby screening and controlled doors, the racks will not extend above countertop. Provide arrangement as follows:

   a. Short Rack for equipment which requires constant attention, such as door control modules, SVS monitors, etc. These racks will be located under countertop.
   b. Tall Racks to house the following:

      1) Remaining security video system (SVS) monitors.
      2) Vehicle barrier and gate override controls.
      3) Door control “racks.”
      4) Intrusion Detection System (IDS) annunciators and receivers.
      5) Emergency Notification System (ENS) control panels and microphone.
      6) Annunciation panels for Imminent Danger Notification System (IDNS) IDNS and duress buttons.

   c. SMSe Workstation.

2. Main EC Room: Provide three 600 mm (24 inch) wide by 800 mm (32 inch) deep by 1.8 mm (14 gauge) thick EIA equipment rack; components housed in these racks include, but are not limited to, the following:

a. SMSe network controls
b. HDVS switching and recording equipment.

3. Safe Haven or Safe Area: Unless otherwise indicated, provide two tall EIA rack to contain controls identified as EAP Rack.
4. Service and Main CAC: Provide racks in guard posts.
5. Consular/Pedestrian-Only CAC: Provide rack in guard post or at security screening area when guard booth is not present.
6. NOX Guard Post: Provide 475 mm (19 inch) wide by 600 mm (24 inch) deep by 1.8 mm (14 gauge) thick EIA equipment racks.

C. Uninterruptible Power Supply (UPS): Provide units to support TSS.

2.4 TSS RACEWAYS AND BOXES

A. TSS Pull Boxes and Junction Boxes:

1. Provide pull boxes located less than 3 meters above floor in Public Access Area spaces with lockable covers or tamper-proof screws.
2. Provide boxes with 25 mm minimum knockouts for TSS equipment.

B. TSS Cabinets:

1. TSS EC is a low voltage (< 48 volts) interface cabinet.
2. Provide steel blank panel insert and locking handle.

C. TSS DIN Rail Terminals: Install in electrical cabinets located in Main EC Room and Sub-EC Rooms. Use these terminals to terminate cables in these cabinets in lieu of screw-type barrier strips to facilitate space utilization.

2.5 TSS IDENTIFICATION FOR ELECTRICAL COMPONENTS

A. Refer to Division 26 Section on identification for electrical systems for general product requirements.

2.6 TSS PANELBOARDS

A. Refer to Section 262417 “Panelboards” for general definitions and product requirements.

B. Fabricate TSS panelboards with appropriate buss connections to provide single phase (Line, Neutral, and Ground) distribution section. This includes covers, labeling, and buss connection for panelboards.

C. TSS Multi-Tap Connector:

1. DS-Approved Equipment: Burndy BIBD2/03MT UNITAP Connector.
2. Characteristics:

a. Length: 90 mm (3-1/2 inches).
b. Width: 40 mm (1-1/2 inches).
c. Height: 38 mm (1-1/2 inches).
d. Number of Ports: Three (two-sided entry).
e. Stranded Copper Wire Range: 12 mm2 – 70 mm2.
f. Hex Key: 3/16 SAE.
g. Torque Specification: 13.5 nM (120 in.lb.).
h. Insulation: Clear Plastisol, 600 V rating.

2.7 WIRING DEVICES

A. Refer to Section 262725 “Wiring Devices” for general definitions and product requirements.

2.8 TSS ENCLOSED SWITCHES AND CIRCUIT BREAKERS

A. Refer to Division 26 Section on enclosed switches and circuit breakers for general definitions and product requirements.

B. Uninterruptible Power System (UPS) Bypass Switch: Provide UPS bypass switch to facilitate providing power to Panel ‘EU” in event of UPS failure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances, clearance requirements, service rough-ins, and other conditions affecting performance of work.

1. Proceed with installation only after unsatisfactory conditions have been corrected.
2. Verify that all pull boxes are accessible without obstructions to installers of technical security systems; access via a ladder is permissible.
3. TSS Itemizer Supplies Freezer: Ensure adequate clearance and proper electrical outlet type and location.

B. Verify that proper security conditions are present in area. Consult with Project Director/COR and Site Security Manager to determine readiness of spaces and systems to receive technical security systems and equipment.

3.2 INSTALLATION - GENERAL

A. Set security equipment level, plumb, properly aligned, and securely in place. Anchor as required for secure operation.

B. Install systems as indicated on TSS drawings.

C. Run cables continuously and without splices between equipment and nearest EC Room.

D. Make final signal and control connections at terminal equipment and at nearest EC Room.

E. Terminate unused alarm zones on low-level alarm system with resistors in Main EC Room.

F. Only TSS equipment, power, and cabling may be placed in Main EC Room. No other conduits serving other systems are permitted to pass through Main EC Room.

G. Place power supplies for TSS equipment which require low voltage AC/DC in Main EC Room, Sub-EC Room, or TSS riser room associated with building housing equipment.

H. Label power supplies as to their system and function.

I. The placement of low-voltage power supplies must consider the voltage drop due to cable loss. It may be more practical to install door control or SVS power supplies close to the equipment loads. Where distance impedes the ability to use the Main EC Room, use Sub-EC Rooms to contain interface points, and other TSS infrastructure.

J. Refer to separate contract attachment “Technical Security (TS) Application Guidelines” for the systems identified below for detailed installation instructions and adjustments to manufactured systems.

1. Fiber Optic Applications.
2. DS Power System.
3. APC Symmetra LX UPS.

3.3 INSTALLATION – TSS RACEWAYS AND BOXES

A. Refer to Division 26 Section on raceways and boxes for general execution requirements.

B. Outdoor Building Hardline:

1. Above Grade Installations: Intermediate metal conduit (IMC), rigid metallic conduit (RMC), or liquid-tight flexible metal conduit (LFMC).
2. Below Grade Installations:

    a. Rigid non-metallic conduit (RNC) such as Schedule 40 poly vinyl chloride (PVC).
    b. Inside diameter must minimum 50 mm (2 inches).
    c. Where using non-metallic conduit below grade, make transition to metallic conduit by using metallic coupling when leaving conduction or duct bank to continue above grade.
    d. Install in accordance with provisions of Chapters 1 and 3 of the OBO Electrical Code related to underground ducts and raceways, including for hand holes and manholes. Utilize "ruggedized cabling."

C. Indoor TSS:

1. Inside Building Hardline: Use one of the following:

    a. FMC with 27 mm min. I.D. and 2 meters max. length. Do not use for wiring of TSS components in door frames.
    b. RMC, IMC, or EMT.

D. General:

1. TSS signal conductors must not share same conduit, handholes, electrical cabinets, or junction boxes with power conductors.
2. Non-security signal and power conductors must not be installed in conduits used for TSS signal and power conductors.

    a. The only exception is for chemical dispensing system.

3. All TSS cabling in Post 1 must come from Main EC Room.
4. Cabling between main compound building and outlying buildings must run to Sub-EC in outlying buildings and then connect to appropriate guard location for each building.
5. Use cable management devices such as cable hangers and wire ducts to ensure facilitate orderly and clear appearance.
6. Conductors Serving Devices: To maintain aesthetic, use only plastic tubing or raceway for these conductors. Place devices and junction boxes to limit length of conductors between them to 1000 mm (39 inches).
7. Refer to separate contract attachment "Technical Security (TS) Application Guidelines" for the systems identified below for detailed installation instructions and adjustments to manufactured systems.

    a. DIN Rail.
    b. Network infrastructure.
    c. Deployment Document TSS Network Infrastructure.

E. Conduit:

1. At transitions from below grade to above grade conduit routing, use metallic elbows at least 3 meters outside of building wall to change from below grade RNC to above grade metallic conduit.
2. Where transiting building hardline, physically protect conduit be means such as embedding conduit in concrete.
3. Conduit above ceiling may be surface mounted.
4. Route TSS conduits to minimize conduits in areas external to building hardline.

F. Pull Boxes:

1. Install pull boxes at every other 90-degree bend.
2. Locate pull boxes at maximum 15 meter intervals along conduit runs.
3. Pull boxes must be accessible to installer using ladder for installation, and inspectable when installed above ceiling grid.

G. Junction Boxes:

1. Junction boxes serving TSS must be metallic and serve TSS only.
2. Junction boxes may be surface mounted above the ceiling where applicable.

H. Electrical Cabinets and Sub-Electrical Cabinets:

1. Main EC Room is located in primary compound building. Sub-EC Rooms are in outlying buildings (e.g., CACs, MSGR+). When untrust network equipment is installed may be designated as LAA.
2. Electrical cabinets or sub-electrical cabinets must serve as central termination for TSS conduits and signal wiring.
3. Install electrical cabinets and sub-electrical cabinets to allow at least 50 mm clearance on sides or ends of cabinets, and between conduit and wall, to facilitate installation of lock-nut and bushing terminations.
4. Main EC Room is interface cabinet tying all TSS terminal equipment into controls in Main EC Room or Post 1.
5. Component Mounting: Components mounted into Main EC Room and Sub-EC Room cabinets must use DS-approved DIN rail connectors to minimize space utilization.
6. Provide separate Active Barrier Sub-EC in CAC building which performs vehicle inspections.
7. Provide separate, dedicated electrical cabinet (EC) for video signals and SVS power wiring.
8. Provide Surge Protection Devices where applicable (e.g. DIN rails).

I. Power Metallic Raceway and Wiring Ducts:

1. Within all EC rooms, use metallic raceways or wiring ducts.

J. Active Vehicle Barrier Controls:

1. For hydraulic vehicle barriers, route conduit from Active Barrier EC at CAC to Post 1 through Main EC Room.
2. Segregate barrier control wiring from all other wiring.

K. Door Control:

1. Terminations: Install short conduit from junction box positioned above door directly into door lintel. Install junction boxes on secure side of door, and above ceiling where applicable. When doors are part of larger glazed assembly, conduits must enter underground directly into door threshold.
2. Route all door control cables from door to Main Electrical Cabinet.
3. Wire doors designated for monitoring only to Main EC Cabinet, and extend to annunciation panels in Post 1 or appropriate Intrusion Detection System (IDS). See Section 281605 "Technical Security Intrusion Detection Systems" for IDS system.

L. Intrusion Detection System (IDS):

1. Terminate unused monitor zones in Main EC Cabinet.
2. Enhanced IDS:

   a. Signal wiring between enhanced IDS input module and end sensor are not permitted to transit unprotected space.
   b. Input Module, Output Module, Alphanumeric Touchpad, Encryption Modules, Automation Modules:

M. Duress Buttons:

1. Terminate unused alarm system zones with resistors in Main EC Cabinet.

N. Security Management Systems Enterprise (SMSe):

1. Connect workstations in Post 1 and Main EC Room by conduit. Connect workstations to TSS Panel "EU" or stand-alone UPS; see Part 3 Article on INSTALLATION – TSS PANELBOARDS.
2. Install conduit with pull cable between Main EC Room and IRM Server Room for future interconnections.

O. Regional Security Office Technical Workstations

1. Provide one dedicated 50 mm (2 inch) EMT pathway from Main EC room with 24 strands of OM3 fiber installed. One end must be terminated near Technical Workstations in wall-mounted fiber patch panel, and the other in wall-mounted fiber patch panel in EC room. This EMT pathway between rooms must remain in LAA areas or must use applicable HCS conduit installation.

2. In EC room, provide pathway equivalent to one 40-mm (1-1/2 inch) EMT to room overhead cable tray from wall mounted patch panel for continuation to SMSe/SVS equipment rack. This pathway may be raceway or may be omitted if patch panel is located in proximity to cable tray.
3. Two 20A EU circuits from EC room, one for each Technical Workstation. Each circuit must provide a 20A locking receptacle, with continuation up to a 20A straight-blade, duplex receptacle behind associated large-format wall display. Technical Workstations must additionally have non-UPS receptacles as required by OBO Electrical Code.
4. Provide two 40-mm (1-1/2 inch) EMT pathway (one pathway for “small” installations based upon input from OBO/PDCS/DE project Electrical Engineer) from Government provided equipment rack location up to large-format display area, terminating in low-voltage box with pass-through brush plate installed 2000 mm (80 inch) AFF. This low-voltage run may be partially in raised floor or may be within raceway, without the need for conduit. Any vertical runs must be in the listed conduit size and embedded within wall.
5. Provide one 40 mm (1-1/2 inch) EMT pathway from IWA equipment rack to each dedicated RSO office, to be located within proximity to planned OpenNet workstation in each office and terminating in a low-voltage box with pass-through brush plate installed. This should branch off or continue (as needed) to wall opposite desk, terminating in a low-voltage box with pass-through brush plate installed 80" AFF. This low-voltage run can be partially in raised floor and/or within raceway, without need for conduit. Any vertical runs should be in the listed conduit size and embedded in wall. (only required for "large" installation).
6. Color-code all conduit related to the RSO Technical Workstations separately from TSS standard blue/yellow.

P. Safe Havens and Safe Areas:

1. Run cabling for equipment on rack in Safe Haven/Area to Main Electrical Cabinet. Unless otherwise indicated, install two 50-mm (2 inch) conduits between EAP rack(s) in the Safe Haven and one 50mm EAP rack in the Safe Area and Main EC Room.
2. Safe Havens and Safe Areas: Install pull box on wall behind EAP rack.

3.4 INSTALLATION – TSS IDENTIFICATION

A. Refer to Division 26 Section on identification for electrical systems for general execution requirements.

B. TSS Installation:

1. Color coding of wiring must be installed in accordance with Chapter 2 of the OBO Electrical Code.
2. Label wiring between TSS termination and Electrical Closet (EC) terminations.
3. Label wiring at both ends and at intermediate points.

3.5 INSTALLATION – TSS PANELBOARDS

A. Refer to Section 262417 “Panelboards” for general execution requirements.

B. Install the separate distribution panelboards identified below for TSS systems. Locate Panel “EU” next to Panel “E”. No other facility system must draw power from these panels.

1. Panel “E”:

a. Panel must be three-phase.
b. Panel must receive power from main distribution panel (MDP), which is on essential generator bus.
c. Panel must supply single-phase power to Panel “EU” through UPS via an UPS bypass switch.
d. Provide circuit breakers with at least 25 percent of active breakers.

2. Panel “EU”:

a. All TSS systems and equipment must receive power from this panel; the exception is that Panel “EU” must not be used as source of power for door closers at security doors where closers are incorporated only to address accessibility requirements (in relation to requirements of OBO Building Code Chapter 11).
b. Panel must be single-phase input and outputs.
c. Place each load component on separate circuit with 20 Amp minimum circuit breaker, and provide spare circuit breakers for at least 25 percent of active breakers. Provide main input circuit breaker on this panel.
d. Power supply must be on independent “EU” panel circuit breaker.

3.6 INSTALLATION – TSS WIRING DEVICES

A. Refer to Section 262725 “Wiring Devices” for general execution requirements.

3.7 INSTALLATION – TSS ENCLOSED SWITCHES AND CIRCUIT BREAKERS

A. Refer to Division 26 Section on enclosed switches and circuit breakers for general execution requirements.

B. Install TSS subsystems as indicated on TSS drawings.

3.8 INSTALLATION – INFRASTRUCTURE

A. Locate main TSS power equipment, UPS units, and panels in Main EC Room.

B. Equipment Racks:

1. Post 1.

a. Place short racks near deal tray.
b. Place tall racks on side or rear solid walls of Post 1.
c. Clearly label individual modules in each rack.
d. Provide adequate cable length between equipment racks and wall-mounted wire ducts and pull boxes to allow racks to be moved for TSS equipment maintenance access and other facility repairs. This cable length is typically 2 to 4 meters. Secure excess cable length with removable cable ties behind rack.

2. Safe Haven and Safe Area:

a. Equipment rack must receive power from local PCC power.

3. Outlying Buildings: Subpanels and UPS units may be located in Sub-EC Rooms for TSS equipment serving the buildings.

3.9 GROUNDING

A. The Technical Security System must be grounded in conformance with Chapter 2 of the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO) and NFPA 708. Refer to Section 260525 "Grounding and Bonding for Electrical Systems."

B. UPS: As part of a "Separately Derived System" as defined by NFPA 70, neutral conductor of voltage regulator output must be connected to local grounding electrode.

C. Refer to individual specifications on technical security system for additional grounding requirements.

3.10 FIELD QUALITY CONTROL

A. Pretesting: At least one month prior to Accreditation, perform complete pretesting of systems which require field testing to determine compliance of system with requirements in the Contract Documents. Correct deficiencies observed in pretesting. Replace malfunctioning or damaged items with new ones and retest until satisfactory performance and conditions are achieved.

B. Testing of Cable:

1. Fiber Optic Cable:

a. Test cable plant at 850 nm and 1300 nm.
b. Test fusion splice for insertion loss.

2. CAT 6:

   a. Test in accordance with TIA Category 6 permanent link criteria.

C. Tag all equipment, stations, and other components at which tests have been satisfactorily completed.

D. Barcode Labeling: Barcode labels will be government furnished, and made available through the Project Director/COR. The contractor is responsible for:

1. Barcode labeling of TSS equipment costing $500 or more that contains serial numbers, all SVS cameras, SVS network equipment, and TSS equipment costing $1500 or more.
2. Affixing labels prior to installation in a location where they will be readily visible once the equipment is installed.
3. The completion of a Barcode matrix using Word Excel with the following information:

   a. Barcode #
   b. Serial #
   c. Manufacturer
   d. Model/Part #
   e. DS Catalog #
   f. Purchase Date
   g. Install Date
   h. Post Name

4. Provide completed Bar Code matrix to OBO/SM/TSB or Project Director/COR.
5. Removing and destroying labels from damaged uninstall able equipment. Unused barcodes labels should be returned to the Government. Barcodes that are destroyed or damaged barcodes that are rendered unusable do not need to be tracked or returned to the Government.

E. Accreditation: Contractor must perform quality control activities associated with Accreditation.

END OF SECTION 280508

SECTION 281005 – TECHNICAL SECURITY ACCESS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Active Vehicle Barrier/gate system controls
2. Door control system

B. Related Sections include the following:

1. Section 087155 “Security Door Hardware” for coordination of door control requirements.
2. Division 26 electrical sections for general electrical requirements, including Section 260525 “Grounding and Bonding for Electrical Systems.”
3. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
4. Section 281805 “Technical Security Access Equipment” for access equipment which do not require detailed assembly design for installation into the Project, such as X-ray machines and explosives detectors.
5. Section 282305 “Security Video System (SVS).”
6. Section 283105 “Technical Security Intrusion Detection System.”
7. Section 284626 “Addressable Fire Alarm Systems” which interfaces with this system as identified in this Section.
8. Section 285115 “Security Management System Enterprise (SMSe).”
9. Applicable Division 32 Section for interface with vehicle barriers.

1.2 SYSTEM DESCRIPTION

A. Active Vehicle Barrier Control System: Facilitate operation of barrier controls at applicable CAC guard booths with active Secondary-control units and Post 1 with Primary override controls. House these controls in TSS equipment racks. Post 1 controls will be rack mounted. CAC guard booths will be desktop mounted.

B. Door Control System:

1. Facilitate remote control and monitoring of security doors from Post 1, local guard post for CACs, and other buildings with PACs.
2. Functions include:

   a. Individual control for all FE/BR doors.
   b. Emergency Lock-Up (ELU) function to secure all doors from a guard station.
   c. Individual door release from ELU function.

d. Interfaces with the Fire Alarm Control Unit (FACU) to unlock the internal security/egress doors.

C. Access Control:

1. CAA Suite Entrance Doors: Remote operation from OMS.

1.3 SUBMITTALS

A. Product Data: Include components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories.

B. Shop Drawings: Detail assemblies of standard components that are custom assembled for specific application on this Project.

C. Equipment and System Operation Description: Include method of operation. Show sequence of operations for manually and automatically initiated system or equipment inputs. Description must cover this specific Project; manufacturer's standard descriptions for generic systems are not acceptable.

D. Contractor QC Pre-Check Certification: Refer to Section 280508 "Common Work Results for Technical Security Systems (TSS) for combined certification for contractor QC for all TSS sub-systems.

E. Operation and Maintenance Data: Include the following:

1. Operating and maintenance instructions.
2. Data for each type of product, including features and operating sequences, both automatic and manual.
3. Parts inventory list.
4. Purchase source for operating and maintenance materials.

1.4 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 "Common Work Results for Technical Security Systems (TSS)."

PART 2 - PRODUCTS

2.1 GENERAL

A. See separate contract attachment, "DS TSS Equipment List" for a listing of products that have been approved for general use in DOS overseas facilities. The selection from this list must be as appropriate for the project.

B. Door Control Systems:

1. Wire accessible pneumatic pump control box using hardware identified in separate contract attachment, "DS TSS Equipment List."
2. Provide door control package suitable for integration with accessible door opener.
3. Provide door control package for all doors assigned a SHW door hardware set containing electrical components, such as a magnetic lock, switch, or electrically released lock. Refer to Section 087155 "Security Door Hardware" for SHW door hardware.

C. Access Control System Accessories:

1. Provide remote release pushbutton.
2. Provide 24-Vdc lock power supply.

PART 3 - EXECUTION

3.1 INSTALLATION – SYSTEM- SPECIFIC

A. See Section 280508 "Common Work Results for Technical Security Systems (TSS)" where use of laptop computer is necessary for programming.

B. Active Vehicle Barrier/Gate System Controls:

1. Coordinate with Section 282305 "Security Video System (SVS)" to facilitate monitoring of barrier functions above with dedicated/fixed camera.
2. Route cabling for controls through dedicated conduit to Post 1 through Main EC Room with no terminations.
3. Provide override control in TSS equipment racks of Post 1.
4. When hydraulic power units are used by barrier system, provide security alarm contact on enclosure door monitored by Intrusion Detection System (IDS). See Section 283105 "Technical Security Intrusion Detection Systems" and applicable Division 32 Section on vehicle barriers.

C. Door Control System:

1. CAC Controls:

    a. Vehicle CAC: Operate from guard booth.
    b. Pedestrian-Only CAC: Operate from guard booth when present.

2. Provide override controls for each individual remote door control module and rack-cutoff for each remote rack at Post 1.
3. Install rack-mounted control modules; for doors penetrating security hard lines at building perimeters; in applicable building. Wire these modules into Main EC Room or sub-EC for applicable building, allowing interconnection and power supply interface with these doors.
4. Refer to Division 08 door hardware specifications for wall-mounted displays and interface devices at fire exits through building hard lines and at some automated access control doors. These doors require wall or header mounted displays and/or interface devices. Security doors in path of egress must unlock via Fire Alarm Control Unit (FACU) upon activation of fire alarm system; provide connection between door control rack and FACU. Modules for fire egress doors must be installed in separate rack than for other doors. Refer to Section 284626 “Addressable Fire Alarm Systems” for FACU and battery.
5. Utilize door control power supplies in Main EC Room or Sub-EC Room associated with each building.

    a. At close or moderate distances from Main EC Room or sub-EC Rooms, normal gauge wiring is usually adequate.
    b. At longer distances from Main EC Room or sub-EC Rooms, higher gauge wire if be necessary, or locate power supply closer to lock.

6. Provide four-hour minimum back-up power for all functions of door control system. Use DS Approved batteries for AES power supplies.
7. Unless noted otherwise, all doors assigned an “SHW” door hardware set in Section 087155 “Security Door Hardware” requires conduit and junction box installed at door header; see Division 26 Section on raceways and boxes.
8. At doors designated for monitoring only, wire to Electrical Cabinet, and extend to low-level alarm annunciation panels in Post 1 or to appropriate Intrusion Detection System (IDS); see Section 283105 “Technical Security Intrusion Detection Systems.”
9. Accessibility Features:

    a. Install accessible power-activation buttons at Public Access Control (PAC) ingress doors to facilitate unassisted access during when PAC lobby is manned by guards. Provide ability to disable this button for after-hours security using disconnect switch in hardened guard booth for PAC area and Post 1. Post 1 will have primary control of the ADA function. When the ADA function is disabled from Post 1 it shall not be able to be turned back on from any other location.
    b. Limit capability to operate power activation of accessible doors exiting PAC to guards in hardened booth.
    c. Provide doors exiting PAC with power activation buttons to facilitate unassisted exiting. Guard in Post 1 or in hardened guard booth serving PAC area must be able to disable this function.

d. Do not install accessible pneumatic pumps further than 15 meters from affected door.
e. Place pneumatic tubing in discrete conduit; pneumatic tubing must not share conduit with electrical and signal cable.

10. Refer to separate contract attachment "Technical Security (TS) Application Guidelines" for the systems identified below for detailed installation instructions and adjustment to manufactured systems.

a. LCN Auto-Equalizer Pneumatic Control System.
b. AES Door Control System.
c. Moniteq CC-8521B Single Door Access Control System.

11. Access Control Accessory Installation at CAA:

a. Install remote release pushbutton at or near OMS desk.
b. Install power supply at OMS desk or above Suite entrance door.

3.2 GROUNDING

A. Conform to Chapter 2 of the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO) and NFPA 780. Refer to Section 260525 "Grounding and Bonding for Electrical Systems."

3.3 FIELD QUALITY CONTROL

A. Inspect field assembly and connection of components, and test operation of controls.

1. Perform these quality control procedures prior to Quality Assurance inspection by the Government.

3.4 DEMONSTRATION

A. Engage service representative to train Government personnel to adjust and operate security equipment. Refer to Division 01 Section "Demonstration and Training." Provide demonstrations for the following systems:

1. Active vehicle barrier/gate system controls.
2. Door control system.

END OF SECTION 281005

SECTION 281805 – TECHNICAL SECURITY ACCESS EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. X-Ray Machine
2. Trace detector unit
3. Walk Through Metal Detector (WTMD).

B. Related Sections include the following:

1. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
2. Section 281005 “Technical Security Access Systems” for access subsystems that are assembled as systems, and as such require detailed assembly and coordination design for installation into the Project. These include subsystems such as door controls and vehicle barrier controls.
3. Section 283105 “Technical Security Intrusion Detection Systems.”

1.2 SYSTEM DESCRIPTION

A. X-Ray Machines: Provide package x-ray machines at the following locations:

1. Public Access Control (PAC) areas at each CAC.

B. Trace Detector Unit:

1. Provide units for screening vehicles and pedestrians. Locate in Guard Booths at CACs.

C. WTMD:

1. Provide at Public Access Control (PAC) areas, Service Entrance of the NOB and at personnel screening area of each CAC for screening embassy staff and visitors.

1.3 SUBMITTALS

A. Product Data: Include components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories.

B. Contractor QC Pre-Check Certification: Refer to Section 280508 "Common Work Results for Technical Security Systems (TSS) for combined certification for contractor QC for all TSS sub-systems.

C. Operation and Maintenance Data: Include the following:

1. Operating and maintenance instructions.
2. Data for each type of product, including features and operating sequences, both automatic and manual.
3. Parts inventory list.
4. Purchase source for operating and maintenance materials.

1.4 OWNERSHIP OF PROPRIETARY MATERIAL

A. The Government shall retain all rights to software and passwords for software identified in this Section.

B. The Government will sign a copy of the manufacturer's standard software and firmware licensing agreement as a condition of this contract. Such license must grant use of all programs and application software to the Government as defined by the manufacturer's license agreement, but must protect the manufacturer's rights to disclosure of Trade Secrets contained within such software.

C. The licensing agreement must not preclude the use of the software by individuals under contract to the Government for commissioning, servicing, or altering the system in the future. Use of the software by individuals under contract to the owner must be restricted to use on the owner's computers and only for the purpose of commissioning, servicing, or altering the installed system.

D. All project developed software, files and documentation shall become the property of the Government.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Requirements for installer qualifications of technical security systems identified in Section 280508 "Common Work Results for Technical Security Systems (TSS)" are not applicable for this section.

1. X-Ray Machines: . All X-Ray machines are required to be installed by a certified technician.

B. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 "Common Work Results for Technical Security Systems (TSS)."

1.6 EXTRA MATERIALS

A. Trace Detector Unit:

1. Supply 90 days of consumable support items for this unit. The supply must commence at the project commissioning date.

PART 2 - PRODUCTS

2.1 GENERAL

A. See separate contract attachment, “DS TSS Equipment List” for a listing of products that have been approved for TSS equipment identified in Article on SYSTEM DESCRIPTION. Provide all products for x-ray machine from list unless otherwise noted.

B. X-Ray Machines:

1. Smith Detection HI-SCAN 6040i X-ray Inspection System and 5030i for desktop version.
2. Software: Install the software identified below and provide copy as part of project closeout. Software versions must be as installed at time of system acceptance.

   a. Advanced Package Software: Package includes; Image Store System, X-ACT, Hi-TIP, High Density and OTS Xtrain.
   b. X-plore Software.
   c. Xport Software.

3. Uninterruptable Power Supply (UPS): Provide UPS and UPS Automatic Shut Down Kit both dedicated to X-Ray machine.
4. Roller Table.

C. VOTI XR3D-50s/50/60s/60 X-ray Scanners

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine clearance space and electrical outlets before installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install equipment in accordance with manufacturer's instructions.

B. X-Ray Machines:

1. Refer to separate contract attachment "Technical Security (TS) Application Guidelines" for the systems identified below for detailed installation instructions and adjustments to manufactured systems.

a. Smiths Detection X-Ray Inspection Systems (HI-SCAN 6040i, 6030i, 7555i).
b. Smiths Detection X-ray Inspection Systems 5030i (desktop version).

2. Power source for associated X-ray UPS must be post power from wall outlet.

C. Detection Equipment:

1. Provide back-up power from panel "EU" powered by a TSS UPS; see Part 3 Article on INSTALLATION – TSS PANELBOARDS in Section 280508 "General Work Results for Technical Security Systems (TSS)."

D. WTMD:

1. Place WTMD minimum 500 mm from x-ray machines, doors, or other moving metal construction or equipment.
2. Install dedicated power outlet fed from Panel "EU."
3. Use manufactures calibration/test object tool.

3.3 FIELD TESTING AND ADJUSTING

A. X-Ray Machine: A certified technician must field test and calibrate equipment.

B. Trace Detector Unit: Contractor must perform manufacturer's recommended installation quality control procedures.

C. WTMD: Contractor must perform manufacturer's recommended installation quality control procedures.

3.4 DEMONSTRATION

A. The certified technician used to install equipment shall train Government personnel to adjust, maintain and operate security equipment. Refer to Division 01 Section "Demonstration and Training."

1. X-Ray machine.
2. Trace Detector Unit
3. Walk Through Metal Detector (WTMD).

END OF SECTION 281805

SECTION 282305 – SECURITY VIDEO SYSTEM (SVS)

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Security video system (SVS) utilizing Internet Protocol (IP); formerly identified as high-definition video system (HDVS) and closed-circuit television (CCTV) system.

B. Related Sections include the following:

1. Division 26 electrical sections for general electrical requirements.
2. Section 271119 “Communications Termination Blocks and Patch Panels”.
3. Section 271305 “Communications Backbone Cabling.”
4. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
5. Section 283105 “Technical Security Intrusion Detection Systems”.
6. Section 285115 “Security Management System Enterprise (SMSe).”

1.2 SYSTEM DESCRIPTION

A. General: Provide cameras with housings that accept mount conforming to each specific application (e.g., wall, pole, or ceiling). Provide supporting system infrastructure and wiring to cameras. Provide approved configuration and operating system to ensure camera operates correctly on Genetec system.

B. Security Video System (SVS):

1. Systems consists of interoperable hardware, software, networking components, database components, and IP communication protocols.
2. System must facilitate viewing of live and recorded video images and controlling of all network cameras.
3. Network must be implemented with redundancy features; when primary system is impaired, all cameras, network, and server components must automatically switch over to redundant system.
4. Network must be protected by firewall from untrust to trust side of SVS.
5. System must utilize Fiber Optic backbone to support distance greater than 100m and data rates over 1000Mbps. Fiber optic backbone must use either multi-mode 50 um fiber or single mode 9 um fiber, depending on distance runs.

C. SVS System Objectives:

1. Assist guard force by providing real-time visual input, supporting access control and security incident response.
2. Assist security personnel in assessing security events detected through other means (e.g., through alarms, duress buttons).
3. Capture and preserve visual record, for 30 days for lock and leave facilities and 14 days for constant presence oversea posts, of significant acts directed toward Department overseas facilities, and provide forensic evidence to security officers for use in investigations.

D. SVS Coverage: Provide coverage for the following areas:

1. Fixed SVS Cameras: These cameras must view:

a. Compound Perimeter: View compound perimeter in such a way that top and exterior side of perimeter wall or other barrier are visible. Field of view for these cameras must overlap to ensure complete coverage to prevent blind spots. Cameras must not be more than 45 meters (150 feet) apart. Install perimeter SVS equipment in compliance with anti-climb provision.
b. Compound Access Control (CAC) Facilities and Public Access Control (PAC). SVS fixed cameras must view personnel and public queuing areas. These views must include visitor access and screening areas, with overall view of area and of walk-through metal detectors (WTMD).
c. Vehicle gates and vehicle screening areas, including front of approaching vehicle. These views allow marine security guard (MSG) or local guard responsible for supervising vehicle inspection to view both vehicle and screening area, including both entry and exit gates.
d. Provide unobstructed view of active vehicle barriers, and at compound parking structures (including those on compound outside of perimeter compound wall/fence).
e. Receiving docks and delivery areas, including overall view of exterior area and loading or access doors.
f. External side of all exterior hardline doors and roof hatches, including every building on compound.
g. Attack side of fire exit doors.
h. Consular section teller windows (including visa section, American Citizen Services, and other consular waiting areas) with views of public waiting area. Supplemental PTZ surveillance cameras within the consular section may be used to supplement views from fixed cameras.
i. CAA Safe Haven and Safe Area:

1) Cameras shall view entrances and egresses. Install these cameras in inconspicuous manner and mount them at safe and secure distance to view side of door subject to attack. These cameras are not to be tied into main SVS network, and only connect to monitors in their respective areas. These cameras shall only function when the area is in active use. Video for these cameras shall only be recorded at lock and leave facilities. Each camera must

have the ability to have power removed independently from the Safe Haven/ Safe Area. These camera and lens combinations must be capable of recognition;

j. NON CAA Safe Haven and Safe Area:

1) Cameras shall view entrances and ingresses. Install these cameras in inconspicuous manner and mount them at safe and secure distance to view side of door subject to attack. These cameras shall be tied into the main SVS network. These cameras shall be viewable by Post 1 and the Safe Haven\Safe Area. Continuous power for these cameras shall originate in the Security Interface Cabinet (SIC) room and be supplied from the essential uninterruptible (EU) power. Video from these cameras shall be recorded by the Post's SVS system.

k. Public Access Areas:

Multipurpose Room (MPR).
American Center.

l. Interior view of Main EC room that houses SMSe equipment.
m. Gallery/Atrium space.
n. External/attack side of NOB/NOX roof, balcony, and terrace doors,
o. Attack side of interior hardline doors, except for the Interview Room. Exterior of Representational residence (e.g., CMR) located on same compound as Chancery.
p. [Areas required by Lock and Leave (L&L) requirements in accordance with Chapter 4 of the OBO Building Code (International Building Code as amended by OBO.]
q. [Elevator lobbies, when post is in shared building, and when elevator provides access to CAA entrance.]
r. MSGR Emergency Residential Response Room looking at inside of door.

2. PTZ Cameras: These cameras must view:

a. CAC's: Exterior side of entrances and exits to compound and to screening area.
b. Main building entrance to office buildings.
c. Pedestrian areas with high traffic volume.
d. Vehicle movement routes on interior grounds and property.
e. Surface parking at compound site, whether inside or outside of compound perimeter wall/fence.
f. Inside and outside compound perimeter wall/fence, including gate entry and exit points.
g. Compound Parking Structures: Provide at least one camera per ramp.
h. Install at least four PTZ cameras on NOB and NOX rooftop to supplement coverage within compound perimeter wall/fences.

i. Provide PTZ cameras on all building rooftops to aid in compound surveillance. These locations are preferred as infrastructure is within building and not exposed to vandalism.
j. Perimeter Wall: Install at corners and curved areas to supplement views from fixed cameras, removing blind spots in overall coverage.
k. Vehicle Sally Port: Provide coverage of blind spots of interior to supplement views from fixed camera.
l. PACs: Provide cameras to supplement views from fixed cameras.
m. Provide coverage of all walkways and driveways leading from CACs to main office building and consular entrances.
n. Provide coverage of consular public walkway and exterior waiting areas.

3. Video Recorders:

a. Four different sizes of Network Video Recorder (NVR) are included in the "DS Approved TSS Equipment List" (separate contract attachment). Selection must be based on number of cameras that are being recorded. To determine size, identify number of cameras in system design and multiply by 1.15 (to account for future growth); select NVR model that accommodates number calculated.
b. [Lock and Leave Posts: Provide dedicated Digital Video Recorder (DVR) or Network Video Recorder (NVR) in Main EC Room for CAA cameras. Coordinate with intrusion detection for Main EC Room; see Section 281605 "Technical Security Intrusion Detection Systems."]

4. Server/Equipment Racks: Core server and network equipment is located in Main EC Room.
5. Remote Interface Cabinets (RIC) and Interior Interface Cabinets (IIC):

a. Use to connect perimeter cameras to network only when closest sub-EC is further than 90 meters from camera or group of cameras.
b. RIC use should be minimized, and only used when camera placement necessitates.
c. IIC are installed in interior temperature-controlled rooms, and thus can use switches that are not ruggedized.

6. Workstation Type: Type is based on number of camera and monitors in system, as follows:

a. High End Workstation: For up to 32 HD camera streams and eight monitors
b. Medium Workstation: For up to 16 HD camera streams and four monitors
c. LGF Workstation: For up to 8 HD camera streams and two monitors

7. Workstation Distribution and Configuration:

a. Main EC Room: High End Workstation with one rack mounted 475 mm (19 inch) monitor.

b. Post 1: High End Workstation with minimum of two 1050 mm (42 inch) or larger monitors, and two 475 mm (19 inch) or larger monitors. An additional 475 mm (19 inch) or larger monitor will be located in the rack above the vehicle barrier controls.
c. Post 2, if applicable: Four 475 mm (19 inch) monitors.
d. Safe Haven: High End Workstation with rack mounted equipment. One 475 mm (19 inch) monitor.
e. RSO Office: One 475 mm (19 inch) monitor.
f. ESC Office: One 475 mm (19 inch) monitor.
g. Each CAC: Each CAC includes one dedicated LGF workstation located in NOB Main EC Room. Each of these workstations must have minimum one 475 mm (19 inch) monitor, but no more than two 450 mm (19 inch) monitors. Video signal will transmit from workstation to each monitor through video extender.
h. [For Lock and Leave posts, controls required at CAC workstations must use PS2 extender.]

8. Edge Switches: Utilize in remote riser closets, Sub-EC Rooms, Main EC room, and Remote Interface Cabinets (RIC).
9. Cable Installation and Management: Install with patch panels, patch cables, and fiber jumbers in accordance with Telecommunications Industry Association (TIA) standards, including TIA-568, TIA-569-B, and TIA 607-A related to data centers.

1.3 SUBMITTALS

A. General: Submit drawings, diagrams, and equipment schedules through COR to OBO/SM/SCD/TSB for review and clearance.

B. Product Data: Include system components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories. Include mounting poles and other accessories.

C. Shop Drawings: Submit detailed block diagram showing components and infrastructure. Indicate components with model numbers.

D. Equipment Schedules: Submit in spreadsheet form indicating the following:

1. Location.
2. Camera: Type and model.
3. Lens: Type and model for fixed cameras.
4. Designation.
5. IP address.
6. Firmware version used in camera model.
7. Archiver designator.
8. Switch port.
9. Power source.
10. Housing model.
11. Mount model.

E. Installer Qualifications: Include applicable industry qualifications and required training certificates.

F. Contractor QC Pre-Check Certification: Refer to Section 280508 "Common Work Results for Technical Security Systems (TSS)" for combined certification for contractor QC for all TSS sub-systems.

G. Operation and Maintenance Data: Include the following for components not from the DS approved list:

1. Operating and maintenance instructions.
2. Data for each type of product, including features and operating sequences, both automatic and manual.
3. Parts inventory list.
4. Purchase source for operating and maintenance materials.

1.4 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 "Common Work Results for Technical Security Systems (TSS)".

B. Design and Installation Qualifications: SVS designers and installation technicians who retain applicable industry certifications and factory training in order to purchase products, receive technical support, and support warranty provisions. Contractor personnel involved in the work of the SVS system must receive all applicable training required by each system and vendor.

1.5 PROCUREMENT AND SHIPMENT

A. Procure and ship the following via secure means in accordance with Division 01 Section "Construction Security":

1. Directory server.
2. Network video recorders (NVR).
3. Trusted switches.
4. Firewall.
5. Workstation.

PART 2 - PRODUCTS

2.1 GENERAL

A. Approved Products: See separate contract attachment, "DS Approved TSS Equipment List" for a listing of products that have been approved for use in DOS overseas facilities. The selection from this list must be as appropriate for the project to provide functional system in accordance with the Article on SYSTEM DESCRIPTION.

2.2 SOFTWARE

A. Product configuration for trust side products (including components such as firewalls, server, workstations, and switches). Use DS approved software configurations to facilitate installation programming.

B. Vendor must obtain and furnish product software licenses and firmware for all IP equipment in system.

2.3 NETWORK

A. Provide a redundant SVS Network consisting of, but not limited to, servers, Network Video Recorders (NVR), client workstations, trusted switches, firewalls, and distribution switches.

B. Directory Server

1. Operates Video Management System (VMS) for network configuration and NVRs.

C. Network Video Recorders (NVR):

1. Capable of providing low band width image for remote viewing.
2. Capable of recording each camera at minimum of 1080.

D. Capable of retaining all recorded video for 14 days for constant presence posts, and 30 days for lock and leave posts. Trusted Switches:

1. Connects Directory Servers, viewing clients, NVRs, and Firewalls.
2. Supports redundant power supplies.

E. Firewall:

1. Protects trust side equipment from untrust equipment (e.g., cameras and edge switches). Supports redundant power supplies.

F. Distribution Switches:

1. Connects edge switches or other approved untrust devices to Firewall/Cores.
2. Supports redundant power supplies.

G. Edge Switches (8, 12, and 24 port switches): These switches provide built-in uplink ports, and may provide Power over Ethernet (PoE).

1. Provide secondary power supplies, if available with switch model.
2. Switches located in non-temperature-controlled areas require use of ruggedized type.
3. Utilize Small Form-factor Pluggable (SFP) Modules when required for distances and data rates to distribution switch.
4. For PoE configuration, verify power requirement as PoE I 802.3 at (12.95W) PoE+ is 802.3 at (25.5W)

2.4 REMOTE INTERFACE CABINET (RIC)

A. Remote Interface Cabinet (RIC): Components housed in RIC must include, but are not limited to, the following:

1. NEMA 4 enclosure with insert panel and modified with a hasp, fans and louvers.
2. Ruggedized Edge Switch.
3. Transformers.
4. Circuit breakers.
5. Patch panels.
6. fiber convertors.
7. PoE extender.

B. If RIC is located in sun-exposed location in high temperature environment, provide sun shield to reduce internal RIC temperatures.

2.5 SERVER/EQUIPMENT RACKS

A. Description:

1. Dimensions: 2100 mm (84 inches, 45U) high x 900 mm (24 inches) wide x 600 mm (36 inches) deep.
2. Components: Split mesh doors, casters and leg levelers, and two 250 mm (10 inch) cooling fans

2.6 PC WORKSTATION

A. DS approved products as selected based on parameters identified in the Article on SYSTEM DESCRIPTION and on overall system design.

2.7 ASSOCIATED COMMUNICATIONS COMPONENTS

A. Provide associated communications components to achieve functioning system. Associated components include, but are not limited to, the following:

1. CAT6 and multi-mode fiber optic cable with LC connectors.
2. Fiber optic patch panels.
3. HDVS Patch cables.
4. Fiber jumpers.

2.8 CAMERAS AND CAMERA ACCESSORIES

A. Cameras - General: Digital and IP addressable. Capable of providing low bandwidth second stream for remote viewing.

B. Cameras - Safe Havens and Safe Areas: Standalone digital systems not connected to main SVS system.

C. Cameras must be capable of recording operating with to the approved video management system (VMS). Selected camera model and firmware must on the supported device list for the approved VMS version.

D. Mounting Poles: Provide poles for mounting exterior SVS cameras.

1. Poles for pole-mounted camera must not exceed 4 meter in height.
2. [Utilize hinged wall/standalone poles.]

PART 3 - EXECUTION

3.1 GENERAL

A. See Section 280508 “Common Work Results for Technical Security Systems (TSS)” for use of laptop computer or workstation where that is necessary for programming.

3.2 NETWORK INSTALLATION

A. The Main EC Room will house primary network equipment. All equipment associated with this system must be housed in separate dedicated systems rack in that room.

3.3 WORKSTATION EQUIPMENT INSTALLATION

A. EC Room: Rack mount equipment.

B. Safe Haven and Safe Area: Rack mount equipment.

C. Post 1:

1. Position monitors so that bottom of screens are minimum of 1050 mm (42 inches) and top of screens are maximum of 2100 mm (84 inches) above finished floor.
2. Wall or Column Mounting: Utilize fully articulating and extendable mount for monitors.

3.4 EDGE SWITCH INSTALLATION

A. Install as follows:

1. Wall mount switches at location in RIC enclosure or rack mount switches in rack.
2. Connect Switches to the Distribution Switches via Fiber Optic for distances greater than 90m utilizing two uplinks for redundancy. For distance less than 90 m, use CAT6 to connect edge switch to distribution switch.
3. Connect switches to cameras via CAT6 cables if distance is less than 90m. If distance is greater than 90 m, Ethernet extender is required. Connectors must use TIA/EIA T568B pin assignments.

3.5 REMOTE INTERFACE CABINET (RIC) INSTALLATION

A. Protect RIC with Intrusion Detection System (IDS); see Section 283105 “Technical Security Intrusion Detection System”.

B. Use PoE and extenders; these have been approved for distance over 90 m.

3.6 GENERAL COMMUNICATIONS COMPONENT INSTALLATION

A. Patch Panels: Install for each SVS rack in Main EC Room and Safe Haven workstation to provide cable management and termination points. Patch panels may be used at Power over Ethernet (PoE) switch locations. The rating on the patch panel should meet or exceed the CAT6 cable rating.

B. Fiber Optic Cable:

1. Connections from each switch to other network device must use fiber optic cable when distances exceed 90m and 1 Gps. The fiber optic connectors are attached via fusion splicing and tested for insertion loss.
2. Provide patch panel.
3. To facilitate future fiber expansion, pull at least 30 percent extra with minimum of two extra strands. Terminate every strand of fiber and tested with appropriate LC connector. Install dust/end caps at disconnected or unused strands to prevent dust buildup.

C. CAT 6 Cable:

1. Use for PoE to cameras within same building in which Edge switch is located.
2. Use for PoE to fixed cameras.
3. Use for PoE+ to PTZ cameras when country's 10-year historically lowest recorded temperature doesn't drop below camera's lowest operating temperature.
4. Maximum cable distance from any camera to switch must be 90 meters. Use extenders for distances greater than 90m.

3.7 CAMERAS AND CAMERA ACCESSORIES

A. Install SVS cameras to in manner to facilitate maintenance without use of specialized equipment (e.g., hydraulic lift, scaffolding, extension ladder over 3.7 meters, or free-standing ladder). The system design must consider safety for maintenance personnel. Maximum camera installation height is 8 meters.

B. Cameras and ancillary equipment mounted on stand-alone poles must be accessible from the ground for maintenance. Pole design must consider the safety of maintenance personnel and preclude use of any specialized equipment/ladders.

C. Configure layout to gain most complete useful coverage. Use of "home" position programming is required for PTZ cameras.

D. Cameras for Safe Havens and Safe Areas must be fed directly to EAP rack.

E. Focus each camera and ensure clear daytime and nighttime view. IK10 vandal resistance rating is required for any cameras within 3 meters of the ground.

F. Install swing mounts at perimeter wall/fence and at rooftop parapet locations.

G. Mount cameras on poles as necessary to support viewing and where mounting surfaces are not available.

3.8 ELECTRICAL AND COMMUNICATIONS INFRASTRUCTURE INSTALLATION

A. Exterior cameras power configuration: Provide one of the following configurations as appropriate:

1. Powered by low-voltage circuit from power supply in Main EC Rooms and Sub-EC Rooms.
2. Powered by dedicated circuit supplied from DS-approved transformer (e.g., inside Remote or Interior Interface Cabinet (RIC or IIC)). This transformer must be circuited from dedicated circuit from panel "EU".

3. PoE/PoE+ may be used as long as total power consumption for cameras does not exceed PoE/PoE+ power ratings.

   a. Cameras with heaters and blowers may exceed power ratings of PoE/PoE+.

B. Power SVS equipment by panel "EU"; see Article on INSTALLATION – TSS PANELBOARDS in Section 280508 "General Work Results for Technical Security Systems (TSS)". UPS supplying EU power must provide 15 minutes of run time and be backed up by compound engine generator; see Section 263214 "Engine Generators." If compound generator is not available for backup, use UPS to provide one hour of run time at full load.

C. House step-down transformers supplying cameras in NEMA weatherproof enclosure if required.

D. Safe Haven SVS rack must be powered from rack mounted UPS. Connect this UPS to breaker in PCC panel that is feed from PCC generator.

   1. UPS must supply 15 minutes of run time to equipment.

E. Refer to separate contract attachments "Technical Security (TS) Application Guidelines"; Guidelines with detailed installation instructions and adjustments to manufactured systems may be available for this system.

   1. Deployment Document Genetec Security Center

3.9 GROUNDING

A. Conform to Chapter 2 of the OBO Electrical Code (NFPA 70 "National Electrical Code" as amended by OBO) and NFPA 780.

B. Provide protection for SVS camera poles at the following locations:

   1. Compound perimeter wall-mounted SVS cameras must be installed with copper clad steel grounding conductor and air terminal when mounted to poles or wall.
   2. Building-mounted SVS cameras connected to building roof lighting conductors.

3.10 FIELD QUALITY CONTROL

A. Manufacturer's Representative: Engage factory-trained service representative to inspect and adjust field assembly and connection of components, and to start up and commission system.

   1. Perform these quality control procedures prior to Quality Assurance inspection by the Government.

3.11 DEMONSTRATION

A. Engage quality assurance representative to demonstrate proper operation of SVS system, and train post staff on operation and maintenance of system.

END OF SECTION 282305

SECTION 283105 – TECHNICAL SECURITY INTRUSION DETECTION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Intrusion Detection System (IDS).

B. Related Sections include the following:

1. Section 083454 "Forced-Entry (FE)/ Ballistic-Resistant (BR) Door Assemblies."
2. Section 087155 "Security Door Hardware."
3. Division 26 electrical sections for general electrical requirements.
4. Section 280508 "Common Work Results for Technical Security Systems (TSS)."
5. **[Section 282305 "Security Video System (SVS)" interface for Lock and Leave installations.]**
6. Section 285115 "Security Management System Enterprise (SMSe)."

1.2 SUBMITTALS

A. Product Data: Include components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories.

B. Contractor QC Pre-Check Certification: Refer to Section 280508 "Common Work Results for Technical Security Systems (TSS) for combined certification for contractor QC for all TSS sub-systems.

C. Operation and Maintenance Data: Include the following:

1. Operating and maintenance instructions.
2. Data for each type of product, including features and operating sequences, both automatic and manual.
3. Parts inventory list.
4. Purchase source for operating and maintenance materials.

1.3 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 "Common Work Results for Technical Security Systems (TSS)."

PART 2 - PRODUCTS

2.1 GENERAL

A. See separate contract attachment, "DS TSS Equipment List" for a listing of products that have been approved for general use in DOS overseas facilities. The selection from this list must be as appropriate for the project.

2.2 SYSTEM DESCRIPTION

A. Intrusion Detection System (IDS): System includes controllers, power supplies, sensors, processors, switches, and other devices to detect change in environment. The system also includes ancillary equipment to facilitate monitoring and recording data received from system. CLAN devices are required for Standard and Enhanced systems. In accordance with DOS requirements, IDS controller must be limited to a maximum of four partitions for LAA and CAA (restricted) controllers.

1. Standard IDS:

a. See Table 3.4-1, "Standard IDS Devices" at end of this Section for location parameters for standard IDS components included in that table.
b. Protect areas identified in Table 3.4-1, "IDS Devices," with low-level alarms monitored by an annunciation panel in Post 1(i.e., without control unit and keypad).
c. [For Lock-and-Leave buildings provide a control unit and keypad for building perimeter]

2. Enhanced IDS:

a. See Table 3.4-2, "Enhanced IDS Devices" at end of this Section for location parameters for enhanced IDS components included in that table.
b. Controlled Access Area (CAA):

1) Suites/Rooms: Protect every workspace and office within a CAA suite with volumetric motion sensors and door contacts. System is monitored with a keypad and controller and annunciates on an encrypted receiver.
2) CAA circulation: Protect corridor, stairwell, work areas and support spaces not located within suite(s) with volumetric motion sensors and door contracts. System is monitored with a keypad and a controller (located in each CAA floor) and annunciates on an encrypted receiver.

c. Limited Access Area (LAA):

1) LAA Rooms/Suites: Protect with volumetric motion sensors, keypad, and door contacts. System is monitored with keypad and controller and annunciates on an encrypted receiver.
2) Horizontal LAA: Protect with volumetric motion sensors and door contacts. System is monitored with keypad and controller and annunciates on an encrypted receiver.
3) Vertical LAA: Protect with volumetric motion sensors and door/hatch contracts. System is monitored with keypad and controller and annunciates an on encrypted receiver.

d. [For Lock-and–Leave posts, do not provide encrypted receiver. CAA Controller must act as standalone system with printer.]

2.3 SYSTEM COMPONENTS

A. Door Monitor Switches: High-security biased/balanced magnetic contacts. For doors receiving security door hardware, magnetic contacts will be provided with the door; see Section 083454 “FE/BR Doors Assemblies,” and Section 087155 “Security Door Hardware.”

B. Volumetric Motion Sensors.

C. System Power Supply: Supply must include battery-backup.

D. Control Unit.

E. Input Module, Output Module, Encryption Modules, Automation Modules.

F. IDS annunciator.

1. Standard:

a. Monitored by an annunciator panel in Post 1.

2. Enhanced:

a. Operated by a keypad and controller.
b. Monitored by separate encrypted receiver in Post 1.

G. Systems Software: Provide and utilize manufacturer’s standard software developed to facilitate installation programming.

PART 3 - EXECUTION

3.1 INSTALLATION

A. IDS - General:

1. Connect each IDS alarm panel to annunciator panels in Post 1 through Main EC Room.
2. Alarm and tamper circuits for all intrusion detection devices must annunciate independently for all panel classifications (i.e., standard and enhanced).
3. Refer to separate contract attachment "Technical Security (TS) Application Guidelines" for the systems identified below for detailed installation instructions and adjustments for manufactured systems.

   a. Cinch Protector Application Guidelines.

B. Standard IDS:

1. Connect low-level alarms to separate alarm annunciator from one used for enhanced IDS.
2. For doors which require remote locking function from Post 1, install and/or connect door switch at each door to alarm annunciation panel.
3. Provide line supervision between sensor and monitor panel.
4. Monitor TSS power supply AC Fail and Low Battery alarm outputs. Wire as one zone.
5. Volumetric Motion Sensor tamper and alarm must be monitored as two separate zones.
6. Terminate unused monitor zones in Main EC Room with the required resistance.
7. Utilize additional Input Modules with remote modules to create remote input collection hubs from compound outbuildings located in Sub-EC Rooms.

C. Enhanced IDS:

1. General:

   a. Connect enhanced alarm systems to a separate encrypted annunciator panel.
   b. Door switches: Install at all perimeter doors, systems rooms, secure storage rooms and roof hatches.
   c. Monitor tamper detection for all IDS equipment cabinets, or sensors with removable covers. Tamper detection must annunciate at monitoring station and must identify individual component experiencing tampering.
   d. Input Module, Output Module, Encryption Modules, Automation Modules:

      1) Install modules in metal tamper-protected enclosures to accommodate conduit termination and to provide protection.

   e. [Love and Leave Installation: Separate enhanced IDS is required for Lock and Leave facilities.

1) Install associated panel in EC Room; this is the Lock and Leave panel.
2) Panel Partition 1 must be for EC Room. Panel Partition 2 must be for building perimeter doors, motion sensors, and interior hard line perimeter doors.
3) Install keypads on secure side of main EC Room, Lock and Leave primary doors, and Lock and Leave bypass doors.
4) Connect controller module to printer to facilitate monitoring of system events.]

2. CAA Suites:

a. Configure system so that each office suite is discrete system with separate control unit and keypad within space they are protecting.
b. Mount control unit below suspended ceiling. When available, mount unit in discreet location within office suite (e.g., coat closet, storage room); otherwise, mount or near interior side of suite entrance door.
c. Install keypad near interior side of suite entrance door with no direct line of site from the perimeter entry.
d. Volumetric Sensor coverage: Protect suite interior with volumetric motion sensors, including the following:

1) Suite perimeter doors
2) Keypads
3) Every computer workstation; consider distance, angle and height of workstation partitions and file cabinets.
4) Doors: Suite perimeter doors and selective interior doors (e.g., Systems Rooms and Secure Storage Rooms).

3. CAA Circulation and common areas:

a. Door Contacts:

1) CAA entrance/exit to and from GWA, including stairs connecting CAA with General Work Area (GWA).
2) Roof hatches and doors.
3) Conference Rooms.
4) FAX Rooms.
5) TDY/Growth Rooms.
6) Telecom, Electrical, and Mechanical Rooms. (CAA Telecom rooms must be on a separate partition or separate panel.

b. Volumetric Sensor:

1) Entrance and exit doors.
2) Roof doors and hatches.
3) Corridors.
4) CLAN drop/outlet locations.

c. Keypads

1) Keypads for CAA Circulation areas must be surface mounted when on a wall that is shared with LAA or GWA.

4. LAA Spaces:

a. Locate controller in an LAA room or LAA suite. Since controller is limited to four partitions, this same controller can monitor other LAA spaces functionally related, adjacent, and located on the same floor of the building.
b. Mount control unit below suspended ceiling. When available, mount unit in discreet location within room (e.g., coat closet, storage room); otherwise, mount or near interior side of entrance door.
c. Install keypad near interior side of entrance door for each LAA space.
d. Monitor doors with contacts.
e. Monitor keypad and space with a volumetric sensor.

5. Horizontal LAA

a. Provide a separate control unit and keypad located in space or adjacent CAA or LAA.
b. Monitor door contacts.
c. Monitor space with a volumetric sensor.

6. Vertical LAA

a. Provide a separate control unit and keypad in adjacent CAA or LAA.
b. Monitor door and hatch contacts.
c. Monitor space with a volumetric sensor.

7. [Lock and Leave

a. Controllers must act as “standalone” system; it must not report to annunciator.
b. Provide dedicated fixed camera coverage of interior side of CAA entrances and exits.
c. Camera must provide view of keypad when present.
d. Upon valid PIN entry, SVS camera must be disabled.
e. Coordinate dedicated Digital Video Recorder (DVR) or Network Video Recorder (NVR) in Main EC Room for CAA cameras with intrusion detection for Main EC Room.]

D. Partitioning: IDS controllers may be subdivided or partitioned to service different offices of the same agency. Partitioning is permitted subject to all of the following conditions:

1. Each IDS controller is limited to a maximum of 4 partitions for LAA and CAA Restricted.
2. An IDS controller that is partitioned must only monitor spaces that are functionally related, adjacent, and located on the same floor of the building.
3. IDS user interface or sensor wiring must not pass through a floor or ceiling from a monitored space on one floor to a monitored space on another floor. As an exception, vertically aligned riser rooms may be partitioned from a common IDS controller.
4. For each partition, user interfaces (keypads) must be installed inside the monitored space, located near the primary entrance door. Keypads for CAA areas sharing wall with GWA or LAA must be surface mounted.
5. IDS system controller and its partitions must be installed in the same security access area (CAA, and LAA). As an exception, an IDS installed in CAA restricted may be partitioned to include the surrounding LAA buffer; the controller must be installed in CAA.
6. Partitions must stay within a building. Do not extend a partition from one building to another.

3.2 FIELD TESTING AND ADJUSTING

A. Engage manufacturer's service representative to field test and adjust detection systems.

1. Intrusion Detection System (IDS).

a. Verify that motion sensors initiate an alarm condition when a person walks four consecutive steps in any direction at a rate of one step per second.
b. Verify that door sensors produce an alarm before doors they monitor have opened a distance of 25 mm (1 inch); measure this at latch.

3.3 DEMONSTRATION

A. Engage manufacturer's service representative to train Government personnel to adjust and operate security equipment. Refer to Division 01 Section "Demonstration and Training."

1. Intrusion Detection System (IDS).

3.4 SCHEDULES

A. Provide standard IDS devices in accordance with Table 3.4-1, "Standard Intrusion Detection System (IDS) Devices."

B. Provide enhanced IDS devices in accordance with Table 3.4-2, "Enhanced Intrusion Detection System (IDS) Devices."

TABLE 3.4-1

END OF SECTION 283105

SECTION 283325 – TSS INTERCOMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies TSS intercommunication systems for the following types of functions:

1. Facilitate public access control by Marine Security Guards (MSG), and by Local Guards
2. Provide interface between MSG at Post 1 and Guard locations

B. Related Sections:

1. Separate Division 27 Section for non-Consular teller intercoms for MSG and Post personnel interface at teller windows with staff and public at locations other than the Consular Area (e.g., intercom at MSG Post-1 teller window for interface in the Main Lobby), are intercommunications systems that are fully separate from TSS systems in this Section.
2. Section 280508 "Common Work Results for Technical Security Systems (TSS)." regarding for conduits, wire ways, connection boxes, pull boxes, junction boxes, and outlet boxes permanently installed in walls, floors, and ceilings.

1.2 SYSTEMS DESCRIPTION

A. Intercoms to facilitate control of public access:

1. Guard Intercom Device: Audio device located in Guard Booth (Post 1 where applicable) for each applicable building/location.

B. MSG Post 1 intercom interface with Guard Booths, guard desks, and PAC screening areas in other locations:

1. MSG Post 1: Location of main unit for this intercom system.
2. Other locations: Provide all Guard Booths, guard desks, and PAC screening areas with substation tied to main unit in Post 1.
3. Public Intercom Device: Wall-mounted audio device located outside applicable building/compound entrance CAC.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data for each type of intercommunication system in this Section.

B. Shop Drawings:

1. Wiring diagram of system including power and signal wiring.
2. Wiring diagrams for the interconnection of all components within each system.
3. Power wiring requirements.
4. Jacks and connectors, including types, ratings, locations, and finishes.
5. Racks and enclosures, including physical size, layout, construction, external and internal wiring, ratings, and installation requirements.
6. Operator's and remote panels, including physical size, panel layout, finishing and labeling, ratings, external and internal wiring, and installation requirements.
7. Power amplifiers.
8. Identification, nomenclature, numbering systems, and layout of all nameplates, receptacle plates, and control panels; include physical size, finish, construction, and installation requirements.
9. Room layouts showing location of all equipment.

C. Design Data: Engineering data, diagrams, and acoustic calculations for each system type.

D. Qualifications: Submit evidence of manufacturer’s qualifications in accordance with Article on QUALITY ASSURANCE.

E. Contractor QC Pre-Check Certification: Refer to Section 280508 “Common Work Results for Technical Security Systems (TSS) for combined certification for contractor QC for all TSS sub-systems.

1.4 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 “Common Work Results for Technical Security Systems (TSS).”

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide devices and associated power supplies in accordance with Article on SYSTEMS DESCRIPTION, and as identified on Construction Drawings.

B. See separate contract attachment, “DS TSS Equipment List” for a listing of products that have been approved for use on technical security systems.

PART 3 - EXECUTION

3.1 PREPARATION

A. At exterior entrance locations for public access intercoms, ensure smooth mounting surface is prepared on exterior wall for mounting public intercom device. Coordinate location with Project Director/COR.

3.2 INSTALLATION - GENERAL

A. Install systems in accordance with Article on SYSTEMS DESCRIPTION, and as indicated on Construction Drawings.

B. For the following systems, refer to separate contract attachment "Technical Security (TS) Deployment Documents" for detailed installation instructions and adjustments for manufactured systems.

C. Do not run audio cables parallel within 300 mm (one foot) or perpendicular within 150 mm (six inches) of any building ac power, telephone, or other communication system.

D. At connection points for all types of cable, wrap pressure sensitive label strips of the appropriate numbers and letters around each cable near its termination.

E. Take such precautions as are necessary to guard against electromagnetic and electrostatic hum, to maintain the integrity and security of the system, to supply adequate ventilation, and to install the equipment so as to provide maximum safety to the person who operates it.

F. General Component Installation:

1. Install equipment so that components are securely attached to substrate or structure. Connections in public areas must be with tamper resistant or concealed fasteners.
2. Install amplifiers, junction boxes and controller components located at workstations with undercounter mounting, not visible, and installed so as not to interfere with occupant use of space.

G. See Construction Drawings for additional requirements and schematics.

3.3 INSTALLATION – MSG POST 1 AND GUARD BOOTH INTERFACE

A. Route cabling through EC or sub-EC cabinet for respective building.

3.4 FIELD QUALITY CONTROL

A. Inspect field assembly and connection of components, and to test functioning of all installations.

1. Perform these quality control procedures prior to Quality Assurance inspection by the Government.

END OF SECTION 283325

SECTION 283337 – TECHNICAL SECURITY DURESS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Duress system.

B. Related Sections include the following:

1. Section 133435 “Mail Screening Facilities.”
2. Division 26 electrical sections for general electrical requirements.
3. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
4. Section 283105 “Technical Security Intrusion Detection System.” This system shares common annunciator in MSG Post 1. Refer to Section for application of IDS Enhanced System.
5. Section 284705 “Mass Notification Systems” for security notification system has no connection with this system.
6. Section 285115 “Security Management System Enterprise (SMSe).”

1.2 SUBMITTALS

A. Product Data: Include components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories.

B. Equipment and System Operation Description: Include method and sequence of operation.

C. Contractor QC Pre-Check Certification: Refer to Section 280508 “Common Work Results for Technical Security Systems (TSS) for combined certification for contractor QC for all TSS sub-systems.

D. Operation and Maintenance Data: Include the following:

1. Operating and maintenance instructions.
2. Purchase source for operating and maintenance materials.

1.3 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 “Common Work Results for Technical Security Systems (TSS).”

PART 2 - PRODUCTS

2.1 GENERAL

A. See separate contract attachment, "DS TSS Equipment List" for a listing of products that have been approved for general use in DOS overseas facilities.

PART 3 - EXECUTION

3.1 INSTALLATION – SYSTEM- SPECIFIC

A. Duress System:

1. Install buttons in the following locations:

a. Executive: Ambassador (Amb)/ Consular General (CG)/ Principal Officer (PO) Office: connect to IDS Enhanced System when present.
b. Executive: Amb/CG/PO Office Management Suite (OMS) desk; connect to IDS Enhanced System when present.
c. Executive: DCM Office; connect to IDS Enhanced System when present.
d. Executive: DCM OMS desk; connect to IDS Enhanced System when present.
e. Main Lobby screening areas.
f. Main Lobby Interview Room.
g. Main Lobby receptionist booth.
h. Service Entrance guard booth.
i. Service Entrance screening areas.
j. Consular: Screening areas.
k. Consular: Cashier.
l. Consular: Interview Room.
m. Consular: Teller Windows.
n. Support: Commercial Bank.
o. CAC: Screening areas.
p. CAC: Guard booths.
q. MSGR: "Pantry" associated with Recreation Room.
r. Mail rooms receiving local mail.
s. Mail screening facilities, where separate from mail rooms; see Section 133435 "Mail Screening Facilities" where used for project.

2. Monitor buttons at the standard alarm system annunciator panel in Post 1. See Section 280508 "Common Work Results for Technical Security Systems (TSS)."

3.2 FIELD QUALITY CONTROL

A. Inspect field assembly and connection of components and start up and commission system.

1. Perform these quality control procedures prior to Quality Assurance inspection by the Government.

3.3 DEMONSTRATION

A. Engage a service representative to train Government personnel to adjust and operate security equipment. Refer to Division 01 Section "Demonstration and Training."

1. Duress system.

END OF SECTION 283337

SECTION 284626 - ADDRESSABLE FIRE ALARM SYSTEMS

PART 1 - - GENERAL

1.1 SUMMARY

A. This Section specifies an addressable fire alarm system, including requirements for system components typical of those below:

1. Automatic detecting and manual initiating devices
2. Audible and visual notification appliances.
3. Fire Alarm Control Unit (FACU) and all network interfaces for all buildings protected within the compound.
4. Automatic sprinkler water-flow.
5. Supervision of control valves, fire pump controller, auxiliary fire suppression systems (food service hood, pre-action sprinkler system, clean agent suppression system, etc.), water reservoir and temperatures when applicable.
6. Fire safety functions for door release, initiation of smoke control, air handler shutdown and elevator capture and recall.
7. Remote annunciators and controllers.

B. Related Specification Sections: The following Sections contain requirements that relate to this Section:

1. Section 087135 “Non-Security Door Hardware” for applicable sets with door closers/holders, electric doors locks, and release devices that interface with fire alarm systems.
2. Section 087155 “Security Door Hardware” for applicable sets with door closers/holders, electric doors locks, and release devices that interface with fire alarm systems.
3. Section 114000 “Food Service Equipment” for associated hoods.
4. Section 142105 “Electric Traction Elevators” for interlocking of controls with fire alarm and smoke control systems.
5. Section 211305 “Fire Sprinkler Systems.”
6. Section 213115 “Fire Pump Assemblies.”
7. Section 230905 “Instrumentation and Controls for HVAC” on HVAC Controls and Sequence of Operations for fan shutdown and smoke control interface.
8. Division 23 Sections that include duct smoke detector installation requirements.
9. Division 26 Section on raceways and boxes.

1.2 CODES AND STANDARDS

A. Codes: Codes adopted by Overseas Building Operations are identified in Chapter 1 of the OBO Building Code (refer to OBO International Code Supplement (OBO-ICS) to that chapter); refer to contract for applicable version.

B. Standards:

1. American National Standards Institute (ANSI):

a. ANSI/ASME A17.1, Safety Code for Elevators and Escalators.

2. National Society of Professional Engineers (NSPE):

a. National Institute for Certification in Engineering Technologies (NICET), Division of NSPE.

3. National Fire Protection Association (NFPA):

a. NFPA 3, “Standards for Commissioning of Fire Protection and Life Safety Systems,” 2024 edition.
b. NFPA 4, “Standard for Integrated Fire Protection and Life Safety System Testing,” 2024 edition.
c. NFPA 13, “Standard for the Installation of Sprinkler Systems,” 2022 edition.
d. NFPA 14, “Standard for Installation of Standpipe and Hose Systems,” 2022 edition.
e. NFPA 20, “Standard for the Installation of Stationary Pumps for Fire Protections,” 2022 edition.
f. NFPA 25, “Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems,” 2023 edition.
g. NFPA 70, “National Electric Code,” as adopted and amended by OBO Electrical Code.
h. NFPA 72, “National Fire Alarm and Signaling Code,” 2022 edition.
i. NFPA 170, Standard for Fire Safety and Emergency Symbols,” 2021 edition.

4. Underwriters Laboratories, Inc. (UL):

a. UL 38, “Standard for Manual Signaling Boxes for Fire Alarm Systems.”
b. UL 268, “Smoke Detectors for Fire Alarm Systems.”
c. UL 268A, “Standard for Smoke Detectors for Duct Application.”
d. UL 521, “Standard for Heat Detectors for Fire Protection Signaling Systems.”
e. UL 864, “Standard for Control Units and Accessories for Fire Alarm Systems.”
f. UL 1971, “Standard for Signaling Devices for the Hearing Impaired.”

C. Conflicts: Where applicable codes and standards differ, notify OBO/OPS/FIRE through the Project Director/COR prior to action. The baseline direction will be to apply the more stringent requirement.

1.3 DEFINITIONS

A. General: Definitions in NFPA 72 "National Fire Alarm and Signaling Code" definitions and in the Codes of Overseas Buildings Operations apply.

B. FAAP: Fire Alarm Annunciator Panel.

C. FACU: Fire Alarm Control Unit

D. Main Primary FACU: Analog addressable fire alarm system is the primary fire alarm control unit in the principal building on a compound. Responsible for protecting the principal building, monitoring all Primary, Remote, Secondary, and Sub-Secondary FACUs throughout the compound, and communicating selected information with Primary FACU to Central Station/Post 1 or where applicable.

E. Global Network Control Annunciator: A full function controllable FAAP.

F. Occupiable Area: Spaces of facility that can be occupied or used by facility occupants as part of building functions or to support building operation and maintenance. This includes, but is not limited to, storage areas, mechanical and electrical equipment areas, restrooms, conference rooms, and individual offices.

G. Post 1: 24-hour manned Marine Security Guard (MSG). Where a Post 1 is not provided on the project, fire alarm equipment normally located in Post 1 must be in a place approved by OBO/OPS/FIRE.

H. Primary FACU: Analog addressable fire alarm system is the primary fire alarm control unit in a building other than the principal building. Responsible for protecting the building, monitoring all Remote, Secondary, and Sub-Secondary FACUs throughout the building in which it is installed, and communicating selected information with Main Primary FACU to Central Station/Post 1 or where applicable via network. Typically, Primary FACU protects an out-building, such as CMR, MSGR, or warehouse where required by the Codes of Overseas Buildings Operations.

I. Qualified Fire Protection Engineer (QFPE) – A Professional Engineer who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience. Refer to the Part 1 Article on QUALITY ASSURANCE and the Part 3 Article on FIELD QUALITY CONTROL.

J. Regional Security Office (RSO): Under Diplomatic Security (DS).

K. Remote FACU: Remote fire alarm control unit connected to the Main Primary FACU or Primary FACU to allow expansion and distribution of notification, initiation, and signaling line circuits throughout building.

L. Site Security Manager (SSM): Under OBO/CFSM/SM.

M. Secondary FACU: Fire alarm control unit that protects designated area within primary building. Secondary FACU exchanges selected information with Primary FACU.

N. Sub-Secondary FACU: Additional fire alarm control unit used to cover specific areas within area protected by Secondary FACU.

O. System: Where this specification refers to "system", the complete fire alarm system, including all networked or interfaced Main Primary, Primary, Remote, Secondary, and Sub-Secondary FACU systems, is implied.

1.4 SYSTEM DESCRIPTION

A. Intent: Provide complete fire alarm system with alarm initiating devices and notification appliances. System must be complete in all respects, ready for Government operation at project completion.

B. Equipment: Provide equipment as follows:

1. Main Primary FACU: Locate in locked, accessible non-CAA electrical or telephone room.
2. Main Primary Network Control Annunciator: Provide adjacent to the Main Primary FACU.
3. Post 1 Network Control Annunciator: In a panel only sized cabinet inside Post 1. Where possible, battery backup for the network control annunciator should be located outside of Post 1.
4. Post 1 Master Pull Station: Master pull station that overrides maintenance bypass and unlocks all electronically locked doors.
5. Remote FACU: Locate in locked, accessible non-CAA electrical rooms throughout to evenly distribute signaling and notification circuits.
6. Secondary and Sub-Secondary FACU: As required in separate project-specific requirements.
7. Primary FACU: Locate in separate buildings when fire alarm systems are required by Code for those buildings.
8. All control units must have minimum 20 percent spare device capacity.
9. All FACUs must be fully expandable type.
10. Signal Transmission: All initiating devices must be addressable.
11. Detection - Partial: Partial detection via addressable alarm initiating devices must be provided in environments suitable for proper detector operation where indicated below:

    a. Smoke Detectors:

        1) Install in common areas and open areas, corridors, lobbies, telephone and electrical closets, and similar areas.
        2) Do not install in rest rooms, shower rooms, individual offices, kitchens, janitor's closets, or in other areas where prohibited by NFPA 72.

3) Spot-type smoke detectors must not be installed on ceilings exceeding 6.4 m (21 feet) in height; beam or aspiration detection must be used in these areas. Beam detection must have remote test switch at accessible level.
4) Equip smoke detectors in residential spaces, sleeping rooms, and other similar sleeping areas with intelligent sounder base features.

b. Heat Detectors: In fully sprinklered buildings, install heat detectors only in food service areas or where necessary for purposes of elevator shunt trip or other fire and life safety control functions.
c. Exception: Partial detection is not required in fully sprinklered CACs, UTLs, SPXs, PKGs, or RECs that are not associated with residential users.

12. Detection – Life Safety Features: Detection required for life safety features (elevator recall, door hold open, etc.) must be provided as required by NFPA 72 and other codes.
13. Manual fire alarm boxes: Install within 1500 mm (5 ft) on latch side of each exit door and where travel distance between manual fire alarm boxes exceeds 60 m (200 ft). Install one box in Post 1. Do not install boxes in consular waiting or other areas accessible to the general public.
14. Fire Alarm Notification:

a. Audible Notification: Appliances must produce public operating mode minimum sound pressure in accordance with NFPA 72 throughout occupiable areas.
b. Visible Notification: Public mode visible notification appliances must continue to flash when audible notification appliances are de-activated. Install visible notification appliances throughout buildings.
c. Fire alarm notification must be provided by horns and or strobes. General mass notification is not a function of the Fire Alarm System; that is addressed by systems in Section 284705, “Mass Notification Systems.”

15. Facilities Management FAAP: Locate network display-only within BAS Control Room.
16. Elevator Shutdown: Where elevator shafts and/or rooms containing elevator machines or control equipment are sprinkled, elevator power must be shut down by fixed temperature heat detectors in accordance with NFPA 72.
17. Elevator Power Shunt Supervision: Provide where control power supervision is required for elevator power shunt trip.
18. Door Unlocking: Provide addressable interface relay in Post1 within 1 meter (3 ft) of door security control rack.
19. ENS System Monitoring: Provide monitoring of Diplomatic Security Emergency Notification System (ENS) for occurrence of a live or recorded paging event.
20. Fire Pump Monitoring: Monitoring must be in accordance with Section 213115 “Fire Pump Assemblies.”
21. Pump room temperature (if applicable): Provide monitoring of pump room for freezing conditions that could affect driver and water contained within pump and associated piping.
22. Water Temperature Monitoring (if applicable): Temperature supervisory device for water storage container exposed to freezing conditions must initiate two separate and distinctive

signals. One signal must indicate decrease in water temperature to 4 deg. C (40 deg. F) and the other must indicate its restoration to above 4 deg. C (40 deg. F).

23. Water Level Monitoring: Provide in accordance with NFPA 72. High and low water level in fire protection water supply tank, independent of building automation system (BAS) or other electronic monitoring system. Switch must be listed float switch suitable for application. Provide full level annunciation for status only.
24. Fire Safety Functions: Auxiliary fire safety control functions as required by the OBO Building Code in relation to design of each building.
25. Remote Annunciator: Install FAAP within 5 ft on main building entrance except for the building which contains Post 1. Annunciator must have full system control features provided. Display on annunciator must be located between 1500 and 1650 mm (5’-0” and 5’-6”) above finish floor (AFF).
26. Systems Records Document Box:

1.5 SUBMITTALS

A. Shop Drawings. Submit two hard copies and one electronic copy on compact disk of the following information. Submit product data, equipment data, calculations, and the shop drawings simultaneously as one package. Submittal will be deemed incomplete and not reviewed unless it is complaint with the information contained herein, and has attached all drawings, calculations and fire alarm equipment submittal for review.

1. General:

   a. Submittal must include all information required by NFPA 72 Chapter 7, including, but not limited to minimum required documentation, design layout documentation, and shop drawings (installation documentation).
   b. Drawings must be legible, plotted in black and white, and not be smaller than ISO A1 sheets; 600 by 900 mm (24 by 36 inches).
   c. Identify revision number and date. All revisions from previous submittal must be clouded to identify changes to the document.
   d. Identify name of organization, name of system designer, and include stamps or seals by qualified lead designer.
   e. Identify name and address of Post in drawing title block and all transmittals and submitted documents.
   f. Symbols must conform to NFPA 170.
   g. Identify scale use, North direction, and match lines (if applicable).
   h. Include site plan where installation involves multiple buildings.

2. Drawing Content:

   a. Point-to-point wiring of all devices.
   b. Conductor and conduit identity, end of line devices, risers, conduit, conduit fill rate, and junction and pull boxes.
   c. Schedule showing number, type, and size of conductors and conduit planned.

d. Device address or zone and device number for each device.
e. Identification labels, numbers, and references for all conductors and junction boxes.
f. Project-specific details of terminations in floor terminal boxes and all panels.
g. Typical details for mounting and wiring of all device types, terminal and junction boxes, and equipment.
h. Identification of all fire resistance rated walls, and fire stop system to be used in those assemblies.
i. Fire-stopping details for all penetrations through rated construction.
j. Matrix of operation in graphical form. Show all alarm and supervisory input devices on left side, and all possible indications of fire alarm system on top (including bypass functions).
k. Complete riser diagram with all devices.
l. Identify power source and dedicated circuit breaker.

B. Product Data: Submit product data and equipment data for all proposed equipment, devices, wire, conduit, hangers, to be incorporated in the Project. Where multiple items are shown on data sheets, product data sheets must be marked up (circled, highlighted, or strikethrough) to indicate which items will be used/provided and which items will not be. Any item not submitted will not be permitted to be used in fire alarm installation.

C. Manufacturer's Installation Instructions.

D. Calculations:

1. Calculations for all FACUs and NAC power supplies. Battery calculations must include list of all devices connected to FACU or NAC power supply.
2. Voltage drop calculations for all NAC and sounder base circuit.

E. Program configuration: Submit electronic copy on CD-ROM of custom fire alarm system configuration (site-specific software) generated by system's programming software.

F. Certifications:

1. Furnish copy of certifications identified in the Part 1 Article on QUALITY ASSURANCE to OBO/OPS/FIRE through Project Director/COR prior to installation.
2. Training Certificate for Qualified Individual: Furnish a copy of the manufacturer's certificate stating that Qualified Individual (see the Part 1 Article on QUALITY ASSURANCE) has received factory training on the equipment to be installed.
3. Record of Completion: The installing Qualified individual must submit Record of Completion Certification as required by NFPA 72 that the fire alarm system complies with Contract Documents and applicable codes for review by OBO/OPS/FIRE through the Project Director/COR. Submit prior to commissioning.
4. Fire and Life Safety Systems Request for Acceptance Inspection, Testing and Certificate of Occupancy Analysis: Complete portions of document applicable to new fire alarm system for final commissioning. Document must be submitted to OBO/OPS/FIRE through

the Project Director/COR. Refer to the Part 3 Article on OBO/OPS/FIRE PROGRESS INSPECTIONS, COMMISSIONING, AND ACCEPTANCE.

G. Field Tests: Signed copy of Completed Record of Inspection and Test as required by NFPA 72.

1. Report of Pretesting: After pretesting is complete, provide letter certifying installation is complete and fully operable; include names and titles of witnesses to pretests. Documentation must state that all input functions have been tested and that their associated outputs have successfully tested appropriately per the matrix of operations.
2. Report of Tests and Inspections: Provide written record of inspections, tests, and detailed test results, in form of test log. Submit log upon satisfactory completion of tests.

H. Record drawings (As-Builts):

1. Identify and mark wires (wire counts), end of line devices, risers, conduit and conduit sizes, junction, and pull boxes.
2. Label all devices identifying the device address or zone and device number.
3. Label, number, and reference all conductors.
4. Number all junction/splice boxes.
5. Show the location of the riser and the size of the conduit leading into and out of the riser's junction boxes.
6. Operating instructions to be mounted at FACU.

I. Record Operation and Maintenance (O&M) Manuals: Unless otherwise specified, the Contractor must submit to Project Director/COR to be kept at post, completed record Operation and Maintenance Manual: Submit no fewer than two hard copies and one digital bound PDF within thirty days of acceptance. Manuals must contain the following information:

1. Reduced-size: 300 by 450 mm (12 x 18 inches) scaled record drawings, including matrix of operations.
2. Manufacturers' data sheets and installation instructions for all installed equipment and wire.
3. Manufacturer's recommended testing and maintenance schedule and procedures.
4. Complete operating instructions.
5. Repair and troubleshooting guide, which lists common causes for breakdowns, malfunctions, and recommended repairs.
6. List of spare parts provided under this contract.
7. List of replacement parts (with prices) and suppliers where they can be purchased.
8. Battery calculations and voltage drop calculations.
9. Copy of Record of Completion.
10. Copy of Completed Record of Inspection.
11. Manufacturer's certification that fire alarm system complies with Contract Documents and applicable codes.
12. Two electronic copies of bound files on CD/DVD.

a. Provide in version conforming to applicable year OBO BIM and CAD Standards. Where a specific desktop version (e.g., architectural desktop) is used, identify version on CD/DVD.
b. All files must be in DWG files only.
c. All CADD files must be complete and must be audited and purged.
d. All CADD files must be capable of being used without X-reference files.
e. Individual CADD files must contain all information necessary, to include title blocks.
f. OBO border and title block must not be drawn in model space.
g. CADD files must contain layouts for both 600 by 900 mm (24 by 36 inches), and 280 by 432 mm (11 by 17 inches) size in paper space layouts.
h. Electronic data base of manufacturer's fire alarm program.

13. Laminated operating instructions for mounting at FACU.
14. Two copies of NFPA 72 (National Electrical Code); edition applicable to contract.

1.6 QUALITY ASSURANCE

A. Lead Designer: Designer responsible for shop drawings must be certified by National Institute for Certification in Engineering Technologies (NICET) at minimum NICET III level in Fire Alarm Systems or QFPE. Shop drawings must be signed and sealed by this qualified lead designer.

B. Lead Installer: The lead on-site fire alarm system installer must be certified at minimum NICET III level, QFPE or other OBO/OPS/FIRE approved certification and must have minimum of five years hands-on experience in the requirements and installation of fire alarm systems for the different building types included in this project. This individual may or may not be the same person as the qualified individual.

1. On-Site Presence: The Lead Installer must be on site from the beginning of fire alarm system installation through completion, commissioning, and acceptance.

C. Qualified Individual: Employ at least one person with current certified qualifications of at a minimum NICET III level or QFPE. This person must also be certified as having received factory training for Manufacturer's system being installed. This person is designated as the qualified individual.

1. Required Consultation: The qualified individual must meet and consult with OBO site management, OBO/OPS/FIRE/FPE, and lead fire alarm system installer to establish means and methods to install the fire alarm system. This meeting must be held prior to the installation of the fire alarm system. Depending upon project schedule, OBO/OPS/FIRE/FPE may attend meeting via conference call.
2. This individual must furnish to OBO/OPS/FIRE thru the Project Director/COR a monthly report detailing status of the job. Separate reports must be prepared for each building, and each floor of those buildings. This report must include resolution of punch list items, if

applicable, whether generated by contractor or OBO personnel. Also furnish any NFPA certificates of completion for completed systems or sub systems generated since the last reporting cycle.

D. Other Required Personnel: Employee at least one person with current certification of at least NICET II level or higher to assist with pre-testing, final acceptance, and commissioning. This individual must be on site for pre-test and for duration of final acceptance and commissioning. This individual is permitted to be the same person as the qualified individual but cannot be the same person as the lead installer.

E. System Continuity: A single lead designer and a single lead installer must be used for all aspects of the design and installation, including classified work and unclassified work.

F. Manufacturer's equipment, design, shop drawings and equipment submittals are required to be sourced from the United States. In addition, all fire alarm control units must be manufactured in the United States and listed to requirements of UL 864; this includes Main Primary FACU, Primary FACU, Secondary FACU, Sub-Secondary FACU, and Remote FACU. Local sourcing is not permitted without the specific authorization in writing from OBO/OPS/FIRE through the Project Director/COR.

G. Installation must be supervised by manufacturer's qualified individual.

H. Manufacturer or authorized fire alarm subcontractor must provide all fire alarm equipment and programming.

I. Performance Testing, Commissioning and Acceptance: The qualified individual must be present to ensure system compliance with contract documents, resolve discrepancies and conduct system testing before arrival of the OBO/OPS/FIRE representative. The qualified individual must remain on site for the performance testing and acceptance of the system, and to resolve with Project Director/COR any discrepancies found by the OBO/OPS/FIRE.

J. Manufacturer's Field Representation: Provide services of Manufacturer's factory-authorized service representative to supervise field assembly and connection of components, pretesting, testing, and adjustment of system.

K. Approved by OBO/OPS/FIRE: A request via RFI for specific approval to satisfy a requirement within this Section for 'approval by OBO/OPS/FIRE;' for design features the request must be submitted by the Lead Designer. Design feature(s) that are specifically identified as requiring approval by OBO/OPS/FIRE require the specific use of an RFI; the inclusion of design features on design drawings or shop drawings (without the RFI) does not meet the requirement for 'approval by OBO/OPS/FIRE,' even if those drawings are reviewed and accepted/approved by OBO/OPS/FIRE.

1.7 EXTRA MATERIALS

A. General: The contractor must provide, at or before acceptance, extra materials identified below that match products installed, packaged with protective covering for storage, and identified with labels clearly describing contents. The materials must be inventoried with an itemized list given to the Project Director/COR and must provide all critical parts for the system to ensure that a single mode failure can be corrected by using critical parts from the spare parts inventory. The Contractor must provide the minimum specified quantity, but no less than one of each type as follows:

1. Manual fire alarm boxes: 15 percent of number of manual fire alarm boxes installed, minimum of two. Provide five manual fire alarm box keys on the bottom of the Main FACU as spares.
2. LED-type remote indicating units: 15 percent of number of units installed.
3. Spot-type Smoke Detectors, Duct Smoke Detectors, and Heat Detectors: 15 percent of number of units of each type installed, but no fewer than two of each type.
4. Detector Bases: 15 percent of number of units of each type installed, but no fewer than two of each type installed.
5. Projected Beam Smoke Detector: One of each type installed.
6. Notification Appliances: 15 percent of number of units installed, but no fewer than two of each type installed.
7. One complete set of fiber optic isolation equipment and sub-secondary controls, where used.
8. Interface (Monitor and Control) Modules: 15 percent of number installed, but not less than two.
9. Initiating Device Circuit Card: One for each unit installed.
10. Notification Appliance Circuit Card: One for each unit installed.
11. Signaling Line Circuit Card: One for each unit installed.
12. Card Cage or Card Chassis (where they contain electronics): One for each unit installed.
13. Fiber Optic Interface Cards: One for each unit installed.
14. Network Communications Interface Cards/Network Power Supply Cards: One for each unit installed.
15. Fire Alarm System Controls Power Supply: One of each type installed.
16. Main Primary and Main System Processor Board: One of each type installed.
17. Main Primary and Main system expander board.
18. Secondary and Sub-Secondary system processor board. One of each type installed.
19. Fire Alarm Annunciator Panel: One for each type installed.
20. Printer interface module: One of each unit installed.
21. Remote NAC booster panel: One of each type of unit installed.
22. Multi-Criteria tester pole and necessary replacement cartridges (one case of at least six cartridges), and primary and spare batteries.

B. Secure Storage: A minimum of 15% of each type of equipment installed in secure areas, but no less than one, must be provided for secure storage.

C. Unless otherwise specified, any surplus materials, fixtures, articles or equipment remaining at completion of the Project shall remain the property of the Government, except those items furnished by Contractor, cost of which is not included in contract price.

1.8 WARRANTY

A. Contractor's Warranty: Submit a written warranty agreeing to repair or replace any portion of the automatic sprinkler system that fails in materials or workmanship within a period of one year after the latter of substantial completion or final acceptance testing of the fire alarm system, which is witnessed by OBO/OPS/FIRE.

PART 2 - PRODUCTS

2.1 MAIN PRIMARY FIRE ALARM CONTROL UNIT

A. The main primary fire alarm systems controls must:

1. Be analog addressable and network capable.
2. Be capable of optical fiber network communications.
3. Be provided with a minimum 80-character screen or LCD.
4. Not incorporate integral radio transmitters.
5. Incorporate programmable function means, such as a momentary key operated switch or keypad.
6. Have capability to be placed in maintenance bypass mode temporarily so that NAC circuits are not energized upon input of specific device address or zone. Maintenance bypass must require a key or password to be activated and must restore to normal mode automatically after 4 hours if not returned to normal mode manually. Upon de-activation of notification appliances, any existing alarm must be transferred to a visual indicator on main FACU and FAAP. Any subsequent alarms from other zones must cause the alarm notification appliances to re-activate.
7. Be capable of supporting a system printer.
8. Receive and indicate common trouble and supervisory (if applicable) from remote power supplies (NAC extenders), secondary control units, and any other interconnected control units, including suppression system controls.
9. Include USB port(s) for system upload / download.
10. Capability to program entire network from single node.

B. System power supplies:

1. Primary Power Supply:

a. Obtain primary power for FACU from a dedicated emergency power circuit and terminated in accordance with Article 760 of NFPA 70 (model National Electrical Code).
b. Supply must be accessible only to authorized personnel. Identify supply as "FIRE ALARM CIRCUIT" using label or phenolic plate; either must be red.
c. Provide surge protective devices at power input to each cabinet.
d. FACU must have integrated transformer to function with the post or local utilities' voltage and frequency.

2. Secondary Power Supply: UL listed storage battery:

a. Provide sealed valve regulated lead acid (VRLA) batteries as secondary power supply.
b. Secondary power supply must supply energy to system with sufficient capacity of 24 hours under maximum quiescent load and at end of that period must be capable of operating all alarm notification appliances used for evacuation for five minutes.
c. Batteries must be sized at 130 percent of calculated size to compensate for alarm reserve and aging.
d. Provide automatic battery-charging circuitry for each standby battery bank in system. All system battery charge rates and terminal voltages must be readable using fire alarm control unit LCD display in service mode, indicating directly in volts and amperes.

C. All battery boxes must be produced by the same manufacturer as the FACU and must be UL listed for fire alarm service.

D. System Programming Software: Provide latest software revision. Programming must be Microsoft Windows based using latest software version. Use of Virtual PC add-ons is not permitted. Configure system with most current version or revision. Proprietary software must be licensed to OBO/OPS/FIRE for life of system at no additional charge (no annual fee from manufacturer).

E. System Compatibility: New fire alarm installation and program must be compatible with existing fire alarm network. Upgrades to existing software, firmware, or programming throughout the compound must be performed by the Contractor where necessary.

1. Exception: Where existing fire alarm system is a legacy system no longer supported by the manufacturer, and scope of the Project is not a compound fire alarm replacement project, a different manufacturer or system is permitted to be installed where approved by OBO/OPS/FIRE. This new system must be provided with a network control annunciator installed in Post 1 via fiber.

F. Site-Specific Software (database): Provide two copies of the final and accepted configuration (site-specific software, using nonvolatile memory) for OBO/OPS/FIRE use upon system acceptance. One copy must be left inside the control unit, and the second copy must be provided to OBO/OPS/FIRE through the Project Director/COR at time of Commissioning.

2.2 SYSTEM DEVICES

A. Initiating Devices:

1. Signal Transmission: By copper wire or fiber optic only. Aluminum conductors are not permitted.
2. Smoke Detectors: Addressable multi-criteria smoke detectors that can be programmed to use a combination of smoke, heat, and time for specific applications.
3. Heat Detectors: Must be selected to operate at a temperature no less than 11 deg C (20 deg F) above the maximum expected ambient temperature.
4. Bases, Smoke and Heat Detectors: Must be programmable only through the use of switches on the base or detector. Separate handheld or stationary programming units must not be used.
5. Duct Smoke Detectors: Addressable type with a plug-in type detector head, duct mounted housing, and sampling tubes that provide airflow through the duct housing.

    a. All duct type smoke detectors must be provided with keyed remote test switch and indicator light installed in readily accessible location (as defined by NFPA 72).

6. Projected Beam Detectors: Must be of the addressable type, must have remote test feature, and must be provided with remote key test switch in accessible location.
7. Manual fire alarm boxes: Must be of the addressable type and must conform to accessibility requirements of the Architectural Barriers Act (ABA) in accordance with Chapter 11 of the OBO Building Code and must be red in color. Break glass type manual fire alarm boxes shall not be permitted. All manual fire alarm boxes must be single action type.
8. Sprinkler supervisory and alarm initiating devices must be connected to the fire alarm system using addressable interface modules.

B. Notification Appliances:

1. Visible Notification Appliances: UL 1971 compliant and synchronized as required by NFPA 72.

    a. All visible notification appliances must be multi-candela, white in color, and labeled “FIRE” with red letters.

2. Audible Notification Appliances: Electronic horns, sounder-bases or speakers complying with UL 464. Audible notification appliances located in sleeping rooms must produce fundamental frequency of 520 Hz +/- 10 percent, with square wave or its equivalent.

    a. All audible notification appliances must be white in color and labeled “FIRE” with red letters.

C. Global Network Control Annunciator:

1. Dedicated network node utilized as a full function controllable FAAP. Console must have minimum 40-characters per event and display multiple panel or network events simultaneously. Annunciator must be capable of all programmed functions including acknowledge, signal silence, and reset across select fire alarm control units.

D. Fire Alarm Annunciator Panel:

1. Panel must have minimum 40-characters per event, must be capable of acknowledge, silence, and reset functions.

E. Interface Modules: Provide addressable modules that must be programmable only through the use of switches on module. Separate handheld or stationary programming units must not be used. All input/output interface modules must be suitably rated for voltage and current they monitor or control.

2.3 WIRING

A. Low Voltage System Wiring: As required by Article 760 of NFPA 70.

1. Wire must be data grade low capacitance sized for initiating device circuits, with signaling line circuits no less than 1 mm (18 AWG) and not larger than 1.5 mm (16 AWG) as required by manufacturer.
2. Minimum size for notification appliance circuits is 2.5 mm (14 AWG), maximum 4 mm (12 AWG).
3. Wire must be solid unless otherwise required by the manufacturer.
4. Provide surge suppression for all circuits where exiting and entering any structure, connected prior to any system devices within the structure.
5. Conductors and cables for initiating device circuits, signaling line circuits, and notification appliance circuits that are not run underground must be approved/listed for such use, and must be listed for environmental conditions in which they are installed.
6. Conductors and cables for initiating device circuits, signaling line circuits, and notification appliance circuits that are run underground must be approved/listed for such use, and must be listed for environmental conditions in which they are installed.
7. All circuits must provide a minimum of 20 percent spare capacity based on design voltage drop calculation.

B. Power Wiring:

1. Cable for 120/240 VAC circuits must be solid 4 mm (12 AWG) minimum.
2. Primary conductor must be Black, neutral conductor must be White, and ground conductor must be Green.

C. Network Communication:

1. Internal network circuits within buildings must be fiber optic.

2. Internal network circuits must be Class X.
3. External network circuits between buildings must be fiber optic.
4. External network circuits must be Class X.
5. All underground conductors must be approved for such use.

D. Circuitry:

1. Signaling Line Circuits (SLC): Class A.
2. Notification Appliance Circuits (NAC): Class A.
3. Initiating Device Circuits: (IDC): Class A.

E. Circuit Isolation:

1. Provide isolation modules for up to 20 percent of the UL listed max number of devices, but no more than every 20 devices.
2. Provide isolation modules for all circuits entering and leaving a building.

F. Pathway Survivability

1. All fire alarm wiring must have Pathway Survivability Level 1 or Level 2.
2. Interconnection of panels, panels to FATC, circuits between floors, and other risers within NOBs, EOBs, NOXs, SDAs, MSGRs, and similar use buildings must have Pathway Survivability Level 2 at a minimum.
3. High Rise Buildings: Interconnection of panels, panels to FATC, circuits between floors, and other risers within all high-rise buildings, regardless of use, must have minimum Level 2 Pathway Survivability.

2.4 FIBER OPTIC CABLES

A. Multimode Fiber: Fiber optic cable installed as part of fire alarm system must meet or exceed the following specifications:

1. Cable must be 50 micron, enhanced grade, multimode, and graded glass fiber. All materials in the cable must be dielectric.
2. Cable must meet or exceed the performance requirements of fire alarm manufacturer's specifications.
3. Cable must be minimum 6 strand fiber count.
4. Cable must be strait tip (ST). Jumper must be used where required to switch between ST and SC connectors.
5. Plenum Cable (Inside Cable) must be used for all interior installations. Installed cable must meet or exceed the following:

   a. EIA/TIA -598 color coding for fiber optic cable.
   b. Capable of bend radii as small as 20 x outside cable diameter.

6. Outside Plant Cable must be used for all applications where cable is to be run in underground conduits. Outside plant cable may not be used for interior applications and must meet or exceed the following:

   a. EIA/TIA -598 color coding for fiber optic cable.
   b. Capable of bend radii as small as 20 x outside cable diameter.

7. Indoor/Outdoor Cable must be designed to withstand both the rigorous environment of the outdoor as well as conform to flame rating requirements for indoors.

   a. EIA/TIA -598 color coding for fiber optic cable.
   b. Capable of bend radii as small as 20 x outside cable diameter.

2.5 REMOTE FACU

A. Remote unit must be compatible with main system controls and must be produced by same manufacture as Main Primary FACU system and Primary FACU. Remote FACU system controls and Primary FACU system controls must be networked using optical fiber cable. Detectors and notification appliances must be consistent throughout system.

2.6 SECONDARY SYSTEM

A. Secondary FACU: Secondary fire alarm system controls must be compatible with Main Primary FACU and Primary FACU system controls and must be produced by same manufacturer as Primary FACU system. Secondary FACU system controls and Primary FACU system controls must be networked using optical fiber cable. Detectors and notification appliances must be consistent throughout system.

2.7 SUB-SECONDARY SYSTEM

A. Sub-Secondary FACU: Sub-Secondary fire alarm system controls must be compatible with Primary FACU and Secondary FACU system controls; and must be produced by same manufacturer as Primary FACU. Sub-Secondary FACU system controls and Secondary FACU system controls must be networked using optical fiber cable. Detectors and notification appliances must be consistent throughout system.

B. Notification Appliances: Sub-Secondary FACU must be electronic chimes and strobes, unless otherwise directed by OBO/OPS/FIRE through the Project Director/COR.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Install system in compliance with required and advisory provisions of NFPA 72 and other applicable codes referenced in the Part 1 Article on CODES AND STANDARDS.

B. Fire Alarm Power Supply Disconnect:

1. AC power supplies for all fire alarm controls, notification appliance power extender panels, and other fire alarm equipment must be on a dedicated branch circuit and must comply with NFPA 72 and other requirements of this Section. Provide surge protective devices for each power supply.
2. Label circuit disconnecting means at panel board as "FIRE ALARM" using red label or lettering. Provide with lockable handle or lockable panel board cover. Identify location of disconnect on placard mounted on FACU cabinet door.

C. Keys:

1. All keyed locks must be keyed the same.

3.2 SYSTEM FUNCTIONAL DESCRIPTION

A. General alarm: Provide system general alarm, responding as follows:

1. Indicate general alarm condition at FACU and remote annunciators.
2. Identify device and provide alphanumeric location of the source of the alarm at FACU and remote annunciators.
3. Initiate audible and visible alarm signals throughout building.
4. Close fire and smoke doors that are held open by magnetic door holders.
5. Initiate control functions associated with the activated device.

B. Manual fire alarm boxes: Initiate a general alarm.

C. Smoke detectors: All area smoke detectors must:

1. Initiate a general alarm.
2. Unlock security doors in accordance with “Security Door Control – Door Unlocking” section below within this Article on SYSTEM FUNCTIONAL DESCRIPTION.
3. Signal smoke control panel to initiate smoke control (design dependent fan shutdown and/or damper positioning), door closure/release and other fire safety functions as required.

D. Smoke Detectors at MSGRs and Other Dormitory-Type Facilities without Cooking Equipment:

1. Any one smoke detector within a room/suite must activate all sounder bases within that suite and must register as an ALARM on the FACU. General Alarm will not be activated.
2. Any second detector must activate general alarm to include all sounder bases.
3. Any single hallway or common-area detector must activate general alarm to include all sounder bases.

E. Smoke Detectors as SDA and Other Multi-Unit Living Facilities with Cooking Equipment:

1. Any one smoke detector within a room/suite must activate all sounder bases within that suite and must register as an ALARM on the FACU. General Alarm will not be activated.
2. Any second detector within the same suite must activate general alarm to include all sounder bases.
3. Any single hallway or common-area detector must activate general alarm to include all sounder bases.

F. Duct smoke detectors: Duct type smoke detectors must:

1. Initiate supervisory signal.
2. Shut down associated HVAC fan(s) and initiate smoke control (if provided), in accordance with mechanical design.
3. Duct type smoke detectors must not be used to release any security doors.

G. Elevator smoke detection: In addition to regular smoke detector function, elevator lobby, hoistway (if required), and machine room detectors must:

1. Activate primary or secondary elevator capture and recall.
2. Signal smoke control panel to initiate smoke control (design dependent fan shutdown and/or damper positioning), door closure/release and other fire safety functions as required.
3. Where “Fireman’s Override” switches are installed, actuation of hoistway or elevator machine room detectors must cause a separate and distinct visible annunciation to alert emergency personnel capable of operating “Fireman Override” that elevators are no longer safe to use.

H. Elevator heat detection:

1. Activate power shunt trip to elevator controllers upon or prior to activation of sprinkler heads in hoistway or elevator machine room to avoid wetting down of live electrical components.
2. Indicate alarm signal upon activation.

I. Elevator Shutdown Control Circuit Supervision: Control circuits to shut down elevator power must be monitored for presence of operating voltage in accordance with NFPA 72.

1. Initiate trouble signal.

J. Secondary System Alarm:

1. Initiate alarm on Secondary FACU.
2. Initiate alarm on Main Primary, Primary, and/or Remote FACUs.
3. Initiate alarm on Sub-Secondary FACU.

K. Sub-Secondary System Alarm:

1. Initiate alarm on Secondary FACU.
2. Initiate alarm on Main Primary, Primary, and/or Remote FACUs.
3. Initiate alarm on Sub-Secondary FACU.

L. Sprinkler Water Flow Switch:

1. Initiate general alarm.
2. Unlock security doors in accordance with "Security Door Control – Door Unlocking" section below within this Article on SYSTEMS FUNCTION DESCRIPTION.

M. Supervisory Devices: Initiate supervisory signal upon actuation of on the following items.

1. Sprinkler valve supervisory switches.
2. Fire pump supervisory devices.
3. Water supply supervisory devices.
4. Duct smoke detectors.
5. Remote FACUs, Primary-FACUs, Secondary FACUs, and Sub-Secondary FACU systems.
6. Other supervisory devices.

N. Auxiliary Fire Suppression Systems: Upon activation, initiate alarm.

O. Security Door Control and Door Unlocking: Addressable interface relay provided in Post 1 within 1 meter (3 ft) of door security control rack that unlocks all electronically locked doors. Program to operate upon activation of Post 1 Master Pull Station any two smoke detectors in non-publicly accessible areas, any heat detector in non-publicly accessible area, or activation of sprinkler water flow switch or sprinkler pressure switch. Door release activation must create trouble condition, and display message on FACU and system-logging printer upon fire alarm door release.

P. Alarm Silence During Mass Notification Paging: Provide addressable interface module in Post 1 within 1 meter (3 ft) of SelecTone system. System must be programed that when SelecTone system is transmitting a live page or pre-recorded message, fire alarm system must have its audible notification appliances temporarily silenced while visible appliances remain active. Once live page or pre-recorded message has stopped, fire alarm audible notification appliances must reactivate.

Q. Network Communications: All communications between fire alarm system units must be by Class X fiber network communications. Fiber must be single run continuous from building to building (patch panel to patch panel) without splices.

R. Sounder Bases: Provide intelligent sounder bases and replace any existing conventional sounder bases. Conventional sounder bases must not be permitted in new systems or systems with intelligent sounder bases.

S. Notification Appliances:

1. Audible notification appliances must be silenceable using “Alarm Silence” function.
2. Visible notification appliances must remain activated after audible silence until control unit reset.

T. Maintenance By-Pass Key Switch: Provide momentary key switch on Main Primary FACU (unless otherwise directed by OBO/OPS/FIRE through the Project Director/COR) to enable system testing and maintenance functions. The system must be configured and programmed to provide the following:

1. System Response: Upon activation of Maintenance By-Pass function:

a. Trouble signal must be initiated on system.
b. Display message saying, "System in Maintenance By-Pass".
c. Disable all notification circuits (NAC) throughout building network.
d. Disable all auxiliary fire and life safety control features, including but not limited to elevator recall, AHU shutdown, smoke damper closure, and stair pressurization,

2. Duration: Maintenance By-Pass feature must be configured and programmed for the following duration settings:

a. Disabling of notification and control features must automatically end, without human intervention, after 4 hours.
b. System network must reset in system normal after 4 hours.
c. Full function of the system throughout the building network must be restored upon system reset.

3. Override: Maintenance By-Pass feature must be overridden by manual alarm box installed in Post 1, or in main Post Access Control (PAC) for Lock and Leave posts.
4. Labeling: Key switch must be permanently labeled as to function, by engraved placard or custom engraving of face plate, on interior of panel as follows:

a. Above the key cylinder: "MAINTENANCE BY-PASS SWITCH".
b. Key Positions:

1) At resting place or orientation of cylinder in normal condition include: "NORMAL".
2) At farthest point in arc of key swing include: "DISABLE".

c. Below key cylinder: "OPERATION OF THE SWITCH WILL BYPASS HORNS, STROBES, ELEVATOR RECALL, AND AHU SHUTDOWN FOR UP TO 4 HOURS. TO CLEAR, PRESS SYSTEM RESET SWITCH."

3.3 FACU OPERATION SEQUENCE/INTERFACES

A. Main Primary FACU Alarm:

1. Main Primary FACU initiates alarm condition on Remote, Secondary, and Sub-Secondary FACUs located in the compound principal building by network communication.
2. Remote, Secondary, and Sub-Secondary FACU notification appliances activate throughout the building.
3. Main Primary FACU must control all alarm silencing and reset functions.
4. Network Control Annunciator in Post 1 must control all alarm silencing and resent functions.

   a. Resetting of fire alarm must not require resetting of Remote, Secondary, and Sub-Secondary FACUs.

B. Primary FACU:

1. In a non-principal building, Primary FACU initiates alarm condition on Remote, Secondary, and Sub-Secondary FACUs located throughout the building by network communication.
2. Notification appliances are only activated throughout the building with Primary FACU.
3. Alarm, trouble, and supervisory conditions with intelligent device information are annunciated at Post 1.
4. Acknowledging at the Network Control Annunciator within Post 1 only silences audible alarm at Post 1.
5. Acknowledge, silence, and reset functions must be performed at Primary FACU or remote annunciator for Primary FACU.

C. Remote, Secondary, and Sub-Secondary FACU Alarm:

1. All intelligent device information must be annunciated at Main Primary or Primary FACU and annunciator panel.

   a. General alarm is annunciated on Network Control Annunciator located at Post 1.

2. Activate all notification appliances throughout the building.
3. Primary FACU must control all alarm silencing and reset functions in non-principal building.
4. Main Primary FACU must control all alarm silence and resent functions in the principal building.

5. Resetting of fire alarm must not require resetting of remote, secondary, and sub-secondary FACUs.

D. Maintenance Bypass: Configure four-hour maintenance bypass throughout the principal building only.

3.4 EQUIPMENT INSTALLATION

A. Manual fire alarm boxes:

1. Identify address or device number on exterior of assembly.

B. Water-Flow Detectors and Valve Supervisory Switches:

1. Properly identified at Main Primary FACU indicating location of devices or area covered.
2. Must have appropriate zone/SLC and device number printed on cover.
3. Water flow devices must be initially adjusted to offer 30 second time delay for activation of alarm.
4. Each valve supervised must have a unique address and must be monitored individually.

C. Automatic (Smoke/Heat) Detectors:

1. Programmed for appropriate environment in which they are installed.
2. Solidly affix detector bases and secure to withstand rotary, tensile, and compressive movement that might occur during detector removal and insertion. Use electrical boxes with all devices capable of being mounted to electrical box. Support all detectors independently on false ceilings with T-bar hanger assemblies.
3. Detectors must not be installed before controlled environments are established well after finished trim out of building interior spaces that are protected by fire alarm system. Any devices contaminated by construction debris from premature installation must be discarded and replaced with new devices at no additional cost to the Government.
4. Automatic detector indicator LED lights must be visible from entry location of protected area.
5. Identify all detectors with zone/address number on exterior of detector base with sticker easily seen from floor level.

D. Remote Lamps:

1. Remote lamps/indicators must identify status of detectors that are located in concealed areas that are not visible from floor level.
2. When used, locate where readily visible by end user.
3. Mark remote lamps with same identification as detectors they represent.

E. Notification Appliances:

1. Visible Notification Appliances: Mount in accordance with NFPA 72.
2. Audible Notification Appliances: Mount in accordance with NFPA 72.

F. Fire Alarm Control Unit (FACU):

1. Install in room that has been approved by OBO/OPS/FIRE. Surface mount, with top of cabinet not more than 1800 mm (6 feet) above finished floor.
2. Install with 900 mm (3 feet) clearance in front of cabinet to open door for service.

G. Fire Alarm Annunciator Panel(s): Installed in locations that have been approved by OBO/OPS/FIRE. Surface mount at nominal 1500-mm (5-feet) above finished floor to top of the Display/Control Screen.

H. Line Isolation Modules: Isolation models must be installed in readily accessible locations as defined in NFPA 72. The location must be shown on shop drawing and record (as-built) drawings.

3.5 WIRING INSTALLATION

A. Methods:

1. Provide dedicated raceway/conduit system solely for fire alarm wiring.
2. Primary power circuits supplied to fire alarm system must not be in the same conduit, raceway or cable tray with fire alarm circuits.
3. T-tap connections are not allowed for fire alarm circuits.
4. Circuits must minimize penetrations (i.e., one penetration in and one penetration out) through physical security hard line walls and other special walls.
5. Conductors must be sized so voltage drop does not exceed 10 percent of nominal voltage. (i.e. strobe circuits) at end of circuit.
6. All wire must be free from any mechanical failures (e.g., open circuits, shorts between conductors or shorts to earth ground).
7. Observe direct current polarity: Black insulated wire must be negative, red must be positive.
8. Provide dedicated SLC at each floor.
9. Outgoing and return cables must have minimum separation of 300 mm (12 in.) where cable is installed vertically, and 1.22 m (48 in.) where cable is installed horizontally.

B. Wire Marking:

1. Wire numbers must correspond with circuit numbers and designators (e.g., SLC #17 must be connected to Signaling Line Circuit #17).
2. Signaling Line Circuits must be labeled ‘SLC’. ‘SLC’, Notification Appliance Circuits must be labeled ‘NAC’. Indicating Line Circuits must be labeled ‘IDC’.
3. Mark all spare wire with numbers beginning with 200.

4. Color-code fire alarm conductors differently from the normal building power wiring. Color-code audible alarm notification appliances differently from alarm-initiating device circuits. Use different colors for visual alarm notification appliances.

C. Fiber Cable Marking:

1. Interior Marking:

   a. Inside Each Fire Alarm Control Unit (FACU): Mark each jacket with the Node # (a panel inside the building), the building the individual fiber is going to, or in the patch panel it is going to before leaving the building.
   b. Inside Each Fiber Patch Panel: Mark each jacket with the building Node # or the building it communicates (connects) with.

2. Exterior Marking:

   a. Exterior fire alarm fiber cabling must be clearly identified as 'Fire Alarm.' Where installed in duct banks, the cabling must also include which buildings the cabling/fiber is from as well as which building the cabling is from.
   b. Along the underground routes (all manholes, pull holes, Junction boxes, patch panels, etc.), the fire alarm network cables must be permanently marked indicating: (1) that the cable is Fire Alarm (i.e., RED stripes) and (2) the routing (e.g., SDA3 to Post One).

3. All fiber optic cable jackets must be permanently marked at each end to identify the buildings or nodes connected and must conform to the following:

   a. Outside Plant Cable: Provide building acronyms for each building any given cable serves (e.g. "OBC" – "NOB").
   b. Inside Cable: Provide node descriptions for each panel served (e.g., "Node1" – "Node 2").

D. Splices/Terminations:

1. Shielded cable must not be used for NAC, SLC, or IDC wiring, unless otherwise recommended by manufacturer.

   a. Where shielded wiring is recommended by manufacturer, all shielding wiring must be installed in accordance with manufacturer's recommendations.

2. Connect conductors to numbered terminal strips in junction, pull, or outlet boxes, cabinets, or equipment enclosures.
3. There must be no field splices. Circuits are to be continuous from device to device, with terminations only on the device itself.
4. Mark each terminal according to wiring diagrams of system.
5. Make all connections in an approved manner.

6. Install conductors parallel with or at right angles to sides and back of enclosures.
7. Bundle, lace, and train conductors to terminal points with no excess lengths.
8. Wire nuts are not permitted to be used.

E. Risers and Network Communications:

1. Provide all network communications in dedicated conduit.
2. Provide Class X network communications with separate conduit paths conforming to survivability requirements of this specification.

F. Between Buildings:

1. When Primary FACUs are required in separate buildings; connect between buildings with fiber optic network communications using fiber patch panels.
2. Provide Class X circuits between buildings. Each network path (primary and redundant) must be in a separate conduit and trench if available. Where located in a single duct bank, each network path must be remote to the maximum extent possible.
3. Provide proper surge protection where copper conductors exit and enter buildings.
4. For wiring and pathways between buildings, (whether by direct burial, over head or on the surface of a wall), both the pathway as well as the conductor must be rated and installed to prevent moisture from entering.

G. Grounding:

1. Ground equipment conductor and cable shields. Shielded FPL cable must have shields or drain wire tied through devices and junction boxes and isolated (insulated) from ground except at the FACU.
2. Grounding for outdoor locations must comply with Chapter 2 of the Electrical Code of Overseas Buildings Operations.

3.6 CONDUIT

A. Minimum conduit size must be 19 mm (¾-inch).

B. The number of conductors in any conduit must meet the requirements of Article 760 and Chapter 9 (Tables 1 and 4) of NFPA 70 (model National Electrical Code).

C. Install junction/pull boxes such that there are no more than equivalents of four quarter bends (360 degrees total) between pull points.

D. Install intermediate junction/pull boxes as necessary.

E. Seal all conduit penetrations through fire rated walls, corridor walls, and mechanical/electrical room walls with fire rated sealant.

F. When multiple buildings are to be connected by conduit runs, and conduit is exposed to the elements or buried underground, the conduit must be rigid metal or rigid nonmetallic conduit.

G. Where the conduit is exposed to adverse climatic conditions, provide weatherproof conduit, electrical boxes and connectors.

H. All conduit must be routed parallel or perpendicular to the structure and must be concealed to the greatest extent possible concealed.

3.7 JUNCTION BOXES

A. All Junction Boxes:

1. Make terminations inside junction box in accordance with NFPA 70 (model National Electrical Code).
2. Label and identify wiring with zone/SLC/NAC it represents.
3. Paint junction boxes red, including the cover.
4. Label boxes using stenciled exterior lettering in white or silver paint “FIRE ALARM WIRE ONLY.”

B. Fire Alarm Terminal Cabinets (FATC) or Riser Junction Boxes: In addition to above:

1. Locate boxes in locked electrical spaces.
2. Boxes must be readily accessible for maintenance personnel.
3. Cover must be hinged, hasped, and have common lock, using same key as main fire alarm system FACU.
4. Assign a number to each FATC riser junction box. Numbers must correspond to floor location (e.g., "FATC BOX NO. 0" is in basement, "FATC BOX NO. 1" is ground floor, "FATC BOX NO. 2" is on second floor). Label junction boxes accordingly.
5. FATCs must have wire listing on inside cover based on wire terminations and must be located above finished floor where extra equipment such as ladders are not necessary for access.
6. Boxes must be 300 x 300 x 100 mm (12 x 12 x 4 inches) minimum, sized appropriately according to number of conductors contained within, and contain terminal strips for wiring connections.

C. Fiber Interface Cabinets (Patch Panels)

1. Each FACU requiring a fiber optic network connection must be furnished with a fiber interface panel. The patch panel must be labeled and must be located in easily accessible location. Patch panels above the ceiling are not permitted. The panel must be Corning WCH-02P or equal. Fiber in and out of each termination cabinet must be 6 strand. All fibers must be terminated, tipped, and tested. Jumpers between the fiber interface panel and the FACU must be provided with mechanical protection.

3.8 FIELD QUALITY CONTROL

A. Periodic Inspection: NICET Level III, NICET Level IV, or QFPE must perform inspection on the work at intervals of no greater than 60 days during the duration of the fire alarm system installation. Submit written inspection reports to OBO/OPS/FIRE/FPE for review. 60 days will be based on Schedule and progress reports required in the Part 1 Article on QUALITY ASSURANCE.

3.9 PRE-TESTING

A. Pretesting and Commissioning: The entire fire alarm system must be satisfactorily pre-tested by Contractor prior to request for final acceptance tests. Correct all deficiencies prior to final acceptance tests. Activities must be performed by factory-authorized service representative.

1. OBO/OPS/FIRE must be present during final performance testing to witness and has role of accepting successful operation of fire alarm systems.

B. Upon completing installation of system, conduct start-up and complete performance testing in accordance with manufacturer's requirements and NFPA 72, except that magnet tests are permitted.

C. Verify that requirements of Contract Drawings, Contract Specifications, and NFPA 72 are met.

D. Contractor is responsible for having equipment on-site for testing system, including test smoke for smoke detectors, sound pressure level meters (conforming to NFPA 72), heat gun for heat detectors, method to reach all detectors (smoke pole, ladder and / or lift) and minimum of three two-way radios for communication. Multi criteria detection devices must be tested with test equipment designed to emit heat and smoke simultaneously. It is not acceptable to use any flame producing or smoke producing items such as cigarettes, cigars, or pump sticks.

E. Correct all deficiencies observed in pre-testing.

F. Required Personnel. Pre-Testing must be performed by the lead installer along with other required personnel.

G. Test in accordance with procedures outlined in NFPA 72. The testing must consist of the following:

1. Verify absence of unwanted voltages between circuit conductors and ground.
2. Test and verify all circuits meet capacitance and resistance ranges and values according to manufacturer's instructions and recommendations.
3. Test all initiating and indicating circuits for proper responses under alarm, trouble, open circuit, shorted, and grounded conditions. Observe and record control unit responses to each circuit condition.

4. Test smoke detectors according to manufacturers approved methods and record sensitivities in accordance with NFPA72.
5. Test complete system for fire safety functions according to system design and specifications; observe and record responses. Note this must include all connected systems and control functions. Observe and record indicating lights, displays, signal tones, and annunciator indications.
6. Test all primary power, secondary power, and batteries. Verify batteries are sized to operate system for period and in manner specified.
7. Retain test equipment and special tools at site until performance testing is completed and system is accepted by OBO/OPS/FIRE through the Project Director/COR.
8. Record of complete successful pre-test must be submitted to OBO/OPS/FIRE through the Project Director/COR minimum of 30 days prior to requested final acceptance test date. This must include completed NFPA 72 certificate of completion, documentation of all required activities listed herein and activity log of fire alarm main panel as proof that 100 percent of the devices, connected systems and control functions were tested.

3.10 CLEANING AND ADJUSTING

A. Cleaning: Initiating devices must not be cleaned. Any devices contaminated (e.g., by construction debris, dust) must be discarded and replaced with new devices in conformance to requirements for automatic (smoke/heat) detector installation timing and non-contamination in the Part 3 Article on EQUIPMENT INSTALLATION.

3.11 POSTED INSTRUCTIONS AND INFORMATION

A. Mount operating instructions at FACU (Frame and Post).

B. Panel Information: Provide the following information at the Main FACU:

1. Label to identify electrical distribution panel and circuit breaker number for primary power serving the FACU and Date(s) of installation.
2. A copy of the “Records of Completion.”
3. CD/DVD with final system program.

3.12 OBO/OPS/FIRE PROGRESS INSPECTIONS, COMMISSIONING, AND ACCEPTANCE

A. Progress Inspections: OBO/OPS/FIRE personnel conduct routine site inspections of fire alarm and connected systems during construction. There are generally three progress inspections that occur; these are at approximately the 40-50 percent, 75 percent, and 90-100 percent completion stages of overall project.

1. At the time of any inspection, OBO/OPS/FIRE must be provided with access to any and all inspection reports made by certified or licensed fire protection professionals as required by contract.
2. The system installation contractor and General Contractor must keep current on file all NFPA inspection and test reports for inspection by OBO/OPS/FIRE personnel during these inspections.
3. All deficiencies identified to contractor must be promptly remedied.

B. Final Inspection, Testing and Acceptance: OBO/OPS/FIRE personnel will conduct one final site inspection, testing, and acceptance visit.

1. Scheduling of Final Inspection, Testing, and Acceptance:

   a. Scheduling of final inspection is not permitted until the building(s) are substantially completed, pre-testing has been completed, and any noted deficiencies have been corrected.
   b. The General Contractor must request to schedule the final inspection in accordance with Division 01 requirements with a minimum of 30 days in advance of proposed date to allow for coordination by OBO/OPS/FIRE.
   c. The General Contractor must submit the completed affidavit titled “Fire and Life Safety Systems Request for Final Acceptance Test” signed with the requested inspection date. The form is attached to this specification and available from OBO/OPS/FIRE. Refer to Part 1 Article on SUBMITTALS.
   d. Required pre-test data and documents must be submitted to OBO/OPS/FIRE through the Project Director/COR.

2. OBO/OPS/FIRE requires 14-day Burn-in period for all fire alarm systems and networks prior to final inspection, testing, and acceptance.

   a. All installation, programming, and testing requirements must be completed prior to initiating the burn-in period.
   b. No system modifications, programming changes, testing, or training must occur during this time.
   c. All events occurring on the system during burn-in must be recorded, documented, and submitted to OBO/OPS/FIRE within 24 hours of each event.

C. When requesting final inspection, general contractor must submit, with requested inspection date, the completed affidavit titled “Fire and Life Safety Systems Request for Final Acceptance Test” signed as indicated on that form. The form is attached to this specification.

D. Programming Changes During Testing: Where programming changes are made during course of acceptance testing/commissioning, testing will restart until system can be 100 percent tested without any programming changes occurring.

E. Contractor is responsible for having equipment on-site for testing system, including, but not limited to test smoke for smoke detectors, sound pressure level meters (conforming to NFPA 72),

heat gun for heat detectors, method to reach all detectors (smoke pole, ladder and / or lift), and minimum of three two way radios for communication approved for use by the Site Security Manager (SSM) or Regional Security Officer (RSO). Multi criteria detection devices must be tested with test equipment designed to emit heat and smoke simultaneously. It is not acceptable to use any flame producing or smoke producing items such as cigarettes, cigars or pump sticks. Use of magnets is not permitted during final acceptance testing.

F. Contractor is responsible for having lead installer and qualified individual present for the duration of final inspection and final testing. Where lead installer and qualified individual are the same person, the Contractor must have at least one additional person qualified at NICET II level during testing for a total of two NICET certified individuals provided by the Contractor. The qualified individual or NICET II level individual will be controlling the main FACU and communicating with lead installer via two-way radio conducts functional tests on each device. OBO/OPS/FIRE personnel must witness testing all aspects of testing. Where OBO/OPS/FIRE personnel have to perform testing due to lack in qualified people provided by the Contractor (as defined in this specification), OBO reserves the right to charge the General Contractor for time and travel expenses for each OBO team member. All fire alarm control units must have factory set passwords active during acceptance testing; they must remain active throughout acceptance period and the period when the system is placed in service.

G. If the project is not substantially complete in accordance with the documentation required in this Section, OBO reserves the right to charge the General Contractor for additional time and travel expenses required by OBO/OPS/FIRE for subsequent inspection.

3.13 TRAINING

A. Training: Training must not be conducted until fire alarm system installation, including fire alarm system monitoring, has been tested in accordance with NFPA 72, and accepted by OBO/OPS/FIRE.

1. The lead installer must provide two separate eight-hour operational maintenance / troubleshooting training sessions on the fire alarm system to Government personnel, including Foreign Service National (FSN) maintenance personnel, MSG, and PCC Tenants on location.
2. Training must include classroom and practical hands-on training covering operation, adjustments, theory, and troubleshooting.
3. Specific operation maintenance manuals, as described within the Part 1 Article on SUBMITTALS (in paragraph on Operation and Maintenance Manuals), must be utilized for this training.
4. Produce video of training, and submit as DVD deliverable, so that future staff may benefit from the training sessions.

END OF SECTION 284626

SECTION 284705 – MASS NOTIFICATION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Emergency Notification System (ENS).
2. Imminent Danger Notification System (IDNS).

B. Related Sections include the following:

1. Section 280508 “Common Work Results for Technical Security Systems (TSS)” for requirements common among TSS system type, and for TSS system racks and interaction with TSS electrical infrastructure.
2. Section 283337 “Technical Security Duress Systems” has no connection with the mass notification system.
3. Section 285115 “Security Management System Enterprise (SMSe).”

1.2 SYSTEM DESCRIPTION

A. Emergency Notification System (ENS):

1. ENS provides audible alert in event of imminent danger to personnel. When activated, personnel are intended to take necessary steps to protect life, information, and property.
2. ENS reports tone activations via Security Management System enterprise (SMSe).
3. ENS system is not to be used as public address system.
4. ENS system uses call station keypads for user interface points.
5. ENS system interfaces with Night Bell Paging Adapter.
6. ENS system must be 15db above ambient noise

B. Imminent Danger Notification System (IDNS):

1. Imminent Danger Notification System (IDNS) immediately alerts building and compound occupants to threat via activation of hardwired switch or remote pendant.
2. IDNS devices activate Emergency Notification System (ENS) “Duck & Cover” tone and voice instructions.
3. IDNS as a whole is not part of ENS; however, the two systems function in unison to inform personnel of imminent danger.
4. Security personnel who perceive plausible, imminent threat are intended to trigger IDNS through one of two methods:

a. Switches and wireless transmitter pendants.
b. Repeaters to transmit pendant signals.

1.3 SUBMITTALS

A. Product Data: Include components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories.

B. Shop Drawings: Details assemblies of standard components that are custom assembled for specific application on this Project.

C. Equipment and System Operation Description: Include method of operation and supervision of each component and each type of circuit. Show sequence of operations for manually and automatically initiated system or equipment inputs. Description must cover this specific Project; manufacturer's standard descriptions for generic systems are not acceptable.

D. Contractor QC Pre-Check Certification: Refer to Section 280508 "Common Work Results for Technical Security Systems (TSS) for combined certification for contractor QC for all TSS sub-systems

E. Operation and Maintenance Data: Include the following:

1. Operating and maintenance instructions.
2. Operating sequences.
3. Purchase source for operating and maintenance materials.

1.4 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Article on QUALITY ASSURANCE in Section 280508 "Common Work Results for Technical Security Systems (TSS)."

PART 2 - PRODUCTS

2.1 GENERAL

A. Approved Products: See separate contract attachment, "DS TSS Equipment List" for a partial listing of products that have been approved for general use in DOS overseas facilities.

B. Emergency Notification System (ENS):

1. Controller:

a. Primary control component for ENS.
b. Provides digital audio to amplifiers and stores digital messages and tones.
c. Interfaces with call station, call station interfaces and amplifiers via CAT5, glass fiber, and proprietary plastic fiber cables.
d. Provides outputs for interfacing with IDNS.

2. Speakers and Horns:

a. Ceiling mounted and wall mounted.

3. Controller: Load ENS controller with three different audio files:

a. “State Department Message # 1 (Duck and Cover).”
b. “State Department Message #2 (Evacuate).”
c. “State Department Message #3 (Retreat).”

4. Program Audio Router for standard zone control as follows:

a. NOB.
b. CAA.
c. MSGR/CMR.
d. Site Buildings.
e. Exterior horns.

5. Safe Haven:

a. Provide control unit and microphone.
b. Cut-off switch for IDNS.
c. Volume control for speakers in Safe Haven.
d. Post 1 override.

6. Safe Area:

a. Provide volume control for speaker inSafe Area.

7. Provide separate and dedicated power supply for each control unit(s).

C. Imminent Danger Notification System (IDNS):

1. If RF Repeater is provided, it must contain tamper switch, which reports to Standard IDS annunciator panel in Post 1.

PART 3 - EXECUTION

3.1 INSTALLATION – SYSTEM- SPECIFIC

A. Emergency Notification System (ENS):

1. Do not install ENS speakers in stairwells.
2. Loop ENS speaker circuit cable from speaker to speaker.
3. Zone speaker circuits to allow Marine Security Guard to activate and deactivate ENS on a building-by-building.

a. .

B. Imminent Danger Notification System (IDNS):

1. Install hardwired switches at all PACs and CAC screening areas and guard booths and provide transmitters in accordance with Table 3.1, "IDNS System."

TABLE 3.1
IDNS SYSTEM

DESCRIPTION/LOCATION	DUCK AND COVER SWITCH
CAC Guard Booths	1
PAC Screening Areas	1
PAC Guard Booths	1
Truck Transfer Screening Area	1
NOB/NOX Service Entrance Screening Area	1
NOB/NOX Service Entrance Guard Booth	1
Consular Screening	1

2. Install hardwired DP/ST switches to activate primary alert tone (ENS Message #1) on ENS control unit and a zone on Standard IDS annunciator panel. This will provide location identifier.
3. Mount remote activation switches/buttons in discreet locations out of public view. Install with switch guard to prevent accidental activation, and clearly label switch guard.

4. Install system so that roving guards carrying transmitter can trigger IDNS tone from any location on compound perimeter. Provide 10 programmed and tested pendants to the RSO or PD.
5. Programming for wireless pendants at CACs must uniquely identify guard locations to MSG Post 1.
6. Lock and Leave Posts: Place RF receivers for wireless pendants in Post 1 or remote CAC guard booth; when placed in CAC, hardwire receiver to ENS in chancery.
7. Refer to separate contract attachment "Technical Security (TS) Application Guidelines" for the systems identified below for detailed installation instructions and adjustments to manufactured systems.

    a. Inovonics Wireless System – Installation for IDNS.

3.2 FIELD QUALITY CONTROL

A. Manufacturer's Representative: Engage factory-authorized service representative to inspect field assembly and connection of components, and to test functioning of system.

1. Perform these quality control procedures prior to Quality Assurance inspection by the Government.

3.3 DEMONSTRATION

A. Engage a service representative to train Government personnel to adjust and operate security equipment. Refer to Division 01 Section "Demonstration and Training."

1. ENS.
2. IDNS.

END OF SECTION 284705

SECTION 284800 AREAS OF REFUGE EMERGENCY COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies intercommunication systems at Areas of Refuge.

B. Related Sections:

1. Other Divisions 26 and 27 sections for conduits, wire ways, connection boxes, pull boxes, junction boxes, and outlet boxes permanently installed in walls, floors, and ceilings, and for interface with panelboards to power each intercom.
2. Section 283325 “TSS Intercommunications Systems” for post security personnel communication with other security personnel, and post security personnel interface for remote access control.

1.2 CODES AND STANDARDS

A. Codes and standards referenced in this Specification must be those editions referenced in the applicable version of the OBO Building Codes (OBO adopted codes and OBO Code Supplements) and references cited in those Codes, or those current at the date of this Specification, unless otherwise noted.

B. In the event of a conflict between referenced codes and standards and/or the Drawings and Specifications, the code or standard having the more stringent requirements must govern.

C. Comply with the following industry Standards, unless more stringent requirements are indicated or are required by an approved product manufacturer:

1. National Fire Protection Association (NFPA):

   a. NFPA 72, “National Fire Alarm and Signaling Code,” 2022 edition

2. Underwriters Laboratory (UL)

   a. UL 2525, Two-Way Emergency Communications Systems for Rescue Assistance

3. International Code Council (ICC) / American National Standard (ANSI)

   a. ICC/ANSI A117.1 Accessible and Usable Buildings and Facilities

1.3 SYSTEM DESCRIPTION

A. System Elements: The system must comprise a command unit station, remotely located communications stations (remote call stations), primary and secondary power supply, and signage.

1. Main Unit Station: Main operator's control device, which includes audible and visual display to indicate specific active remote call station location(s). Located in Post 1.
2. Remote Call Station (call boxes): Located at each Area of Refuge (typically stairwells) and communicate directly to the Main Unit Station in Post 1. Communication must be analog (no exceptions).
3. Signage: Elements locating each designated Area of Refuge and notification system, including instructions on how to operate Remote Call Station.

B. System Operation: When an occupant(s) activates a remote call station(s), a two-way live voice communication must operate between the remote call station(s) and the Main Unit Station located in Post 1.

C. This project is a ring-and-string project; that connectivity must be provided as work of this section.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and equipment data for all proposed equipment, devices, wire, conduit to be incorporated in the project. Where multiple items are shown on data sheets, product data sheets must be marked up (circled, highlighted, or strike through) to indicate which items will be used/provided and which items will not be.

B. Shop Drawings: Prepare code compliant working plans according to NFPA 72. Shop drawings must be consistent with construction drawing set, including plans, schematics, and diagrams, which indicate locations and arrangement of command unit stations, each remote call station, wiring, power supply, and signage.

C. System Test Performance Confirmation: Provide notification that each system location has been tested in accordance with the Article on FIELD QUALITY CONTROL, and that each system location conforms to the requirements for function and performance identified in this Section.

D. Operations and Maintenance: Submit completed record of manufacturer's operations and maintenance manual, including manufacturer's data sheets and installation instructions for installed equipment. Include testing and maintenance schedule and procedures. Provide complete operating instructions and repair/troubleshooting guide listing common causes for breakdowns, malfunctions, and recommended repairs. List spare parts and replacement parts as well as suppliers. Provide copies of NFPA 72 and drawings identifying location of command unit station, all remote call stations, wiring pathways, and signage.

1.5 QUALITY ASSURANCE

A. Manufacturer, Supplier, and Installer Qualifications:

1. The term "manufacturer" is defined as a firm regularly engaged in the manufacture and integration of intercommunication system components, of types and ratings specified and indicated, whose products have been in satisfactory use in similar services for not less than five years.
2. All command unit installation, configurations, setup, program and related work must be performed by electronic technicians thoroughly trained by the manufacturer in the installation and service of the equipment provided.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver assemblies, components, and accessories to job site in undamaged factory packaging.

B. Inspect all items upon delivery to job site.

C. Storage of active equipment:

1. Do not deliver to site more than six months prior to final commissioning.
2. Store in temperature-controlled room or container in accordance with manufacturer’s recommendations.

D. Store cabling, consumables, electronics, and batteries away from moisture, dust, and static electricity.

1. Store these items in location that maintains temperature between 10 deg C (50 deg F) and 30 deg C (85 deg F), and humidity between 30 and 70 percent.

1.7 PROJECT CONDITIONS

A. Due to the sensitive nature of system components, items identified above as requiring environmentally controlled storage must only be installed when environmental controls and power are operational to maintain those environmental conditions in spaces where those items are installed, and other work in those spaces is approximately 90 percent complete.

1.8 COORDINATION

A. Coordinate the work in this section with other sections as required ensuring that the entire work will be carried out in orderly, complete, and organized fashion.

B. Coordinate with other trades for installation of backbone cabling such as mechanical, electrical, and structural.

PART 2 - PRODUCTS

2.1 GENERAL

A. All cables in this Section must conform to TIA standards cited in Section 270508 "Common Work Results for Telecommunication."

B. Overall system must comply with UL 2525 "Two-way Emergency Communications Systems for Rescue Assistance."

2.2 MAIN UNIT STATION

A. Description: Area of Refuge analog main unit station.

1. Built-in local main unit phone for on-site calling with no outside phone line.
2. Monitoring panel providing audible and visual indication (strobe/sounder) when emergency call is detected.
3. Support and provide power to each analog remote call station as an area of refuge (or area of rescue assistance) station used for emergency communications.
4. Specific location of each active remote call station must be identified on the Main Unit Station display on a floor and area basis.
5. Steel enclosure cabinet with acrylic windows.
6. Located in Post 1.

B. Basis-of-Design System: Talkaphone, AOR-16

1. Area of Refuge Analog Station: AOR-CSE-FM

2.3 REMOTE CALL STATIONS

A. Description: Analog, hands-free operated, ADA-compliant communication endpoint.

1. 2-way hands-free communication with push button once to call.
2. Phone line powered: no power supply or battery backup
3. Two LED indicators for hearing impaired (calling, answered)
4. Flush mount configuration.

B. Basis-of-Design System: Talkaphone, AOR-CSE-FM

2.4 AREA OF REFUGE SIGNAGE

A. Description: Signage to designate each Area of Refuge.

1. Constructed of UV light-resistant polycarbonate.
2. Self-adhesive sign.
3. ICC A117.1 raised lettering and Braille for ADA-compliance.
4. Signage must be located adjacent to each door providing access into an Area of Refuge.
5. Signage must be in English and local language.

B. Basis-of-Design System: Talkaphone, ETP-SIGN

2.5 REMOTE CALL STATION SIGNAGE

A. Description: Signage providing operating instructions for remote call stations.

1. Constructed of UV light-resistant polycarbonate.
2. Self-adhesive sign.
3. ICC A117.1 raised lettering and Braille for ADA-compliance.
4. Signage must be located adjacent to each Remote Call Station.
5. Signage must be in English, local language, and use internationally accepted graphic symbols.

B. Basis-of-Design System: Talkaphone, ETP-SIGN

2.6 SECONDARY POWER SUPPLY

A. Systems must be capable of operating the system under quiescent load for a minimum of 24 hours and then subsequently during a fire or other emergency condition for a period of 4 hours with all remote call stations activated and all main unit stations annunciating the calls.

2.7 PATHWAYS

A. The remote call stations and the main unit station must communicate with each other via pathways based on their performance capabilities under abnormal (fault) conditions in accordance with the requirements for Class A, Class B, Class N, or Class X pathways specified in NFPA 72, Chapter 12.

B. All pathways between the remote call stations and the main unit station must be monitored for integrity.

2.8 DISPLAY LOCATION INFORMATION

A. The specific location of each active remote call station must be identified on the main unit station display on a floor and area basis in accordance with the following:

1. Where all active calls are not simultaneously displayed, the main unit stations must provide the following:

a. Previously answered calls must be capable of being prioritized as urgent on the main unit station to differentiate more urgent life safety related calls from less urgent calls.
b. A minimum of 8 active call station identifiers must be visible in the following order of priority:

1) Previously unanswered calls, oldest first.
2) Previously answered calls, prioritized as urgent, oldest first.
3) Previously answered calls, not prioritized as urgent, oldest first.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate equipment work with the work of other Sections and provide items to be placed during the installation of other work at the proper time to avoid delays in the work. Furnish installation templates, diagrams, and other data to fabricators and installers of related work as necessary for coordination of the installation. Place such items, including pipes, conduit, inserts and anchors, accurately in relation to the final location of equipment components.

B. Install all components of the equipment in accordance with the manufacturer's written instructions and recommendations.

3.2 FIELD QUALITY CONTROL

A. Contractor must perform tests to verify proper operation of main unit station and each remote call station.

3.3 TRAINING

A. Training: Training must not be conducted until area of refuge emergency communication system installation has been tested in accordance with NFPA 72 and accepted by OBO/OPS/FIRE.

1. The lead installer must provide two separate operational maintenance and troubleshooting training sessions on the area of refuge system to Government personnel, including Locally Employed Staff maintenance personnel and MSG on location.
2. Training must include classroom and practical hands-on training covering operations, adjustments, theory, and troubleshooting.
3. Specific operation maintenance manuals, as described within Part 1.4 (Operations and Maintenance) must be utilized for this training.
4. Produce video of training, and submit as DVD deliverable, so that future staff may benefit from the training sessions.

END OF SECTION 284800

SECTION 285115 – SECURITY MANAGEMENT SYSTEM ENTERPRISE (SMSE)

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Security Management System Enterprise (SMSe):

B. Related Sections include the following:

1. Division 087155 “Security Door Hardware.”
2. Division 26 for general electrical requirements.
3. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
4. Division 28 sections for TSS systems interfaced by the SMSe.

C. Access systems in Section 281005 “Technical Security Access Systems” are not tied in with the SMSe.

1.2 SUBMITTALS

A. Product Data: Include components, rated capacities, operating characteristics, furnished specialties, dimensions, finishes, and accessories.

B. Shop Drawings: Details assemblies of standard components that are custom assembled for specific application on this Project.

1. Functional Block Diagram: Show single-line interconnections between components specified in this Section and those furnished under other Sections. Indicate methods used to achieve systems integration. Indicate control, signal, and data communication paths and identify control interface devices. Describe characteristics of network and other data communication lines.

C. Equipment and System Operation Description: Include method of operation. Description must cover this specific Project; manufacturer’s standard descriptions for generic systems are not acceptable.

D. Contractor QC Pre-Check Certification: Refer to Section 280508 “Common Work Results for Technical Security Systems (TSS)” for combined certification for contractor QC for all TSS sub-systems.

E. Operation and Maintenance Data: Include the following:
1. Operating and maintenance instructions.

2. Data for each type of product, including features and operating sequences, both automatic and manual.
3. Parts inventory list.
4. Purchase source for operating and maintenance materials.

1.3 QUALITY ASSURANCE

A. Perform quality control in advance of QA checks by the Government in accordance with Quality Assurance requirements in Section 280508 "Common Work Results for Technical Security Systems (TSS)."

1.4 DELIVERY AND STORAGE

A. Refer to Section 280508 "Common Work Results for Technical Security Systems (TSS)" for storage and protection.

PART 2 - PRODUCTS

2.1 GENERAL

A. Approved Products: See separate contract attachment, "DS Approved Equipment List" for a listing of products that have been approved for general use in DOS overseas facilities.

2.2 SYSTEM DESCRIPTION

A. SMSe provides computer-based monitoring system that interfaces with TSS equipment via SMSe Network. The system allows network to monitor security equipment performance and provides diagnostics capabilities.

B. SMSe Network monitors/integrates with the following standard TSS:

1. Intrusion Detection Systems (IDS).
2. Network Video Recorders (NVR) for Security Video System (SVS) monitoring.
3. Automated Access Control Systems (AACS).
4. Emergency Notification System (ENS).
5. EC Room Environmental sensors.
6. EC Room Uninterruptible Power Supply (UPS) with Ethernet module.
7. Automated Key Control Systems (AKCS) with Ethernet module (NOB and NOX only).

2.3 EQUIPMENT

A. Automated Access Control System (AACS): Panels and readers.

B. Global Identification (GLID) system and accessories:

1. Badging Workstation
2. Widescreen Flat Panel LCD Monitor.
3. Camera.
4. Tripod for camera.
5. Backdrop Screen.
6. Badge Printer with magnetic stripe encoder and holographic lamination module.
7. Associated supplies, uninterruptible power supplies (UPS), and cabling.

C. SMSe workstation monitors for Post 1, Main EC Room, Regional Security Office (RSO), Safe Area EAP, and Engineering Service Center (ESC) office.

D. Infrastructure associated with system; see Section 280508 Common Work Results for TSS Systems."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Automated Access Control System (AACS):

1. AACS Readers: Install card reader with PIN pad as identified in Table 3.1, "AACS Readers."

TABLE 3.1: AACS READERS

LOCATION	DESCRIPTION
NOB Entrance(s) Exterior Hardline	Main NOB and Service Entrance
NOB Entrance(s) Interior Hardline	Hardline doors that allow access from public space to General Work Area (GWA)
CAA Perimeter	GWA primary and secondary access to CAA Buffer
Main EC Room	Entrance to room
Room which holds AACS control panel (e.g. I.D. Badge Office)	Monitor AACS control panel (e.g., I-Star)

[Lock and Leave Bypass Door 1	**Not to operate door; only for record]**

2. AACS Control Panel (e.g., I-Star):

   a. Connect readers, reader outputs and door related inputs

3. AACS Control Sub-Panel:

   a. Provide separate enclosure with input boards and standoffs for connection to Enhanced IDS Controller**[and for Lock-and-Leave panel outputs]**.
   b. Provide three spare input boards

B. Global Identification (GLID) Badging Workstation:

1. Install GLID Badging workstation as server to establish temporary SMSe Local Area Network (LAN).
2. Install "EU" power to workstations, and do not use standalone UPS; see Part 3 Article on INSTALLATION – TSS PANELBOARDS in Section 280508 "Common Work Results for Technical Security Systems (TSS)."
3. Install Hardened Carrier System (HCS) infrastructure for non-encrypted SMSeNet local area network (LAN) signal lines transiting general work area (GWA), and lines from Main EC Room to spaces such as RSO and ESC office, Safe Haven EAP, and GLID I.D. Badging Office workstations, where those signal lines transit public access area (PAA).

C. Refer to Division 26 Section on wiring devices and Section 280508 "Common Work Results for TSS Systems" for outlets associated with SMSe.

D. Refer to separate contract attachments "Technical Security (TS) Application and Deployment Guidelines" for the SMSe identified below for detailed installation instructions and adjustments to modified manufactured systems.

1. SMSe Net.
2. SMSe I-Star/C-Cure Server.
3. Remote Video Integration.
4. SMSe Ancillary Devices.
5. Alarm Reporting.

3.2 FIELD QUALITY CONTROL

A. Manufacturer's Representative: Engage factory-authorized service representative to inspect field assembly and connection of components, and to start up and commission unit.

1. Perform these quality control procedures prior to Quality Assurance inspection by the Government.

3.3 DEMONSTRATION

A. Train Government personnel to adjust and operate the SMSe. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 285115

SECTION 311005 - SITE CLEARING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Removing existing vegetation which are not indicated for protection.
2. Clearing and grubbing.
3. **[Stripping and stockpiling topsoil.]**
4. **[Stripping and stockpiling rock.]**
5. **[Removing above- and below-grade site improvements.]**
6. **[Disconnecting, capping or sealing, and [removing site utilities] [abandoning site utilities in place].]**

B. Related Requirements:

1. **[Section 311305 “Temporary Tree and Plant Protection”:**
2. Section 312507 "Temporary Erosion and Sedimentation Controls” for temporary control measures.

1.2 DEFINITIONS

A. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms.

B. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil," but in disturbed areas such as urban environments, the surface soil can be subsoil.

C. Topsoil: Top layer of the soil profile consisting of existing native surface topsoil or existing in-place surface soil; the zone where plant roots grow. Its appearance is generally friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects larger than **[50 mm (2 inches)]** in diameter; and free of weeds, roots, toxic materials, or other non-soil materials.

D. Plant-Protection Zone or Tree-Protection Zone: See Section 312507 “Temporary Tree and Plant Protection.”

E. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.3 MATERIAL OWNERSHIP

A. Except for materials indicated to be stockpiled or otherwise remain the Government's property, cleared materials shall become Contractor's property and shall be removed from Project site.

1.4 [ACTION SUBMITTALS

A. [Topsoil stripping and stockpiling program: Prepare written program. Include dimensioned diagrams for placement and protection of stockpiles. Written program requires approval by Project Director/COR in terms of available usage of project site.]

B. [Rock stockpiling program. Prepare written program. Include dimensioned diagrams for placement and protection of stockpiles. Written program requires approval by Project Director/COR in terms of available usage of project site.]

C. [Burning permit. Permit from local authorities having jurisdiction indicating permission to burn, as well as identifying necessary protocols and documentation.]

1.5 INFORMATIONAL SUBMITTALS

A. Existing Conditions: Documentation of adjoining construction, and site improvements that establishes preconstruction conditions that might be misconstrued as damage caused by site clearing.

1. Use sufficiently detailed photographs or video recordings.
2. Coordinate with documentation in Section 311395 "Temporary Tree and Plant Protection." Indicate tree and plant protection zones, and their associated protective fencing.

B. Record Drawings: Identifying and accurately showing locations of utilities which were capped or were capped during site clearing, as well as other subsurface structural, electrical, and mechanical conditions identified during site clearing activities.

C. [Compliance with Burning Permit: Documentation of compliance with local burning requirements and with permitting of local authorities having jurisdiction. Identify location(s) and conditions under which burning will be performed.]

1.6 QUALITY ASSURANCE

A. Preinstallation (Pre-Execution) Meetings:

1. Consolidated meeting for general site clearing, temporary tree and plant protection if applicable, and temporary erosion and sedimentation controls.
2. Conduct at project site with Project Director/COR at least two weeks prior to any activity associated with the meeting.
3. Meeting topics shall include:

a. Approvals required by local authority having jurisdiction.
b. Existing improvements to be removed and to remain.
c. Existing utilities to be removed and to remain.
d. Required documentation.
e. Coordination with other work associated with the project.
f. Stockpiling programs for topsoil and rock, if applicable.

B. [Topsoil Stripping and Stockpiling Program: Prepare a program to systematically demonstrate the ability of personnel to properly follow procedures and handle materials and equipment during the Work.]

C. [Rock Stockpiling Program: Prepare a program to systematically demonstrate the ability of personnel to properly follow procedures and handle materials and equipment during the Work.]

1.7 FIELD CONDITIONS

A. Traffic: Minimize interference with adjoining public and on-compound roads, streets, walks, and other adjacent occupied or used facilities during site-clearing operations.

1. Do not close or obstruct those existing site elements without permission from Project Director/COR, and local authorities having jurisdiction for public where applicable.
2. Provide alternate routes around closed or obstructed trafficways if required by Project Director/COR or local authorities having jurisdiction, as applicable.

B. [Improvements on Adjoining Property: Authority for performing site clearing indicated on property adjoining Government's property will be obtained by Project Director/COR before award of Contract.

1. Do not proceed with work on adjoining property until directed by Project Director/COR.]

C. [Salvageable Improvements: Carefully remove items indicated to be salvaged and store on Government's premises where indicated.]

D. Identify Existing Utility Locations: Notify utility locator service for area where Project is located before site clearing. If no such service is available,

E. Do not commence general site clearing operations until measures for temporary erosion- and sedimentation-control and for temporary tree **and plant-protection** (if applicable) are in place.

F. Soil Stripping, Handling, and Stockpiling: Perform only when the soil is dry or slightly moist.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Satisfactory Soil Material: Requirements for satisfactory soil material are specified in Division 31 Section on "Earth Moving."

1. Obtain approved borrow soil material off-site when satisfactory soil material is not available on-site.

B. [Antirust Coating: Fast-curing, lead- and chromate-free, self-curing, universal modified-alkyd primer complying with [MPI #23 (surface-tolerant, anticorrosive metal primer)] [or] [SSPC-Paint 20 or SSPC-Paint 29 zinc-rich coating] <Insert requirement>.]

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect and maintain benchmarks and survey control points from disturbance during construction.

B. [Verify that trees, shrubs, and other vegetation to remain or to be relocated have been flagged, and that associated protection zones have been identified and enclosed according to requirements in Section 311305 "Temporary Tree and Plant Protection."]

C. Protect existing site improvements indicated to remain from damage during construction.

1. Restore damaged improvements to their original condition, as acceptable to Project Director/COR.

3.2 EXISTING UTILITIES

A. [The Government will arrange for disconnecting and sealing indicated utilities that serve existing structures before site clearing, when requested by Contractor.

1. Verify that utilities have been disconnected and capped before proceeding with site clearing.]

B. [Locate, identify, disconnect, and seal or cap utilities indicated to be removed [or abandoned in place].

1. [Arrange with utility companies to shut off indicated utilities.]
2. [The Project Director/COR will arrange to shut off indicated utilities when requested by Contractor.]

C. Locate, identify, and disconnect utilities indicated to be abandoned in place.

D. Interrupting Existing Utilities: Do not interrupt utilities serving facilities occupied by the Government or others, unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Project Director/COR not less than five days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Project Director/COR's written permission.

E. [Excavate for and remove underground utilities indicated to be removed.]

F. [Removal of underground utilities is included in earthwork sections; in applicable fire suppression, plumbing, HVAC, electrical, communications, electronic safety and security, and utilities sections; and in Division 02 Section(s) on "Structure Demolition" and "Selective Demolition."]

3.3 CLEARING AND GRUBBING

A. Remove obstructions, trees, shrubs, and other vegetation to permit installation of new construction.

1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
2. Grind down stumps and remove roots larger than 75 mm (3 inches) in diameter, obstructions, and debris to a depth of 450 mm (18 inches) below exposed subgrade.
3. Use only hand methods or air spade for grubbing within protection zones.
4. Chip removed tree branches and dispose of off-site.

B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material unless further excavation or earthwork is indicated. Coordinate with Division 31 Section on "Earth Moving."

1. Place fill material in horizontal layers not exceeding a loose depth of 200 mm (8 inches) and compact each layer to a density equal to adjacent original ground.

3.4 [TOPSOIL STRIPPING

A. Remove sod and grass before stripping topsoil.

B. Strip topsoil to depth indicated on Drawings, or otherwise to depth of 150 mm (6 inches), in a manner to prevent intermingling with underlying subsoil or other waste materials.

1. Remove subsoil and non-soil materials from topsoil, including clay lumps, gravel, and other objects larger than 50 mm (2 inches) in diameter; trash, debris, weeds, roots, and other waste materials.

C. [Stockpile topsoil away from edge of excavations without intermixing with subsoil or other materials. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust and erosion by water.

1. Limit height of topsoil stockpiles to 1800 mm (72 inches).
2. Do not stockpile topsoil within protection zones.

3. [Dispose of surplus topsoil. Surplus topsoil is that which exceeds quantity indicated to be stockpiled or reused.]
4. [Stockpile surplus topsoil to allow for respreading deeper topsoil.]

3.5 [STOCKPILING ROCK

A. Remove from [area indicated on Drawings] naturally formed rocks that measure more than 300 mm (12 inches) across in least dimension. Do not include excavated or crushed rock.

1. Separate or wash off non-rock materials from rocks, including soil, clay lumps, gravel, and other objects larger than 50 mm (2 inches) in diameter; trash, debris, weeds, roots, and other waste materials.

B. Stockpile rock [where indicated on Drawings] without intermixing with other materials. Cover to prevent windblown debris from accumulating among rocks.

1. Limit height of rock stockpiles to 900 mm (36 inches).
2. Do not stockpile rock within protection zones.

3. [Dispose of surplus rock. Surplus rock is that which exceeds quantity indicated to be stockpiled or reused.]
4. [Stockpile surplus rock to allow later use by the Government.]]

3.6 SITE IMPROVEMENTS

A. Remove existing above- and below-grade improvements as indicated and necessary to facilitate new construction.

B. Remove slabs, paving, curbs, gutters, and aggregate base as indicated.

1. Unless existing full-depth joints coincide with line of demolition, neatly saw-cut along line of existing pavement to remain before removing adjacent existing pavement. Saw-cut faces vertically.
2. Paint cut ends of steel reinforcement in concrete to remain with two coats of antirust coating, following coating manufacturer's written instructions. Keep paint off surfaces that will remain exposed.

3.7 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials including trash and debris, and legally dispose of them off Government's property.

B. [Where permitted by local authorities having jurisdiction, burn tree, shrub, and other vegetation waste in accordance with the permit requirements. Control such burning to produce the least smoke or air pollutants and minimum annoyance to surrounding properties. Burning of other waste and debris is prohibited.]

C. Separate recyclable materials produced during site clearing from other nonrecyclable materials. Store or stockpile without intermixing with other materials and transport them to recycling facilities. Do not interfere with other Project work.

END OF SECTION 311005

SECTION 311305 – TEMPORARY TREE AND PLANT PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes general protection and pruning of those existing trees and plants which are intended to remain, and that are affected by execution of the Work, whether temporary or permanent construction.

B. Related Requirements:

1. Division 01 Section "Temporary Facilities and Controls" for general temporary site fencing.
2. Section 311005 "Site Clearing" for removing those existing trees and shrubs which are not intended to remain.
3. Section 312000 “Earth Moving” for adjacent grading work, and for utility trenching and backfill.
4. Section 312507 “Temporary Erosion and Sedimentation Control” for coordination of temporary protection.

1.2 DEFINITIONS

A. Caliper (DBH): Diameter breast height; utilize measurement parameters of local or host country authorities. If no host country parameters apply, use diameter of a trunk as measured by a diameter tape at a height 1400 mm (54 inches) above the ground line.

B. [Plant-Protection Zone: Area surrounding individual trees, groups of trees, shrubs, or other vegetation to be protected during construction and indicated on Drawings.]

C. Tree-Protection Zone: Area surrounding individual trees, tree stand, or forest to be protected during construction, as defined by local or host country authorities, if applicable, and [**indicated on Drawings**] [**defined by a circle concentric with each tree with a radius 1.5 times the diameter of the drip line unless otherwise indicated**] [**defined by a circle concentric with each tree with a radius 12 times the tree's caliper size and with a minimum radius of 2400 mm (96 inches) unless otherwise indicated**].

D. Tree Stands and Forest: As defined by local or host country authorities; if no definition is available, use the following:

1. Tree Stand: Any group of five or more trees in a 5000 sq. meter area, with no more than 5 meters separating any tree. Shrubs and vegetative growth between these trees are not included unless indicated on the Drawings.

2. Forest: In accordance with definition of American Forestry Association. For projects governed by the European Commission of the European Union in accordance with definition of professional trade publications. For projects in locales with bamboos or palms, the host country definition identification of whether these are considered trees apply; on a project-specific basis and where indicated on the Drawings, these may be considered trees even if the host country does not identify them in that manner. Where identified by host country standards, woody shrubs also are included in the definition of a forest.

E. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review methods and procedures related to temporary tree and plant protection including, but not limited to, the following:

a. Tree-service firm's personnel, and equipment needed to make progress and avoid delays.
b. Project Arborist's responsibilities.
c. Coordination of Work and equipment movement with the locations of Tree- and Plant-Protection Zones.
d. Trenching by hand within Tree- and Plant-Protection Zones.
e. Field quality control.
f. Project enforcement procedures for Tree- and Plant-Protection Zones.

2. Construction Schedule.

a. Verify availability of materials, personnel, and equipment need to make progress and avoid delays.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Qualification Data: For Project Arborist. Include certifications and registrations, and three references for representative projects.

C. Samples: For each type of the following:

1. Organic Mulch: 1-Liter (1-quart) volume of organic mulch; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch.
2. Protection-Zone Signage: Full-size Samples of each size and text, ready for installation.

D. Tree Pruning Schedule: Written schedule detailing scope and extent of pruning of trees to remain that interfere with or are affected by construction.

1. Species and size of tree.
2. Location on site plan. Include unique identifier for each.
3. Reason for pruning.
4. Description of pruning to be performed.
5. Description of maintenance following pruning.

E. Tree Protection and Demolition Plan: Plan must be prepared by Project Arborist and must identify all protection measures for existing trees and plants to remain. The approved Plan must be used by the Contractor to control construction activities within and adjacent to Tree- and Plant-Protection Zones, and exceptions are permitted only upon approval of both the Project Arborist and Project Director/COR. The Plan must identify:

1. Location of all tree and plant protection fencing, including locations of laydown and construction logistics that interface with protected areas.
2. Location of areas requiring special root zone protection and associated logistics.
3. Identification of any locations where specified root zone protection is not possible and identify alternate means of protection.
4. Locations of existing and new paving and concrete with Protection Zones.
5. Locations of grade change at edges of Protection Zones.
6. Location and nature of project work located within and adjacent to Protection Zones, including temporary service access and paths, and associated details and calculations.
7. Location of existing and new utility pathways, including associated trenching, within or adjacent to Protection Zones.
8. Surface and subsurface drainage and aeration systems. Identify interface with Section 312507 “Temporary Erosion and Sedimentation Control.”
9. Methodology and logistics for temporary and permanent landscape watering and irrigation for planting to remain.
10. Identify materials and schedule for mulching and fertilization with Protection Zones.
11. Identify procedures to prevent pollution from all sources.
12. Identify procedures to avoid disruption of environmental support of planting to remain which would result in loss of vigor.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For tree service firm.

B. Certification: From Project Arborist, certifying that trees and plants indicated to remain have been protected during construction according to recognized standards and the Tree and Plant Protection Plan, and were promptly and properly treated and repaired when damaged.

C. Maintenance Recommendations: From Project Arborist, for care and protection of trees affected by construction during and after completing the Work.

D. Existing Conditions: Annotated plan documentation of existing trees and plantings indicated to remain, which establishes preconstruction conditions that might be misconstrued as damage caused by construction activities.

1. Use sufficiently detailed photographs or video recordings for annotation of plan.
2. Plans with associated notations must:

    a. Indicate specific wounds and damage conditions of each tree or other plants designated to remain.
    b. Show an accurate representation for trees with caliper of 200 mm (8 inches) or greater as measured at a height of 300 mm (12 inches).
    c. Identify botanical names of species.
    d. Identify canopy diameter of each tree to remain.

1.6 QUALITY ASSURANCE

A. Project Arborist Qualifications: Certified Arborist as certified by ISA**.** Licensed Arborist licensed or certified in local jurisdiction where Project is located, with minimum 5 years of successful commercial or institutional tree preservation projects in the locality or region of the project, and approved by Project Director/COR. Project Arborist must oversee on-site activity involving welfare of trees and plants to remain. Retain Project Arborist prior to on-site demolition and construction activities.

    1. Project Arborist must assist in preparation of submittals, such as documentation of existing conditions, to ensure appropriate detail.

B. Tree Service Firm Qualifications: An experienced tree service firm that has successfully completed temporary tree and plant protection work similar to that required for this Project in the Project locale or region, and that will assign an experienced, qualified Project Arborist to the site during execution of the Work.

C. Standards: At a minimum, utilize standards required by local or host country authorities. Where no such standards are available, as well as to the degree that the following standards are more stringent, the following international standards apply in relation to protection of existing trees and plants:

    1. International Society of Arboriculture (ISA): *Guide for Plant Appraisal*; prepared by the Council of Tree and Landscape Appraisers (CTLA).
    2. ISA *Best Management Practices Series* (bundled with *ANSI 300 Guidelines*):

        a. *Best Management Practices Fertilization Combo*.
        b. *Best Management Practices Integrated Vegetation Management Combo*.
        c. *Best Management Practices Planting Combo*.
        d. *Best Management Practices Pruning Combo*.
        e. *Best Management Practices Support Systems Combo*.

1.7 FIELD CONDITIONS

A. The following practices are prohibited within Protection Zones. Exceptions are permitted only upon approval of both the Project Arborist and Project Director/COR.:

1. Cutting, girdling, over-watering, and excessive pruning of trees and planting to remain.
2. Poisoning of soil within and adjacent to Protection Zones.
3. Unscheduled and unauthorized relocation and transportation of trees and planting to remain.
4. Storage of construction materials, debris, or excavated material.
5. Paving within "root zone" of trees to remain.
6. Parking vehicles or storing equipment.
7. Foot traffic or vehicle traffic.
8. Erection of sheds or structures.
9. Impoundment of water.
10. Excavation or other digging unless otherwise indicated on Drawings. In no case is machine trenching permitted within or adjacent to Protection Zones.
11. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.
12. Stockpiling or temporary storage of building materials, soils, dumpsters, or accumulated debris and refuse of excavated material is only permitted in accordance with the approved "Tree Protection and Demolition Plan," or where approved by the Project Arborist and Project Director/COR consistent with that Plan.
13. Use of tress as support posts, power poles, or signposts; anchorage for ropes, guy wires, or power lines; or similar functions.

B. Do not direct vehicle or equipment exhaust toward Protection Zones.

C. Prohibit heat sources, flames, ignition sources, and smoking within or near Protection Zones and organic mulch.

1.8 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings covered by the provisions of this Section that experience injury or fail to demonstrate flourishing condition of active growth, as determined by Project Director/COR with input from Project Arborist.

1. Failure for individual plants and for areas of groundcover requiring repair includes injury, unscheduled alteration, or death to 25 percent or less of each.
2. Failure for individual plants and for areas of ground cover requiring removal and replacement includes injury, unscheduled alteration or removal, or death to more than 25 percent of each, failure to demonstrate flourishing condition of active growth, damaged appearance that cannot be remedied with repair, or unscheduled removal.
3. Injury includes, but is not limited to, the following:

    a. Bruising, scarring, tearing, or breakup of root, trunk, branches, or foliage.
    b. Damage from herbicide or poisoning.
    c. Mechanical injury (i.e., non-infectious) due to landscape maintenance equipment, staking damage, vehicular traffic, vandalism, non-severe weather, insects, or animals.

4. Remove damaged vegetation as well as cuts and pruning associated with repairs and dispose off-site.
5. Replacement vegetation must match species and caliper of damaged vegetation, or may be of similar species with approval of Project Arborist
6. The warranty does not apply to transplanted vegetation.
7. Warranty Period: 1 year from date of Final Completion.

B. Plant Repair: Where repair is suitable remedy per parameters identified above, repair trees shrubs, and groundcover associated with the work of this Sections, and in a manner approved by Project Arborist.

1. Damage to tree crowns or roots of protected trees for trees over 50 mm (2 inches) in diameter must be reported to Project Arborist and Project Director/COR.
2. Submit details of proposed root cutting, and tree and shrub repair to Project Arborist, with copy to Project Director/COR.
3. Project Arborist must perform root cutting, branch pruning, and damage repair of trees and shrubs.
4. Treat damaged trunks, limbs, and roots in accordance with Project Arborist's written instructions, and under supervision of Project Arborist. Perform repairs within 24 hours.
5. Plant and maintain replacement trees, shrubs, and other vegetation as specified in Division 32 Section(s) on trees and plants.

C. Tree Replacement: Replace trees in accordance with parameters above.

1. General Replacement Tree Caliper: Caliper of replacement trees must be as follows:

a. Shade Trees: 100-mm (4-inch), 5 m (16 feet) tall.
b. Ornamental Trees: 50-mm (2-inch) at 250-mm (10-inches) above top of root ball, 2 m (8 feet) tall.
c. Palm Trees: 3.5 m (12 feet) to base of fronds.

2. Replacement Tree Quantities: Provide the following quantity of replacement trees per tree removed, and locate as directed by Project Arborist, with notification to Project Director/COR:

a. Caliper DBH up to 200-mm (8-inch): Three.
b. Caliper DBH between 200-mm and 600-mm (8-inch and 2-feet): Six.
c. Caliper DBH 600-mm (2-feet) or greater: Twelve.
d. Palm Trees: Three.

D. General Plant Replacement: Replace shrubs and vegetation in accordance with parameters above.

1. Replacement Shrub and Vegetation Size: Container or root ball size complying with ANSI Z60.1 for applicable type and form of plant.
2. Replacement Quantities: Provide three replacement shrubs per each damaged, removed, or altered shrub. Provide coverage of ground cover to match area requiring replacement. Locate as directed by Project Arborist, with notification to Project Director/COR.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Topsoil: Natural or cultivated top layer of soil profile or manufactured topsoil; containing organic matter and sand, silt, and clay particles; friable, pervious, and black or darker shade of brown, gray, or red than underlying subsoil; free of subsoil, clay lumps, gravel, and other objects more than 25 mm (1 inch) diameter, and free of weeds, roots, toxic materials, and other non-soil materials.

1. Existing topsoil of suitable quality may be stockpiled and mixed with new planting soil for use in limited regrading within Protection Zones.

B. Mulch: Free from deleterious materials and suitable as a top dressing for trees and shrubs, consisting of

1. Type: Shredded hardwood**.**
2. Size Range: 75 mm **(**3 inches**)** maximum**,** 13 mm **(**1/2 inch**)** minimum**.**
3. Color: Natural.

C. Protection Zone Fencing: Fencing fixed in position and meeting the following requirements: Previously used materials may be used when approved by Project Director/COR**.**

1. Chain-Link Protection Zone Fencing: Galvanized-steel fencing fabricated from minimum 50-mm (2-inch) opening, 3.75-mm- (0.15-inch-) diameter wire chain-link fabric; with pipe posts, minimum 60-mm- (2-3/8-inch-) OD line posts, and 75-mm- (2-7/8-inch-) OD corner and pull posts; with 4.5-mm**- (**0.175-inch-**)** diameter top and bottom tension wire; with tie wires, hog ring ties, and other accessories for a complete fence system.

   a. Height: 1800 mm (72 inches).
   b. Gates: Single**-** swing access gates matching material and appearance of fencing, to allow for maintenance activities within protection zones; leaf width 900 mm **(**36 inches**)**.

2. Silt Fence Fabric: For specific temporary staging applications identified in the Article on ROOT MAT PROTECTION. Refer to Section 312507 “Temporary Erosion and Sedimentation Control.”

D. Protection Zone Signage: Shop-fabricated, rigid plastic or metal sheet, with attachment holes prepunched and reinforced; legibly printed with nonfading lettering, and as follows or as otherwise required by local or regional authorities:

1. Text:” TREE/LANDSCAPE PRESERVATION AREA – DO NOT ENTER”
2. Language: Provide message in both English and local language.
3. Lettering: 75-mm**- (**3-inch**)** high minimum, black characters on white background; block, all capital letters.

E. Ground Protection Mat Products:

1. General: Various triple-ply geo-composites consisting of inner permeable layer of high-density polypropylene construction attached to outer layers of non-woven permeable fabric.
2. Project-Specific Product Selection: Characteristics based upon site visit by Contractor's geotechnical specialist and Project Arborist.

    a. General factors considered in determining acceptable products must include characteristics of underlying soils, slope, drainage, erosion and sedimentation controls.
    b. Operational factors must be discussed on-site with Contractor's construction manager and Project Director/COR's representative. Factors considered must include, but are not limited to, anticipated equipment, staging, and stockpiling within protection zones, and frequency and duration of loading, and static versus dynamic loading. In addition, discussion must include interaction of operational factors with general factors.

3. Basis-of Design Products: The following products are approved for use with specific identified applications. Other products may be acceptable as determined by Contractor's geotechnical specialist and Project Arborist.

    a. Root Protection Matting (RPM) for protection from staging of greater than 24-hour duration and from foot and vehicle traffic: Tenax Tendrain 770/2.
    b. Root Aeration Matting (RAM) for protection of roots and soil with grade fills: Tenax Tendrain 770/2.
    c. Permanent mats at paving profiles: Tensar Triax TX5.
    d. Matting for staffing of 24-hour or less duration: AlturnaMATS.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Inspection of Protective Tree Fencing: Before construction activities commence for the project the protection fencing must be installed by the tree service firm and approved by the Project Arborist and Project Director/COR. The Project Arborist must provide a written statement verifying that they have conducted a field inspection of all trees, and that protective fencing conforms to the requirements of the Tree Protection Plan is in place.

B. Inspection of Rough Grading: The Project Arborist must perform an inspection during the course of rough grading adjacent to the Tree-Protection Zones, and must ensure trees will not be injured by compaction, cut or fill, drainage and trenching, nor injured by project-specific measures (as applicable) such as aeration systems, tree wells, drains, and special protection measures as identified in the Tree Protection Plan.

C. General Site Erosion and Sedimentation Control: Examine the site to verify that temporary erosion- and sedimentation-control measures are in place; refer to Section 312507 "Temporary Erosion and Sedimentation Controls." Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross protection zones.

D. Prepare written report, endorsed by Project Arborist, listing conditions detrimental to tree and plant protection.

3.2 PREPARATION

A. Locate and clearly identify trees, shrubs, and other vegetation to remain or to be relocated. Conform to local and regional standards, where applicable.

1. **[Vegetation to remain have plant tags with identification numbers from previous survey. Confirm identification numbers with Drawings and replace missing plant tags to facilitate future identification.]**
2. Tie a 25-mm **(**1-inch) blue vinyl tape around each tree trunk at 1350 mm (54 inches) above the ground.
3. **[Flag each tree trunk to be relocated at 54 inches (1372 mm) above the ground.]**

B. Protect tree root systems from damage caused by runoff or spillage of noxious materials while mixing, placing, or storing construction materials. Protect root systems from ponding, eroding, or excessive wetting caused by dewatering operations.

C. Tree-Protection Zones: Mulch areas inside tree-protection zones and other areas indicated. Do not exceed indicated thickness of mulch.

1. Apply 50- to 75-mm **(**2- to 3-inch**)** uniform thickness of organic mulch unless otherwise indicated. Do not place mulch within 450 mm **(**18 inches**)** of tree trunks.

3.3 TREE- AND PLANT-PROTECTION ZONES

A. Protection Zone Fencing: Install protection zone fencing along edges of Protection Zones before materials or equipment are brought on the site and construction operations begin in a manner that will prevent people from easily entering protected areas except by entrance gates. Construct fencing so as not to obstruct safe passage or visibility at vehicle intersections where fencing is located adjacent to pedestrian walkways or in close proximity to street intersections, drives, or other vehicular circulation.

1. Chain-Link Fencing: Install to comply with ASTM F567 or local standards and with manufacturer's written instructions.
2. Posts: Set or drive posts into ground one-third the total height of the fence without concrete footings. Where a post is located on existing paving or concrete to remain, provide appropriate means of post support acceptable to Project Director/COR.
3. Access Gates: Install where indicated**,** or otherwise unlikely to be blocked by material storage or side of fence opposite activity; adjust to operate smoothly, easily, and quietly; free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.
4. Keep gates chained and padlocked at all times other than to gain entry for useful purposes related to tree and plant protection.

B. Protection Zone Signage: Install Protection Zone signage in visibly prominent locations in a manner approved by Project Director/COR. Install one sign spaced approximately every 7 m (23 feet) on Protection Zone fencing, but no fewer than four signs with each facing a different direction. For essentially straight runs of fencing, signs may be placed 15 m (50-feet) apart, or slightly greater if approved by Project Director/COR.

C. Maintain Protection Zones free of weeds and trash.

D. Maintain Protection Zone fencing and signage in good condition as acceptable to Project Director and remove when construction operations are complete, and equipment has been removed from the site.

1. Do not remove Protection Zone fencing, even temporarily, to allow deliveries or equipment access through the Protection Zone.
2. Temporary access is permitted subject to preapproval in writing by arborist if a root buffer effective against soil compaction is constructed as directed by Project Arborist. Maintain root buffer so long as access is permitted.

3.4 ROOT PROTECTION

A. General: Root protection is intended to reduce compaction, rutting, and contamination of soils and root systems for specimen trees of high impact designated to remain should staging, temporary stockpile, or equipment access be required within tree- and plant-protection areas due to extreme site constraints.

B. Root Zone Protection: Trees anticipated to experience temporary or repetitive materials staging, foot traffic, or equipment access within protected root zone must receive Root Protection Matting (RPM) or Root Aeration Matting (RAM), as applicable. For high impact trees, the Project Arborist will determine need to place wood chip mulch of 50- to 100-mm (2- to 4-inch) thickness under matting.

C. All-Weather RPMs: Where all-weather usage requires special protection against heavy vehicle use, provide 300-mm (12-inch) stone layer over RPM to allow these vehicles to have potential for dynamic compaction without rutting original surface soils and roots. This additional stone layer may be contained with silt fence or super silt fence where adjacent to or within tree-protection zone.

D. Protection Fencing at RPMs and RAMs: Since these mats are intended for greater than 24 hours, surround matted area with protection fencing in accordance with this Section.

1. For temporary staging of soils only, “trenchless” silt fence fabric may be installed; locate on lower/downhill side or as directed by Project Arborist.

E. Short-Duration Staging Mats: If access and operations are needed for 24 hours or less, use approved temporary mat products such as “Alturnamats”, 19-mm plywood sheathing, 25-mm steel plate or similar material as approved by Project Director/COR to avoid rutting and compaction. These products or materials may be shifted and reused as work progresses as long as they maintain suitable strength.

3.5 [EXCAVATION

A. General: Excavate at edge of Protection Zones and for trenches indicated within Protection Zones according to requirements in Section 312000 "Earth Moving" unless otherwise indicated.

B. Trenching within Protection Zones: Where utility trenches are required within Protection Zones, excavate under or around tree roots by hand or with air spade, or tunnel under the roots by drilling, auger boring, or pipe jacking. Do not cut main lateral tree roots or taproots; cut only smaller roots that interfere with installation of utilities. Cut roots as required for root pruning. If excavating by hand, use narrow-tine spading forks to comb soil and expose roots.

C. [Where identified on the Drawings, redirect roots in backfill areas where possible. If encountering large, main lateral roots, expose roots beyond excavation limits as required to bend and redirect them without breaking. If encountered immediately adjacent to location of new construction and redirection is not practical, cut roots approximately 75 mm (3 inches) back from new construction and as required for root pruning.]

D. Do not allow exposed roots to dry out before placing permanent backfill. Provide temporary earth cover or pack with peat moss and wrap with burlap. Water and maintain in a moist condition. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.]

3.6 TREE REMOVAL

A. Trees indicated on Drawings to be removed, or otherwise identified by Project Arborist for removal, must be removed to point at least 300-mm (12-inches) below lowest level of sub-grade upon which topsoil fill will be placed.

1. Backfilling with ground tree stump material is not permitted.
2. Adjacent Paved Areas: Areas within radius of 3 meters (10 feet) of removed trees that are under areas to be paved must receive treatment as recommended by Civil Engineer prior to preparation of sub-grade for the paved area.

B. Project Arborist must identify those trees that are indicated to remain on the Drawings but are dead trees or are damaged to the point of being incapable of restoration to normal growth pattern lifespan. These trees must be removed at the expense of the Contractor. Project Arborist must notify Project Director/COR within 48 hours.

3.7 ROOT PRUNING

A. Prune tree roots that are affected by temporary and permanent construction. Prune roots as follows:

1. Cut roots manually by digging a trench and cutting exposed roots with sharp pruning instruments; do not break, tear, chop, or slant the cuts. Do not use a backhoe or other equipment that rips, tears, or pulls roots.
2. Cut Ends: Do not paint cut root ends**.**
3. Temporarily support and protect roots from damage until they are permanently redirected and covered with soil.
4. Cover exposed roots with burlap and water regularly.
5. Backfill as soon as possible according to requirements in Section 312000 "Earth Moving."

B. Root Pruning at Edge of Protection Zone: Prune tree roots 300 mm **(**12 inches**)** outside] of the Protection Zone by cleanly cutting all roots to the depth of the required excavation.

C. Root Pruning within Protection Zones: Clear and excavate by hand to the depth of the required excavation to minimize damage to tree root systems. Use narrow-tine spading forks to comb soil to expose roots. Cleanly cut roots as close to excavation as possible.

3.8 CROWN PRUNING

A. Prune branches that are affected by temporary and permanent construction. Prune branches as directed by Project Arborist, or otherwise as follows:

1. Prune to remove only [**injured,**] broken, dying, or dead branches unless otherwise indicated. Do not prune for shape unless otherwise indicated.
2. Do not remove or reduce living branches to compensate for root loss caused by damaging or cutting root system.
3. Pruning Standards: Prune trees according to ANSI A300 (Part 1) and the following:

   a. Type of Pruning: Cleaning, raising, reducing, and thinning where indicated.
   b. Specialty Pruning: Restoration, vista, and utility where indicated.

B. Cut branches with sharp pruning instruments; do not break or chop.

C. Do not paint or apply sealants to wounds.

D. Provide subsequent maintenance pruning during Contract period as recommended by Project Arborist.

E. Chip removed branches and dispose of off-site**.**

3.9 REGRADING

A. Coordinate with Section 312507 “Temporary Erosion and Sedimentation Controls.” Provide coordinated measures to control erosion due to activities outside of Protection Zones.

B. Lowering or Raising Grade within Tree Protection Zones: No modifications to existing grade must be made within Protection Zones.

C. Lowering Grade at Edge of Protection Zones: Where new finish grade is indicated below existing grade of Protection Zones, begin to adjust slope 1 meter (3 feet) away from Protection Zone fencing.

D. Raising Grade at Edge of Protection Zones: Where new finish grade is indicated above existing grade of Protection Zones, provide drainage away from Protection Zones as indicated, or at minimum 1 meter (3 feet) from protection-zone fencing.

E. Minor Fill within Protection Zone: Where existing grade is 50 mm (2 inches) or less below elevation of finish grade, and if directed by Project Arborist, fill with backfill soil; place backfill soil in a single uncompacted layer, and hand grade to required finish elevations.

3.10 FIELD QUALITY CONTROL

A. Inspections: Project Arborist must direct plant-protection measures in the vicinity of trees, shrubs, and other vegetation indicated to remain, and must prepare inspection reports. Inspections must include, but are not limited to, the following:

1. Weekly Inspections: The Project Arborist must perform weekly inspections to monitor changing conditions and tree health and submit a written report to the Project Director/COR.
2. Wall Construction and Pavements: The Project Arborist must perform inspection during wall, utility, and pavement construction.
3. Special Activities within the Tree-Protection Zone: Work within the Tree-Protection Zone requires the direct on-site supervision of the Project Arborist. The Project Arborist must provide a field report for each visit recording the activities performed and the precautions implemented.

3.11 SOIL AERATION

A. Soil Aeration: Where directed by Project Arborist, aerate surface soil compacted during construction. Aerate 3 m (10 feet) beyond tree drip line and no closer than 900 mm (36 inches) to tree trunk. Drill 50-mm- (2-inch-) diameter holes a minimum of 300 mm (12 inches) deep at 600 mm (24 inches) on center. Backfill holes with an equal mix of augered soil and sand.

3.12 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Remove excess excavated material, displaced trees, trash, and debris and legally dispose of them off Government's property

END OF SECTION 311305

SECTION 312000 - EARTH MOVING

PART 1 - GENERAL

SUMMARY

A. Section Includes:

1. Excavating and filling for rough grading the Site.
2. Preparing subgrades for [**floor slabs**] [**walks**] [**pavements**] [**turf and grasses**] [**and**] [**plants**].
3. Excavating and backfilling for buildings and structures.
4. Drainage course for floor slabs.
5. Subbase course for concrete [**walks**] and [**pavements**].
6. Subbase course [**and base course**] for asphalt paving.
7. Subsurface drainage backfill for walls and trenches.
8. Excavating and backfilling trenches for utilities and pits for buried utility structures.

B. Related Requirements:

1. Section 311000 "Site Clearing" for site stripping, grubbing, stripping and stockpiling topsoil, and removal of above- and below-grade improvements and utilities.
2. Section 315000 "Excavation Support and Protection" for shoring, bracing, and sheet piling of excavations.
3. Section 316329 "Drilled Concrete Piers and Shafts" for excavation of shafts and disposal of surplus excavated material.
4. Section 329200 "Turf and Grasses" for finish grading in turf and grass areas, including preparing and placing planting soil for turf areas.
5. Section 329300 "Plants" for finish grading in planting areas and tree and shrub pit excavation and planting.

1.2 DEFINITIONS

A. Backfill: Soil material or controlled low-strength material used to fill an excavation.

1. Initial Backfill: Backfill placed beside and over pipe in a trench, including haunches to support sides of pipe.
2. Final Backfill: Backfill placed over initial backfill to fill a trench.

B. Base Course: Course placed between the subgrade and pavements or walks.

C. Bedding Course: Aggregate layer placed over the excavated subgrade in a trench before laying pipe.

D. Borrow Soil: Satisfactory soil imported from off-site for use as fill or backfill.

E. Drainage Course: Aggregate layer supporting the slab that also minimizes upward capillary flow of pore water.

F. Filter Material: Drainage fill material to be used in subsurface drainage applications for site retaining walls and building foundations.

G. Excavation: Removal of material encountered above subgrade elevations and to lines and dimensions indicated.

1. Authorized Additional Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions as directed by Project Director/COR. Authorized additional excavation and replacement material will be paid for according to Contract provisions for changes in the Work.
2. Bulk Excavation: Excavation more than 3 m in width and more than 9 m in length.
3. Unauthorized Excavation: Excavation below subgrade elevations or beyond indicated lines and dimensions without direction by Project Director/COR. Unauthorized excavation, as well as remedial work directed by Project Director/COR, must be without additional compensation.

H. Fill: Soil materials used to raise existing grades.

I. Rock: Rock material in beds, ledges, unstratified masses, conglomerate deposits, and boulders of rock material that exceed 0.76 cu. m for bulk excavation or 0.57 cu. m for footing, trench, and pit excavation that cannot be removed by rock-excavating equipment equivalent to the following in size and performance ratings, without systematic drilling, ram hammering, ripping, or blasting, when permitted:

1. Equipment for Footing, Trench, and Pit Excavation: Late-model, track-mounted hydraulic excavator; equipped with a 1065-mm maximum-width, short-tip-radius rock bucket; rated at not less than 103-kW flywheel power with bucket-curling force of not less than 128 kN and stick-crowd force of not less than 82 kN with extra-long reach boom.
2. Equipment for Bulk Excavation: Late-model, track-mounted loader; rated at not less than 172-kW flywheel power and developing a minimum of 213.3-kN breakout force with a general-purpose bare bucket.

J. Structures: Buildings, footings, foundations, retaining walls, slabs, tanks, curbs, mechanical and electrical appurtenances, or other man-made stationary features constructed above or below the ground surface.

K. Subgrade: Uppermost surface of an excavation or the top surface of a fill or backfill immediately below base, drainage fill, drainage course, or topsoil materials.

L. Utilities: On-site underground pipes, conduits, ducts, and cables as well as underground services within buildings.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct pre-excavation conference at [**Project site**] <**Insert location**>.

1. Review methods and procedures related to earthmoving, including, but not limited to, the following:

a. Personnel and equipment needed to make progress and avoid delays.
b. Coordination of Work with utility locator service.
c. Coordination of Work and equipment movement with the locations of tree- and plant-protection zones.
d. Extent of trenching by hand or with air spade.
e. Field quality control.
f. <**Insert agenda items**>.

1.4 SUBMITTALS

A. Product Data: For each type of the following manufactured products required:

1. Geotextiles.
2. Controlled low-strength material, including design mixture.
3. Geofoam.
4. Warning tapes.
5. Vapor barrier.
6. Drainage material.
7. Waterproofing.

B. Qualification Data: For qualified testing agency.

C. Material Test Reports: For each [**on-site**] [**and**] [**borrow**] soil material proposed for fill and backfill as follows:

1. Classification according to ASTM D2487.
2. Laboratory compaction curve according to [**ASTM D698**] [**ASTM D1557**].
3. California Bearing Ratio (CBR) according to ASTM D 1883 of each soil material proposed to support pavement sections.
4. Corrosion testing (pH, resistivity, sulfate content, and chloride content) to demonstrate that imported soils are not more corrosive to buried concrete or steel than the on-site soils or the corrosion protection measures can accommodate. Corrosion testing of at least four representative samples of each import fill material must include:

a. pH according to ASTM G51
b. Soil resistivity according to American Association of State Highway Officials (AASHTO) T288
c. Water-soluble chloride ion content in soil according to AASHTO T291

d. Water-soluble sulfate content in soil (Method A – Gravimetric) according to AASHTO T290.

5. For each proposed borrow source of fill or backfill, at least four representative samples must be tested for [**total petroleum hydrocarbons (TPH)-gasoline range organics (GRO);] [TPH-diesel range organics (DRO);] [benzene, toluene, ethylbenzene, xylenes (BTEX);] [and] [the EPA hazardous waste profile parameters (EOX, TCLP metals, ignitability, reactivity, polychlorinated biphenyls (PCBs) and paint filter test)]**.

D. Blasting plan [**approved by Project Director/COR and authorities having jurisdiction**].

E. Pre-excavation Photographs or Videotape: Show existing conditions of adjoining construction and site improvements, including finish surfaces that might be misconstrued as damage caused by earthwork operations. Submit before earthwork begins.

F. Health and Safety Plan

1.5 QUALITY ASSURANCE

A. Blasting: Comply with applicable requirements in NFPA 495, "Explosive Materials Code," and prepare a blasting plan reporting the following:

1. Types of explosive and sizes of charge to be used in each area of rock removal, types of blasting mats, sequence of blasting operations, and procedures that will prevent damage to site improvements and structures on Project site and adjacent properties.
2. Seismographic monitoring during blasting operations.

B. Geotechnical Testing Agency Qualifications: A qualified independent testing agency approved by the Geotechnical Engineer of Record and Project Director/COR to conduct soil materials testing, as documented according to ASTM D3740 and ASTM E329.

C. Conform to grading, excavation, and other earth moving requirements of the OBO Zoning Code.

D. Pre-Excavation Conference: Conduct conference at Project site to comply with requirements in Division 01 Section, "Contractor’s Quality Control” and Section 1.3.

1.6 PROJECT CONDITIONS

A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during earth-moving operations.

1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Project Director/COR and authorities having jurisdiction.

2. Provide alternate routes around closed or obstructed traffic ways if required by Project Director/COR or authorities having jurisdiction.

B. Existing Utilities: Do not interrupt utilities serving facilities occupied by Government or others unless permitted in writing by Project Director//COR and then only after arranging to provide temporary utility services according to requirements indicated.

1. Notify Project Director//COR not less than two days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Project Director/COR's written permission.
3. Contact utility-locator service for area where Project is located before excavating.

C. Do not commence earth-moving operations until temporary site fencing and erosion- and sedimentation-control measures specified in [**Section 015000 "Temporary Facilities and Controls"**] [**and**] [**Section 311000 "Site Clearing"**] are in place.

D. Do not commence earth-moving operations until plant-protection measures specified in Section 015639 "Temporary Tree and Plant Protection" are in place.

E. The following practices are prohibited within protection zones:

1. Storage of construction materials, debris, or excavated material.
2. Parking vehicles or equipment.
3. Foot traffic.
4. Erection of sheds or structures.
5. Impoundment of water.
6. Excavation or other digging unless otherwise indicated.
7. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.

F. Do not direct vehicle or equipment exhaust towards protection zones.

G. Prohibit heat sources, flames, ignition sources, and smoking within or near protection zones.

H. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies to shut off services if lines are active.

I. Demolish and completely remove existing shallow foundation, floor slabs, grade beams, and utilities below all pavement, floor slab, foundations, pile caps, or other structural elements. Replace with satisfactory soil.

J. Refer to the Geotechnical Engineering Report prepared and associated boring and test data for information pertaining to the general subsurface conditions within the project site.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

A. General: Provide borrow soil materials when sufficient satisfactory soil materials are not available from excavations.

B. Satisfactory Soils: Soil Classification Groups GW, GP, GM, SW, SP, and SM according to ASTM D2487 or a combination of these groups; free of rock or gravel larger than 75 mm in any dimension, debris, waste, frozen materials, vegetation, potentially corrosive materials, and other deleterious matter. These materials should exhibit a Liquid Limit and Plasticity Index of less than 40 and 15, respectively.

C. Unsatisfactory Soils: Soil Classification Groups GC, SC, CL, ML, OL, CH, MH, OH, and PT according to ASTM D2487, or a combination of these groups.

1. Unsatisfactory soils also include satisfactory soils not maintained within 2 percent of optimum moisture content at time of compaction and potentially corrosive imported soils.

D. Base Course: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D2940/D2940M; with at least 100 percent passing a 50 mm sieve, 80 to 95 percent passing the 25 mm sieve, 50 to 70 percent passing the 9.5 mm sieve, 9 to 20 percent passing the 0.425 mm sieve, and not more than 8 percent passing a 0.075 mm sieve.

E. Engineered Fill: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D2940/D2940M; with at least 90 percent passing a 37.5-mm sieve and not more than 12 percent passing a 0.075-mm sieve.

F. Bedding Course: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D2940/D2940M; except with 100 percent passing a 25-mm sieve and not more than 8 percent passing a 0.075-mm sieve.

G. Drainage Course: Narrowly graded mixture of washed crushed stone or crushed or uncrushed gravel; ASTM D448; coarse-aggregate grading Size 57; with 100 percent passing a 37.5-mm sieve and zero to 5 percent passing a 2.36-mm sieve.

H. Filter Material: Narrowly graded mixture of natural or crushed gravel, or crushed stone and natural sand; ASTM D448; coarse-aggregate grading Size 67; with 100 percent passing a 25-mm sieve and zero to 5 percent passing a 4.75-mm sieve.

I. Sand: ASTM C33/C33M; fine aggregate.

J. Impervious Fill: Soil classification groups CH, MH, CL, ML according to ASTM D 2487 or a combination of these groups.

2.2 GEOTEXTILES

A. Subsurface Drainage Geotextile: Nonwoven needle-punched geotextile, manufactured for subsurface drainage applications, made from polyolefins or polyesters; with elongation greater than 50 percent; complying with AASHTO M 288 and the following, measured per test methods referenced:

1. Survivability: As follows:

   a. Grab Tensile Strength: 700 N; ASTM D4632.
   b. Sewn Seam Strength: 630 N; ASTM D4632.
   c. Tear Strength: 250 N; ASTM D4533.
   d. Puncture Strength: 250 N; ASTM D4833.

2. Apparent Opening Size: [**0.425-mm**] [**0.250-mm**] [**0.212-mm**] sieve, maximum; ASTM D4751.
3. Permittivity: [**0.5**] [**0.2**] [**0.1**] per second, minimum; ASTM D4491.
4. UV Stability: 50 percent after 500 hours' exposure; ASTM D4355.

B. Separation Geotextile: Woven geotextile fabric, manufactured for separation applications, made from polyolefins or polyesters; with elongation less than 50 percent; complying with AASHTO M 288 and the following, measured per test methods referenced:

1. Survivability: As follows:

   a. Grab Tensile Strength: 1100 N; ASTM D4632.
   b. Sewn Seam Strength: 990 N; ASTM D4632.
   c. Tear Strength: 400 N; ASTM D4533.
   d. Puncture Strength: 400 N; ASTM D4833.

2. Apparent Opening Size: 0.250-mm sieve, maximum; ASTM D4751.
3. Permittivity: 0.02 per second, minimum; ASTM D4491.
4. UV Stability: 50 percent after 500 hours' exposure; ASTM D4355.

2.3 CONTROLLED LOW-STRENGTH MATERIAL

A. Controlled Low-Strength Material: Self-compacting [**, low-density**], flowable concrete material produced from the following:

1. Portland Cement: ASTM C150/C150M, [**Type I**] [**Type II**] [**or**] [**Type III**].
2. Fly Ash: ASTM C618, Class C or F.
3. Normal-Weight Aggregate: ASTM C33/C33M, [**19-mm**] [**10-mm**] <**Insert dimension**> nominal maximum aggregate size.

4. Foaming Agent: ASTM C869/C869M.
5. Water: ASTM C94/C94M.

6. Air-Entraining Admixture: ASTM C260/C260M.

B. Produce conventional-weight, controlled low-strength material with 550-kPa compressive strength when tested according to ASTM C495/C495M.

2.4 DRAINAGE PANEL

A. Drainage Panel: MiraDRAIN 6000, Hydroduct 220 with Hydroduct Coil 600 Drainage Composite, or approved equivalent consisting of a 3-dimensional dimpled core and geotextile fabric for use over waterproofing membranes, lagging and retaining wall applications.

2.5 VAPOR BARRIER

A. Vapor Barrier: Multi-ply lamination consisting of highly puncture resistant virgin polyolefin designed for preventing moisture migration through concrete slabs-on-grade with a minimum thickness of 10 mils.

2.6 GEOFOAM

A. Extruded-Polystyrene Board Insulation: ASTM C578, [**Type IV, 25-kg/cu. m density, 173-kPa compressive strength**] [**Type X, 21-kg/cu. m density, 104-kPa compressive strength**] [**Type VI, 29-kg/cu. m density, 276-kPa compressive strength**] [**Type VII, 35-kg/cu. m density, 414-kPa compressive strength**] [**Type V, 48-kg/cu. m density, 690-kPa compressive strength**].

B. Molded-Polystyrene Board Insulation: ASTM C578, [**Type I, 15-kg/cu. m density, 69-kPa compressive strength**] [**Type VIII, 18-kg/cu. m density, 90-kPa compressive strength**] [**Type II, 22-kg/cu. m density, 104-kPa compressive strength**].

1. Manufacture molded polystyrene with an inorganic mineral registered with the EPA and suitable for application as a termite deterrent.

C. Connectors: [**Geofoam manufacturer's multibarbed, galvanized-steel sheet connectors**] [**Deformed steel reinforcing bars, 19 mm in diameter**] <**Insert requirement**>.

2.7 ACCESSORIES

A. Warning Tape: Acid- and alkali-resistant, polyethylene film warning tape manufactured for marking and identifying underground utilities, 150 mm wide and 0.1 mm thick, continuously inscribed with a description of the utility; colored as follows:

1. Red: Electric.
2. Yellow: Gas, oil, steam, and dangerous materials.
3. Orange: Telephone and other communications.
4. Blue: Water systems.
5. Green: Sewer systems.

B. Detectable Warning Tape: Acid- and alkali-resistant, polyethylene film warning tape manufactured for marking and identifying underground utilities, a minimum of 150 mm wide and 0.1 mm thick, continuously inscribed with a description of the utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 750 mm deep; colored as follows:

1. Red: Electric.
2. Yellow: Gas, oil, steam, and dangerous materials.
3. Orange: Telephone and other communications.
4. Blue: Water systems.
5. Green: Sewer systems.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.

B. Preparation of subgrade for earthwork operations including removal of vegetation, topsoil, debris, obstructions, and deleterious materials from ground surface within [x] feet beyond the limit of construction area as specified in Division 31 Section "Site Clearing."

C. After stripping and prior to placing fill, proof-roll subgrade below **[the building slabs], [new fill], [foundations], [and] [pavements**] with a heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding not encountered in the test borings.

D. Protect and maintain erosion and sedimentation controls, which are specified in Division 31 Section "Site Clearing," during earthwork operations.

E. Stockpile on-site materials anticipated for re-use after screening. Care must be taken to avoid blending with the deleterious materials.

3.2 DEWATERING

A. Provide dewatering system of sufficient scope, size, and capacity to control hydrostatic pressures and to lower, control, remove, and dispose of ground water and permit excavation and construction to proceed on dry, stable subgrades.

B. Prevent surface water and ground water from entering excavations, from ponding on prepared subgrades, and from flooding Project site and surrounding area.

C. Protect subgrades from softening, undermining, washout, and damage by rain or water accumulation.

1. Reroute surface water runoff away from excavated areas. Do not allow water to accumulate in excavations. Do not use excavated trenches as temporary drainage ditches.
2. Install a dewatering system as indicated in Division 31 Section "Dewatering" as required to keep subgrades dry and convey groundwater away from excavations. Groundwater levels should be maintained a minimum of 0.6m (2 ft) below subgrade level. Maintain until dewatering is no longer required.

D. Dispose of all dewatering effluent in strict accordance with the project environmental requirements, US Federal regulations, and local requirements. The Project Director must review and approve dewatering disposal method.

3.3 EXPLOSIVES

A. Explosives: Do not use explosives.

B. Explosives: Obtain written permission from authorities having jurisdiction before bringing explosives to Project site or using explosives on Project site.

1. Perform blasting without damaging adjacent structures, property, or site improvements.
2. Perform blasting without weakening the bearing capacity of rock subgrade and with the least-practicable disturbance to rock to remain.

3.4 EXCAVATION, GENERAL

A. Unclassified Excavation: Excavate to subgrade elevations regardless of the character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions. No changes in the Contract Sum or the Contract Time will be authorized for rock excavation or removal of obstructions.

1. If excavated materials intended for fill and backfill include unsatisfactory soil materials and rock, replace with satisfactory soil materials.
2. Remove rock to lines and grades indicated to permit installation of permanent construction without exceeding the following dimensions:

a. 600 mm outside of concrete forms other than at footings.
b. 300 mm outside of concrete forms at footings.
c. 150 mm outside of minimum required dimensions of concrete cast against grade.
d. Outside dimensions of concrete walls indicated to be cast against rock without forms or exterior waterproofing treatments.
e. 150 mm beneath bottom of concrete slabs-on-grade.
f. 150 mm beneath pipe in trenches and the greater of 600 mm wider than pipe or 1065 mm wide.

3.5 EXCAVATION FOR STRUCTURES

A. Excavate to indicated elevations and dimensions within a tolerance of plus or minus 25 mm. If applicable, extend excavations a sufficient distance from structures for placing and removing concrete formwork, for installing services and other construction, and for inspections.

1. Excavations for Footings and Foundations: Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work.

a. Foundations must be constructed on suitable natural soils, new compacted fill, or lean concrete. Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work.
b. Foundation subgrades must be observed by a qualified local Geotechnical Engineer to evaluate whether the soils are suitable for the recommended bearing pressures and to verify that subgrades have not become excessively disturbed.

2. Pile Foundations: Stop excavations 150 to 300 mm above bottom of pile cap before piles are placed. After piles have been driven, remove loose and displaced material. Excavate to final grade, leaving solid base to receive concrete pile caps.
3. Excavation for Underground Tanks, Basins, and Mechanical or Electrical Utility Structures: Excavate to elevations and dimensions indicated within a tolerance of plus or minus 25 mm. Do not disturb bottom of excavations intended as bearing surfaces.

B. Excavations at Edges of Tree- and Plant-Protection Zones:

1. Excavate by hand or with an air spade to indicated lines, cross sections, elevations, and subgrades. If excavating by hand, use narrow-tine spading forks to comb soil and expose roots. Do not break, tear, or chop exposed roots. Do not use mechanical equipment that rips, tears, or pulls roots.
2. Cut and protect roots according to requirements in Section 015639 "Temporary Tree and Plant Protection."

3.6 EXCAVATION FOR WALKS AND PAVEMENTS

A. Excavate surfaces under walks and pavements to indicated lines, cross sections, elevations, and subgrades. Excavate to planned subgrade level and remove existing fill, high plasticity, soft/loose soils, and soils containing deleterious materials to a depth of 600 mm or entirely, whichever is less, and replace with compacted satisfactory soil exhibiting a CBR value of at least 6.

3.7 EXCAVATION FOR UTILITY TRENCHES

A. Excavate trenches to indicated gradients, lines, depths, and elevations.

1. Beyond building perimeter, excavate trenches to allow installation of top of pipe below frost line.
2. See Drawings for duck bank earthwork requirements.

B. Excavate trenches to uniform widths to provide the following clearance on each side of pipe or conduit. Excavate trench walls vertically from trench bottom to 300 mm higher than top of pipe or conduit unless otherwise indicated.

1. Clearance: 300 mm each side of pipe or conduit.

C. Trench Bottoms: Excavate and shape trench bottoms to provide uniform bearing and support of pipes and conduit. Shape subgrade to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits. Remove projecting stones and sharp objects along trench subgrade.

1. For pipes and conduit less than 150 mm in nominal diameter, hand-excavate trench bottoms and support pipe and conduit on an undisturbed subgrade.

2. For pipes and conduit 150 mm or larger in nominal diameter, shape bottom of trench to support bottom 90 degrees of pipe or conduit circumference. Fill depressions with tamped sand backfill.
3. For flat-bottomed, multiple-duct conduit units, hand-excavate trench bottoms and support conduit on an undisturbed subgrade.
4. Excavate trenches 150 mm deeper than elevation required in rock or other unyielding bearing material to allow for bedding course.

D. Trenches in Tree- and Plant-Protection Zones:

1. Hand-excavate to indicated lines, cross sections, elevations, and subgrades. Use narrow-tine spading forks to comb soil and expose roots. Do not break, tear, or chop exposed roots. Do not use mechanical equipment that rips, tears, or pulls roots.
2. Do not cut main lateral roots or taproots; cut only smaller roots that interfere with installation of utilities.
3. Cut and protect roots according to requirements in Section 015639 "Temporary Tree and Plant Protection."

3.8 SUBGRADE INSPECTION

A. Notify Project Director and Geotechnical Testing Agency when excavations have reached required subgrade.

B. If Project Director or Geotechnical Testing Agency determine that unsatisfactory soil is present, continue excavation and replace with compacted backfill or fill material as directed.

C. Proof-roll subgrade below **[the building slabs], [new fill], [foundations], [and] [pavements**] with a heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding. Do not proof-roll wet or saturated subgrades.

1. Completely proof-roll subgrade in one direction**,** repeating proof-rolling in direction perpendicular to first direction. Limit vehicle speed to 5 km/h.
2. Proof-roll with a loaded dump truck or other suitable weight rubber-tired construction equipment weighing not less than 14 tons. Alternate equipment must be approved by Project Director.
3. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by Project Director and Geotechnical Testing Agency, and replace with compacted backfill or fill as directed.

D. In confined areas where proof-rolling with heavy pneumatic-tired equipment is not feasible, the subgrade should be evaluated using other methods to determine the suitability of subgrade soils before fill placement. Other methods include the use of a dynamic cone penetrometer (DCP), geostick penetrometer or similar methods.

E. Subgrades beneath structural slab areas must be sufficient strength to support construction activities and machinery without excessive damage.

F. Authorized additional excavation and replacement material will be paid for according to Contract provisions for changes in the Work.

G. Reconstruct subgrades damaged by freezing temperatures, frost, rain, accumulated water, or construction activities, as directed by the Geotechnical Testing Agency and Project Director/COR, without additional compensation.

3.9 UNAUTHORIZED EXCAVATION

A. Fill unauthorized excavation under foundations or wall footings by extending bottom elevation of concrete foundation or footing to excavation bottom, without altering top elevation. Lean concrete fill, with 28-day compressive strength of 17.2 MPa, may be used when approved by the Project Director/COR when foundations bear on soil.

1. Fill unauthorized excavations under other construction, pipe, or conduit as directed by Project Director/COR or Geotechnical Testing Agency.

3.10 STORAGE OF SOIL MATERIALS

A. Stockpile borrow soil materials and excavated satisfactory soil materials without intermixing. Place, grade, and shape stockpiles to drain surface water. Cover to protect from rain and to prevent windblown dust.

1. Stockpile soil materials away from edge of excavations. Do not store within drip line of remaining trees.
2. Contractor must be solely responsible for the stability of stockpiles and the areas where stockpiles are placed. Contractor must stockpile materials in a manner so as to not compromise the stability or cause loss of support to existing structures and surfaces.

3.11 BACKFILL

A. Place and compact backfill in excavations promptly, but not before completing the following:

1. Construction below finish grade including, where applicable, subdrainage, dampproofing, waterproofing, vapor barrier installation, and perimeter insulation.
2. Surveying locations of underground utilities for Record Documents.
3. Testing and inspecting underground utilities.
4. Removing concrete formwork.
5. Removing trash and debris.
6. Removing temporary shoring, bracing, and sheeting.
7. Installing permanent or temporary horizontal bracing on horizontally supported walls.

B. Place backfill on subgrades free of debris, water, mud, frost, snow, or ice that are not loose or contain deleterious materials.

3.12 UTILITY TRENCH BACKFILL

A. Place backfill on subgrades free of mud, frost, snow, or ice.

B. Place and compact bedding course on trench bottoms and where indicated. Shape bedding course to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits.

C. Trenches under Footings: Backfill trenches excavated under footings and within 450 mm of bottom of footings with satisfactory soil; fill with concrete to elevation of bottom of footings. Concrete is specified in Division 03 Section “Cast-in-Place Concrete.”

D. Trenches under Roadways: Provide 100-mm thick, concrete-base slab support for piping or conduit less than 750 mm below surface of roadways. After installing and testing, completely encase piping or conduit in a minimum of 100 mm of concrete before backfilling or placing roadway subbase course. Concrete is specified in Division 03 Section “Cast-in-Place Concrete.”

E. Backfill voids with satisfactory soil while removing shoring and bracing.

F. Initial Backfill:

1. Soil Backfill: Place and compact initial backfill of satisfactory soil, free of particles larger than 25 mm in any dimension, to a height of 300 mm over the pipe or conduit.

   a. Carefully compact initial backfill under pipe haunches and compact evenly up on both sides and along the full length of piping or conduit to avoid damage or displacement of piping or conduit. Coordinate backfilling with utilities testing.

2. Controlled Low-Strength Material: Place initial backfill of controlled low-strength material to a height of 300 mm over the pipe or conduit. Coordinate backfilling with utilities testing.

G. Final Backfill:

1. Soil Backfill: Place and compact final backfill of satisfactory soil to final subgrade elevation.
2. Controlled Low-Strength Material: Place final backfill of controlled low-strength material to final subgrade elevation.

H. Warning Tape: Install warning tape directly above utilities, 300 mm below finished grade, except 150 mm below subgrade under pavements and slabs.

3.13 SOIL FILL

A. Place and compact fill material in layers to required elevations as follows:

1. Under grass and planted areas, use satisfactory soil material.
2. Under walks and pavements, use satisfactory soil or engineered fill material.

3. Under steps and ramps, use engineered fill.
4. Under building slabs, use engineered fill.
5. Under footings and foundations, use engineered fill.

B. Place soil fill on subgrades free of mud, water, frost, snow, or ice and that are not loose or contain deleterious materials.

3.14 GEOFOAM FILL

A. Place a leveling course of sand, 50 mm thick, over subgrade. Finish leveling course to a tolerance of 13 mm when tested with a 3-m straightedge.

1. Place leveling course on subgrades free of mud, water, frost, snow, or ice and that are not loose or contain deleterious materials.

B. Install geofoam blocks in layers with abutting edges and ends and with the long dimension of each block at right angles to blocks in each subsequent layer. Offset joints of blocks in successive layers.

C. Install geofoam connectors at each layer of geofoam to resist horizontal displacement according to geofoam manufacturer's written instructions.

D. Cover geofoam with [**subdrainage**] [**separation**] geotextile before placing overlying soil materials.

3.15 SOIL MOISTURE CONTROL

A. Uniformly moisten or aerate subgrade and each subsequent fill or backfill soil layer before compaction to within 2 percent of optimum moisture content.

1. Do not place backfill or fill soil material on surfaces that are muddy, frozen, contain frost or ice or that are loose or contain deleterious materials.
2. Remove and replace, or scarify and air dry, otherwise satisfactory soil material that exceeds optimum moisture content by 2 percent and is too wet to compact to specified dry unit weight.

3.16 COMPACTION OF SOIL BACKFILLS AND FILLS

A. Place backfill and fill soil materials in layers not more than 200 mm in loose depth for material compacted by heavy compaction equipment and not more than 100 mm in loose depth for material compacted by hand-operated tampers.

B. Place backfill and fill soil materials evenly on all sides of structures to required elevations and uniformly along the full length of each structure.

C. Compact soil materials to not less than the following percentages of maximum dry unit weight according to [**ASTM D698**] [**ASTM D1557**]:

1. Under structures, building slabs, steps, and pavements, compact each layer of backfill or fill soil material at **[95]** percent.
2. Under walkways, compact each layer of backfill or fill soil material at **[95]** percent.
3. Under turf or unpaved areas, compact each layer of backfill or fill soil material at **[92]** percent.
4. For utility trenches, compact each layer of initial and final backfill soil material at 95 percent.

3.17 GRADING

A. General: Uniformly grade areas to a smooth surface, free of irregular surface changes. Comply with compaction requirements and grade to cross sections, lines, and elevations indicated.

1. Provide a smooth transition between adjacent existing grades and new grades.
2. Cut out soft spots, fill low spots, and trim high spots to comply with required surface tolerances.

B. Site Rough Grading: Slope grades to direct water away from buildings and to prevent ponding. Finish subgrades to elevations required to achieve indicated finish elevations, within the following subgrade tolerances:

1. Turf or Unpaved Areas: Plus or minus 25 mm.
2. Walks: Plus or minus 25 mm.
3. Pavements: Plus or minus 13 mm.

C. Grading inside Building Lines: Finish subgrade to a tolerance of 13 mm when tested with a 3-m straightedge.

3.18 SUBSURFACE DRAINAGE

A. Subsurface Drain: Place subsurface drainage geotextile around perimeter of subdrainage trench. Place a 150-mm course of filter material on subsurface drainage geotextile to support subdrainage pipe. Encase subdrainage pipe in a minimum of 300 mm of filter material, placed in compacted layers 150 mm thick, and wrap in subsurface drainage geotextile, overlapping sides and ends at least 150 mm.

1. Compact each filter material layer with a minimum of two passes of a plate-type vibratory compactor.

B. Drainage Backfill: Place and compact filter material over subsurface drain, in width indicated, to within 300 mm of final subgrade, in compacted layers 150 mm thick. Overlay drainage backfill with one layer of subsurface drainage geotextile, overlapping sides and ends at least 150 mm.

1. Compact each filter material layer with a minimum of two passes of a plate-type vibratory compactor.
2. Place and compact impervious fill over drainage backfill in 150-mm thick compacted layers to final subgrade.

3.19 SUBBASE AND BASE COURSES UNDER PAVEMENTS AND WALKS

A. Place subbase course and base course on subgrades free of mud, water, frost, snow, ice and that are not loose or contain deleterious materials.

B. On prepared subgrade, place subbase course and base course under pavements and walks as follows:

1. Install separation geotextile on prepared subgrade according to manufacturer's written instructions, overlapping sides and ends.
2. Place base course material over subbase course under pavement.
3. Shape subbase course and base course to required crown elevations and cross-slope grades.
4. Place subbase course and base course 150 mm or less in compacted thickness in a single layer.
5. Place subbase course and base course that exceeds 150 mm in compacted thickness in layers of equal thickness, with no compacted layer more than 150 mm thick or less than 75 mm thick.
6. Compact subbase course and base course at optimum moisture content to required grades, lines, cross sections, and thickness to not less than 95 percent of maximum dry unit weight according to [**ASTM D698**] [**ASTM D1557**].

C. Pavement Shoulders: Place shoulders along edges of subbase course and base course to prevent lateral movement. Construct shoulders, at least 300 mm wide, of satisfactory soil materials and compact simultaneously with each subbase and base layer to not less than 95 percent of maximum dry unit weight according to [**ASTM D698**] [**ASTM D1557**].

3.20 DRAINAGE COURSE

A. Place drainage course on subgrades free of mud, frost, snow, or ice.

B. On prepared subgrade, place and compact drainage course under cast-in-place concrete slabs-on-grade as follows:

1. Install subdrainage geotextile on prepared subgrade according to manufacturer's written instructions, overlapping sides and ends.

2. Place drainage course 150 mm or less in compacted thickness in a single layer.
3. Place drainage course that exceeds 150 mm in compacted thickness in layers of equal thickness, with no compacted layer more than 150 mm thick or less than 75 mm thick.
4. Compact each layer of drainage course to required cross sections and thicknesses to not less than 95 percent of maximum dry unit weight according to [**ASTM D698**] [**ASTM D1557**].

3.21 FIELD QUALITY CONTROL

A. Geotechnical Testing Agency: The Contractor will engage a qualified geotechnical engineering testing agency to perform field quality-control testing. Geotechnical Testing Agency must be from independent from Contractor and Contractor's firm unless approved by the Project Director/COR.

B. Allow geotechnical testing agency to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earth moving only after test results for previously completed work comply with requirements.

C. Testing agency will test compaction of soils in place according to ASTM D1556, ASTM D2167, ASTM D2922, ASTM D2937, and ASTM D6938, as applicable. Note that if Contractor request approval to use a electromagnetic density gauge (EDG) according to ASTM D 7830 to assess soil compaction, prior approval should be received from Project Director/COR and a minimum of one sand cone (ASTM D 1556) or drive-cylinder (ASTM D 2937) compaction test must be performed for every 20 EDG tests. Tests will be performed at the following locations and frequencies:

1. Paved and Building Footprint Areas: At subgrade and at each compacted fill and backfill layer, at least one test for every 186 sq. m or less of paved area or building footprint but in no case fewer than three tests.
2. Foundation Wall Backfill: At each compacted backfill layer, at least one test for every 30 m or less of wall length but no fewer than two tests.
3. Trench Backfill: At each compacted initial and final backfill layer, at least one test for every 46 m or less of trench length but no fewer than two tests.

D. When testing agency reports that subgrades, fills, or backfills have not achieved degree of compaction specified, scarify and moisten or aerate, or remove and replace soil materials to depth required; recompact and retest until specified compaction is obtained.

3.22 PROTECTION

A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.

B. Repair and reestablish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.

1. Scarify or remove and replace soil material to depth as directed by Project Director/COR; reshape and recompact.

C. Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.

1. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.23 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Remove surplus satisfactory soil and waste materials, including unsatisfactory soil, trash, and debris, and legally dispose of them off Government's property.

END OF SECTION 312000

SECTION 312319 - DEWATERING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes construction dewatering.

B. Related Requirements:

1. Section 013233 "Photographic Documentation" for recording preexisting conditions and dewatering system progress.
2. Section 312000 "Earth Moving" for excavating, backfilling, site grading, and controlling surface-water runoff and ponding.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**> and include the following agenda items:

1. Verify availability of Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
2. Review condition of site to be dewatered including coordination with temporary erosion-control measures and temporary controls and protections.
3. Review geotechnical report.
4. Review proposed site clearing and excavations.
5. Review existing utilities and subsurface conditions.
6. Review observation and monitoring of dewatering system.

1.3 SUBMITTALS

A. Shop Drawings: For dewatering system, prepared by or under the supervision of a qualified professional engineer.

1. Include plans, elevations, sections, and details.
2. Show arrangement, locations, and details of wells and well points; locations of risers, headers, filters, pumps, power units, and discharge lines; and means of discharge, control of sediment, and disposal of water.

3. Include layouts of piezometers and flow-measuring devices for monitoring performance of dewatering system.
4. Include written plan for dewatering operations including sequence of well and well-point placement coordinated with excavation shoring and bracings and control procedures to be adopted if dewatering problems arise.

B. Qualification Data: For [**Installer**] [**land surveyor**] [**and**] [**professional engineer**].

C. Field quality-control reports.

D. Existing Conditions: Using [**photographs**] [**or**] [**video recordings**], show existing conditions of adjacent construction and site improvements that might be misconstrued as damage caused by dewatering operations. Submit before Work begins.

E. Record Drawings: Identify locations and depths of capped wells and well points and other abandoned-in-place dewatering equipment.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer that has specialized in [**design of dewatering systems and]** dewatering work.

1.5 FIELD CONDITIONS

A. Project-Site Information: A geotechnical report has been prepared for this Project. The opinions expressed in this report are those of a geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by a geotechnical engineer. OBO is not responsible for interpretations or conclusions drawn from this data.

1. Make additional test borings and conduct other exploratory operations necessary for dewatering according to the performance requirements.
2. The geotechnical report is [**included**] [**referenced**] elsewhere in Project Documents.

B. Survey Work: Engage a qualified land surveyor or professional engineer to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Dewatering Performance: Design, furnish, install, test, operate, monitor, and maintain dewatering system of sufficient scope, size, and capacity to control hydrostatic pressures and to lower, control, remove, and dispose of ground water and permit excavation and construction to proceed on dry, stable subgrades.

1. Design dewatering system, including comprehensive engineering analysis by a qualified professional engineer.
2. Continuously monitor and maintain dewatering operations to ensure erosion control, stability of excavations and constructed slopes, prevention of flooding in excavation, and prevention of damage to subgrades and permanent structures.
3. Prevent surface water from entering excavations by grading, dikes, or other means.
4. Accomplish dewatering without damaging existing buildings, structures, and site improvements adjacent to excavation.
5. Remove dewatering system when no longer required for construction.

B. Regulatory Requirements: Comply with governing notification regulations before beginning dewatering. Comply with water- and debris-disposal regulations of authorities having jurisdiction.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by dewatering operations.

1. Prevent surface water and subsurface or ground water from entering excavations, from ponding on prepared subgrades, and from flooding site or surrounding area.
2. Protect subgrades and foundation soils from softening and damage by rain or water accumulation.

B. Install dewatering system to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.

1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Project Director/COR and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.

C. Provide temporary grading to facilitate dewatering and control of surface water.

D. Protect and maintain temporary erosion and sedimentation controls, which are specified in [**Section 015000 "Temporary Facilities and Controls,"**] [**Section 311000 "Site Clearing,"**] during dewatering operations.

3.2 INSTALLATION

A. Install dewatering system utilizing wells, well points, or similar methods complete with pump equipment, standby power and pumps, filter material gradation, valves, appurtenances, water disposal, and surface-water controls.

1. Space well points or wells at intervals required to provide sufficient dewatering.
2. Use filters or other means to prevent pumping of fine sands or silts from the subsurface.

B. Place dewatering system into operation to lower water to specified levels before excavating below ground-water level.

C. Provide sumps, sedimentation tanks, and other flow-control devices as required by authorities having jurisdiction.

D. Provide standby equipment on-site, installed, and available for immediate operation, to maintain dewatering on continuous basis if any part of system becomes inadequate or fails.

3.3 OPERATION

A. Operate system continuously until drains, sewers, and structures have been constructed and fill materials have been placed or until dewatering is no longer required.

B. Operate system to lower and control ground water to permit excavation, construction of structures, and placement of fill materials on dry subgrades. Drain water-bearing strata above and below bottom of foundations, drains, sewers, and other excavations.

1. Do not permit open-sump pumping that leads to loss of fines, soil piping, subgrade softening, and slope instability.
2. Reduce hydrostatic head in water-bearing strata below subgrade elevations of foundations, drains, sewers, and other excavations.
3. Maintain piezometric water level a minimum of 600 mm <**Insert dimension**> below bottom of excavation.

C. Dispose of water removed by dewatering in a manner that avoids endangering public health, property, and portions of work under construction or completed. Dispose of water and sediment in a manner that avoids inconvenience to others.

D. Remove dewatering system from Project site on completion of dewatering. Plug or fill well holes with sand or cut off and cap wells a minimum of 900 mm below overlying construction.

3.4 FIELD QUALITY CONTROL

A. Observation Wells: Provide observation wells or piezometers, take measurements, and maintain at least the minimum number indicated; additional observation wells may be required by authorities having jurisdiction.

1. Observe and record daily elevation of ground water and piezometric water levels in observation wells.
2. Repair or replace, within 24 hours, observation wells that become inactive, damaged, or destroyed. In areas where observation wells are not functioning properly, suspend construction activities until reliable observations can be made. Add or remove water from observation-well risers to demonstrate that observation wells are functioning properly.
3. Fill observation wells, remove piezometers, and fill holes when dewatering is completed.

B. Survey-Work Benchmarks: Resurvey benchmarks [**regularly**] [**monthly**] <**Insert time period**> during dewatering and maintain an accurate log of surveyed elevations for comparison with original elevations. Promptly notify Project Director/COR if changes in elevations occur or if cracks, sags, or other damage is evident in adjacent construction.

C. Provide continual observation to ensure that subsurface soils are not being removed by the dewatering operation.

D. Prepare reports of observations.

3.5 PROTECTION

A. Protect and maintain dewatering system during dewatering operations.

B. Promptly repair damages to adjacent facilities caused by dewatering.

END OF SECTION 312319

SECTION 312507 – TEMPORARY EROSION AND SEDIMENTATION CONTROL

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Temporary preventative measures for erosion and sedimentation control and for stormwater pollution necessary to protect adjacent properties and municipal water sources from damage due to water erosion, flooding, or deposition of mud or debris originating from work on the site.

B. Related Requirements:

1. Section 311005 "Site Clearing" for general preparation of the site.
2. [Section 311305 "Temporary Tree and Plant Protection".]

1.2 CONTRACTUAL AND REGULATORY AUTHORIZATION

A. Prior to proceeding with site work which may generate erosion, sedimentation damage, and stormwater pollution to the site, adjacent properties, and must obtain authorization to proceed with site work. Required authorization includes:

1. Project Director/Contracting Officer contractual authorization.
2. As applicable, regulatory permits from local or host country authorities.

1.3 ACTION SUBMITTALS

A. Notice of Intent (NOI): Site work authorization request to Project Director/COR. Where required by local or host country authorities, submit their comparable application to local or host country authorities with copy to Project Director/COR.

1. Include Stormwater Pollution Prevention Plan (SWPPP), or comparable plan where required by local or host country authorities.

B. Local or Host Country permit/authorization where applicable.

1. Submit copy of their applicable standard and project-specific regulations and requirements.

C. Qualifications.

1. Responsible individual.
2. Inspector.

D. Notice of Termination (NOT), or comparable documentation used by local or host country authorities.

1.4 QUALITY ASSURANCE

A. Qualifications for Responsible Person and for Inspector: May be same individual. Person(s) knowledgeable in principles and practice of erosion and sediment controls and pollution prevention, and with appropriate skills and training to assess conditions at construction site that could impact stormwater quality, to assess effectiveness of stormwater controls selected, and to ensure requirements of this Section are fulfilled. Minimum three projects performing this role for project of general similar magnitude.

B. Pre-Execution Meeting: On-Site minimum of three weeks in advance of project work protected by this Section.

C. Training: Prior to commencement of activities, Responsible Individual must provide 6-hour training session. Attendees must include:

1. Contractor/subcontractor personnel responsible for work affecting erosion, generation of sedimentation, and generation of stormwater pollution.
2. Inspector of erosion and sedimentation controls, if different than Responsible Individual.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS FOR TEMPORARY CONTROLS

A. In accordance with approved project Stormwater Pollution Prevention Plan (SWPPP).

PART 3 - EXECUTION

3.1 PREPARATION

A. Do not proceed until Notice of Intent (NOI) has been submitted and approved for contractual and regulatory authorization.

3.2 TEMPORARY PROTECTION INSTALLATION

A. Required protection must be in accordance with approved Stormwater Pollution Protection Plan (SWPPP).

1. Protection practices included in SWPPP must be consistent or comparable to those in the U.S. Environmental Protection Agency (EPA) SWPPP template, and in no case be lesser than the following:

    a. Protect newly graded areas from traffic, erosion, and settlements that may occur after clearing, installation of erosion control measures, stockpiling, or excavation until hydroseeding and planting for permanent erosion control is installed, or until otherwise scheduled.
    b. Repair or reestablish damaged grades, elevations, or slopes.
    c. Protect exposed earth surfaces with slope of 2:1 or steeper from inclement weather using hydroseeding or approved polyethylene sheeting staked to ground. Overlay individual polyethylene sheeting minimum of 450 mm (18 inches) at adjacent sheets.
    d. Protect exposed earth surfaces with slopes flatter than 2:1 with straw mulch spread over areas where concentrated surface water is anticipated.
    e. Where work has permanently or temporarily ceased, initiate and complete stabilization measures within time frames outlined in EPA Construction General Permit (CGP) template.

B. Maintenance of Erosion and Sediment Control Measures:

1. For duration of contract, maintain, repair, and replace erosion and sediment control elements where necessary to ensure that system is in good working condition.
2. Inspect erosion control elements in accordance with EPA CGP, and repair as necessary to conform to detail requirements. Corrective actions must be implemented within timeframes identified in EPA CGP.
3. Construct additional control elements at no additional cost where necessary to accommodate Contractor operations or scheduling of work.

3.3 TERMINATION OF TEMPORARY EROSION AND SEDIMENTATION CONTROL

A. Ensure final stabilization of all soil.

B. Ensure removal of all sources of water source pollution.

C. Remove products and materials used only for the purpose of providing temporary controls, and surplus materials (e.g., gravel) used for temporary controls. Legally dispose of them off Government's property.

D. Submit Notice of Termination (NOT) to Project Director/COR. Where required by local or host country authorities, submit their comparable application to local or host country authorities with copy to Project Director/COR.

E. Once temporary protections are removed, no further discharge into water sources is permitted.

END OF SECTION 312507

SECTION 313117 - TERMITE CONTROL

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following for termite control:

1. Soil treatment

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project Site with Project Director/COR present.

B. Notify Project Director/COR at least two weeks in advance of application of termite treatment so that Project Director/COR can contact OBO/OPS/SHEM for input regarding the conference.

C. Conference Topics:

1. Requirements of local Authorities Having Jurisdiction where more stringent than manufacturer's instructions.
2. Manufacturer's application instructions, and interface with Project work.
3. Manufacturer's safety procedures.
4. Include in the conference an anticipated schedule for application of termite treatment to facilitate opportunity of Project Director/COR to observe a portion of the application.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. As applicable, data is used by Government to evaluate whether termiticides are suitably equivalent to EPA-registered termiticides identified in PART 2 PRODUCTS.

1. Include registered label for soil and wood treatment termiticide products; see Article on QUALITY ASSURANCE.
2. Include documentation regarding local or national authorities and regulations.

1.4 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of termite control product, signed by product manufacturer.

B. Qualification Data: For qualified Installer.

C. Soil Treatment Application Report: After application of termiticide is completed, submit report for Government's record information, including the following:

1. Date and time of application.
2. Moisture content of soil before application.
3. Brand name and manufacturer of termiticide.
4. Quantity of undiluted termiticide used.
5. Dilutions, methods, volumes, and rates of application used.
6. Areas of application.
7. Water source for application.

1.5 QUALITY ASSURANCE

A. Applicator Qualifications: A Pest Management Professional (PMP) who is licensed according to regulations of local authorities having jurisdiction to apply termite control treatment in jurisdiction where Project is located, who has at least five years of experience with termite control, who has completed termite control treatment similar to that specified for this Project, and whose work has a record of successful in-service performance.

B. Regulatory Requirements: Formulate and apply termiticides to comply with U.S. Environmental Protection Agency (EPA) regulations, or with local authorities having jurisdiction and acceptable to the Department, as applicable.

1. Document any applicable local codes or local or national authorities, and local or national regulations or codes, to facilitate compliance.
2. Label with a EPA registration number or similar label used by local authorities having jurisdiction if applicable.

C. Implement applicable provisions of the Quality Control program as established in Division 01 Section "Contractor’s Quality Control."

1.6 PROJECT CONDITIONS

A. Environmental Limitations: To ensure penetration, do not treat soil that is water saturated or frozen. Do not treat soil while precipitation is occurring. Comply with restrictions identified in EPA-Registered Label or by local authorities having jurisdiction, as applicable.

1.7 COORDINATION

A. Coordinate soil treatment application with excavating, filling, and grading and concreting operations. Treat soil under footings, grade beams, and ground-supported slabs, before construction

PART 2 - PRODUCTS

2.1 TERMITICIDES

A. Soil Termiticide: Provide a termiticide in an aqueous solution formulated to prevent termite infestation.

1. The Department of State currently only authorizes fipronil and imidacloprid as soil termiticides. The following are the only EPA-registered soil termiticide formulations acceptable to the Department:

   a. BASF Corp., Agricultural Products: Termidor.
   b. Bayer Environmental Science: Premise.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Applicator present, for interfaces with earthwork, slab and foundation work, landscaping, and other conditions affecting performance of termite control.

1. Examine for compliance with requirements for moisture content of the soil per termiticide label.
2. Examine for general removal of cleared vegetation, of wood and cellulose construction debris (including form boards and grade stakes).
3. Examine for minimum clearance of 150 mm of unsupported finishes and wood above finished grade.
4. Examine for grading and roof drainage at foundations; finish grade should slope away from buildings, and roof drainage should not be directed onto grade (i.e., it should be connected to piped stormwater drainage system).
5. Examine for clearance of trees with potential to grow at least 12 meters in height; these should be placed at least 15 meters from foundations.

B. Proceed with application only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare work areas in accordance with the most stringent requirements of either local authorities having jurisdiction or manufacturer's written instructions before begging application of termite control treatments. Remove extraneous sources of wood cellulose and other edible materials such as wood debris, tree stumps and roots, stakes, formwork, and construction waste wood from soil within and around foundations.

B. Soil Treatment Preparation: Remove foreign matter and impermeable soil materials that could decrease treatment effectiveness on areas to be treated. Loosen, rake, and level soil to be treated, except previously compacted areas under slabs and footings. Termiticides may be applied before placing compacted fill under slabs if recommended in writing by termiticide manufacturer.

1. Fit filling hose connected to water source at the site with a backflow preventer, complying with requirements of local authorities having jurisdiction and Project Director/COR.

C. Coordinate preinstallation conference with Project Director/COR.

3.3 APPLICATION STANDARDS

A. Comply with the most stringent application requirements of local authorities having jurisdiction, manufacturer's EPA-Registered Label for products, or requirements of this Section.

3.4 APPLYING SOIL TREATMENT

A. Application: Mix soil treatment termiticide solution to a uniform consistency. Distribute the treatment evenly. Apply treatment at the label volume and rate for maximum specified concentration of termiticide, to the following so that a continuous horizontal and vertical termiticidal barrier or treated zone is established around and under building construction.

1. Slabs-on-Grade and Basement Slabs: Underground-supported slab construction, including footings, building slabs, and attached slabs as an overall treatment. Treat soil materials before concrete footings and slabs are placed; often a slab will crack or shrink away from the foundation wall allowing termites to infest the wood above.

a. Apply termiticide after installation of the sub-slab fill material.
b. Apply diluted insecticide to the fill material in accordance with the label (typical rate is 4.0 L/m^2 (1 gal. per 10-sq. ft)).
c. If final fill material is washed stone, apply termiticide in accordance with the label, (typical rate of 6.0 L/m^2 (1½ gal. per 10 sq. ft)).
d. Establish vertical barrier around foundation elements adjacent to slabs.

2. Foundations:

a. Establish continuous termiticide barrier in soil adjacent to foundation elements.
b. Apply treatment after the footings have been poured and the foundation walls and /or pillars have been built. The soil
c. Apply termiticide in soil by trenching or trenching and rodding adjacent to foundation elements.
d. For shallow footings, remove soil trenching, and treat with termiticide as soil is being replaced into trench.
e. Where footings are exposed, perform treatment next to footing but not below bottom of footing.
f. Where deep footings exist (such as basement), apply termiticide as soil backfill is being placed around foundation. Alternatively, trench and rod into trench, or trench

along foundation walls and around pillars and other foundation elements, and apply termiticide at rate prescribed by label from top of grade to minimum depth of 1.20 m (4 feet).

g. Apply termiticide on all sides of all foundation elements, including chimney bases, foundation walls, pilasters, and pillars.

h. French drains and other foundation drainage systems present a hazard of contamination outside treatment zone. Perform treatment in a manner that will not introduce insecticide into drainage system.

i. Apply termiticide to minimum depth of 1.20 m (4 feet) at the rate of 5 L per meter, per each 30 cm of depth (4 gallons per 10 linear feet, per foot of depth) to adjacent soil (including soil along entire inside perimeter of foundation walls):

1) Along both sides of interior partition walls.
2) Around plumbing pipes and electric conduit penetrating slab.
3) Around interior column footers, piers, and chimney bases.
4) Along entire outside perimeter, from grade to bottom of footing.

j. Avoid soil washout around footings.

3. Penetrations: At expansion joints, control joints, and areas where slabs will be penetrated.

4. [Masonry: Treat voids.]

B. Avoid disturbance of treated soil after application. Keep off treated areas until completely dry.

C. Protect termiticide solution, dispersed in treated soils and fills, from being diluted until ground-supported slabs are installed. Use waterproof barrier according to EPA-Registered Label instructions.

D. Post warning signs in areas of application.

E. Reapply soil treatment solution to areas disturbed by subsequent excavation, grading, landscaping, or other construction activities following application.

END OF SECTION 313117

SECTION 315000 - EXCAVATION SUPPORT AND PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes temporary excavation support and protection systems.

B. Related Requirements:

1. Section 013233 "Photographic Documentation" for recording preexisting conditions and excavation support and protection system progress.
2. Section 312000 "Earth Moving" for excavating and backfilling, for controlling surface-water runoff and ponding, and for dewatering excavations.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**> and include the following agenda items:

1. Review geotechnical report.
2. Review existing utilities and subsurface conditions.
3. Review coordination for interruption, shutoff, capping, and continuation of utility services.
4. Review proposed excavations.
5. Review proposed equipment.
6. Review monitoring of excavation support and protection system.
7. Review coordination with waterproofing.
8. Review abandonment or removal of excavation support and protection system specific project needs.

B. Design Criteria:

1. Design support of excavation in accordance with design criteria as specified in the Contract and on the Construction Documents.
2. Design component members of the excavation support system to support maximum loads occurring during excavation or removal stages.
3. Design excavation support to limit wall lateral deformations to **[XX]** percent of the exposed wall height at any given stage. Design excavation support to limit ground settlements to **[XX]** mm.
4. Support of excavation walls should be designed to ensure stability against passive failure of the embedded portion of the vertical wall elements (below the case of the excavation). The minimum factor of safety should be **[XX]** .
5. Where anchors are used, the axial load carrying capacity of the embedded portion of the vertical wall elements (below the base of the excavation) must be evaluated. The minimum FS must be **[XX]**. The wall must be designed to resist vertical loads including vertical

anchor forces and the weight of the lagging and the vertical wall elements. Relying on transfer of vertical load into the soil behind the wall by friction must not be permitted, unless approved by the Engineer.

6. The external stability of the wall must be evaluated. Failure surfaces extending beyond the ends of the ground anchors and below the bottom of the wall must be checked using slope stability calculations. The minimum FS with respect to external stability must be **[XX]** for the wall system.
7. The external stability of the wall system subjected to the seismic acceleration provided in the Geotechnical Report must be evaluated using slope stability calculations. The minimum FS must be **[XX]**.
8. Where soft underlying layers exist, the basal stability of the wall should be evaluated. The minimum FS must be **[XX]**.
9. The design and testing of anchors must be in accordance with the PTI DC35.1-14 Recommendations.
10. Surcharge vertical load due to adjacent traffic or equipment for design must be **[XX]** kPa unless noted otherwise on the Contract Documents. The Contractor may require and designate additional loading based on the construction equipment to be used. The type, magnitude, and location of this additional loading must be shown on the working drawings, with limitations and restrictions clearly shown.

1.3 SUBMITTALS

A. Delegated-Design Submittal: For excavation support and protection systems, include design drawings and analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Include plans, elevations, sections, and details.
2. Show arrangement, locations, and details of structural elements and other components of excavation support and protection system.
3. Indicate type and location of waterproofing.
4. Provide estimates of wall and ground movements at various stages of construction.
5. Include assessments of nearby structures if required in accordance with the OBO Building Code.

B. Work Plan and Method Statement: The Contractor's Qualified Professional Engineer must prepare an outline of the Contractor's construction methods and step-by-step procedures together with plans and details of proposed excavation support and bracing. At a minimum, this work plan must include:

1. Detailed temporary excavation support wall construction sequence.
2. A preliminary construction sequence including a clear plan indicating locations of material storage areas and limits of work areas during different stages of construction.
3. Plan describing how surface water will be diverted, controlled and disposed off-site including wall drainage elements.
4. Proposed methods and equipment for excavation of the soil to the staged excavation lifts.

5. Measures to ensure wall and slope stability during various stages of wall construction and excavation where discontinuous rows of anchors will be installed (if applicable); information on space requirement for installation equipment; temporary shoring plans (if applicable); information on provisions of working in the proximity of underground utilities (if applicable).
6. Drill hole diameters and lengths of verification test and production anchors the Contractor intends to use and any variation of these along the wall alignment in order to achieve the performance requirements.
7. Proposed anchor drilling and grouting method, and equipment required to achieve the installation lengths and pullout resistance values to achieve the performance requirements stated on the Contract Drawings.
8. Proposed anchor testing methods and equipment (if applicable) including but not limited to:

    a. Details of jacking frame and appurtenant bracing. If the jack is to rest on a shotcrete construction facing, the Contractor must submit design calculations showing that no damage to the shotcrete facing will occur during the jacking procedure.
    b. Details showing methods of isolating anchors during shotcrete application (i.e. methods to prevent bonding of the anchor and the shotcrete facing during testing, if tested after shotcreting).
    c. Details showing methods of providing the temporary unbonded length for test anchors and of grouting the temporary unbonded length of after completion of testing.
    d. Certified calibration records of hydraulic jack, pressure gauge and load cell calibrated together as a set, for all such sets the Contractor intends to use. Calibration records must include the date tested, device ID and the calibration test results and must be certified for an accuracy of 2 percent of the applied certification loads or better by a qualified independent testing laboratory within 90 days prior to submittal. If the Contractor decides to use a different combination of the jack, pressure gauge and load cell a new set of calibration results will have to be submitted at least 3 days prior to the intended use of the equipment.

9. Proposed methods and procedures to safeguard against loss of slurry, concrete, or grout into other project areas, storm and sanitary sewers, or off-site.
10. Quality control plan for slurry to include minimum and maximum properties, types of testing, and frequency of testing. Testing must include density, viscosity, pH, and sand content at a minimum.

C. Monitoring Plan: Submit proposed plan to monitor vibrations, accelerations, vertical settlement, and lateral movement of temporary support structures, adjacent ground, and existing structures and infrastructure within the zone of influence of proposed excavations.

1. Include product data for materials used in monitoring activities including product data cut-sheets and calibration data used to identify the allowable tolerances of all proposed equipment. Unless otherwise indicated, transmit all submittals to the Project Director/COR for review before proceeding with ordering, fabricating, or any other work of this Section.
2. Include drawings showing the plan and vertical locations of all proposed monitoring points. The plan must graphically identify the type of monitoring point (i.e., optical survey, surface

points, seismographs, crack gages, borehole instruments, benchmarks, etc.), with each monitoring point bearing a unique identification number. Where required, provide section drawings (i.e., excavation faces, building facades, etc.) and identify the elevations at which monitoring points have been or will be installed. The drawings must be updated and resubmitted in the event that monitoring points are abandoned, relocated, or additional monitoring points are added.

3. The plan should identify Alert and Action levels for vibrations and movements at each monitoring location.

D. Pre-Construction Conditions Survey: The Contractor must perform a pre-construction conditions verification survey and must submit any findings that differ from the Project Director/COR's survey as specified herein at least 15 days before beginning the work.

E. Qualification Data: For the following:

1. Land surveyor.
2. Professional Engineer: Experience with providing delegated-design engineering services of the type indicated, including documentation that engineer is licensed in a U.S. State or Territory.

F. Existing Conditions: Using [**photographs**] [**or**] [**video recordings**], show existing conditions of adjacent buildings, structures, and site improvements that might be misconstrued as damage caused by inadequate performance of excavation support and protection systems. Submit before Work begins.

G. Baseline Monitoring Report: The Contractor must submit a baseline data report at the start of construction summarizing the baseline values for each instrument. This must include a summary of baseline value determination and the resultant baseline or datum value to be used for comparison with all subsequent monitoring data. Requirements of the baseline value determination are discussed elsewhere herein.

H. Monitoring Reports: Provide **[daily/weekly]** monitoring reports to the Project Director. Reports should summarize the results of monitoring, exceedances of Alert or Action limits, and any corrective actions that were taken. Maintain the instrumentation and monitor measurements during and after construction up to Project Closeout or when directed by the Project Director to cease.

I. Anchor grout, shotcrete, and other concrete/grout mix design (if applicable) in accordance with 033000

1.4 CLOSEOUT SUBMITTALS

A. Record Drawings: Identify locations and depths of capped utilities, abandoned-in-place support, and protection systems, and other subsurface structural, electrical, or mechanical conditions.

B. Final Monitoring Report: Summarize the results of monitoring and any corrective actions that were taken.

C. Installation logs inclusive of any inconsistent or variable conditions encountered.

D. Field and sample test results including grout, shotcrete, and concrete strength.

E. Tieback test results (if applicable).

1.5 FIELD CONDITIONS

A. Interruption of Existing Utilities: Do not interrupt any utility-serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility according to requirements indicated:

1. Notify Project Director/COR no fewer than [**two**] <**Insert number**> days in advance of proposed interruption of utility.
2. Do not proceed with interruption of utility without Project Director/COR written permission.

B. Survey Work: Engage a qualified land surveyor or professional engineer to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide suitable piles, sheeting, bracing, lagging underpinning, and support, and temporary tie back anchor materials which will withstand loads imposed without unsatisfactory movement. Materials must be kept in serviceable condition at all times.

B. Materials comprising or used to fabricate the excavation support system must be determined by the Contractor. The Contractor must make use of such methods of work as are best adapted to preserve the safety and stability of foundations, walls, and other parts of existing neighboring buildings and structures.

C. Provide survey targets, survey marks, and seismographs to perform the required monitoring.

PART 3 - EXECUTION

3.1 MONITORING

A. The Project Director/COR may monitor instrumentation at any time. Provide and facilitate access to instrumentation for the Project Director/COR and any other party as requested by the Project Director/COR.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards that could develop during excavation support and protection system operations.

1. Shore, support, and protect utilities encountered.

3.3 INSTALLATION - GENERAL

A. Locate excavation support and protection systems clear of permanent construction, so that construction and finishing of other work is not impeded.

B. Install excavation support and protection systems to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.

1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
2. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.

C. Install excavation support and protection systems without damaging existing buildings, structures, and site improvements adjacent to excavation.

3.4 SOLDIER PILES AND LAGGING

A. Install steel soldier piles before starting excavation.

1. Extend soldier piles below excavation grade level to depths adequate to prevent lateral movement.
2. Space soldier piles at regular intervals not to exceed allowable flexural strength of wood lagging.
3. Accurately align exposed faces of flanges to vary not more than [**2 inches (50 mm) from a horizontal line and not more than 1:120 out of vertical alignment**] <**Insert tolerances**>.

B. Install wood lagging within flanges of soldier piles as excavation proceeds.

1. Trim excavation as required to install lagging.
2. Fill voids behind lagging with soil, and compact.

C. Install wales horizontally at locations indicated on Drawings and secure to soldier piles.

3.5 SHEET PILING

A. Before starting excavation, install one-piece sheet piling lengths and tightly interlock vertical edges to form a continuous barrier.

B. Accurately place the piling using templates and guide frames unless otherwise recommended in writing by the sheet piling manufacturer.

1. Accurately align exposed faces of sheet piling to vary not more than [**2 inches (50 mm) from a horizontal line and not more than 1:120 out of vertical alignment**] <**Insert tolerances**>.

C. Cut tops of sheet piling to uniform elevation at top of excavation.

3.6 TIEBACKS

A. Drill, install, grout, and tension tiebacks.

B. Test load-carrying capacity of each tieback and replace and retest deficient tiebacks.

1. Have test loading observed by a qualified professional engineer responsible for design of excavation support and protection system.

C. Maintain tiebacks in place until permanent construction is able to withstand lateral earth and hydrostatic pressures.

3.7 BRACING

A. Locate bracing to clear columns, floor framing construction, and other permanent work. If necessary to move brace, install new bracing before removing original brace.

1. Do not place bracing where it will be cast into or included in permanent concrete work unless otherwise approved by Architect.
2. Install internal bracing if required to prevent spreading or distortion of braced frames.
3. Maintain bracing until structural elements are supported by other bracing or until permanent construction is able to withstand lateral earth and hydrostatic pressures.

3.8 MAINTENANCE

A. Monitor and maintain excavation support and protection system.

B. Prevent surface water from entering excavations by grading, dikes, or other means.

C. Continuously monitor vibrations, settlements, and movements to ensure stability of excavations and constructed slopes and to ensure that damage to permanent structures is prevented.

3.9 FIELD QUALITY CONTROL

A. Contractor Responsibilities:

1. Establish field quality control procedures.
2. Maintain records of field quality control measurements and tests.
3. Provide the following observation and survey data:

   a. Movements monitoring of surrounding structures, pavements, and other features potentially subject to damage due to temporary excavation.
   b. Tieback or soil nail testing.
   c. Installation records for secant pile walls or diaphragm walls to include:

      1) Actual top and bottom elevations
      2) Description of Soil Materials
      3) Description, location, and dimensions of obstructions
      4) Variation of wall from plumb
      5) Levelness of bottom and adequacy of cleanout
      6) Groundwater conditions, depth, and pumping required.
      7) Date and time of starting and completing excavation.
      8) Position of reinforcing steel.
      9) Concrete placing method, including elevation of consolidation and delays.
      10) Actual volume of concrete placed including comparison to theoretical volume.
      11) Concrete testing results
      12) Remarks, unusual conditions encountered, and deviations from requirements.

   d. Photographic survey of existing conditions.

4. Other Items:

   a. Conduct Pre-Condition Surveys as necessary on structures within 200 m from excavation support system to document conditions prior to commencement of pile driving operations. Crack gauges should be installed and monitored weekly on any existing cracks identified within the surrounding structures.
   b. Alert neighboring property owners prior to commencement of pile driving or drilling and support of excavation installation operations to alert them of the perceptible ground vibrations that will be generated.

B. Survey-Work Benchmarks: Resurvey benchmarks [**regularly**] [**daily**] [**weekly**] <**Insert time period**> during installation of excavation support and protection systems, excavation progress, and for as long as excavation remains open.

1. Maintain an accurate log of surveyed elevations and positions for comparison with original elevations and positions.

2. Promptly notify the Project Director if Alert levels are exceeded or if cracks, sags, or other damage is evident in adjacent construction.

3.10 PROTECTION

A. Protect adjoining properties, streets, and utilities. Repair and restore damage caused by construction operations.

B. The responsibility for any damage to adjacent buildings and associated structures, adjacent utilities, sidewalks, pavement, and other facilities in the vicinity resulting from the Contractor's operations will be entirely his, and he must take whatever measures necessary to prevent the same. Should damage occur due to work of this Section, all costs in connection with the repair of such damage and restoration of damaged construction to its original condition and to the satisfaction of the owner must be borne solely by the Contractor.

C. Provide vibration monitoring during pile driving or drilling, if applicable, to include the following observations and controls:

1. Vibration levels at the structure of concern must be limited to 1.25 cm/s (0.5 inch/s) for existing structures. These limits may be refined during vibration monitoring to establish site specific limits to be used during pile driving.
2. Monitor ground vibrations during pile driving or drilling to obtain a well-defined relationship between peak particle velocity and distance (both horizontal and slant) from the pile being driven or drilled.
3. Use equipment capable of providing a continuous visual reading of particle velocity. The equipment must be equipped with a three-channel recording system to record the three components of particle velocity.

    a. For each pile monitored, submit the following information:

        1) Pile designation and location,
        2) Pile type and dimensions,
        3) Pile hammer,
        4) Horizontal distance from pile,
        5) Record of particle velocity vs. depth,
        6) Plot of peak particle velocity from the pile.

D. The Contractor must establish monitoring points at select locations on adjacent buildings within 30 meters of the work and on the excavation support system to adequately monitor and otherwise keep him informed of the conditions during the work.

1. Monitoring points must be placed at 20 m spacing along the face of the adjacent structures.
2. Monitoring points must be placed along the top of the excavation support and protection system at a maximum spacing of 10 meters.
3. A minimum of four additional monitoring points must be established away from the Site so as to establish initial elevations with distance from the site. Additional monitoring points may be required based on the Contractor's means and methods of survey.

4. Establish and monitor all elevation points to an accuracy of 1 mm. Measure monitoring point elevations at least twice a week during temporary excavation support installation, foundation construction, and until the permanent support is complete. Record and report elevation of each benchmark at least twice a week while installation is in progress. On the same day, submit to the Project Director a written monitoring data report, signed, and sealed by a professional land surveyor.
5. Should adjacent building monitoring point readings indicate a displacement exceeding 3 mm between two consecutive readings or a cumulative displacement exceeding 6.4 mm, halt excavation, sheeting and bracing, and foundation construction until corrective action has been provided by the Contractor and is acceptable to the Project Director. The above threshold criteria are tentative; it must be the Contractor's responsibility to monitor conditions during his work to assure the protection requirements specified herein are maintained.

E. The above described monitoring is the minimum required. The Contractor must establish all necessary monitoring measures as necessary to inform him of the conditions around the site and that his work is not adversely impacting surrounding structures.

3.11 REMOVAL AND REPAIRS

A. Remove excavation support and protection systems when construction has progressed sufficiently to support excavation and earth and hydrostatic pressures.

1. Remove in stages to avoid disturbing underlying soils and rock or damaging structures, pavements, facilities, and utilities.

2. Remove excavation support and protection systems to a minimum depth of 1200 mm below overlying construction, and abandon remainder.
3. Fill voids immediately with approved backfill compacted to density specified in Section 312000 "Earth Moving."
4. Repair or replace, as approved by Architect, adjacent work damaged or displaced by removing excavation support and protection systems.

B. Leave excavation support and protection systems permanently in place.

END OF SECTION 315000

SECTION 316213 - CONCRETE PILES

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. Available information for reference as part of the request for proposal and bidding include the following:

1. Plan Set(s) ____, Project No. _____, prepared by _____, dated _____.
2. Geotechnical Report No.(s)_____, Project No. _____, prepared by _____, dated _____, included or referenced in the bid documents, containing the results of exploratory borings, observation pits, or other site investigation data obtained in the vicinity of the proposed timber pile locations.

1.2 SUMMARY

A. Section includes [**hollow**] [**solid**], precast, prestressed concrete piles.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**>.

B. The pre-construction meeting will be conducted to clarify the construction requirements for the work, to coordinate the construction schedule activities and identify contractual relationships and delineation of responsibilities among the prime Contractor and various Subcontractors.

1. The Engineer, prime Contractor, concrete pile Contractor, Inspectors, and Geotechnical Instrumentation Specialist (if applicable) must attend the meeting.
2. During preinstallation conference, the attendance should discuss the subsurface conditions, pile installation and testing, quality control and assurance plan, pile structure survey control, site drainage control, review proposed pile driving equipment to be used (such as leads, pile hammers, helmet, pile cushion or any other accessories), to be used, and any other detail that may affect the construction the timber piles.
3. Review methods and procedures related to timber piles including, but not limited to, the following:

   a. Review geotechnical report.
   b. Discuss existing utilities and subsurface conditions.
   c. Review coordination with temporary controls and protections.

d. Review of QA/QC and safety procedures.

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For concrete piles. Prepared by or under the supervision of a qualified professional engineer detailing fabrication and lifting devices necessary for handling and driving piles.

1. Indicate pile dimensions, cross sections, locations, and sizes. Show details of pile splices and shoes.
2. Indicate types of reinforcement, including prestressing strand, and detail fabricating, bending, and placing.
3. Indicate layout and dimensions and identify each pile. Indicate welded connections by AWS standard symbols. Detail cast-in hardware.
4. Indicate transportation, storage, and lifting points.

5. Include arrangement of static pile reaction frame, test and anchor piles, equipment, and instrumentation. Submit structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Pile Driving Sequential Layout:

1. Submit layout drawings showing the proposed sequence of pile driving, pile identification as indicated on the Contract Drawings, its driving sequence number, type, size, load bearing capacity and pile tip elevation planned.
2. Pile installation plan
3. Pile Driving

D. Qualification Data: For [**Installer**] [**manufacturer**] [**professional engineer**] [**and**] [**testing agency**].

E. Welding certificates.

F. Design Mixes: For each concrete mix.

G. Material Certificates: For [**steel reinforcements**] [**prestressing strand**] [**and**] [**concrete admixtures**].

H. Material Test Reports: For concrete materials.

I. Pile-Driving Equipment Data: Include type, make, and rated energy range; weight of striking part of hammer; weight of drive cap; and, type, size, and properties of hammer cushion.

J. Approval of pile driving equipment by the Engineer will be based on wave equation analysis unless a dynamic formula has been specified for nominal resistance verification in the field. In no case must the driving equipment be transported to the project site until approval of the Engineer is received in writing.

K. Static Pile Test Reports: Submit within three days of completing each test.

L. Pile-Driving Records: Submit within three days of driving each pile.

M. Certified Piles Survey: Submit within **[seven] <Insert number>** days of pile driving completion.

N. Field quality-control reports.

O. Preconstruction Photographs: Photographs or video of existing conditions of adjacent construction. Submit before the Work begins.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Engineering Responsibility: Assumes engineering responsibility to comply with requirements in "Performance Requirements" Article by engaging a qualified professional engineer to prepare design calculations, Shop Drawings, and other structural data for piles.

2. PCI Plant Certification Program: Participates in PCI's Plant Certification Program and is designated a PCI-Certified Plant for [**B2**] [**and**] [**C2**] product group and category, or better.

B. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1. Installer's responsibility includes engaging a qualified professional engineer to prepare pile-driving records.

C. Testing Agency Qualifications: Qualified according to ASTM C1077 and ASTM E329 for testing indicated [**and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025**].

D. Design Practices: Comply with ACI 318M (ACI 318) and the recommendations in PCI Committee Report: "Recommended Practice for Design, Manufacture and Installation of Prestressed Concrete Piling."

E. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for piles, comply with applicable requirements in PCI MNL-116, "Manual for Quality Control for Plants and Production of Structural Precast Concrete Products."

F. Comply with requirements in ACI 301, "Specifications for Structural Concrete."

G. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.4/D1.4M, "Structural Welding Code - Reinforcing Steel."

1.6 PRECONSTRUCTION TESTING

A. General: Static pile tests are used to verify driving criteria and pile lengths and to confirm allowable load of piles.

1. Furnish test piles [**1524 mm (60inches)**] <**Insert dimension**> longer than production piles.
2. Determination of actual length of piles is based on results of static pile tests.

B. Pile Tests: Arrange and perform the following pile tests:

1. Axial Compressive Static Load Test: ASTM D1143/D1143M. Procedure A, Quick Test [**and the following Procedures:**][**.**]

a. Procedure B, Maintained Test.
b. Procedure C, Loading in Excess of Maintained Test.
c. Procedure G, Cyclic Loading Test.

2. Axial Tension Static Load Test: ASTM D3689.
3. Lateral Load Test: ASTM D3966.

C. Equip each test pile with two telltale rods, according to ASTM D1143/D1143M, for measuring deformation during load test.

D. Provide pile reaction frame, anchor piles, equipment, and instrumentation with enough reaction capacity to perform tests. Notify Project Director/COR at least 48 hours in advance of performing tests. On completion of testing, remove testing structure, anchor piles, equipment, and instrumentation.

1. Allow a minimum of [**seven**] <**Insert number**> days to elapse after driving test piles before starting pile testing.

2. Number of Test Piles: [**One pile**] [**As indicated**] <**Insert number**>.

E. Drive test piles at locations indicated to the minimum penetration or driving resistance indicated. Use test piles identical to those required for Project, and drive with appropriate pile-driving equipment operating at rated driving energy to be used in driving permanent piles.

1. Pile Design Load: [**As indicated**] <**Insert load**>.

F. Approval Criteria: Allowable load must be the load acting on the test pile when [**the lesser of**] the following criteria are met, divided by a factor of safety of [**2**] <**Insert value**>:

1. Net settlement, after deducting rebound, of not more than 0.25 mm/907 kg (0.01 inch/ton) of test load.
2. Total settlement exceeds the pile elastic compression by 4 mm (0.15 inch), plus 1.0 percent of the tip diagonal dimension.
3. A plunging failure or sharp break in the load settlement curve.

G. Test Pile-Driving Records: Prepare driving records for each test pile [**, compiled and attested to by a qualified professional engineer**]. Include same data as required for driving records of permanent piles.

H. Test piles that comply with requirements, including location tolerances, may be used on Project.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver piles to Project site in such quantities and at such times to ensure continuity of installation. Handle and store piles at Project site to prevent cracking, distorting, warping, or other physical damage, and so markings are visible.

B. Lift and support piles only at designated lifting or supporting points as shown on Shop Drawings.

1.8 FIELD CONDITIONS

A. Protect structures, underground utilities, and other construction from damage caused by pile driving.

B. Site Information: A geotechnical report has been prepared for this Project and is [**included**] [**referenced**] elsewhere in the Project Manual for information only.

C. Preconstruction Photographs: Inventory and record the condition of adjacent structures, underground utilities, and other construction. Document conditions that might be misconstrued as damage caused by pile driving. [**Comply with Section 013233 "Photographic Documentation."**]

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, [**provide products by the following**] [**provide products by one of the following**] [**available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**]:

1. <**Insert, in separate subparagraphs, manufacturer's name**>.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design piles, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Structural Performance: Piles must withstand transportation, erection, and driving stresses and design loads within limits indicated and under conditions existing at Project site.

1. Design Loads: <**Insert loads**>.

2.3 MOLD MATERIALS

A. Molds: Provide molds of metal, plastic, wood, or another material that is nonreactive with concrete and that produces required finish surfaces.

2.4 STEEL REINFORCEMENT

A. Reinforcing Bars: ASTM A615/A615M, Grade 420 (Grade 60); deformed.

B. Low-Alloy-Steel Reinforcing Bars: ASTM A706/A706M.

C. Galvanized Reinforcing Bars: ASTM A767/A767M, Class II zinc coated, hot-dip galvanized after fabrication and bending, as follows:

1. Steel Reinforcement: [**ASTM A615/A615M, Grade 420 (Grade 60)**] [**ASTM A706/A706M**], deformed.

D. Epoxy-Coated Reinforcing Bars: ASTM A775/A775M or ASTM A934/A934M, as follows:

1. Steel Reinforcement: [**ASTM A615/A615M, Grade 420 (Grade 60)**] [**ASTM A706/A706M**], deformed.

E. Plain Steel Wire: ASTM A82/A82M, [**as drawn**] [**galvanized**].

F. Deformed-Steel Wire: ASTM A496/A496M.

G. Epoxy-Coated-Steel Wire: ASTM A884/A884M, Class A coated, [**plain**] [**deformed**].

2.5 PRESTRESSING TENDONS

A. Prestressing Strand: ASTM A416/A416M, Grade 1725 or 1860 (Grade 250 or 270); uncoated, seven-wire, low-relaxation strand.

2.6 CONCRETE MATERIALS

A. General: Limit water-soluble chloride ions in concrete to the maximum percentage by mass of cementitious material permitted by ACI 318M (ACI 318), but not more than 0.06 percent.

B. Portland Cement: ASTM C150/C150M, [**Type I or Type III**] [**Type II**], of same type, brand, and source.

1. Fly Ash: ASTM C618, Class C or F.
2. Silica Fume: ASTM C1240, amorphous silica.

C. Normal-Weight Aggregates: Except as modified by PCI MNL-116, ASTM C33/C33M, with coarse aggregates complying with [**Class 4S**] [**Class 4M**] [**Class 1N**] <**Insert class**>. Provide aggregates from single source.

1. Nominal Maximum Size of Aggregate: [**25 mm (1 inch)**] [**19 mm (3/4 inch)**].

D. Water: Potable, free of deleterious material that may affect color stability, setting, or strength of concrete, and complying with chemical limits of PCI MNL-116.

E. Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures.

1. Air-Entraining Admixture: ASTM C260/C260M.
2. Water-Reducing Admixture: ASTM C494/C494M, Type A.

3. Retarding Admixture: ASTM C494/C494M, Type B.
4. Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type D.
5. Water-Reducing and Accelerating Admixture: ASTM C494/C494M, Type E.
6. High-Range, Water-Reducing Admixture: ASTM C494/C494M, Type F.
7. High-Range, Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type G.
8. Plasticizing and Retarding Admixture: ASTM C1017/C1017M, Type II.

2.7 PILE ACCESSORIES

A. Pile Shoes: 25 mm (1 inch) thick minimum, carbon-steel plate fabricated to match shape of pile tip.

B. Pile Splices: Manufactured from carbon-steel plates or castings and capable of developing strength of continuous pile at splice location.

2.8 CONCRETE MIXES

A. Prepare design mixes for each type of concrete required.

1. Limit use of fly ash and silica fume to not exceed, in total, [**25**] <**Insert number**> percent of portland cement by weight.

B. Design mixes may be prepared by a qualified independent testing agency or by qualified personnel at precast manufacturing plant at precast manufacturer's option.

C. Proportion mixes by either laboratory trial batch or field-test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:

1. Compressive Strength (28 Days): [**55.2 MPa (8000 psi)**] [**48.3 MPa (7000 psi)**] [**41.4 MPa (6000 psi)**] [**34.5 MPa (5000 psi)**] <**Insert value**>.

2. Maximum Water-Cementitious Material Ratio: 0.40.

D. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content of [**6.0 percent, plus or minus 1.5**] [**2.5 to 4.5**] percent.

2.9 FABRICATION

A. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete placement and temperature changes and for pretensioning and detensioning operations. Maintain molds to provide completed piles of shapes, lines, and dimensions indicated, within fabrication tolerances specified in PCI MNL-116 and PCI MNL-135.

1. Unless molds are stripped before detensioning, design molds so stresses are not induced in piles due to deformation of concrete under prestress or movement during detensioning.

2. Chamfer edges and corners of square piles.

B. Reinforcement: Comply with recommendations in CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy bond with concrete.

1. Accurately position, support, and secure reinforcement against displacement by molds, construction, or concrete placement. Locate and support reinforcement by metal chairs, runners, bolsters, spacers, and hangers, as required.
2. Place reinforcement to obtain at least the minimum coverages for concrete protection. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Set wire ties so ends are directed into concrete, not toward exposed concrete surfaces.

C. Prestress tendons for piles by either pretensioning or post-tensioning methods. Comply with PCI MNL-116.

D. Pile Shoes: Accurately position and secure pile shoes at pile tips so as to not affect pile alignment during driving. Weld pile shoes to longitudinal reinforcements.

E. Pile Splices: Accurately position and secure pile-splice segments requiring embedding in tips of piles.

F. Mix concrete according to PCI MNL-116 and requirements in this Section. After initial concrete batching, no additional water may be added.

G. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in piles. Comply with requirements in PCI MNL-116 for measuring, mixing, transporting, and placing concrete.

1. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL-116.
2. Comply with ACI 306.1 procedures for cold-weather concrete placement.
3. Comply with ACI 305R recommendations for hot-weather concrete placement.

H. Identify pickup points of piles with permanent markings that correspond with markings indicated on Shop Drawings. Imprint casting date on each pile.

I. Cure concrete, according to requirements in PCI MNL-116, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.

J. Delay detensioning piles until concrete has attained at least [**70**] <**Insert number**> percent of its compressive strength as established by test cylinders cured under the same conditions as concrete.

1. If concrete has been heat cured, detension while concrete is still warm and moist to avoid dimensional changes that may cause cracking or undesirable stresses.
2. Detension pretensioned tendons either by gradually releasing tensioning jacks or by heat-cutting tendons, using a sequence and pattern to prevent shock or unbalanced loading.

K. Where ends of strands are not enclosed or covered, cut flush and cover with a high-strength mortar bonded to unit with an epoxy-resin bonding agent.

L. Fabricate precast, prestressed concrete piles straight and true to size and shape with exposed edges and corners precise and true so each finished unit complies with PCI MNL-116 and PCI MNL-135 product tolerances.

M. Finish: Fabricate concrete piles with normal plant-run finish produced in forms that impart a smooth finish to concrete. Small surface holes caused by air bubbles, normal color variations, form joint marks, and minor chips and spalls are tolerated. Major or unsightly imperfections, honeycombs, or structural defects are not permitted.

1. Finish unformed surfaces by trowel unless otherwise indicated. Consolidate concrete, bring to proper level with straightedge, float, and trowel to a smooth, uniform finish.

N. Pile-Length Markings: Mark each pile with horizontal lines at 305 mm (12 inch) intervals; label the distance from pile tip at 1524 mm (60 inch) intervals. Maintain markings on piles until driven.

2.10 SOURCE QUALITY CONTROL

A. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to evaluate pile manufacturer's quality-control and testing methods.

1. Allow Owner's testing agency access to material storage areas, concrete production equipment, concrete placement, and curing facilities. Cooperate with Owner's testing agency and provide samples of materials and concrete mixes as may be requested for additional testing and evaluation.

B. Testing: Test and inspect piles according to PCI MNL-116.

1. Strength of piles will be considered deficient if units fail to comply with requirements.

C. If there is evidence that strength of piles may be deficient or may not comply with PCI MNL-116 requirements, Owner will employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C42/C42M.

1. A minimum of three representative cores must be taken from piles of suspect strength, from locations directed by Project Director/COR.

2. Cores must be tested, following immersion in water, in a wet condition per ACI 301 if piles are wet under service conditions.
3. Cores must be tested in an air-dry condition per ACI 301 if piles are dry under service conditions.
4. Strength of concrete for each series of three cores must be considered satisfactory if average compressive strength is at least 85 percent of the 28-day design compressive strength and no core compressive strength is less than 75 percent of the 28-day design compressive strength.
5. Test results must be reported in writing on same day that tests are performed, with copies to Project Director/COR, Contractor, and pile manufacturer. Test reports must include the following:

   a. Project identification name and number.
   b. Date when tests were performed.
   c. Name of precast concrete manufacturer.
   d. Name of concrete testing agency.
   e. Identification letter, name, and type of pile represented by core tests; design compressive strength; type of break; compressive strength at break, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.

D. Patching: If core test results are satisfactory and piles comply with requirements, solidly fill core holes with patching mortar and finish to match adjacent pile surfaces.

E. Piles will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Site Conditions: Do not start pile-driving operations until earthwork fills have been completed or excavations have reached an elevation of 152 to 305 mm (6 to 12 inches) above bottom of footing or pile cap.

3.2 DRIVING EQUIPMENT

A. All pile driving equipment should be sized such that the project piles can be driven with reasonable effort to the estimated contract lengths without damage. Approval of pile driving equipment by the Engineer will be based on wave equation analysis unless a dynamic formula has been specified for nominal resistance verification in the field. In no case shall the driving equipment be transported to the project site until approval of the Engineer is received in writing.

B. Pile Hammer: Air-, steam-, hydraulic-, or diesel-powered type capable of consistently delivering adequate peak-force duration and magnitude to develop the ultimate capacity required for type and size of pile driven and character of subsurface material anticipated.

1. Use pile hammer capable of adjustment to deliver reduced impact to maintain tensile stress within 70 percent of yield strength of pile reinforcement.

C. Hammer Cushions and Driving Caps: Between hammer and top of pile, provide hammer cushion and steel driving cap as recommended by hammer manufacturer and as required to drive pile without damage.

D. Leads: Use fixed, semifixed, or hanging-type pile-driver leads that hold the full length of pile firmly in position and in axial alignment with hammer.

3.3 DRIVING PILES

A. General: Continuously drive piles to elevations or penetration resistance indicated [**or established by static load testing of piles**]. Establish and maintain axial alignment of leads and piles before and during driving.

B. Predrilling: Provide pre-excavated holes where indicated, to depths indicated. Drill holes with a diameter less than the largest cross-section dimension of pile. If subsurface obstructions, such as boulders or rock layers are encountered, the diameter of the predrilled hole may be increased with Engineers approval to the least dimension adequate for pile installation.

1. Firmly seat pile in predrilled hole by driving with reduced energy before starting final driving.

C. Heaved Piles: Redrive heaved piles to tip elevation at least as deep as original tip elevation with a driving resistance at least as great as original driving resistance.

D. Pile Splices: Splice piles during installation and align pile segments concentrically.

E. Driving Tolerances: Drive piles without exceeding the following tolerances, measured at pile heads:

1. Location: 102 mm (4 inches) from location indicated after initial driving, and 152 mm (6 inches) after pile driving is completed.
2. Plumb: Maintain 25 mm (1 inch) in 1219 mm (48 inches) from vertical, or a maximum of 102 mm (4 inches), measured when pile is aboveground in leads.
3. Batter Angle: Maximum 25 mm (1 inch) in 1219 mm (48 inches) from required angle, measured when pile is aboveground in leads.

F. Withdraw damaged or defective piles and piles that exceed driving tolerances and install new piles within driving tolerances.

1. Fill holes left by withdrawn piles using cohesionless soil material such as gravel, broken stone, and gravel-sand mixtures. Place and compact in lifts not exceeding 1830 mm (72 inches).
2. Fill holes left by withdrawn piles as directed by Project Director/COR.

G. Abandon and cut off rejected piles as directed by Project Director/COR. Leave rejected piles in place, and install new piles in locations as directed by Project Director/COR.

H. Cut off tops of driven piles square with pile axis and at elevations indicated.

I. Buildups: Construct buildups to elevations indicated of cast-in-place reinforced concrete with compressive strength not less than [**34.5 MPa (5000 psi)**] <**Insert value**> at 28 days.

J. Pile-Driving Records: Maintain accurate driving records for each pile [**, compiled and attested to by a qualified professional engineer**]. Include the following data:

1. Project name and number.
2. Name of Contractor.
3. Date and time of pile driving (start, stop and interruptions).
4. Hammer make, model, ram weight, energy rating, stroke height and operating speed if available.
5. Type of pile and date of casting.
6. Pile location in pile group and designation of pile group.
7. Sequence of driving in pile group.
8. Pile dimensions.
9. Ground elevation.
10. Elevation of tips after driving.
11. Final tip and cutoff elevations of piles after driving pile group.
12. Records of redriving.
13. Elevation of splices.
14. Type, make, model, and rated energy of hammer.
15. Weight and stroke of hammer.
16. Type of pile-driving cap used.
17. Cushion material and thickness.
18. Actual stroke and blow rate of hammer.
19. Pile-driving start and finish times, and total driving time.
20. Time, pile-tip elevation, and reason for interruptions.
21. Number of blows for every 305 mm (12 inches) of penetration, and number of blows per 25 mm (1 inch) for the last 152 mm (6 inches) of driving.
22. Pile deviations from location and plumb.
23. Pre-boring, jetting, or special procedures used.
24. Unusual occurrences during pile driving.
25. Any visual pile damage during or after pile driving.

K. Certified Piles Survey: Engage a [**land surveyor**] [**professional engineer**] to prepare a piles survey showing final location of piles in relation to the property survey and existing benchmarks.

1. Notify Project Director/COR when deviations from locations exceed allowable tolerances.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: [**Owner will engage**] [**Engage**] a qualified special inspector to perform the following special inspections:

1. Pile foundations.
2. <**Insert special inspections**>.

B. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to perform tests and inspections.

C. Tests and Inspections:

1. Dynamic Pile Testing: High-strain dynamic monitoring must be performed and reported according to ASTM D4945 during initial driving and during restriking on [**five single**] [**3 percent of**] <**Insert number or percent of**> piles.

2. Low-strain integrity measurement must be performed and reported for each pile.
3. Rapid Load Tests: If required, the nominal resistance must be determined by a rapid load test performed in accordance with the procedures set forth in ASTM D7383.

D. Piles will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.5 DISPOSAL

A. Remove withdrawn piles and cutoff sections of piles from site and legally dispose of them off Owner's property.

END OF SECTION 316213

SECTION 316216 - STEEL PILES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes driven steel piles.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**>.

1.3 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For steel H piles. Show fabrication and installation details for piles, including details of driving points, splices, and pile caps.

1. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld.

2. Include arrangement of static pile reaction frame, test and anchor piles, equipment, and instrumentation. Submit structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Qualification Data: For [**Installer**] [**professional engineer**] [**and**] [**testing agency**].

D. Welding certificates.

E. Mill Test Reports: For [**steel H piles**] [**steel castings**] [**and**] [**steel plate**], signed by manufacturer.

F. Pile-Driving Equipment Data: Include type, make, and rated energy range; weight of striking part of hammer; weight of drive cap; and, type, size, and properties of hammer cushion.

G. Static Pile Test Reports: Submit within three days of completing each test.

H. Pile-Driving Records: Submit within three days of driving each pile.

I. Certified Piles Survey: Submit within [**seven**] <**Insert number**> days of pile driving completion.

J. Field quality-control reports.

K. Preconstruction Photographs: Photographs or video of existing conditions of adjacent construction. Submit before the Work begins.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1. Installer's responsibility includes engaging a qualified professional engineer to prepare pile-driving records.

B. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated [**and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025**].

C. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.5 PRECONSTRUCTION TESTING

A. General: Static pile tests are used to verify driving criteria and pile lengths and to confirm allowable load of piles.

1. Furnish test piles [**1524 mm (60 inches)**] <**Insert dimension**> longer than production piles.
2. Determination of actual length of piles is based on results of static pile tests.

B. Pile Tests: Arrange and perform the following pile tests:

1. Axial Compressive Static Load Test: ASTM D1143/D1143M. Procedure A, Quick Test[**and the following Procedures:**][**.**]

   a. Procedure B, Maintained Test.
   b. Procedure C, Loading in Excess of Maintained Test.
   c. Procedure G, Cyclic Loading Test.

2. Axial Tension Static Load Test: ASTM D3689.
3. Lateral Load Test: ASTM D3966.

C. Equip each test pile with two telltale rods, according to ASTM D1143/D1143M, for measuring deformation during load test.

D. Provide pile reaction frame, anchor piles, equipment, and instrumentation with enough reaction capacity to perform tests. Notify Project Director/COR at least 48 hours in advance of performing tests. On completion of testing, remove testing structure, anchor piles, equipment, and instrumentation.

1. Allow a minimum of [**seven**] <**Insert number**> days to elapse after driving test piles before starting pile testing.

2. Number of Test Piles: [**One pile**] [**As indicated**] <**Insert number**>.

E. Drive test piles at locations indicated to the minimum penetration or driving resistance indicated. Use test piles identical to those required for Project, and drive with appropriate pile-driving equipment operating at rated driving energy to be used in driving permanent piles.

1. Pile Design Load: [**As indicated**] <**Insert load**>.

F. Approval Criteria: Allowable load must be the load acting on the test pile when [**the lesser of**] the following criteria are met, divided by a factor of safety of [**2**] <**Insert value**>:

1. Net settlement, after deducting rebound, of not more than 0.25mm/907kg (0.01inch/ton) of test load.
2. Total settlement exceeds the pile elastic compression by 4 mm (0.15 inch), plus 1.0 percent of the tip diagonal dimension.
3. A plunging failure or sharp break in the load settlement curve.

G. Test Pile-Driving Records: Prepare driving records for each test pile [**, compiled and attested to by a qualified professional engineer**]. Include same data as required for driving records of permanent piles.

H. Test piles that comply with requirements, including location tolerances, may be used on Project.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver piles to Project site in such quantities and at such times to ensure continuity of installation. Handle and store piles at Project site to prevent buckling or physical damage.

1. Painted Piles: Protect finish and touch up paint damage before driving piles.

1.7 FIELD CONDITIONS

A. Protect structures, underground utilities, and other construction from damage caused by pile driving.

B. Site Information: A geotechnical report has been prepared for this Project and is [**included**] [**referenced**] elsewhere in the Project Manual for information only.

C. Preconstruction Photographs: Inventory and record the condition of adjacent structures, underground utilities, and other construction. Document conditions that might be misconstrued as damage caused by pile driving. Comply with Section 013233 "Photographic Documentation."

PART 2 - PRODUCTS

2.1 STEEL H PILES

A. High-Strength, Low-Alloy, Columbium-Vanadium Structural Steel: ASTM A572/A572M, [**Grade 345 (Grade 50)**] [**Grade 415 (Grade 60)**] <**Insert grade**>.

1. Manufacturers: Subject to compliance with requirements, [**provide products by the following**] [**provide products by one of the following**] [**available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**]:

a. <**Insert, in separate subparagraphs, manufacturer's name**>.

B. High-Strength, Low-Alloy, Nickel, Copper, Phosphorous Steel H Piles: ASTM A690/A690M.

1. Manufacturers: Subject to compliance with requirements, [**provide products by the following**] [**provide products by one of the following**] [**available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**]:

a. <**Insert, in separate subparagraphs, manufacturer's name**>.

C. High-Strength, Low-Alloy, Structural Steel: ASTM A588/A588M.

1. Manufacturers: Subject to compliance with requirements, [**provide products by the following**] [**provide products by one of the following**] [**available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**]:

a. <**Insert, in separate subparagraphs, manufacturer's name**>.

2.2 PILE ACCESSORIES

A. Driving Points: Manufacturer's standard one-piece driving point, fabricated from steel castings as follows to provide full bearing of web and flange of pile tip:

1. Carbon-Steel Castings: ASTM A27/A27M, [**Grade 450-240 (Grade 65-35), heat treated**] [**or**] [**Grade N1**].
2. High-Strength Steel Castings: ASTM A148/A148M, [**Grade 550-275 (Grade 80-40)**] [**or**] [**Grade 620-415 (Grade 90-60)**].

B. Splice Unit: Manufacturer's standard splice unit, fabricated from two connected steel plates of same material as steel H pile or material of equal strength, shaped to encase web and part of each flange.

2.3 PAINT

A. Paint: SSPC-Paint 16; self-priming, two-component, coal-tar epoxy polyamide, [**black**] [**red**] [**manufacturer's standard color**].

2.4 FABRICATION

A. Fabricate and assemble piles in shop to greatest extent possible.

B. Pile-Length Markings: Mark each pile with horizontal lines at 305 mm (12 inch) intervals; label the distance from pile tip at 1524 mm (60 inch) intervals. Maintain markings on piles until driven.

C. Fabricate full-length piles to eliminate splicing during driving, with ends square.

D. Fabricate full-length piles by splicing lengths of steel H pile together. Accurately mill meeting ends of piles and bevel for welding. Maintain axial alignment of pile lengths. Maintain structural properties of pile across splice.

1. Splice Units: Notch web of pile, fit splice unit into position, and weld according to manufacturer's written instructions and AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.
2. Continuously Welded Splices: Splice piles by continuously welding according to AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.

3. Splice piles during fabrication [**or field installation**].

E. Fit and weld driving points to tip of pile according to manufacturer's written instructions and AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.

2.5 SHOP PAINTING

A. General: Shop paint steel pile surfaces, except for surfaces to be encased in concrete, as follows:

1. Extend painting to a depth of 1524 mm (60 inches) below [**finished grade**] [**low-tide level**] to top of exposed pile.

B. Surface Preparation: Clean surfaces to be painted. Remove loose rust and loose mill scale, spatter, slag, and flux deposits. Prepare surfaces according to SSPC-SP 10/NACE No. 2, "Near-White Blast Cleaning."

C. Painting: Immediately after surface preparation, apply coat of paint according to manufacturer's written instructions to provide a dry film thickness of not less than 0.2 mm (8 mils).

1. Apply second coat to provide a dry film thickness of not less than 0.2 mm (8 mils), resulting in a two-coat paint system thickness of not less than 0.4 mm (16 mils).
2. Apply second and third coats with each coat having a dry film thickness of not less than 0.2 mm (8 mils), resulting in a three-coat paint system thickness of not less than 0.6 mm (24 mils).
3. Mark pile lengths after shop painting.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Site Conditions: Do not start pile-driving operations until earthwork fills have been completed or excavations have reached an elevation of 152 to 305 mm (6 to 12 inches) above bottom of footing or pile cap.

3.2 DRIVING EQUIPMENT

A. Pile Hammer: Air-, steam-, hydraulic-, or diesel-powered type capable of consistently delivering adequate peak-force duration and magnitude to develop the ultimate capacity required for type and size of pile driven and character of subsurface material anticipated.

B. Hammer Cushions and Driving Caps: Between hammer and top of pile, provide hammer cushion and steel driving cap as recommended by hammer manufacturer and as required to drive pile without damage.

C. Leads: Use fixed, semifixed, or hanging-type pile-driver leads that hold the full length of pile firmly in position and in axial alignment with hammer.

3.3 DRIVING PILES

A. General: Continuously drive piles to elevations or penetration resistance indicated [**or established by static load testing of piles**]. Establish and maintain axial alignment of leads and piles before and during driving.

B. Predrilling: Provide pre-excavated holes where indicated, to depths indicated. Drill holes with a diameter less than the largest cross-section dimension of pile.

1. Firmly seat pile in predrilled hole by driving with reduced energy before starting final driving.

C. Heaved Piles: Redrive heaved piles to tip elevation at least as deep as original tip elevation with a driving resistance at least as great as original driving resistance.

D. Driving Tolerances: Drive piles without exceeding the following tolerances, measured at pile heads:

1. Location: 102 mm (4 inches) from location indicated after initial driving, and 152 mm (6 inches) after pile driving is completed.
2. Plumb: Maintain 25 mm (1 inch) in 1219 mm (48 inches) from vertical, or a maximum of 102 mm (4 inches), measured when pile is aboveground in leads.

3. Batter Angle: Maximum 25 mm (1 inch) in 1219 mm (48 inches) from required angle, measured when pile is aboveground in leads.

E. Withdraw damaged or defective piles and piles that exceed driving tolerances and install new piles within driving tolerances.

1. Fill holes left by withdrawn piles using cohesionless soil material such as gravel, broken stone, and gravel-sand mixtures. Place and compact in lifts not exceeding 1830 mm (72 inches).
2. Fill holes left by withdrawn piles as directed by Project Director/COR.

F. Abandon and cut off rejected piles as directed by Project Director/COR. Leave rejected piles in place, and install new piles in locations as directed by Project Director/COR.

G. Cut off tops of driven piles square with pile axis and at elevations indicated.

H. Pile-Driving Records: Maintain accurate driving records for each pile[**, compiled and attested to by a qualified professional engineer**]. Include the following data:

1. Project name and number.
2. Name of Contractor.
3. Pile location in pile group and designation of pile group.
4. Sequence of driving in pile group.
5. Pile dimensions.
6. Ground elevation.
7. Elevation of tips after driving.
8. Final tip and cutoff elevations of piles after driving pile group.
9. Records of redriving.
10. Elevation of splices.
11. Type, make, model, and rated energy of hammer.
12. Weight and stroke of hammer.
13. Type of pile-driving cap used.
14. Cushion material and thickness.
15. Actual stroke and blow rate of hammer.
16. Pile-driving start and finish times, and total driving time.
17. Time, pile-tip elevation, and reason for interruptions.
18. Number of blows for every 305 mm (12 inches) of penetration, and number of blows per 25 mm (1 inch) for the last 152 mm (6 inches) of driving.
19. Pile deviations from location and plumb.
20. Pre-boring, jetting, or special procedures used.
21. Unusual occurrences during pile driving.

I. Certified Piles Survey: Engage a [**land surveyor**] [**professional engineer**] to prepare a piles survey showing final location of piles in relation to the property survey and existing benchmarks.

1. Notify Project Director/COR when deviations from locations exceed allowable tolerances.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: [**Owner will engage**] [**Engage**] a qualified special inspector to perform the following special inspections:

1. Pile foundations.
2. <**Insert special inspections**>.

B. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to perform tests and inspections.

C. Tests and Inspections:

1. Dynamic Pile Testing: High-strain dynamic monitoring must be performed and reported according to ASTM D4945 during initial driving and during restriking on [**five single**] [**3 percent of**] <**Insert number or percent of**> piles.

2. Weld Testing: In addition to visual inspection, welds must be tested and inspected according to AWS D1.1/D1.1M and inspection procedures listed below, at testing agency's option. Correct deficiencies in Work that test reports and inspections indicate do not comply with the Contract Documents.

a. Liquid Penetrant Inspection: ASTM E165.
b. Magnetic Particle Inspection: ASTM E709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration are not accepted.
c. Radiographic Inspection: ASTM E94, minimum quality level "2-2T."
d. Ultrasonic Inspection: ASTM E164.

D. Steel H piles will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.5 TOUCHUP PAINTING

A. Clean field welds, splices, and abraded painted areas and field-apply paint according to SSPC-PA 1. Use same paint and apply same number of coats as specified for shop painting.

1. Apply touchup paint before driving piles to surfaces that are immersed or inaccessible after driving.

3.6 DISPOSAL

A. Remove withdrawn piles and cutoff sections of piles from site and legally dispose of them off USG property.

END OF SECTION 316216

SECTION 316219 - TIMBER PILES

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. Available information for reference as part of the request for proposal and bidding include the following:

1. Plan Set(s) ____, Project No. _____, prepared by _____, dated _____.

2. Geotechnical Report No.(s)_____, Project No. _____, prepared by _____, dated _____, included or referenced in the bid documents, containing the results of exploratory borings, observation pits, or other site investigation data obtained in the vicinity of the proposed timber pile locations.

1.2 SUMMARY

A. Section includes round timber piles.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**>.

B. The pre-construction meeting will be conducted to clarify the construction requirements for the work, to coordinate the construction schedule activities and identify contractual relationships and delineation of responsibilities among the prime Contractor and various Subcontractors

1. The Engineer, prime Contractor, timber pile Contractor, Inspectors, and Geotechnical Instrumentation Specialist (if applicable) shall attend the meeting.
2. During preinstallation conference, the attendance should discuss the subsurface conditions, pile installation and testing, quality control and assurance plan, pile structure survey control, site drainage control, review proposed pile driving equipment to be used (such as leads, pile hammers, helmet, pile cushion or any other accessories), to be used, and any other detail that may affect the construction the timber piles.
3. Review methods and procedures related to timber piles including, but not limited to, the following:

a. Review geotechnical report.

b. Discuss existing utilities and subsurface conditions.
c. Review coordination with temporary controls and protections.
d. Review of QA/QC and safety procedures.

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For timber piles. Show fabrication and installation details for piles, including details of driving shoes, tips or boots, and pile butt protection.

1. Include arrangement of static pile reaction frame, test and anchor piles, equipment, and instrumentation. Submit structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Pile Driving Sequential Layout:

1. Submit layout drawings showing the proposed sequence of driving the piles.
2. On the sequential layout, show each pile identification as indicated on the Contract Drawings, its driving sequence number, type, size, load bearing capacity and pile tip elevation planned.

D. Approval of pile driving equipment by the Engineer will be based on wave equation analysis unless a dynamic formula has been specified for nominal resistance verification in the field. In no case shall the driving equipment be transported to the project site until approval of the Engineer is received in writing.

E. Qualification Data: For [**Installer**] [**professional engineer**] [**and**] [**testing agency**].

F. Round timber pile treatment data as follows, including chemical treatment manufacturer's written instructions for handling, storing, installing, and finishing treated material:

1. For each type of preservative-treated timber product, include certification by treating plant stating type of preservative solution and pressure process used, net amount of preservative retained, and compliance with applicable standards.
2. For waterborne-treated products, include statement that moisture content of treated materials was reduced to levels indicated before shipment to Project site.

G. Pile-Driving Equipment Data: Include type, make, and rated energy range; weight of striking part of hammer; weight of drive cap; and type, size, and properties of hammer cushion.

H. Static Pile Test Reports: Submit within three days of completing each test.

I. Pile-Driving Records: Submit within three days of driving each pile.

J. Certified Piles Survey: Submit within [**seven**] <**Insert number**> days of pile driving completion.

K. Field quality-control reports.

L. Material Certificates: For preservative-treated piles. Indicate type of preservative used and net amount of preservative retained.

M. Preconstruction Photographs: Photographs or video of existing conditions of adjacent construction. Submit before the Work begins.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1. Installer's responsibility includes engaging a qualified professional engineer to prepare pile-driving records.

B. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated [**and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025**].

1.6 PRECONSTRUCTION TESTING

A. General: Static pile tests are used to verify driving criteria and pile lengths and to confirm allowable load of piles.

1. Furnish test piles [**1524 mm (60 inches)**] <**Insert dimension**> longer than production piles.
2. Determination of actual length of piles is based on results of static pile tests.

B. Pile Tests: Arrange and perform the following pile tests:

1. Axial Compressive Static Load Test: ASTM D1143/D1143M. Procedure A, Quick Test[**and the following Procedures:**][**.**]

   a. Procedure B, Maintained Test.
   b. Procedure C, Loading in Excess of Maintained Test.
   c. Procedure G, Cyclic Loading Test.

2. Axial Tension Static Load Test: ASTM D3689.
3. Lateral Load Test: ASTM D3966.

C. Equip each test pile with two telltale rods, according to ASTM D1143/D1143M, for measuring deformation during load test.

D. Provide pile reaction frame, anchor piles, equipment, and instrumentation with enough reaction capacity to perform tests. Notify Project Director/COR at least 48 hours in advance of performing tests. On completion of testing, remove testing structure, anchor piles, equipment, and instrumentation.

   1. Allow a minimum of [**seven**] <**Insert number**> days to elapse after driving test piles before starting pile testing.

   2. Number of Test Piles: [**One pile**] [**As indicated**] <**Insert number**>.

E. Drive test piles at locations indicated to the minimum penetration or driving resistance indicated. Use test piles identical to those required for Project, and drive with appropriate pile-driving equipment operating at rated driving energy to be used in driving permanent piles.

   1. Pile Design Load: [**As indicated**] <**Insert load**>.

F. Approval Criteria: Allowable load shall be the load acting on the test pile when[**the lesser of**] the following criteria are met, divided by a factor of safety of [**2**] <**Insert value**>:

   1. Net settlement, after deducting rebound, of not more than 0.25mm/907 kg (0.01 inch/ton) of test load.

2. Total settlement exceeds the pile elastic compression by 4 mm (0.15 inch), plus 1.0 percent of the tip diagonal dimension.
3. A plunging failure or sharp break in the load settlement curve.

G. Test Pile-Driving Records: Prepare driving records for each test pile [**, compiled and attested to by a qualified professional engineer**]. Include same data as required for driving records of permanent piles.

H. Test piles that comply with requirements, including location tolerances, may be used on Project.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver piles to Project site in such quantities and at such times to ensure continuity of installation. Handle and store piles at Project site to prevent breaks, cuts, abrasions, or other physical damage and as required by AWPA M4.

1. Do not drill holes or drive spikes or nails into pile below cutoff elevation.

1.8 FIELD CONDITIONS

A. Protect structures, underground utilities, and other construction from damage caused by pile driving.

B. Site Information: A geotechnical report has been prepared for this Project and is [**included**] [**referenced**] elsewhere in the Project Manual for information only.

C. Preconstruction Photographs: Inventory and record the condition of adjacent structures, underground utilities, and other construction. Document conditions that might be misconstrued as damage caused by pile driving. Comply with Section 013233 "Photographic Documentation."

PART 2 - PRODUCTS

2.1 TIMBER PILES

A. Round Timber Piles: ASTM D25 Standard Specification for Round Timber Piles, unused, clean peeled, one piece from butt to tip; of the following species and size basis:

1. Manufacturers: Subject to compliance with requirements, [**provide products by the following**] [**provide products by one of the following**] [**available manufacturers**

offering products that may be incorporated into the Work include, but are not limited to, the following]:

a. <**Insert, in separate subparagraphs, manufacturer's name**>.

2. Species: [**Coastal Douglas fir**] [**Southern yellow pine**] <**Insert species**>.

3. Size Basis: [**Butt circumference**] [**Class A**] [**Class B**] [**Tip circumference**] [**203 mm (8 inch) tip and natural taper**].

B. Pressure-treat round timber piles according to AWPA U1 as follows:

1. Service Condition: [**UC4C Ground Contact, Extreme Duty**] [**UC5A Marine Use Northern Waters**] [**UC5B Marine Use Central Waters**] [**UC5C Marine Use Southern Waters**]

2. Treatment: [**Waterborne preservative**] [**Creosote or creosote solution**] [**Oil-borne preservative**] [**Waterborne preservative, creosote or creosote solution, or oil-borne preservative**] [**Waterborne preservative, severe marine borer hazard**] [**Dual treatment consisting of waterborne preservative, followed by creosote or creosote solution**] <**Insert treatment**>.

2.2 PILE ACCESSORIES

A. Driving Shoes: Fabricate from ASTM A1011/A1011M, hot-rolled carbon-steel strip to suit pile-tip diameter, of the following type and thickness, and secure to pile tip so as to not affect pile alignment during driving:

1. Type: [**Flat boot**] [**Arrow point**].
2. Thickness: [**4.8 mm (3/16 inch)**] [**6 mm (1/4 inch)**].

2.3 FABRICATION

A. Pile Tips: Cut and shape pile tips to accept driving shoes. Fit and fasten driving shoes to pile tips according to manufacturer's written instructions.

B. Pile Butt: Trim pile butt and cut perpendicular to longitudinal axis of pile. Chamfer and shape butt to fit tightly to driving cap of hammer.

C. Field-Applied Wood Preservative: Treat field cuts, holes, and other penetrations according to AWPA M4.

1. Coal-tar roofing cement for treating drilled holes or sealing cutoffs shall be free of asbestos.

D. Pile Splices: Splices are not permitted.

E. Pile-Length Markings: Mark each pile with horizontal lines at 305 mm (12 inch) intervals; label the distance from pile tip at 1524 mm (60 inch) intervals. Maintain markings on piles until driven.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Site Conditions: Do not start pile-driving operations until earthwork fills have been completed or excavations have reached an elevation of 152 to 305 mm (6 to 12 inches) above bottom of footing or pile cap.

3.2 DRIVING EQUIPMENT

A. Pile Hammer: Air-, steam-, hydraulic-, or diesel-powered type capable of consistently delivering adequate peak-force duration and magnitude to develop the ultimate capacity required for type and size of pile driven and character of subsurface material anticipated.

B. Hammer Cushions and Driving Caps: Between hammer and top of pile, provide hammer cushion and steel driving cap as recommended by hammer manufacturer and as required to drive pile without damage.

C. Leads: Use fixed, semifixed, or hanging-type pile-driver leads that hold the full length of pile firmly in position and in axial alignment with hammer.

3.3 DRIVING PILES

A. General: Continuously drive piles to elevations or penetration resistance indicated [**or established by static load testing of piles**]. Establish and maintain axial alignment of leads and piles before and during driving.

B. Spudding: Drive spud piles through overlying highly resistant strata or obstructions and withdraw for reuse.

C. Predrilling: Provide pre-excavated holes where indicated, to depths indicated. Drill holes with a diameter less than the largest cross-section dimension of pile.

1. Firmly seat pile in predrilled hole by driving with reduced energy before starting final driving.

D. Heaved Piles: Redrive heaved piles to tip elevation at least as deep as original tip elevation with a driving resistance at least as great as original driving resistance.

E. Driving Tolerances: Drive piles without exceeding the following tolerances, measured at pile heads:

1. Location: 102 mm (4 inches) from location indicated after initial driving, and 152 mm (6 inches) after pile driving is completed.
2. Plumb: Maintain 25 mm (1 inch) in 1219 mm (48 inches) from vertical, or a maximum of 102 mm (4 inches), measured when pile is aboveground in leads.

3. Batter Angle: Maximum 25 mm (1 inch) in 1219 mm (48 inches) from required angle, measured when pile is aboveground in leads.

F. Withdraw damaged or defective piles and piles that exceed driving tolerances and install new piles within driving tolerances.

1. Fill holes left by withdrawn piles using cohesionless soil material such as gravel, broken stone, and gravel-sand mixtures. Place and compact in lifts not exceeding 1830 mm (72 inches).
2. Fill holes left by withdrawn piles as directed by Project Director/COR.

G. Abandon and cut off rejected piles as directed by Project Director/COR. Leave rejected piles in place and install new piles in locations as directed by Project Director/COR.

H. Cut off butts of driven piles square with pile axis and at elevations indicated.

1. Cover cut-off piling surfaces with [**caps overlapping pile end by minimum 51 mm (2 inches)**] [**minimum three coats of preservative treatment**] according to AWPA M4.

I. Pile-Driving Records: Maintain accurate driving records for each pile[**, compiled and attested to by a qualified professional engineer**]. Include the following data:

1. Project name and number.
2. Name of Contractor.
3. Date and time of pile driving (start, stop and interruptions).
4. Hammer make, model, ram weight, energy rating, stroke height and operating speed if available.
5. Pile species.
6. Pile location in pile group and designation of pile group.
7. Sequence of driving in pile group.
8. Pile dimensions.
9. Ground elevation.
10. Elevation of tips after driving.
11. Final tip and cutoff elevations of piles after driving pile group.
12. Records of redriving.
13. Elevation of splices.
14. Type, make, model, and rated energy of hammer.
15. Weight and stroke of hammer.
16. Type of pile-driving cap used.
17. Cushion material and thickness.
18. Actual stroke and blow rate of hammer.
19. Pile-driving start and finish times, and total driving time.
20. Time, pile-tip elevation, and reason for interruptions.
21. Number of blows for every 305 mm (12 inches) of penetration, and number of blows per 25 mm (1 inch) for the last 152 mm (6 inches) of driving.
22. Pile deviations from location and plumb.
23. Pre-boring, jetting, or special procedures used.
24. Unusual occurrences during pile driving.
25. Any visual pile damage during or after pile driving.

J. Certified Piles Survey: Engage a [**land surveyor**] [**professional engineer**] to prepare a piles survey showing final location of piles in relation to the property survey and existing benchmarks.

1. Notify Project Director/COR when deviations from locations exceed allowable tolerances.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: [**Owner will engage**] [**Engage**] a qualified special inspector to perform the following special inspections:

1. Pile foundations.
2. <**Insert special inspections**>.

B. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to perform tests and inspections.

C. Tests and Inspections:

1. Dynamic Pile Testing: High-strain dynamic monitoring shall be performed and reported according to ASTM D4945 during initial driving and during restriking on [**five single**] [**3 percent of**] <**Insert number or percent of**> piles.

3.5 DISPOSAL

A. Remove withdrawn piles and cutoff sections of piles from site and legally dispose of them off USG property.

END OF SECTION 316219

SECTION 316223 - COMPOSITE PILES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes concrete-filled [**steel-shell**] [**steel pipe**] piles.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**>.

1.3 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For composite piles. Show fabrication and installation details for piles, including splices and tip details.

1. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld.
2. Indicate locations, sizes, type, and arrangement of reinforcement.
3. Include arrangement of static pile reaction frame, test and anchor piles, equipment, and instrumentation. Submit structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Qualification Data: For [**Installer**] [**professional engineer**] [**and**] [**testing agency**].

D. Welding certificates.

E. Design Mixes: For each concrete mix. Include revised mix proportions when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

F. Material Certificates: For [**steel-shell piles and accessories**] [**steel pipe piles and accessories**] [**steel reinforcement**] [**and**] [**concrete admixtures**].

G. Material Test Reports: For concrete materials.

H. Pile-Driving Equipment Data: Include type, make, and rated energy range; weight of striking part of hammer; weight of drive cap; and type, size, and properties of hammer cushion.

1. Include mandrel type and details.

I. Static Pile Test Reports: Submit within three days of completing each test.

J. Pile-Driving Records: Submit within three days of driving each pile.

K. Certified Piles Survey: Submit within [**seven**] <**Insert number**> days of pile-driving completion.

L. Field quality-control reports.

M. Preconstruction Photographs: Photographs or video of existing conditions of adjacent construction. Submit before the Work begins.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1. Installer's responsibility includes engaging a qualified professional engineer to prepare pile-driving records.

B. Testing Agency Qualifications: Qualified according to ASTM C1077 and ASTM E329 for testing indicated[**and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025**].

C. Comply with requirements in ACI 301, "Specifications for Structural Concrete."

D. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3/D1.3M, "Structural Welding Code - Sheet Steel."
3. AWS D1.4/D1.4M, "Structural Welding Code - Reinforcing Steel."

1.5 PRECONSTRUCTION TESTING

A. General: Static pile tests are used to verify driving criteria and pile lengths and to confirm allowable load of piles.

1. Furnish test piles [**1524 mm (60 inches)**] <**Insert dimension**> longer than production piles.
2. Determination of actual length of piles is based on results of static pile tests.

B. Pile Tests: Arrange and perform the following pile tests:

1. Axial Compressive Static Load Test: ASTM D1143/D1143M. Procedure A, Quick Test[**and the following Procedures:**][**.**]

a. Procedure B, Maintained Test.
b. Procedure C, Loading in Excess of Maintained Test.
c. Procedure G, Cyclic Loading Test.

2. Axial Tension Static Load Test: ASTM D3689.
3. Lateral Load Test: ASTM D3966.

C. Equip each test pile with two telltale rods, according to ASTM D1143/D1143M, for measuring deformation during load test.

D. Provide pile reaction frame, anchor piles, equipment, and instrumentation with enough reaction capacity to perform tests. Notify Project Director/COR at least 48 hours in advance of performing tests. On completion of testing, remove testing structure, anchor piles, equipment, and instrumentation.

1. Allow a minimum of [**seven**] <**Insert number**> days to elapse after driving test piles before starting pile testing.

2. Number of Test Piles: [**One pile**] [**As indicated**] <**Insert number**>.

E. Drive test piles at locations indicated to the minimum penetration or driving resistance indicated. Use test piles identical to those required for Project and drive with appropriate pile-driving equipment operating at rated driving energy to be used in driving permanent piles.

1. Pile Design Load: [**As indicated**] <**Insert load**>.

F. Approval Criteria: Allowable load shall be the load acting on the test pile when[**the lesser of**] the following criteria are met, divided by a factor of safety of [**2**] <**Insert value**>:

1. Net settlement, after deducting rebound, of not more than 0.25 mm/907 kg (0.01 1inch/ton) of test load.
2. Total settlement exceeds the pile elastic compression by 4 mm (0.15 inch), plus 1.0 percent of the tip diagonal dimension.
3. A plunging failure or sharp break in the load settlement curve.

G. Test Pile-Driving Records: Prepare driving records for each test pile [**, compiled and attested to by a qualified professional engineer**]. Include same data as required for driving records of permanent piles.

H. Test piles that comply with requirements, including location tolerances, may be used on Project.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver piles to Project site in such quantities and at such times to ensure continuity of installation. Handle and store piles at Project site to prevent physical damage.

1. Painted Piles: Protect finish and touch up damage before driving piles.

1.7 FIELD CONDITIONS

A. Protect structures, underground utilities, and other construction from damage caused by pile driving.

B. Site Information: A geotechnical report has been prepared for this Project and is [**included**] [**referenced**] elsewhere in the Project Manual for information only.

C. Preconstruction Photographs: Inventory and record the condition of adjacent structures, underground utilities, and other construction. Document conditions that might be misconstrued as damage caused by pile driving. Comply with Section 013233 "Photographic Documentation."

PART 2 - PRODUCTS

2.1 STEEL-SHELL PILES

A. Fluted Pile Shells: Manufacturer's standard, vertically fluted, pile shells; cold formed from steel sheet; 345 MPa (50,000 psi) minimum yield strength after forming. Fabricate watertight, uniformly tapered sections with forged-steel conical nose welded to tip.

1. Constant Diameter Extensions: Fabricate with splice overlap capable of telescoping into tapered section.

2. Taper: [**1:86 (0.14 inch in 12 inches)**] [**1:48 (0.25 inch in 12 inches)**] [**1:30 (0.40 inch in 12 inches)**].

3. Thickness: [**3.80 mm (0.150 inch)**] [**4.55 mm (0.179 inch)**] [**5.31 mm (0.209 inch)**] [**60.7 mm (0.239 inch)**].

B. Helically Corrugated Pile Shells: Manufacturer's standard, helically corrugated, uniform-diameter, steel sheet shell piles; of enough strength and thickness to remain watertight and resist distortion and buckling due to soil pressure, internal mandrel operation, or redriving. Fabricate in one-piece lengths with minimum 4.76 mm- (3/16 inch-) thick steel-plate boot continuously welded to tip.

1. Nominal Diameter: [**219 mm (8-5/8 inches)**] [**270 mm (10-5/8 inches)**] [**283 mm (11-1/8 inches)**] [**311 mm (12-1/4 inches)**] [**350 mm (14 inches)**] [**410 mm (16-1/8 inches)**].

2. Thickness: [**1.12 mm (0.048 inch), minimum**] [**1.52 mm (0.060 inch), minimum**] [**1.90 mm (0.075 inch), minimum**] [**2.66 mm (0.105 inch)**] <**Insert dimension**>.

2.2 STEEL PIPE PILES

A. Steel Pipe: ASTM A252, [**Grade 2**] [**Grade 3**]; seamless or welded.

2.3 STEEL REINFORCEMENT

A. Reinforcing Bars: ASTM A615/A615M, Grade 420 (Grade 60); deformed.

B. Low-Alloy-Steel Reinforcing Bars: ASTM A706/A706M.

C. Galvanized Reinforcing Bars: ASTM A767/A767M, Class II zinc coated, hot-dip galvanized after fabrication and bending, as follows:

1. Steel Reinforcement: [**ASTM A615/A615M, Grade 420 (Grade 60)**] [**ASTM A706/A706M**]; deformed.

D. Epoxy-Coated Reinforcing Bars: ASTM A775/A775M or ASTM A934/A934M, as follows:

1. Steel Reinforcement: [**ASTM A615/A615M, Grade 420 (Grade 60)**] [**ASTM A706/A706M**]; deformed.

E. Plain Steel Wire: ASTM A82/A82M, [**as drawn**] [**galvanized**].

F. Deformed-Steel Wire: ASTM A496/A496M.

G. Epoxy-Coated-Steel Wire: ASTM A884/A884M, Class A coated, [**plain**] [**deformed**].

2.4 CONCRETE MATERIALS

A. Portland Cement: ASTM C150/C150M, Type I or II.

1. Fly Ash: ASTM C618, Class C or F.
2. Ground Granulated Blast-Furnace Slag: ASTM C989, Grade 100 or 120.

B. Blended Hydraulic Cement: ASTM C595/C595M, [**Type IS, portland blast-furnace slag**] [**Type IP, portland-pozzolan**] [**Type I (PM), pozzolan-modified portland**] [**Type I (SM), slag-modified portland**] cement.

C. Normal-Weight Aggregates: ASTM C33/C33M, [**Class 4S**] [**Class 4M**] [**Class 1N**] <**Insert class**>, uniformly graded, 19 mm (0.75 inch) maximum aggregate size. Provide aggregates from a single source.

D. Water: Potable, complying with ASTM C94/C94M requirements.

E. Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and to contain no more than 0.1 percent chloride ions by mass of cementitious material.

1. Air-Entraining Admixture: ASTM C260/C260M.
2. Water-Reducing Admixture: ASTM C494/C494M, Type A.
3. Retarding Admixture: ASTM C494/C494M, Type B.
4. Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type D.
5. High-Range, Water-Reducing Admixture: ASTM C494/C494M, Type F.
6. High-Range, Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type G.
7. Plasticizing and Retarding Admixture: ASTM C1017/C1017M, Type II.

2.5 PILE ACCESSORIES

A. Driving Points: Manufacturer's standard 60-degree conical driving point, with integral reinforcing ribs, to provide full bearing of pipe pile tip. Fabricate from steel castings as follows:

B. Inside Cutting Shoes: Manufacturer's standard, inside-flanged, open-ended cutting shoe, to provide full bearing of pipe pile tip. Fabricate from steel castings as follows:

C. Outside Cutting Shoes: Manufacturer's standard, outside-flanged, open-ended cutting shoe, to provide full bearing of pipe pile tip. Fabricate from steel castings as follows:

1. Carbon-Steel Castings: ASTM A27/A27M, [**Grade 450-240 (Grade 65-35), heat treated**] [**or**] [**Grade N1**].

2. High-Strength Steel Castings: ASTM A148/A148M, [**Grade 550-275 (Grade 80-40)**] [**or**] [**Grade 620-415 (Grade 90-60)**].

D. Splice Coupling: Manufacturer's standard splice coupling, rolled from ASTM A36/A36M, carbon-steel bar or cast from heat-treated carbon steel, ASTM A27/A27M, Grade 450-240 (Grade 65-35), with interior stop and internally tapered for friction fit driving.

2.6 PAINT

A. Paint: SSPC-Paint 16; self-priming, two-component, coal-tar epoxy polyamide, [**black**] [**red**] [**manufacturer's standard color**].

2.7 CONCRETE MIXES

A. Prepare concrete design mixes according to ACI 301, determined by either laboratory trial batch or field test data basis.

1. Use a qualified testing agency for preparing and reporting proposed mix designs determined by laboratory trial batch.

B. Proportion mixes according to ACI 301 to provide normal-weight concrete suitable for piles with the following properties:

1. Compressive Strength (28 Days): [**34.5 MPa (5000 psi)**] [**27.6 MPa (4000 psi)**] [**20.7 MPa (3000 psi)**] <**Insert value**>.

2. Maximum Water-Cementitious Material Ratio at Point of Placement: [**0.45**] [**0.50**] <**Insert ratio**>.

3. Slump Limit: [**127 mm (5 inches)**] [**203 mm (8 inches)**] <**Insert dimension**>, plus or minus 25 mm (1 inch).

C. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content of [**6.0 percent, plus or minus 1.5**] [**2.5 to 4.5**] percent.

D. Cementitious Materials: Limit percentage, by weight, of cementitious materials other than portland cement according to ACI 301 limits as if concrete were exposed to deicing chemicals.

E. Limit water-soluble, chloride-ion content in hardened concrete to [**0.15**] [**0.30**] percent by weight of cement.

F. Concrete-mix design adjustments may be considered if characteristics of materials, Project conditions, weather, test results, or other circumstances warrant. Resubmit and obtain approval from Project Director/COR of proposed changes to concrete-mix proportions.

2.8 FABRICATION

A. Fabricate and assemble piles in shop to greatest extent possible.

B. Fabricate full-length piles to eliminate splicing during driving.

C. Fabricate full-length piles by splicing pile lengths together. Maintain axial alignment of pile lengths. Maintain structural properties of pile across splice.

1. Splice Coupling: Fit splice coupling into position and weld to adjoining steel pipe pile sections according to manufacturer's written instructions and AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.

2. Welded Splices: Accurately mill meeting ends of steel pipe piles, and bevel for welding. Continuously weld pile according to AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.

3. Welded Splices: Continuously weld steel-shell pile according to manufacturer's written instructions and AWS D1.1/D1.1M[**and AWS D1.3/D1.3M**] for procedures, appearance and quality of welds, and methods used in correcting welding work.

4. Splice piles during fabrication or field installation.

D. Fit and weld driving points to tip of pile according to manufacturer's written instructions and AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.

E. Fit and weld cutting shoes to tip of pile according to manufacturer's written instructions and AWS D1.1/D1.1M for procedures, appearance and quality of welds, and methods used in correcting welding work.

F. Pile-Length Markings: Mark each pile with horizontal lines at 305 mm (12 inch) intervals; label the distance from pile tip at 1524 mm (60 inch) intervals. Maintain markings on piles until driven.

2.9 SHOP PAINTING

A. General: Shop paint steel pile surfaces, except for surfaces to be encased in concrete, as follows:

1. Extend painting to a depth of 1524 mm (60 inches) below [**finished grade**] [**low-tide level**] to top of exposed pile.

B. Surface Preparation: Clean surfaces to be painted. Remove loose rust and loose mill scale, and remove spatter, slag, or flux deposits. Prepare surfaces according to SSPC-SP 10/NACE No. 2, "Near-White Blast Cleaning."

C. Painting: Immediately after surface preparation, apply coat of paint according to manufacturer's written instructions to provide a dry film thickness of not less than 0.2 mm (8 mils).

1. Apply second coat to provide a dry film thickness of not less than 0.2 mm (8 mils), resulting in a two-coat paint system thickness of not less than 0.4 mm (16 mils).
2. Apply second and third coats with each coat having a dry film thickness of not less than 0.2 mm (8 mils), resulting in a three-coat paint system thickness of not less than 0.6 mm (24 mils).
3. Mark pile lengths after shop painting.

2.10 CONCRETE MIXING

A. Ready-Mixed Concrete: Comply with ASTM C94/C94M.

1. Do not add water to concrete mix after mixing.
2. Maintain concrete temperature to not exceed 32 deg C (90 deg F).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Site Conditions: Do not start pile-driving operations until earthwork fills have been completed or excavations have reached an elevation of 152 to 305 mm (6 to 12 inches) above bottom of footing or pile cap.

3.2 DRIVING EQUIPMENT

A. Pile Hammer: Air-, steam-, hydraulic-, or diesel-powered type capable of consistently delivering adequate peak-force duration and magnitude to develop the ultimate capacity required for type and size of pile driven and character of subsurface material anticipated.

B. Hammer Cushions and Driving Caps: Between hammer and top of pile, provide hammer cushion and steel driving cap as recommended by hammer manufacturer and as required to drive pile without damage.

C. Leads: Use fixed, semifixed, or hanging-type pile-driver leads that hold the full length of pile firmly in position and in axial alignment with hammer.

D. Mandrel: Expandable mandrel, capable of distributing driving energy throughout length of steel-shell pile.

3.3 STEEL REINFORCEMENT

A. Comply with recommendations in CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy bond with concrete.

C. Fabricate and install reinforcement cages symmetrically about axis of pile [**shell**] [**pipe**] in a single unit.

D. Accurately position, support, and secure reinforcement against displacement during concreting. Maintain minimum cover on reinforcement.

E. Protect exposed ends of extended reinforcement, dowels, or anchor bolts from mechanical damage and exposure to weather.

3.4 CONCRETE PLACEMENT

A. Do not place concrete until other piles within a radius of [**6 m (20 feet)**] <**Insert value**> have been driven and approved.

B. Inspection: Before placing concrete, allow testing and inspecting agency to visually inspect and verify that each pile [**shell**] [**pipe**] is clean, watertight, plumb, and free of distortion or other defects.

C. Place concrete in a continuous operation and without segregation immediately after cleaning out pile [**shell**] [**pipe**].

D. Place concrete by means of bottom discharge bucket, flexible drop chute, or steep-sided funnel hopper or tremie or pump concrete into place.

E. Place concrete in a dry pile [**shell**] [**pipe**] unless placement underwater is approved by Project Director/COR.

1. Place concrete underwater by tremie method or pumping. Control placement operations to ensure tremie is embedded no less than 1524 mm (60 inches) into concrete, and flow of tremie concrete is continuous from bottom to top of pile [**shell**] [**pipe**].
2. Other methods of depositing concrete may be used if approved by Project Director/COR.

F. Consolidate final 3 m (10 feet) of concrete during placement to ensure that concrete is thoroughly worked around steel reinforcement and into corners.

G. Screed concrete level at cutoff elevation and apply a scoured, rough finish.

3.5 DRIVING PILES

A. General: Continuously drive piles to elevations or penetration resistance indicated [**or established by static load testing of piles**]. Establish and maintain axial alignment of leads and piles before and during driving.

B. Predrilling: Provide pre-excavated holes where indicated, to depths indicated. Drill holes with a diameter less than the largest cross-section dimension of pile.

1. Firmly seat pile in predrilled hole by driving with reduced energy before starting final driving.

C. Heaved Piles: Redrive heaved piles to tip elevation at least as deep as original tip elevation with a driving resistance at least as great as original driving resistance.

D. Pile Splices: Splice piles during installation and align pile segments concentrically.

E. Driving Tolerances: Drive piles without exceeding the following tolerances, measured at pile heads:

1. Location: 102 mm (4 inches) from location indicated after initial driving, and 152 mm (6 inches) after pile driving is completed.
2. Plumb: Maintain 1 inch (25 mm) in 1219 mm (48 inches) from vertical, or a maximum of 102 mm (4 inches), measured when pile is aboveground in leads.

3. Batter Angle: Maximum 25 mm (1 inch) in 1219 mm (48 inches) from required angle, measured when pile is aboveground in leads.

F. Excavation: Clean out steel pipe pile by removing soil and debris from inside pile before placing steel reinforcement or concrete.

G. Withdraw damaged or defective piles and piles that exceed driving tolerances and install new piles within driving tolerances.

1. Fill holes left by withdrawn piles using cohesionless soil material such as gravel, broken stone, and gravel-sand mixtures. Place and compact in lifts not exceeding 1830 mm (72 inches).
2. Fill holes left by withdrawn piles as directed by Project Director/COR.

H. Abandon and cut off rejected piles as directed by Project Director/COR. Leave rejected piles in place, and install new piles in locations as directed by Project Director/COR.

I. Cut off tops of driven piles square with pile axis and at elevations indicated.

J. Pile-Driving Records: Maintain accurate driving records for each pile [**, compiled and attested to by a qualified professional engineer**]. Include the following data:

1. Project name and number.
2. Name of Contractor.
3. Pile location in pile group and designation of pile group.
4. Sequence of driving in pile group.
5. Pile dimensions.
6. Ground elevation.
7. Elevation of tips after driving.
8. Final tip and cutoff elevations of piles after driving pile group.
9. Records of redriving.
10. Elevation of splices.
11. Type, make, model, and rated energy of hammer.
12. Weight and stroke of hammer.
13. Type of pile-driving cap used.
14. Cushion material and thickness.
15. Actual stroke and blow rate of hammer.
16. Pile-driving start and finish times, and total driving time.
17. Time, pile-tip elevation, and reason for interruptions.
18. Number of blows for every 305 mm (12 inches) of penetration, and number of blows per 25 mm (1 inch) for the last 152 mm (6 inches) of driving.
19. Pile deviations from location and plumb.
20. Pre-boring, jetting, or special procedures used.
21. Unusual occurrences during pile driving.

K. Certified Piles Survey: Engage a [**land surveyor**] [**professional engineer**] to prepare a piles survey showing final location of piles in relation to the property survey and existing benchmarks.

1. Notify Project Director/COR when deviations from locations exceed allowable tolerances.

3.6 FIELD QUALITY CONTROL

A. Special Inspections: [**Owner will engage**] [**Engage**] a qualified special inspector to perform the following special inspections:

1. Pile foundations.
2. <**Insert special inspections**>.

B. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to perform tests and inspections.

C. Tests and Inspections:

1. Dynamic Pile Testing: High-strain dynamic monitoring shall be performed and reported according to ASTM D4945 during initial driving and during restriking on [**five single**] [**3 percent of**] <**Insert number or percent of**> piles.

2. Low-strain integrity measurement shall be performed and reported for each pile.

3. Weld Testing: In addition to visual inspection, welds shall be tested and inspected according to AWS D1.1/D1.1M and the inspection procedures listed in subparagraphs below, at testing agency's option. Correct deficiencies in Work that test reports and inspections indicate does not comply with the Contract Documents.

   a. Liquid Penetrant Inspection: ASTM E165.
   b. Magnetic Particle Inspection: ASTM E709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration are not accepted.
   c. Radiographic Inspection: ASTM E94; minimum quality level "2-2T."
   d. Ultrasonic Inspection: ASTM E164.

4. Concrete: Sampling and testing of concrete for quality control shall include the following:

   a. Sampling Fresh Concrete: ASTM C172/C172M, except modified for slump to comply with ASTM C94/C94M.

      1) Slump: ASTM C143/C143M; one test at point of placement for each compressive-strength test, but no fewer than one test for each concrete load.
      2) Concrete Temperature: ASTM C1064/C1064M; one test hourly when air temperature is 5 deg C (40 deg F) and below or when 27 deg C (80 deg F) and above, and one test for each set of compressive-strength specimens.
      3) Compression Test Specimens: ASTM C31/C31M; one set of [**four**] <**Insert number**> standard cylinders for each compressive-strength test unless otherwise indicated. Mold and store cylinders for laboratory-cured test specimens unless field-cured test specimens are required.

      4) Compressive-Strength Tests: ASTM C39/C39M; one set for each truck load. One specimen shall be tested at seven days, two specimens shall be tested at

28 days, and one specimen shall be retained in reserve for later testing if required.

b. When frequency of testing provides fewer than five strength tests for a given class of concrete, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
c. When strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, evaluate current operations and provide corrective procedures for protecting and curing in-place concrete.
d. Strength level of concrete is considered satisfactory if averages of sets of three consecutive strength test results equal or exceed specified compressive strength and no individual strength test result falls below specified compressive strength by more than 3.45 MPa (500 psi).
e. Test results shall be reported in writing to Project Director/COR, concrete manufacturer, and Contractor within 24 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, concrete type and class, location of concrete batch in piles, design compressive strength at 28 days, concrete-mix proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
f. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted but shall not be used as sole basis for acceptance or rejection.
g. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate concrete strengths or other requirements have not been met.

D. Concrete-filled steel piles will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.7 TOUCHUP PAINTING

A. Clean field welds, splices, and abraded painted areas and field-apply paint according to SSPC-PA 1. Use same paint and apply same number of coats as specified for shop painting.

1. Apply touchup paint before driving piles to surfaces that are immersed or inaccessible after driving.

3.8 DISPOSAL

A. Remove withdrawn piles and cutoff sections of piles from site, and legally dispose of them off USG property.

END OF SECTION 316223

SECTION 316316 - AUGER CAST-IN-PLACE PILES (ACIP)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Contract Documents and general provisions of the Contract, including OBO Contract Clauses and Supplementary Conditions and Division 1 Specification Sections of these Contract Specifications, apply to work of this Section.

B. Available information for reference as part of the request for proposal and bidding include the following:

1. Plan Set(s) ____, Project No. _____, prepared by _____, dated _____.
2. Geotechnical Report No.(s)_____, Project No. _____, prepared by _____, dated _____, included or referenced in the bid documents, containing the results of exploratory borings, observation pits, or other site investigation data obtained in the vicinity of the proposed CFA pile locations.

1.2 SUMMARY

A. Section includes auger cast in-place (ACIP) constructed by rotating a hallow-stem auger in the ground to a specified pile depth. Grout or concrete is injected through the hollow-stem auger under continuous positive pressure as the auger is withdrawn. Reinforcing steel, as specified, is inserted into the column of fluid grout or concrete following the completion of grout or concrete placement.

B. Related Sections include the following:

1. Division 1 Section "Unit Prices" for a schedule of unit prices.
2. Division 1 Section "Construction Facilities and Temporary Controls."
3. Division 3 Section “Cast-in-Place Concrete”: For requirements for reinforcing steel, accessories and grout provided under this Section.

1.3 PERFORMANCE AND DESIGN REQUIREMENTS

A. ACIP piles must be the location(s), number, and diameter(s) as specified on the project plans.

B. The ACIP piles must have:

1. Allowable vertical load capacity as specified on the project plans.
2. Allowable uplift load capacity as specified on the project plans.
3. Allowable lateral load capacity as specified on the project plans.

C. ACIP piles must extend to the estimated tip elevation(s) indicated on the project plans or to prior refusal, whichever occurs first. The ACIP pile contractor must define the proposed refusal criteria in a method statement submittal that must be reviewed by the Geotechnical Engineer prior to starting the work.

D. Pile length must be determined by Pile Subcontractor, in accordance with requirements herein, as necessary to achieve designated pile design loads. The pile length shown on the drawings is an estimated length to achieve pile capacity based on the geotechnical report.

1. Refer to Geotechnical Engineering report for anticipated soil conditions.
2. Adjustments to pile length must not be measured for payment.

E. Pile reinforcement shown on drawings is a reference design. Pile subcontractor must design the pile reinforcement based on the design loads provided on the drawings and along with the information provided in the geotechnical report to meet code requirements.

F. Quality:

1. The as-built diameter of the pile must be greater than or equal to the design diameter along the entire length of the pile. Pile system or installation methods must prevent necking.
2. The strength and stiffness of grout or concrete fill must be uniform along the entire length of the pile. Pile system or installation methods must prevent contamination of grout by groundwater or soil.
3. The Owner reserves the right to request additional information to evaluate the proposed pile system.

1.4 REFERENCES

A. Standards and reference documents listed below apply where designation is cited in this Section. Where the applicable year of adoption or revision is not listed below, the latest edition applies.

B. ACI: Standards of the American Concrete Institute (ACI) apply where designated in this section.

1. ACI 301 - Specifications for Structural Concrete for Buildings.
2. ACI 318 - Building Code Requirements for Reinforced Concrete, 2014.

C. American Society for Testing and Materials (ASTM):

1. C 33: Specifications for Concrete Aggregates
2. C 39: Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
3. C 150: Standard Specification for Portland Cement
4. C 494: Standard of Specification for Chemical Admixtures for Concrete
5. C 618: Standard Specification for Fly Ash and Raw or Calcinized Natural Pozzolan for use as a Mineral Admixture in Portland Cement Concrete
6. C 942: Test Method for Compressive Strength of Grouts for Preplaced-Aggregate Concrete in the Laboratory
7. D 1143: Standard Test Method for piles under static axial compression load.
8. C1611: Standard Test Method for Slump Flow of Self-Consolidating Concrete.

9. D 3689: Standard Test Method for individual piles under static axial tension load.
10. D 4945: Standard Test Method for High Strain Dynamic Testing of Piles

H. Geotechnical Report

1.5 SUBMITTALS

A. Design Submittals: must include design calculation detailing dimensions, quantities, ground profiles, cross-sections necessary to design the ACIP. Design submittals must include:

1. A written summary report of the overall pile design.
2. Applicable codes requirements.
3. Design criteria, including soil/rock shear strengths (friction angle and cohesion), unit weights, unit skin friction values, and unit end-bearing values. Any additional subsurface borings, laboratory work, or other subsurface data collected for the design must also be included.
4. Safety factors used in the deigns.
5. Seismic design earthquake acceleration coefficient or the seismic design criteria applicable for the area.

B. Working Drawings: Must include all information required for the construction and quality control of the ACIP. Working drawings must include:

1. Plan view of the ACIP, reference baseline datum.
2. Offset from the construction centerline or baseline to the face of the ACIP structure at all changes in horizontal alignment.
3. ACIP pile location with center-to-center spacing.
4. Subsurface exploration locations shown on a plan view of the ACIP alignment with appropriate reference base lines to fix the locations of the explorations relative to the ACIP.
5. Identify each pile and indicate pile dimensions, cross sections, locations, and sizes.
6. Indicate types and configurations of reinforcement and detail fabricating.
7. Detail connections to pile caps.
8. Typical pile sections including spacing, diameter, reinforcing bar sizes, locations, and details; centralizers and spacers; and connection details to the substructure footing/pile cap.

9. Method of centralizing reinforcement, type and size of centralizing devices, and locations on reinforcing bars.

C. Design Mixtures: For each grout or concrete mixture. Submit alternative design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

1. Indicate amounts of mixing water to be withheld for later addition at Project site.

D. Test Program: At least 14-days prior to the commencement of the load test program, the contractor must submit the following specifics of the program for approval by the Geotechnical Engineer:

1. Static Load Test Procedure in accordance with ASTM D 1143 Quick Load Test Method, including details of the load testing apparatus, referencing measuring locations and devices, etc.
2. Hydraulic Jack and/or load cell calibrations. Calibrations must be current within 6 months preceding the test date.
3. The Trial Piles (a minimum of 4 are required) must be installed at the locations accepted by the geotechnical engineer. The trial drilled shafts must be located near existing borings and must avoid permanent drilled shafts (a minimum of 3 pile diameters away), to demonstrate the Installer's construction methods, equipment, standards of workmanship, and tolerances.

E. Qualification Data:

1. ACIP Pile Contractor must submit evidence that he has been engaged in the successful installation of ACIP piles for at least five years and that his crane operators or "keymen" who give directions to the crane operators have at least two years of experience in the successful installation of ACIP piles. The Contractor must furnish records of past successful experience in performing this type of work and must submit to the Engineer for review a description of the materials used and method of operations. The information furnished must demonstrate that the finished piles complying, in all respects, with the quality and properties required by the Specifications.

F. Welding certificates.

G. Installation and monitoring procedures: Provide description of drilling and grouting equipment and detailed procedure to be followed for installing piles. Describe procedures for monitoring installation. Include form proposed for preparation of standard daily log.

H. Provide the following submittals for approval in accordance with Section 01300:

1. Concrete Grout Materials Test Reports as proposed for use in grout mixes.
2. Concrete Grout Design Mix Reports listing mixes required and their respective test results.
3. CFA Pile details.
4. Electromagnetic Flow Meters and Digital Pressure Gauges data for monitoring grout flow together with electronic warning system for operator.
5. Trial pile installation logs and load test program details.
6. Installation logs for all field constructed piles including grout batch number.

7. Welding Certificates: Copies of certificates indicating compliance of welding procedures and personnel with requirements in Section 1.6 “Quality Assurance”.

I. Material Certificates: For the following:

1. Cementitious materials.
2. Grout or Concrete admixtures.
3. Steel reinforcing.
4. Steel Casing.

J. Equipment Data: Description of drilling and grout-pumping equipment including the following:

1. Type and make of drilling rig, rated capacity, and boom lengths.
2. Torque of drilling machine and horsepower of hydraulic power unit.
3. Pressure and discharge capacity of grout pump.
4. Automated monitoring equipment to be used.

K. Static Pile Test Reports: Submit within seven days of completing each test.

L. Record Documents:

1. Submit two copies of the placing record of each pile to the Engineer not later than two (2) days after placement.
2. Daily logs: In accordance with approved installation and monitoring procedures. The testing and inspection agency will compile final report based on daily logs and their observations.
3. As-built survey: Plan location and elevation of pile heads and deviation from indicated locations, prepared by a licensed land surveyor.
4. Record drawing: Accurately record the following on project record drawing:

   a. Pile location, where location exceeds specified tolerances.
   b. Final tip elevation.

1.6 PREINSTALLATION CONFRENCE:

A. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**>.

B. The pre-construction meeting will be conducted to clarify the construction requirements for the work, to coordinate the construction schedule activities and identify contractual relationships and delineation of responsibilities among the prime Contractor and various Subcontractors.

1. The Engineer, prime Contractor, ACIP Contractor, Inspectors, excavation Contractor, and Geotechnical Instrumentation Specialist (if applicable) must attend the meeting.
2. During preinstallation conference, the attendance should discuss the subsurface conditions, pile installation and testing, quality control and assurance plan, pile structure survey control, site drainage control, review proposed drill rig to be used, and any other detail that may affect the construction ACIP.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified according to ASTM C1077, ASTM D3740, and ASTM E329 for testing indicated [**and accredited by IAS or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025**].

B. Installer:

1. Installer Qualifications: An Experienced installer that has demonstrated specialized experience in CFA pile installation with at least five years of experience successfully installing CFA Piles. Not less than three successfully completed contracts with similar soil conditions, shaft sizes, depths, and volumes of Work contained in this Project.
2. Have present on the site at all times while work is in progress at least one authorized representative fully experienced in the installation of CFA piles. The representative must be competent to receive and carry out instructions which may be given by proper authority and to act in full capacity on behalf of the installer.
3. Certificates of material properties, indicating compliance with specified requirements, may be submitted in lieu of testing when acceptable to Architect. Certificates of Compliance must be signed by materials producer and Contractor.

C. Inspections and testing must be performed by Quality Control Manager in accordance with requirements of this Section and Division 01 Section “Contractor’s Quality Control.”

D. Mix Designs: For each type of grout or concrete **[include if applicable]**. Include description of type and proportions of ingredients.

E. Survey Work: Engage a qualified land surveyor or professional engineer to perform surveys, layouts, and measurements for CFA piles. Before excavating, lay out each CFA pile to lines and levels required. Record actual measurements of each CFA pile’s location, diameter, bottom and top elevations, deviations from specific tolerances, and other specified data.

1. Record and maintain information pertinent to each CFA pile and cooperate with the testing and inspecting agency to provide data for required reports.

F. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.4/D1.4M, "Structural Welding Code - Reinforcing Steel."

1.8 PRECONSTRUCTION TESTING

A. Test Piles: Construct at diameter, depth, and at locations indicated on Drawings or, if not indicated, of same diameter and depth as largest production piles and at locations selected by Architect or its Design Engineer, to confirm allowable load of piles and demonstrate Installer's construction methods, equipment, standards of workmanship, and tolerances.

B. The complete installation process and equipment used during the pre-production test pile program must be used to install the production piles. Sampling and testing of materials used on the project must also be included in the conformance testing plan.

1. If Architect determines that test pile does not comply with requirements, excavate for and cast another until it is accepted.
2. Tests: Arrange and perform the following pile tests:

   a. Axial Compressive Static Load Test: ASTM D1143/D1143M, Procedure A, Quick Test **[and the following Procedures:**][**.**]

      1) Procedure B, Maintained Test.
      2) Procedure C, Loading in Excess of Maintained Test.
      3) Procedure G, Cyclic Loading Test.

   b. Axial Tension Static Load Test: ASTM D3689.
   c. Lateral Load Test: ASTM D3966.

3. Equip each test pile with two telltale rods, according to ASTM D1143/D1143M, for measuring deformation during load test.
4. Provide pile reaction frame, anchor piles, equipment, and instrumentation with enough reaction capacity to perform tests. Notify Architect at least 48 hours in advance of performing tests. On completion of testing, remove testing structure, anchor piles, equipment, and instrumentation.

   a. Allow a minimum of twenty-eight days to elapse after installing test piles before starting pile testing.
   b. Number of Test Piles: [**One pile**] [**As indicated**] <**Insert number**>.

5. Approval Criteria: Allowable load must be the load acting on the test pile when [**the lesser of**] the following criteria are met, divided by a factor of safety of [**2**] <**Insert value**>:

   a. Net settlement of not more than 0.25 mm/907 kg of test load.
   b. Total settlement of 25 mm provided the load settlement curve shows no sign of failure.
   c. A plunging failure or sharp break in the load settlement curve.

6. Test Pile Records: Prepare records for each test pile [**, compiled and attested to by a qualified professional engineer**]. Include same data as required for permanent piles.
7. Test piles that comply with requirements, including location tolerances, may be used on Project.

1.9 DELIVERY, STORAGE AND HANDLING

A. Store materials in orderly manner above ground and stabilize with blocks during storage to minimize possible distortion of members. Materials exhibiting variations beyond tolerance limits will be considered distorted and may not be used in the work.

1.10 FIELD CONDITIONS

A. Protect structures, underground utilities, and other construction from damage caused by pile excavation.

B. Existing Utilities: Locate existing underground utilities before installation of CFA piles. If utilities are to remain in place, provide protection from damage during pile operations.

1. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, consult Architect immediately for directions as to procedure. Cooperate with Owner and utility companies in keeping services and facilities in operation. Repair damaged utilities to satisfaction of utility owner.

C. Site Information: A geotechnical report has been prepared for this Project and is available for information only. The report is not part of the Contract Documents. Opinions expressed in this report are those of the geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by the geotechnical engineer. Owner will not be responsible for interpretations or conclusions drawn from this data by Contractor.

1. Make additional test borings and conduct other exploratory operations as necessary.
2. The geotechnical report is included elsewhere in the Project Manual.

D. Survey Work: Engage a qualified land surveyor or professional engineer to perform surveys, layouts, and measurements for auger cast grout piles. Before excavating, lay out each pile to lines and levels required. Record actual measurements of each pile's location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other specified data.

E. Existing Adjacent Facilities: Take extraordinary precautions concerning the preservation of adjacent properties. Before beginning construction, the Contractor must ascertain that the structures are sound and agree to assume responsibility for the safety and preservation of the adjoining property.

F. Examine foundation drawings for existing structures. Plan and execute operations in a manner that will prevent damage to the existing foundations.

PART 2 - PRODUCTS

2.1 STEEL REINFORCEMENT

A. Reinforcing Bars: ASTM A615/A615M, Grade 420, deformed.

B. Single Bar Reinforcing: ASTM A722/A722M, high strength, threaded.

1. Mechanical Couplings: Screw-on type, capable of supporting the minimum ultimate tensile strength of the coupled bars.

C. Centralizers: Devices to center steel reinforcement in excavation; spaced not less than 6 m o.c. for vertical piles.

2.2 GROUT MIXTURES:

A. Prepare design mixtures for each type and strength of grout, proportioned on the basis of laboratory trial mixture, field test data, or both.

1. Use a qualified independent testing agency for preparing and reporting proposed mixture designs based on laboratory trial mixtures.

B. Proportion grout mixture as follows:

1. Minimum Compressive Strength: [**34.5 MPa (5000 psi)**] [**31 MPa (4500 psi)**] [**27.6 MPa (4000 psi)**] <**Insert value**> at 28 days; ASTM C109/C109M with cube specimens restrained from expansion according to ASTM C942.
2. Maximum Water-Cementitious Materials Ratio: [**0.43**] [**0.38**] <**Insert ratio**>.
3. Grout Flow: [**10 to 25 seconds**] <**Insert flow rate**>; ASTM C939 and ASTM C109/C109M using a flow cone with 19 mm (0.75 inch) opening. Grout must be designed so as to maintain the range of acceptable fluid consistency for a period of at least 2 hours **[insert time**] or longer.

2.3 CONCRETE MATERIALS: THE CONCRETE MUST BE MIXED SO THAT THE CONCRETE WILL EXHIBIT THE PROPERTIES NOTED IN SECTION 1.7.B.

A. Portland Cement: ASTM C150/C150M, [**Type I**] [**Type II**] [**Type I/II**] [**Type III**] [**Type V**].[**Supplement with the following:**]

1. Fly Ash: ASTM C618, [**Class C**] [**Class F**].

B. Fine Aggregate: ASTM C33/C33M with 100 percent passing a 2.36 mm (No. 8) sieve, free of materials with deleterious reactivity to alkali in cement. Provide aggregate from single source.

C. Water: ASTM C94/C94M and potable.

D. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures. Do not use calcium chloride or admixtures containing calcium chloride.

1. Water-Reducing Admixture: ASTM C494/C494M, Type A.
2. Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type D.
3. High-Range, Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type G.
4. Plasticizing and Retarding Admixture: ASTM C1017/C1017M, Type II.

E. Fluidifier: ASTM C937, with expansion of less than 4 percent.

2.4 RELATED MATERIALS

A. Pile-Top Forms: Metal, glass-fiber-reinforced plastic, paper, or fiber tubes. Provide units with enough wall thickness to resist plastic concrete loads without detrimental deformation. Diameter same as pile diameter.

2.5 FABRICATING REINFORCEMENT

A. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."

2.6 GROUT MIXING

A. Ready-Mixed Grout: Measure, batch, mix, and deliver according to ASTM C94/C94M, and furnish batch ticket information.

1. Temperature Limits: Comply with ACI 305.1 for hot weather and ACI 306.1 for cold weather.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, and other hazards created by drilling operations.

B. Rough grade ground elevation at pile locations to a minimum of 305 mm above required cutoff elevation.

3.2 DRILLING AND PUMPING EQUIPMENT

A. Drilling Rig: Capable of advancing hollow-stem, continuous-flight augers of design diameters to depths 20 percent greater than design depths; with stabilizing arm at bottom of leads to prevent rotation, and middle guide for augers greater than 12 m in length.

1. Mark leads at maximum 1500-mm intervals to facilitate measurement of penetration.

B. Hollow-Stem Auger: Continuous auger flighting without gaps or breaks, of diameter no more than 3 percent less than pile diameter; with grout pumping hole at bottom of auger head below cutting teeth. Seal grout-pumping hole with temporary tip plug to be fully opened by grout pressure or reinforcing bar during grout installation. The length of any auger brought to the project site must be such that the auger can install a pile to a depth that is 20% greater than the depth of the pile shown on the approved working drawings.

1. Hollow Shaft Diameter: Minimum 32-mm clear ID.

C. Grout Pump: Positive-displacement pump with a known volume per stroke. Minimum displacement pressure at pump of 2.4 MPa. The ACIP Contractor must provide the Engineer with the value of the volume of grout or concrete delivered by each stroke of the pump and must demonstrate to the Engineer that the actual volume delivered by each stroke of the pump is within 3% of the value provided. The volume per stroke must be recalibrated when the Engineer suspects that the grout or concrete delivery performance has changed.

D. Automated Monitoring Equipment: Capable of measuring auger depth, penetration rate, and grout volume pumped per unit depth increment and of printing results.

3.3 DRILLING

A. Prevent surface water from entering excavated piles. Conduct water to site drainage facilities.

B. Advance auger at a continuous rate during insertion that prevents removal of excess soil.

C. Drilling must advance through whatever materials are encountered, to the dimensions and elevations required by the Pile Contractor's design, as shown on the approved working drawings.

D. Drilling must not commence until sufficient supply of grout or concrete is present on the project site to complete the pile.

E. The same procedures used to install the test piles must be used to install production piles.

F. The center of any pile must be within 75 mm **[updated as needed]** of the location shown on the approved working drawings in a horizontal plane (i.e., plan-view).

G. Excavate piles to [**elevations indicated**] [**auger refusal**] [**elevations indicated or auger refusal**]. Establish and maintain axial alignment of leads and shaft before and during driving.

1. Auger Refusal: Rate of less than [**0.3 m/s (1 fpm)**] <**Insert value**>.

H. Drilling Tolerances:

1. Location: Pile centers maximum 75 mm from locations indicated.
2. Plumb: Within 2 percent from vertical.
3. Batter Angle: Within 4 percent from required angle.
4. Deviations in excess of the above must be cause for pile rejection and replacement piles will be at the expense of the Contractor.
5. Top of finished piles must be within the tolerance range indicated on the Structural Drawings.
6. Fill all temporary holes that are not pile holes with grout.
7. Where specified tolerances are exceeded, provide corrective construction to compensate for eccentricity as determined by Owner's Representative.

3.4 INSTALLATION

A. Maintain positive (clockwise) rotation of auger during withdrawal. Promptly remove excavated spoils to prevent accumulation.

B. Grout Placement: Place grout in continuous operation.

1. Grout or concrete placement must commence within 5 minutes after the auger has achieved the planned depth.
2. Lift auger 6 to 12 inches 152 to 305 mm (6 to 12 inches) at start of grout pumping to facilitate tip plug removal, then return to previously established tip elevation.
3. Develop an initial grout head of [**1500 mm (60 inches)**] <**Insert dimension**> before start of auger withdrawal and maintain during extraction.
4. Monitor pumped grout volumes using automated monitoring equipment.
5. Volume of placed grout is at least [**115**] <**Insert number**> percent of theoretical volume. If less than required volume is placed for any given 1500 mm (60 inch) segment, lower auger a minimum of 1500 mm (60 inch), or to bottom of pile if less than 1500 mm (60 inch) available, and restart withdrawal.
6. If grout pumping is interrupted during placement, lower auger a minimum of 1500 mm (60 inch) or to bottom of pile if less than 1500 mm (60 inch) available, and restart withdrawal.
7. If placement of grout or concrete is suspended for any reason, such as equipment failure, the pile will need to be re-drilled. The pile may be re-drilled in the same location if the grout or concrete is still fluid enough for the drill rig to penetrate. If the concrete or grout has set, the pile will need to be re-drilled in a new location.

C. Steel Reinforcement Installation, General: Comply with recommendations in CRSI's "Manual of Standard Practice."

1. Any required reinforcing steel must be placed as shown on the plans by lowering the steel into the grout or concrete column while it is in a fluid state.
2. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy bond with grout.
3. The reinforcing steel must not be spliced except at locations that are shown on the plans.
4. Screen pile top to remove spoils immediately after auger withdrawal and before placing reinforcement.
5. The reinforcing steel must be placed in the grout column immediately after screening the grout or concrete and before the grout or concrete begins to set.
6. The steel may be lowered into the grout or concrete by gravity or pushed gently to final position by hand. The reinforcing steel must not be vibrated, driven, or otherwise guided into position by mechanical means.
7. The reinforcing steel must be held in position at the ground surface within the fluid grout column by supports appropriate for the reinforcement used, which must remain in place until the grout reaches its initial set, or 24 hours, whichever is longer.

D. Single Bar Reinforcing: Install through center of hollow-stem auger before grout placement.

E. Reinforcing Cages: Install immediately after grout placement and support at ground surface until initial set. Allow cages to fall into shaft freely under their own weight; do not force by vibrating or pushing with mechanical equipment.

F. Adjacent Piles: Do not install piles within [**6 pile diameters**] <**Insert dimension**> of piles grouted within the previous [**12**] <**Insert duration**> hours.

G. Pile Completion:

1. Where cutoff elevation is above the ground elevation, form top section above grade and extend shaft to required elevation with pile-top form.
2. Where cutoff elevation is below the ground elevation, cut off top of piles at elevations indicated by removing fresh grout from the top of pile or cutting off hardened pile top after initial set.
3. The finished top of pile must be no more than 25 mm (1 inch) below or 75 mm (3 inch) above the elevation shown on the approved working drawings.

H. If location or out-of-plumb tolerances are exceeded, provide corrective construction. Submit corrective construction proposals to Architect for review before proceeding.

3.5 FIELD QUALITY CONTROL

A. Special Inspections: [**Owner will engage**] [**Engage**] a qualified special inspector to perform the following special inspections:

1. Pile drilling, grout or concrete placement, and testing.
2. Steel reinforcement welding.

B. Testing Agency: [**Owner will engage**] [**Engage**] a qualified testing agency to perform tests and inspections.

C. Grout Tests: Testing of samples of fresh grout obtained according to ASTM C172/C172M must be performed according to the following requirements:

1. Flow Rate: ASTM C939 and ASTM C109/C109M using a flow cone with 19 mm (0.75 inch) opening.
2. Compressive Strength: ASTM C109/C109M with cube specimens restrained from expansion according to ASTM C942.

a. Testing Frequency: Obtain [**six**] <**Insert quantity**> 101 mm (2 inch) cubes for each 38 cu m (50 cu yd) or fraction thereof of grout placed, but not less than one set for

each day's pour. Obtain an additional set of cubes from each truck during test pile placement.

b. Test two cubes at 7 days, two cubes at 28 days, and hold two cubes in reserve.
c. Strength of each grout mixture is satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than [**3.4 MPa (500 psi)**] <**Insert value**>.
d. Report test results in writing to Architect, grout manufacturer, and Contractor within 48 hours of testing. List Project identification name and number, date of placement, name of testing and inspecting agency, location of grout batch in Work, design compressive strength at 28 days, grout mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests in reports of compressive-strength tests.
e. Additional Tests: Testing and inspecting agency to make additional tests of grout if test results indicate that compressive strengths or other requirements have not been met, as directed by Architect. Additional samples may be required at the discretion of the Engineer at any time during the grout or concrete placing process to ensure that consistent fluidity/slump is being achieved.
f. Perform additional testing and inspecting, at Contractor's expense, to determine compliance of replaced or additional work with specified requirements.
g. Correct deficiencies in the Work that test reports and inspections indicate do not comply with the Contract Documents.

D. Low-Strain Integrity Testing:

1. Performed and reported according to ASTM D5882 on [**five single**] [**3 percent of**] <**Insert number or percent of**> piles and reported for each pile.
2. Such tests include, but are not limited to, sonic echo tests, impulse-response tests, cross-hole sonic tests, and backscatter gamma tests.
3. ACIP Contractor must install access tubes (of a design that is acceptable to the Integrity Testing Firm) to accommodate those tests that require access to the interior of the ACIP.

E. Pile Inspection Reports: Prepare inspection reports for each auger cast grout pile as follows:

1. Pile location.
2. Pile diameter.
3. Weather conditions.
4. Ground surface elevation.
5. Pile (bottom) depth elevation.
6. Elevation of top of grout or concrete.
7. Final length.
8. Final top centerline location and deviations from requirements.
9. Variation from plumb.
10. Date and time of beginning drilling, completion of drilling, beginning of grout or concrete pumping, completion of grout or concrete pumping, and placement of reinforcing steel.
11. Depth, position and condition of reinforcing steel and splices or mechanical couplings.

12. Details of the reinforcing steel (number, size, and grade of longitudinal bars, size and spacing of transverse steel; outside diameter and length of cage).
13. Theoretical volume of drilled hole (theoretical diameter = diameter of auger).
14. Automatic monitoring equipment record including grout volume pumped.
15. Grout testing results.
16. Remarks, unusual conditions encountered, and deviations from requirements.

F. Certified Piles Survey: Prepared by a qualified land surveyor or professional engineer showing final location of piles in relation to the property survey and existing benchmarks.

1. Notify Architect when deviations from locations exceed allowable tolerances.

G. ACIP will be considered defective if they do not pass tests and inspections. Further, ACIP will be considered unacceptable if they do not meet the project performance criteria with regard to load carrying capacity and deflection.

H. Prepare test and inspection reports.

3.6 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Remove surplus satisfactory soil and waste material, including unsatisfactory soil, trash, and debris, and legally dispose of it off Owner's property.

END OF SECTION 316316

SECTION 316329 - DRILLED CONCRETE SHAFTS

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. Related Sections include the following:

1. Specification 033000 “Cast-in-Place Concrete” for general structural and building applications of concrete and for drilled shafts, concrete materials, mix design and mixing requirements.
2. Federal Highway Administration (FHWA) “Drilled Shafts: Construction Procedures and LRFD Design Methods,” Publication No. FHWA-NHI-10-016.
3. Section 312000 “Earth Moving.”
4. Section 312319 “Dewatering.”
5. Section 315000 “Temporary Excavation Support.”

1.2 SUMMARY

A. Section Includes:

1. Dry-installed drilled shafts.
2. Slurry displacement-installed drilled shafts.
3. Dry-installed or slurry displacement-installed drilled shafts at Contractor's choice.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site. to comply with requirements in Division 01 Section "Construction Execution and Coordination."

B. Preinstallation Conference: Conduct conference at [**Project site**] <**Insert location**>.

C. The pre-construction meeting will be conducted to clarify the construction requirements for the work, to coordinate the construction schedule activities and identify contractual relationships and delineation of responsibilities among the prime Contractor and various Subcontractors.

1. The Engineer, prime Contractor, drilled piers Contractor, Inspectors, excavation Contractor, and Geotechnical Instrumentation Specialist (if applicable) must attend the meeting.
2. During preinstallation conference, the attendance should discuss the subsurface conditions, pile installation and testing, quality control and assurance plan, pile structure survey control, site drainage control, review proposed drill rig to be used, and any other detail that may affect the construction drilled piers.
3. Review methods and procedures related to drilled shafts including, but not limited to, the following:

a. Review geotechnical report.
b. Discuss existing utilities and subsurface conditions.
c. Review coordination with temporary controls and protections.
d. Review of QA/QC and safety procedures.

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Pier Location Plan: Provide a plan clearly showing the designation and location of all drilled shafts, including trial drilled shafts, by an identifying system, including the planned tip and design cut-off elevations for all piers. The plan must include the location of the centerline of each pier by a coordinate system from an approved reference working point.

C. Drilled Shaft Installation Method Statement: Prior to beginning of drilled shaft construction, the Contractor must submit a drilled shaft method statement giving the amount and characteristics of equipment to be used in the work, schedule for performing the work, and method and sequence for the construction of both dry (if applicable) and wet drilled pier construction. The following must be submitted together with the means and methods for installing test drilled pier and plumbness, where applicable.

1. A complete description of the drilled pier installation equipment, including casing.
2. Installation Method. Submit procedures of the installation method, including (where applicable) type of drilling rigs and equipment, casing size and length, casing removal method, drilling fluid type, dewatering method (if necessary), concrete placement, details of tremie and sealing technique, and reinforcing steel securing and placement.
3. Additional for Wet Method Installation Method: Submit procedures of the installation method including slurry operation, means and methods for utilizing slurry including de-sanding, handling, storage, testing and disposal, if required. Also submit means and methods for stabilizing and cleaning shaft excavations.
4. Inspection Devices: Submit procedures and equipment information on shaft inspection devices for inspecting and verifying the pier bottom conditions as well as the diameter and plumbness.
5. Submit procedures for tremie concrete. Submit a detailed procedure for construction of both dry and wet drilled shaft construction techniques, if deemed applicable.
6. Identification of pier concrete and reinforcement, and procedures for placing reinforcing and tremie concrete.
7. The planned use of cleanout buckets, hydraulic lifts, and alternative systems to clean the bottom of drilled piers adequately if pier design relies on end bearing.

D. Non-Destructive Testing Equipment: Submit shop drawings showing equipment and procedures to facilitate cross-hole sonic logging, pile integrity testing, or other approved method as needed.

E. Design Mixtures: Refer to Specification Section 033000 “Cast-in-Place Concrete” for drilled shaft design mix submittal requirements. For each concrete mixture, submit alternative design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

1. Indicate amounts of mixing water to be withheld for later addition at Project site.
2. Laboratory Test Reports: For evaluation of concrete materials and mix design.

F. Shop Drawings: For concrete reinforcement, detailing fabricating, bending, supporting, and placing.

G. Qualification Data: For Installer, land surveyor, professional engineer, and testing agency.

H. Load Test Plan at least 14 days prior to commencement of the load test program. The plan should include at a minimum the drilled shaft schedule, sequence, load test pile locations, the reaction proposed, load testing increments and maximum loading, planned deflection measurement instrumentation, and hydraulic jack and/or load cell calibrations. Calibrations loads cells, jacks, and instrumentation must be current within 6 months preceding the test date. For axial capacity, instrumentation should be set to estimate the respective end bearing and friction contributions of the axial pile capacity.

I. Welding certificates.

J. Material Certificates: From manufacturer, for the following:

1. Cementitious materials.
2. Admixtures.
3. Steel reinforcement and accessories.

K. Material Test Reports: For each material below, by a qualified testing agency:

1. Aggregates: Include service record data indicating absence of deleterious expansion of concrete due to alkali aggregate reactivity.

L. Field quality-control reports and drilled shaft installation records. Submit report within 7 days of shaft installation.

M. Record drawings at Project closeout according to Division 01 Section “Closeout Procedures.”

1.5 QUALITY ASSURANCE

A. The contractor is solely responsible for quality of the Work. The contractor must implement a Quality Control Program (QCP) for the work of this section. The implementation of the QCP does not relieve the contractor from responsibility of providing the Work in accordance with the Contract Documents and all applicable codes and regulations.

B. All drilled shaft work in this project must conform to all requirements of ACI 336.1-01 and ACI 336.36R-14, except as modified by these Contract Documents.

C. Installer Qualifications: An Experienced installer that has demonstrated specialized experience in drilled shaft work with at least five years of experience successfully installing drilled shafts. The installer must have not less than three successfully completed contracts with similar soil conditions, pile sizes, depths, and volumes of Work contained in this Project.

D. Licensed Engineer: The contractor will provide the services of a licensed local or US Engineer on site during construction of the drilled shafts and load tests to confirm compliance with the contract documents.

E. Survey Work: Engage a qualified land surveyor or professional engineer to perform surveys, layouts, and measurements for drilled shafts. Before excavating, lay out each drilled shaft to lines and levels required. Record actual measurements of each drilled shaft's location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other specified data.

1. Record and maintain information pertinent to each drilled shaft and cooperate with the testing and inspecting agency to provide data for required reports.

F. Testing and Inspection Agency Qualifications: A licensed local or US based geotechnical engineering approved by the Design Team and Project Director/COR after submittal of qualifications.

G. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.4/D1.4M, "Structural Welding Code - Reinforcing Steel."

1.6 TRIAL DRILLED PIER

A. Trial Drilled Pier: Construct trial drilled pier of diameter and depth and at location indicated or, if not indicated, of same diameter and depth as largest drilled piers, located at least three diameters clear of permanent drilled piers, to demonstrate Installer's construction methods, equipment, standards of workmanship, and tolerances.

1. Install reinforcement, fill with concrete, remove temporary casings, and terminate trial drilled pier 600 mm below subgrade and leave in place.
2. Install permanent casings, excavate bell, excavate rock socket, and place slurry, as required for permanent drilled piers.
3. Load testing must not be performed on any shaft until concrete has reached the minimum 28-day strength as specified in the section.
4. Cross hole sonic logging (CSL) should be performed on all trial drilled shafts and at least 15% of production drilled shafts. CSL testing must be performed in accordance with FHWA’s GEC#10 – Drilled Shaft Manual.
5. If Project Director/COR determines that trial drilled pier does not comply with requirements, excavate for and cast another until it is accepted.
6. Drilled shafts must be subjected to static load testing requirements in ASTM D1143. Strain gauge locations of test shafts should be reviewed and approved by the Geotechnical Engineer.
7. See project Geotechnical Engineering Report for additional information regarding soils, subsurface conditions, trial drilled shafts, testing, and acceptance procedures.
8. Trial drilled shafts must not be re-used as permanent drilled shafts.

1.7 PROJECT CONDITIONS

A. Existing Utilities: Locate existing underground utilities before excavating drilled shafts. If utilities are to remain in place, provide protection from damage during drilled shaft operations.

1. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, adapt drilling procedure if necessary to prevent damage to utilities. Cooperate with Project Director/COR and utility companies in keeping services and facilities in operation without interruption. Repair damaged utilities to satisfaction of Project Director/COR. Costs incurred by the Contractor will be compensated in accordance with the changed conditions contract section.

B. Interruption of Existing Utilities: Do not interrupt any utility to facilities occupied by Project Director/COR or others unless permitted under the following conditions and then only after arranging to provide temporary utility according to requirements indicated:

1. Notify Project Director/COR no fewer than seven days in advance of proposed interruption of utility.
2. Do not proceed with interruption of utility without Project Director/COR written permission.

C. Project-Site Information: A geotechnical report has been prepared for this Project and is available for information only. The opinions expressed in this report are those of geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by geotechnical engineer. Project Director/COR is not responsible for interpretations or conclusions drawn from this data.

1. Make additional test borings and conduct other exploratory operations necessary for drilled piers.
2. The geotechnical report is included elsewhere in the Contract Documents.

D. Survey Work: Engage a qualified land surveyor or professional engineer to perform surveys, layouts, and measurements for drilled piers. Before excavating, lay out each drilled shaft to lines and levels required. Record actual measurements of each drilled shaft's location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other specified data.

1. Record and maintain information pertinent to each drilled pier and indicate on Record Drawings. Cooperate with Project Director/COR and the testing and inspecting agency to provide data for required reports.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Drilled-Pier Standard: Comply with ACI 336.1 except as modified in this Section.

2.2 STEEL REINFORCEMENT

A. Reinforcing Bars: ASTM A615/A615M, Grade 420, deformed.

B. Low-Alloy-Steel Reinforcing Bars: ASTM A706/A706M, deformed.

C. Galvanized Reinforcing Bars: [**ASTM A615/A615M, Grade 420**] [**ASTM A706/A706M**], deformed bars, ASTM A767/A767M, [**Class I**] [**Class II**] zinc coated after fabrication and bending.

D. Epoxy-Coated Reinforcing Bars: [**ASTM A615/A615M, Grade 420**] [**ASTM A706/A706M**], deformed bars, [**ASTM A775/A775M**] [**or**] [**ASTM A934/A934M**], epoxy coated, with less than 2 percent damaged coating in each 300-mm bar length.

E. Plain-Steel Wire: ASTM A82/A82M, [**as drawn**] [**galvanized**].

F. Deformed-Steel Wire: ASTM A496/A496M.

G. Epoxy-Coated Wire: ASTM A884/A884M, Class A, Type 1 coated, [**as-drawn, plain**] [**deformed**]-steel wire, with less than 2 percent damaged coating in each 300-mm wire length.

H. Joint Dowel Bars: ASTM A615/A615M, Grade 420, plain. Cut bars true to length with ends square and free of burrs.

2.3 CONCRETE MATERIALS

A. Concrete materials must conform to Specification 033000 “Cast-in-Place Concrete.”

2.4 STEEL CASINGS

A. Steel Pipe Casings: ASTM A283/A283M, Grade C, or ASTM A36/A36M, carbon-steel plate, with joints full-penetration welded according to AWS D1.1/D1.1M.

B. Corrugated-Steel Pipe Casings: ASTM A929/A929M, steel sheet, zinc coated.

C. Liners: Comply with ACI 336.1.

2.5 SLURRY

A. Slurry: [**Pulverized bentonite**] [**pulverized attapulgite**] [**or**] [**polymers**] mixed with water to form stable colloidal suspension; complying with ACI 336.1 for density, viscosity, sand content, and pH.

B. Water may be used as slurry when casing is used for the entire length of the drilled hole, provided that the method of drilled shaft installation maintains stability at the bottom of the shaft

excavation. A water slurry is water that is maintained as clean a possible during its use. Water slurry must comply with API 13B-1 Section 1 for density and sand content.

2.6 CONCRETE MIXTURES

A. Refer to specification Section 033000 for Concrete Mixtures Requirements.

2.7 REINFORCEMENT FABRICATION

A. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."

2.8 CONCRETE MIXING

A. Refer to specification Section 033000 for Concrete Mixing Requirements.

2.9 SHAFT LOAD TESTS

A. Hydraulic Jack(s) and Pressure Gauges:

1. Hydraulic jack(s) must be equipped with the necessary gauges and piping which must transmit constant load to the pier.
2. Hydraulic jack(s) must be rated for a load capacity of at least 1.5 times the total test load.
3. Hydraulic jack(s) must have sufficient ram so that the full test load can be applied at no more than 80% of its extension.
4. Pressure gauge must be able to read pressures accurately to the nearest 250 kPa and must have a range equivalent to at least twice the pressure required to maintain the full test load.
5. Hydraulic jack(s) and pressure gauge must be calibrated as a unit by a certified testing laboratory not more than Six months prior to their use at the Site. A calibration report indicating jack and pressure gauge identification numbers and a calibration curve must be submitted to the Project Director/COR at least one week prior to beginning any load tests.

B. Dial Indicators:

1. Dial gauges must be capable of reading to the nearest 0.25mm and must have a travel of at least 50mm.

C. Strain Gauges:

1. The strain gauges must be vibrating sister gauge bars, Model 4911 as manufactured by Geokon, or approved equivalent.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, vibration, and other hazards created by drilled-pier operations.

3.2 EXCAVATION

A. Unclassified Excavation: Excavate to bearing elevations regardless of character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions.

1. Obstructions: Unclassified excavation may include removal of unanticipated boulders, concrete, masonry, or other subsurface obstructions. No changes in the Contract Sum or the Contract Time are authorized for removal of obstructions.

B. Prevent surface water from entering excavated shafts. Conduct water to site drainage facilities.

C. Excavate shafts for drilled piers to indicated elevations. Remove loose material from bottom of excavation.

1. Excavate bottom of drilled piers to level plane within 1:12 tolerance.
2. Remove water from excavated shafts before concreting.
3. Excavate rock sockets of dimensions indicated.
4. Excavate to the minimum tip elevations indicated on the project plans.

D. Notify and allow the testing and inspecting agency to observe and document installation of drilled shafts. These observations must be performed on a full-time basis during installation of drilled shafts. If unsuitable materials are encountered, make adjustments to drilled shafts as determined by the Geotechnical Engineer and Project Director/COR.

1. Do not excavate shafts deeper than elevations indicated unless approved by Project Director/COR.
2. Additional authorized excavation will be paid according to Contract provisions for changes in work.

E. End-Bearing Drilled Piers: Probe with auger to a depth below bearing elevation, equal to diameter of the bearing area of drilled pier. Determine whether voids, clay seams, or solution channels exist.

1. Test first three drilled piers and one of every six drilled piers thereafter.
2. Fill augur-probe holes with grout.

F. Excavate shafts for closely spaced drilled piers and for drilled piers occurring in fragile or sand strata only after adjacent drilled piers are filled with concrete and allowed to set.

G. Slurry Displacement Method: Stabilize excavation with slurry maintained a minimum of 2500 mm above ground-water level and above unstable soil strata to prevent caving or sloughing of shaft. Maintain slurry properties before concreting.

1. Excavate and complete concreting of drilled pier on same day, or redrill, clean, and test slurry in excavation before concreting.
2. Clean bottom of each shaft before concreting.

H. Temporary Casings: Install watertight steel casings of sufficient length and thickness to prevent water seepage into shaft; to withstand compressive, displacement, and withdrawal stresses; and to maintain stability of shaft walls.

1. Remove temporary casings, maintained in plumb position, during concrete placement and before initial set of concrete [**, or leave temporary casings in place**].
2. The casing must be capable of being removed without deforming and causing damage to the completed shaft, and without disturbing the surrounding soil.

I. Bells: Excavate bells for drilled piers to shape, base thickness, and slope angle indicated. Excavate bottom of bells to level plane and remove loose material before placing concrete.

1. Shore bells in unstable soil conditions to prevent cave-in during excavation, inspection, and concreting.

J. Tolerances: Construct drilled shafts to remain within ACI 336.1 tolerances.

1. If location or out-of-plumb tolerances are exceeded, provide corrective construction. Submit design and construction proposals to Project Director/COR for review with OBO/PDCS/DE/CSE input before proceeding.
2. For any location or out-of-plumb tolerances that are exceeded, and that also affect following works the Engineer may instruct that additional piles are installed at no additional cost in order to reduce/mitigate the knock-on effect of the out of tolerance drilled piers on the following works.

K. Inspection: Each drilled shaft must be inspected and tested by the testing and inspecting agency before placing concrete.

1. Provide and maintain facilities with equipment required for testing and inspecting excavations. Cooperate with testing and inspecting personnel to expedite the Work.
2. Notify Project Director/COR and testing agency at least six hours before excavations are ready for tests and inspections.

3.3 PERMANENT STEEL CASING INSTALLATION

A. Install permanent steel casings of minimum wall thickness indicated and of diameter not less than diameter of drilled pier.

1. Install casings as excavation proceeds, to maintain sidewall stability.

2. Fabricate bottom edge of lowest casing section with cutting shoe capable of penetrating rock and achieving water seal.
3. Connect casing sections by continuous penetration welds to form watertight, continuous casing.
4. Remove and replace or repair casings that have been damaged during installation and that could impair strength or efficiency of drilled pier.
5. Fill annular void between casing and shaft wall with grout.

3.4 STEEL REINFORCEMENT INSTALLATION

A. Comply with recommendations in CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy bond with concrete.

C. Fabricate and install reinforcing cages symmetrically about axis of shafts in a single unit.

D. Accurately position, support, and secure reinforcement against displacement during concreting. Maintain minimum cover over reinforcement.

E. Use templates to set anchor bolts, leveling plates, and other accessories furnished in work of other Sections. Provide blocking and holding devices to maintain required position during final concrete placement.

F. Provide extended reinforcement as defined on the Contract Documents. Protect exposed ends of extended reinforcement, dowels, or anchor bolts from mechanical damage and exposure to weather.

G. Provide temporary steel to maintain shape of reinforcing cage during lifting operations.

3.5 CONCRETE PLACEMENT

A. Place concrete in continuous operation and without segregation immediately after inspection and approval of shaft by the independent testing and inspecting agency.

B. Place concrete in shaft during the same working shift as completion of the drilling.

1. Construct a construction joint if concrete placement is delayed more than one hour. Level top surface of concrete and insert joint dowel bars as required by Engineer upon review. Before placing remainder of concrete, clean surface laitance, roughen, and slush concrete with commercial bonding agent or with sand-cement grout mixed at ratio of 1:1.

C. Dry Method: Place concrete to fall vertically down the center of drilled pier without striking sides of shaft or steel reinforcement.

1. Where concrete cannot be directed down shaft without striking reinforcement, place concrete with chutes, tremies, or pumps.
2. Vibrate top 1500 mm of concrete.

D. Slurry Displacement Method: Place concrete in slurry-filled shafts by tremie methods or pumping in accordance with ACI 336.3 Section 5.4. Control placement operations to ensure that tremie or pump pipe is embedded no fewer than 3000 mm into concrete, and flow of concrete is continuous from bottom to top of drilled shaft. Allow water or slurry in pier shaft to rise to a stable static level. Fill tremie pipe with sufficient concrete to release the pipe plug and discharge concrete from pipe bottom when concrete pressure exceeds the hydrostatic head. Allow the concrete to rise like a liquid from the pier bottom. Begin raising the tremie pipe after placement of the initial 3000mm of concrete depth measured from the pier bottom, then maintain pipe at not less than 3000mm constant penetration in the concrete.

1. Vibrate top 1500 mm of concrete after withdrawal of temporary casing.

E. Screed concrete at cutoff elevation level and apply scoured, rough finish. Where cutoff elevation is above the ground elevation, form top section above grade and extend shaft to required elevation.

F. Protect concrete work, according to ACI 301M, from frost, freezing, or low temperatures that could cause physical damage or reduced strength.

1. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
2. Do not use calcium chloride, salt, or other mineral-containing antifreeze agents or chemical accelerators.

G. If hot-weather conditions exist that would seriously impair quality and strength of concrete, place concrete according to Specification 033000 “Cast-in-Place Concrete” and ACI 301M to maintain delivered temperature of concrete at no more than 32 deg C.

1. Place concrete immediately on delivery. Keep exposed concrete surfaces and formed shaft extensions moist by fog sprays, wet burlap, or other effective means for a minimum of seven days.

H. Coordinate withdrawal of temporary casings with concrete placement to maintain at least a 1500 mm head of concrete above bottom of casing.

3.6 FIELD QUALITY CONTROL

A. Testing Agency: The contractor will engage a licensed local or US based independent testing and inspecting agency to sample materials, perform tests, and submit reports during excavation and concrete placement for drilled shafts.

B. Licensed Engineer: The contractor will provide the services of a licensed local or US Engineer on site during construction of the drilled piers and load tests to confirm compliance with the contract documents.

C. Drilled-Pier Tests and Inspections: For each drilled pier, before concrete placement.

1. Soil Testing: Bottom elevations, bearing capacities, and lengths of drilled piers indicated have been estimated from available soil data. Actual elevations and drilled-pier lengths and bearing capacities are determined by testing and inspecting agency. Final evaluations and approval of data are determined by Geotechnical Engineer and Project Director/COR.

   a. Bearing Stratum Tests: Testing agency takes undisturbed [**hardpan**] [**rock**] core samples from drilled-pier bottoms; tests each sample for compression, moisture content, and density; and reports results and evaluations.

D. Concrete Tests and Inspections: ASTM C172/C172M except modified for slump to comply with ASTM C94/C94M.

1. Slump: ASTM C143/C143M; one test at point of placement for each compressive-strength test but no fewer than one test for each concrete load.
2. Concrete Temperature: ASTM C1064/C1064M; one test hourly when air temperature is 4.4 deg C and below and 27 deg C and above, and one test for each set of compressive-strength specimens.
3. Compression Test Specimens: ASTM C31/C31M; one set of four standard cylinders for each compressive-strength test unless otherwise indicated. Mold and store cylinders for laboratory-cured test specimens unless field-cured test specimens are required.
4. Compressive-Strength Tests: ASTM C39/C39M; one set for each drilled pier but not more than one set for each truck load. Test one specimen at seven days, test two specimens at 28 days, and retain one specimen in reserve for later testing if required.
5. If frequency of testing provides fewer than five strength tests for a given class of concrete, conduct tests from at least five randomly selected batches or from each batch if fewer than five are used.
6. If strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, Contractor must evaluate operations and provide corrective procedures for protecting and curing in-place concrete.
7. Strength of each concrete mixture is satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 3.4 MPa.
8. Report test results in writing to Engineer, concrete manufacturer, and Contractor within 48 hours of testing. List Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests in reports of compressive-strength tests.
9. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Engineer but not be used as sole basis for approval or rejection of concrete.
10. Additional Tests: Testing and inspecting agency to make additional tests of concrete if test results indicate that slump, compressive strengths, or other requirements have not been met, as directed by Architect.

a. Continuous coring of drilled piers may be required, at Contractor's expense, if temporary casings have not been withdrawn within specified time limits or if observations of placement operations indicate deficient concrete quality, presence of voids, segregation, or other possible defects.

11. Perform additional testing and inspecting, at Contractor's expense, to determine compliance of replaced or additional work with specified requirements.
12. Correct deficiencies in the Work that test reports and inspections indicate do not comply with the Contract Documents.

E. An excavation, concrete, or a drilled shaft will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports for each drilled pier as follows:

1. Actual top and bottom elevations.
2. Actual drilled-pier diameter at top, bottom, and bell.
3. Top of rock elevation.
4. Description of soil materials.
5. Description, location, and dimensions of obstructions.
6. Final top centerline location and deviations from requirements.
7. Variation of shaft from plumb.
8. Shaft excavating method.
9. Design and tested bearing capacity of bottom.
10. Depth of rock socket.
11. Levelness of bottom and adequacy of cleanout.
12. Properties of slurry and slurry test results at time of slurry placement and at time of concrete placement.
13. Ground-water conditions and water-infiltration rate, depth, and pumping.
14. Description, purpose, length, wall thickness, diameter, tip, and top and bottom elevations of temporary or permanent casings. Include anchorage and sealing methods used and condition and weather tightness of splices if any.
15. Description of soil or water movement, sidewall stability, loss of ground, and means of control.
16. Bell dimensions and variations from original design.
17. Date and time of starting and completing excavation.
18. Inspection report.
19. Condition of reinforcing steel and splices.
20. Position of reinforcing steel.
21. Concrete placing method, including elevation of consolidation and delays.
22. Elevation of concrete during removal of casings.
23. Locations of construction joints.
24. Concrete volume.
25. Concrete testing results.
26. Remarks, unusual conditions encountered, and deviations from requirements.
27. <**Insert requirement**>.

3.7 NON-DESTRUCTIVE TESTING OF DRILLED SHAFTS

A. Implement Cross-Hole-Sonic Logging (CSL) on trial shafts and at least 15% of production piers. CSL testing frequency on production shafts must be spread out evenly across entire drilled shaft construction time period.

1. A minimum of six (6), equally spaced, 3.5 to 5 cm-inside-diameter schedule 40 steel pipes must be installed into the designated piers. Pipes must be watertight and free from corrosion with clean internal and external faces to ensure passage of the probes and a good bond between the concrete and the pipes.
2. Fit each pipe with a watertight shoe on the bottom and a removable cap on the top. Securely attach the pipes to the interior of the reinforcement cage with a minimum cover of 7.5 cm. Install the pipes in each pier in a regular, symmetrical pattern such that each pipe is placed the maximum distance possible form each adjacent pipe, with an equal spacing around the perimeter of the cage.
3. Install the pipes as near as to parallel as possible. Extend the pipes as necessary to facilitate testing. Fill the pipes with clean water before concrete placement and close the pipe tops to keep debris out of the pipes.

B. Perform CSL testing in accordance with industry standards and FHWA's GEC #10 – Drilled Shaft Manual. CSL anomalies must be evaluated in accordance with guidelines of FHWA's manual with supplemental Cross Hole Tomography work being accomplished if required.

C. CSL testing must be conducted a minimum of 72 hours after the placement of concrete in the shaft but no later than 7 calendar days after placement and prior to loading for test shafts, or within 30 days after placement on production drilled shafts.

D. After the Project Director/COR and Contractor's Geotechnical Engineer have approved each individual CSL test report submitted by the specialty subcontractor, the water from within the access pipes can be removed and the pipes should be filled with grout having a minimum design compressive strength equivalent or greater than the respective pier concrete. Samples of the grout must be obtained to confirm the 28-day compressive strength of the grout utilized to fill the access pipes. Appropriate tremie techniques must be implemented to fill each access pipe from the bottom of the hole displacing the water and resulting in a properly filled and grouted hole.

E. If a defect is detected, additional evaluation should be performed. If necessary, the pier must be cored to facilitate further evaluation of the defect. The core hole must be of sufficient diameter to allow down hole inspection with a borehole type camera to provide additional qualitative information regarding the potential defect.

F. Remedial measures must be implemented as necessary by the Contractor to either sufficiently remediate the condition allowing use of the pier or alternatively replacement piers must be installed. The need and requirements for remediation or replacement must be determined by the Project Director/COR, Structural Engineer and Contractor's Geotechnical Engineer.

3.8 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Remove surplus satisfactory soil and waste material, including unsatisfactory soil, trash, and debris, and legally dispose of it off Government's property.

END OF SECTION 316329

SECTION 323118 - DECORATIVE METAL FENCES AND GATES

PART 1 - GENERAL

1.1 SUMMARY

A. The extent and locations of ornamental metal fences are shown on the Construction Drawings and include devices for anchorage of fence units to substrates.

B. Ornamental Metal Security Perimeter Fence installation types include the following where identified on the Construction Drawings:

1. Anti-climb fencing installed on anti-ram barrier to create an anti-ram perimeter fence.
2. Anti-climb fencing with no anti-ram perimeter barrier.

C. Ornamental Metal Control Fence installation types include the following where identified on the Construction Drawings:

1. Control fencing outside perimeter wall or fence.
2. Control fencing within perimeter wall or fence.
3. Consular barrier fence.

D. Ornamental Metal Safety Fence installation types include the following where identified on the Construction Drawings:

1. Safety fencing serving as barriers at swimming pools.

1.2 CORROSION RESISTANCE PERFORMANCE

A. Corrosion Risk: As indicated in project Contract (e.g., Statement of Work). The OBO Building Code Appendix W defined OBO Atmospheric Corrosivity Level for this site is **[Low] [Moderate] [Extreme]**. The atmospheric corrosion risk exposure risk type for a given component shall be as defined by OBO Building Code W101.1.2 (i.e., direct exterior, indirect exposure to exterior, and interior exposure only).

B. Corrosion Resistance Standards: Provide materials and finishes for the components in accordance with the material specifications of this Specification Section and the general material type as indicated by this article for the project-specific corrosion risk identified above or elsewhere in the Contract Documents.

C. Material Standards for Components for Exterior Fences: As applicable for the OBO Atmospheric Corrosivity Level (ACL) of site and for both direct exterior exposure and indirect exposure to the exterior:

1. Mild Steel: **[hot-dipped galvanized coating] [hot-dipped galvanized plus paint (duplex) coating system]**; low and moderate ACL.
2. Stainless Steel: low, moderate, and extreme ACL.

1.3 PERFORMANCE REQUIREMENTS

A. General: Performance requirements in this Article represent minimum values and qualities that are permitted for DOS facilities. On a project-specific basis, greater values and qualities may be selected; where those are indicated on Construction Drawings, the greater values take precedence over those identified in this Article. Fence details and assemblies shall enable proper application and maintenance of any intended coating systems, prevent the accumulation of standing water on surfaces or within closed sections, and mitigate galvanic interactions between any dissimilar metals.

B. Ornamental Metal Security Perimeter Fence:

1. Minimum Height: Security fence shall provide anti-climb protection for minimum of 2.75 meters (9 feet) above grade or accessible platform on attack side.
2. Intrusion Resistance: Fabricate for maximum strength against the use of ordinary hand tools to bend pickets in a manner that would enlarge openings sufficiently to allow passage of intruders through the fence.
3. Anti-Ram and Anti-Climb Design: The requirement to use anti-ram or anti-climb design for each section of perimeter fence is identified on Construction Drawings. The fence designs included in the “Physical Security Detail Handbook” reference document in the OBO Design Standards are not specifically certified by Diplomatic Security (DS); rather, these designs depict previously developed designs that have been considered acceptable by DS and OBO in terms of providing “non-climb” and “non-man-passable” design. Other designs that address those security considerations are permissible from a security standpoint.

    a. This Specification Section only addresses anti-ram design of perimeter fences regarding the ornamental metal portion of anti-ram fence assemblies and its interaction with the lower anti-ram portion of those fences.

C. Ornamental Metal Control Fence:

1. Detail, fabricate, and install fencing to match construction of anti-climb perimeter fencing used, if applicable. The control fencing shall not create a climb hazard where it intersects buildings, perimeter walls/fences and other elements.
2. Control Fence Outside Perimeter: Control fencing shall provide a minimum of 2.1 meters of non-climbable protection.
3. Control Fence Within Perimeter: Control fencing shall provide a minimum of 1.2 meters of non-climbable protection.

4. Consular Barrier: Fencing, where selected as barrier type, shall be minimum height as indicated on Construction Drawings.

D. Ornamental Metal Safety Fence: The following represent minimum safety requirements for ornamental metal safety fence around portions of pools where buildings do not provide safety barriers.

1. Fence Height: Minimum 1200 mm (48 inches) above grade measured on side of barrier that faces away from swimming pool.
2. Opening Limitations: Construct with balusters or ornamental patterns as indicated on Construction Drawings, and such that a 100 mm (4-inch) diameter sphere cannot pass through any opening.
3. Vertical Clearance at Grade: Maximum vertical clearance between grade and bottom of barrier shall be 100 mm (4 inches) measured on side of barrier that faces away from swimming pool.
4. Access Gates:

   a. Gates shall open outward away from pool, be self-closing with self-latching device, and accommodate locking device.
   b. Where fences and gates exceed minimum requirements, and if release mechanism is located less than 1370 mm (54 inches) from bottom of access point, locate release mechanism on pool side of gate at least 75 mm (3 inches) below top of access point and not higher than 1875 mm above grade.
   c. Gate shall have no opening greater than 15 mm (5/8 inch) within 450 mm (18 inches) of release mechanism.
   d. Maximum vertical clearance between grade and bottom of barrier gate shall be 100 mm (4 inches) measured on side of barrier that faces away from pool.

5. [Match style of ornamental metal fencing shown for anti-climb fencing, except that height and picket spacing shall conform to requirements above for safety fencing rather than for security fencing.]

1.4 SUBMITTALS

A. Product data for fencing systems. Include mill certificates and product data for each type and grade of metal used in fabricating units, and for bolts and accessory items used in assembly and installation. Include manufacturer's product data for materials to be used in finishing or painting fence units. Product data for coating systems shall establish appropriateness for the intended exposure to the Project site environment.

B. Shop drawings for each type and size of metal fence unit. Show layout at same scale as site plan; typical plan, elevation, and section of units, including bracing, at 1:20 scale; and joint/anchorage details at 1:5 scale. Include details of fence posts, corners, and terminations. Include structural analysis of resistance to wind loading.

C. Welding certificates.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, “Structural Welding Code – Steel” for mild steel and AWS D1.6 “Structural Welding Code-Stainless Steel” for stainless steel.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver prefabricated fence units and support bracing/anchorage units to project site, completely assembled and prefinished, with finish fully protected during handling, shipping, storage, and delivery/installation.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Welding Rods and Bare Electrodes: Provide type conforming to fence design drawings and as recommended by applicable AWS specifications for metal/alloy being welded in each element of fence fabrication and installation.

B. Bolts and Fasteners: Where within reach from attack-face of fence, provide non-removable bolt/nut units (not removable by use of commonly available tools).

C. Concrete Inserts: Furnish anchorage units to be placed in concrete substrate; of hot-dip galvanized cast-iron/malleable-iron body. ASTM A 153 zinc coating, ASTM A 47 castings.

D. Setting/Anchoring Cement: Non-shrinking, non-staining, hydraulic-controlled expansion cementitious compound; factory prepackaged for mixing with water at project site for a pourable and trowelable mix; recommended by manufacturer for exterior exposure without protective coating, sealer, or waterproofing. Provide product equivalent to "Super Por-Rock" by Minwax Const. Products Div.

E. Expansion Shims: To allow for thermal expansion of fence units, provide fluorocarbon resin (or similar) plastic washers, pads, and slip sheets in bolted connections between units, and between fence components and anchorages.

F. Shop Primer Paint:

1. Epoxy Primer for Galvanized Steel: Complying with MPI #101 and compatible with coating to be applied over it. As applicable, conform to VOC content requirements for jurisdiction where fabrication occurs.

G. High-Performance Coating: Field-applied epoxy system over shop primer paint.

1. Intermediate coat: Epoxy, gloss, MPI #77.
2. Topcoat: Epoxy, gloss, MPI #77.

2.2 MATERIALS, GENERAL REQUIREMENTS FOR MILD STEEL FENCES

A. Plates, Bars, Angles, and Channels: ASTM A36 or ASTM A572

B. Hollow Structural Sections (steel tubes): ASTM A500 or ASTM A1085

C. Inserts, Bolts Fasteners: Standard units of strengths required to endure performances; hot-dip zinc coated in compliance with ASTM F2329.

D. Hot-Dip Galvanizing: All mild steel fence components must be hot-dip galvanized in accordance with ASTM A123.

2.3 MATERIALS, GENERAL REQUIREMENTS FOR STAINLESS STEEL FENCES

A. Stainless Steel Plates, Sheets, and Strips: AISI Type 316, 316L, 2101 or 2205 complying with ASTM A240/A240M or ASTM A895/A895M

B. Stainless Steel Bars and Shapes: AISI Type 316, 316L, 2101 or 2205 where welding is to be performed, complying with ASTM A276/A276M or A582/A582M

C. Stainless Steel Tubing: AISI Type 316, 316L, 2101 or 2205A1016/A1016M

D. Stainless Steel Wire and Rod: AISI Type 316, 316L, or as recommended by the manufacturer for AISI 2101 or 2205 steel, complying with ASTM A555/A555M

E. Stainless Steel Bolts, Hex Headed Screws, Nuts, and Washers: AISI Type 316 (Alloy Group 2), complying with ASTM F593 and ASTM A594, or ASTM A193 and ASTM A194, or ASTM A320 and ASTM A194, or ASTM A1082; provide washers of compatible stainless steel alloy where appropriate.

2.4 FABRICATION

A. General: Cut and form/shape members to sizes and shapes required for assembly of fence units. Weld joints of assembly with welds all around, to produce joints of full-member-strength, with no possible moisture penetration. Grind welds reasonably smooth, but not necessarily flush. Prefabricate units in plant by welding, to the greatest extent possible. Provide bolted connections for bracing elements and similar parts, but only to the extent units must be disassembled for delivery to project and for installation.

1. Drill anchor bolt holes accurately spaced, oversized by 6 mm above bolt size, for installation tolerance.
2. Provide for thermal movement of units, amounting to plus-or-minus 1 mm in 1 meter of fence length.
3. Close ends of hollow members (pipes/tubes) which are not butt welded tight against another member in the assembly. Close with 6 mm thick steel plate, slightly recessed and welded all around for tight seal.

4. Avoid the use of bolts and screws exposed to and accessible from the threat side of fence. Where unavoidable, provide nonremovable type fasteners in the assembly.
5. Ease exposed metal edges of fabricated units, to approximately 0.8 mm radius, prior to finishing.
6. Pedestrian Gates at Control Fencing: **[Single][and] [double]** swing gates as indicated. This type of gate is not permitted for use at perimeter walls.

    a. Hinges: Offset type, malleable iron, 180-degree swing.
    b. Lock: DS-approved lock.
    c. Closer: Manufacturer's standard.
    d. Latches permitting operation from **[one side][both sides]** of gate. **[Fabricate latches with integral eye openings for padlocking; padlock accessible from both sides of gate.]**

7. Pedestrian Gates at Safety Fencing: Single swing gates as indicated.

    a. Hinges: Offset type, malleable iron, 180-degree swing.
    b. Safety Gate Latch: Basis of Design is Top Pull model by Magna Latch with gate handle and gate stop. Provide two sets of keys. Provide round post adaptor if required for style of picket selected.
    c. Closer: Manufacturer's standard.
    d. Latches permitting operation of gate to swing outward away from the pool.

8. Stainless Steel Welded Joint Treatment: At all welded joints in stainless steel assemblies, remove oxides, carbon precipitation, and weld spatter at or around welded joints and passivate surfaces in accordance with ASTM A380 and ASTM A967.

B. Shop-applied Finish, General: Comply with applicable provisions/recommendations of NAAMM Metal Finishes Manual, the coating system manufacturer's printed instructions, and the following:

1. Prepare ferrous metal surfaces by cleaning in compliance with SSPC-SP6, "Commercial Blast Cleaning."
2. Apply shop primer paint coat in accordance with paint manufacturer's recommendations for application and baking.

PART 3 - EXECUTION

3.1 PREPARATION

A. Coordinate fence installation with work of other sections of these specifications. Deliver concrete inserts to Installer of concrete substrates that will support fence units, prior to time scheduled for placement of concrete. Furnish templates and complete instructions for placing inserts.

B. Check concrete substrate and anchorage inserts, for compliances and tolerances required to facilitate installation of fence units. Coordinate beginning of installation with curing of concrete

substrate, and with other work at project site; for both temporary security utilization of fence enclosure, and for preservation of metal work and finish.

3.2 INSTALLATION

A. Set plumb and level, and true to line-of-slope; accurately located with respect to adjacent units, setbacks and property lines, and adjoining work. Comply with Fabricator's instructions on unpacking, handling, preservation/removal of protective covering, and assembly of fabricated elements. Set base/support plates of units in confined bed of setting/anchoring cement, without voids. Trim away excess bedding material, and tool exposed joint faces for neat, water-resistant exposure.

B. Anchor fence units to substrate. Install fasteners in manner to prevent them from being removed.

C. Provide continuous top and bottom rails. Fabricate fencing to follow the slope of the grade with the pickets remaining vertical.

D. Complete the installation of corner posts, special bracing, gates, special security features, and other elements of the work indicated as work of this section.

E. Stainless Steel Welded Joint Treatment: At all welded joints in stainless steel assemblies, remove oxides, carbon precipitation, and weld spatter at or around welded joints and passivate surfaces in accordance with ASTM A380 and ASTM A967.

3.3 FIELD-APPLIED COATING

A. Coating Preparation: Clean exposed surfaces of fence work, and touch up abraded shop primer finishes to restore corrosion resistance in accordance with the coating system manufacturer’s printed instructions and with consideration for compatibility with the substrate material.

B. Apply high-performance coatings according to manufacturer’s written instructions and recommendations in “MPI Architectural Painting Specification Manual.”

1. Use applicators and techniques suited for coating and substrate indicated.
2. Tint each undercoat a lighter shade to facilitate identification of each coat. Tint undercoats to match color of finish coat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.
3. If undercoats or other conditions show through final coat, apply additional coats until cured film has a uniform coating finish, color, and appearance.
4. Apply coating to produce surface films with surface imperfections.

3.4 CLEANING AND PROTECTION

A. At end of each workday, remove rubbish, empty cans, and other discarded materials from Project site.

B. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

C. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces.

END OF SECTION 323118

SECTION 323305 - SITE FURNISHINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Seating.
2. Bicycle racks.
3. Trash receptacles.

B. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for installing pipe sleeves cast in concrete footings.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Design Submittals:

1. Product Data: For recycled content, indicating postconsumer and preconsumer recycled content and cost.
2. Chain-of-Custody Certificates: For certified wood products. Include statement of costs.

C. Samples for Verification: For each type of exposed finish, not less than 150-mm- long linear components and 100-mm- square sheet components.

D. Product Schedule: For site furnishings. **[Use same designations indicated on Drawings]**.

1.3 INFORMATIONAL SUBMITTALS

A. Material Certificates: For site furnishings manufactured with preservative-treated wood.

1. Indicate type of preservative used and net amount of preservative retained**. [For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.]**

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For site furnishings to include in maintenance manuals.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Trash Receptacle Inner Containers: [**Five**] <**Insert number**> full-size units for each size indicated, but no fewer than [**two**] <**Insert number**> units.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with applicable accessibility provisions in OBO-ICS Chapter 11 for seating and trash receptacles.

2.2 SEATING <**INSERT DRAWING DESIGNATION**>

A. Frame: **[Cast iron][Steel][Stainless steel][Wrought iron][Cedar][Teak]<Insert wood>**.

B. Seat**[and Back]**:

1. Steel straight-backed seat, framed with 32 mm (1-1/4 inch) O.D. 0.120 wall steel tube with four mitered corners. Insert panel constructed of 16 mm (5/8 inch) O.D. round steel rods welded to steel frame, and hardware for seat attachment.
2. Horizontal seat supports on dual 64 mm (2-1/2 inch) steel tube, adapters are welded onto tubes matching adapters are welded to seats, fasteners included with assemblies, standard vertical supports – with supports the same color as the seat.
3. Seat Surface Shape: **[Flat][Contoured or dished]**.

4. Overall Height: **[As indicated] <Insert dimension>**.
5. Overall Width: **[As indicated] <Insert dimension>**.
6. Arms: None.

7. Seating Configuration: Multiple units**[as indicated]**.

C. Steel Finish: Galvanized and color coated.

1. Color: **[Match Project Director/COR's samples] [As selected by Project Director/COR from manufacturer's full range]**.

D. Stainless Steel Finish: **[ASTM A480/A480M, No. 6] <Insert description>**.

E. Wood Finish: **[Unfinished][Factory-applied transparent finish][Factory-applied stain and transparent finish; Manufacturer's standard stain][Factory-applied opaque finish] [Manufacturer's standard finish]**.

F. **[**Fiberglass][HDPE] Color: [**Match Project Director/COR's samples**][**As selected by Project Director/COR from manufacturer's full range**].

2.3 BICYCLE RACKS

A. Bicycle Racks: Corrosion-resistant construction.

1. Basis-of-Design: CycleSafe Two-Tiered High-Density Bike Racks.
2. Capacity: **[XX][As indicated on Drawings]**.

2.4 TRASH RECEPTACLES <**INSERT DRAWING DESIGNATION**>

A. Steel Facing Surrounds: **[Steel sheet][Perforated-steel sheet][Evenly patterned, parallel flat steel straps, bars, or tubular shapes][Evenly patterned, parallel round steel rods, bars, or tubular shapes][Grid in tubular frame][Match benches]<Insert material and description>**.

B. Stainless-Steel Facing Surrounds: **[Steel sheet][Perforated-steel sheet][Evenly patterned, parallel flat steel straps, bars, or tubular shapes][Evenly patterned, parallel round steel rods, bars, or tubular shapes][Grid in tubular frame][Match benches]<Insert material and description>**.

C. Wood Facing Surrounds: **[Evenly spaced cedar slats][Teak panels][Evenly spaced teak slats] [Match benches]<Insert wood type and description>**.

D. Fiberglass Facing Surrounds: Molded fiberglass shape.

E. Plastic Facing Surrounds: **[Molded HDPE shape][Evenly spaced HDPE slats][Evenly spaced, recycled HDPE slats][Match benches]<Insert plastic type and description**>.

F. Support Frames: [**Steel**][**Galvanized steel**]; welded.

G. Trash Receptacles:

1. Receptacle Shape and Form: **[Round cylinder][Round cylinder with tapered funnel top] [Round, tapered column][Square column][Rectangular column][As indicated] <Insert shape and form>; with opening for depositing trash in [lid or top][side of lid or top]**.
2. Lids and Tops: Matching facing panels secured by cable or chain, hinged, swiveled, or permanently secured.

   a. Opening for depositing trash covered by self-closing, spring-loaded-hinged, push-in weather flap.

3. Inner Container: **[Galvanized-steel sheet][Perforated-metal][Fiberglass][Rigid plastic]** container with **[drain holes][lift-out handles]**; designed to be removable and reusable.
4. Disposable Liners: Provide receptacle designed to accommodate disposable liners.
5. Capacity: Not less than 150 L (40 Gal).

6. Service Access: Removable lid or top; inner container and disposable liner lift or slide-out for emptying; self-latching hinge.
7. Post Mount: Galvanized-steel pipe**.**

H. Steel Finish: Galvanized and **c**olor coated.

1. Color: **[Match Project Director/COR's samples][As selected by Project Director/COR from manufacturer's full range]**.

I. Stainless-Steel Finish: **[No. 6] <Insert description>**.

J. Wood Finish: **[Unfinished][Factory-applied transparent finish] [Factory-applied stain and transparent finish; Manufacturer's standard stain] [Factory-applied opaque finish] [Manufacturer's standard finish]**.

K. **[Fiberglass][HDPE]** Color: **[Match Project Director/COR's samples][As selected by Project Director/COR from manufacturer's full range]**.

L. Graphics: **[Surface-applied][Engraved][Attached brass plaque with engraved] copy, content, and style [according to manufacturer's standard][as indicated on Drawings]**.

1. Copy: Match text from Project Director/COR; dual language unless they direct otherwise.

2.5 MATERIALS

A. Steel and Iron: Free of surface blemishes and complying with the following:

1. Plates, Shapes, and Bars: ASTM A 36/A 36M.
2. Steel Pipe: Standard-weight steel pipe complying with ASTM A 53/A 53M, or electric-resistance-welded pipe complying with ASTM A 135/A 135M.
3. Tubing: Cold-formed steel tubing complying with ASTM A 500/A 500M.
4. Mechanical Tubing: Cold-rolled, electric-resistance-welded carbon or alloy steel tubing complying with ASTM A 513/A 513M, or steel tubing fabricated from steel complying with ASTM A 1011/A 1011M and complying with dimensional tolerances in ASTM A 500/A 500M; zinc coated internally and externally.
6. Perforated Metal: From steel sheet not less than **[1.9-mm][2.3-mm][3.0-mm]<Insert dimension>** nominal thickness; manufacturer's standard perforation pattern.

7. Expanded Metal: Carbon-steel sheets, deburred after expansion, and complying with ASTM F 1267.
8. Malleable-Iron Castings: ASTM A 47/A 47M, grade as recommended by fabricator for type of use intended.
9. Gray-Iron Castings: ASTM A 48/A 48M, Class 200.

B. Stainless Steel: Free of surface blemishes and complying with the following:

1. Sheet, Strip, Plate, and Flat Bars: ASTM A 666.
2. Pipe: Schedule 40 steel pipe complying with ASTM A 312/A 312M.

3. Tubing: ASTM A 554.

C. Wood: Surfaced smooth on four sides with eased edges; kiln-dried; free of knots; solid stock, of species indicated.

1. Wood Species:

a. **[Red][Yellow]** Cedar: Select Grade or better.
b. Teak (Botanical name: “Tectona grandis”): Clear Grade.
c. **<Insert wood species>**: **<Insert grade, if applicable, and other requirements>**.

D. **[Certified Wood: Wood products shall be certified as "FSC Pure**"[or "FSC Mixed Credit"] **according to FSC STD-01-001 and FSC STD-40-004.]**

1. **[Finish: Manufacturer's standard [stain][and][transparent sealer][transparent wood-preservative treatment and sealer]<Insert treatment or finish>].**

E. Fiberglass: Multiple laminations of glass-fiber-reinforced polyester resin with UV-light stable, colorfast, nonfading, weather- and stain-resistant, colored polyester gel coat, and with manufacturer's standard finish.

F. Plastic: Color-impregnated, color and UV-light-stabilized, and mold-resistant.

1. Polyethylene: Fabricated from virgin plastic HDPE resin.
2. Polyethylene with Recycled Content: Fabricated from HDPE and other resins with postconsumer recycled content plus one-half of preconsumer recycled content not less than <**Insert value**> percent.

G. Anchors, Fasteners, Fittings, and Hardware: Manufacturer's standard, corrosion-resistant-coated or noncorrodible materials; commercial quality, tamperproof, vandal and theft resistant.

H. Galvanizing: Where indicated for steel and iron components, provide the following protective zinc coating applied to components after fabrication:

1. Zinc-Coated Tubing: External, zinc with organic overcoat, consisting of a minimum of 0.27 kg/sq. m of zinc after welding, a chromate conversion coating, and a clear, polymer film. Internal, same as external or consisting of 81 percent zinc pigmented coating, not less than 0.0076 mm thick.
2. Hot-Dip Galvanizing: According to ASTM A 123/A 123M, ASTM A 153/A 153M, or ASTM A 924/A 924M.

2.6 FABRICATION

A. Metal Components: Form to required shapes and sizes with true, consistent curves, lines, and angles. Separate metals from dissimilar materials to prevent electrolytic action.

B. Welded Connections: Weld connections continuously. Weld solid members with full-length, full-penetration welds and hollow members with full-circumference welds. At exposed connections,

finish surfaces smooth and blended, so no roughness or unevenness shows after finishing and welded surface matches contours of adjoining surfaces.

C. Pipes and Tubes: Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.

D. Exposed Surfaces: Polished, sanded, or otherwise finished; all surfaces smooth, free of burrs, barbs, splinters, and sharpness; all edges and ends rolled, rounded, or capped.

E. Factory Assembly: Factory assemble components to greatest extent possible to minimize field assembly. Clearly mark units for assembly in the field.

2.7 GENERAL FINISH REQUIREMENTS

A. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.8 STEEL AND GALVANIZED-STEEL FINISHES

A. Powder-Coat Finish: Manufacturer's standard polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

2.9 IRON FINISHES

A. Powder-Coat Finish: Manufacturer's standard polyester powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

2.10 STAINLESS-STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.

1. Run directional finishes with long dimension of each piece.
2. Directional Satin Finish: No 4.
3. Dull Satin Finish: No. 6.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.

B. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.

C. Install site furnishings level, plumb, true, and securely anchored at locations indicated on Drawings.

D. Support Post Setting: Set cast-in support posts in concrete footing with smooth top, shaped to shed water. Protect portion of posts above footing from concrete splatter. Verify that posts are set plumb or at correct angle and are aligned and at correct height and spacing. Hold posts in position during placement and finishing operations until concrete is sufficiently cured.

END OF SECTION 323305

SECTION 324003 – ANTI-CLIMB GATE SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. The work of this section includes, but is not necessarily limited to, the following elements as indicated on Drawings located in and around Compound Access Control (CAC) facilities at entrance/exit gate locations to control passage of vehicles through compound perimeter:

B. Anti-climb gates for passage of vehicles, in and out of the project site, on and off the post.

1. Gate Type: **[Bi-fold][Sliding rolling][Sliding cantilever][Swing]** gate system.

2. Console/User Controls:

a. Primary:

1) Interface: **[Physical button][Touchscreen]**.
2) Location Type: **[Rack mounted][Countertop unit]**.

b. Secondary:

1) Interface: **[Physical button][Touchscreen]**.
2) Location Type: **[Rack mounted][Countertop unit]**.

C. Related Sections include the following:

1. Section 033000 "Cast-In-Place Concrete" for requirements of concrete foundations and other elements of work in and around entrance/exit gates of the perimeter.
2. Section 055005 “METAL FABRICATIONS” and 0512000 for STRUCTURAL STEEL FRAMING and metal fabrications required at entrance/exit gate locations.
3. Division 09 painting and coating Sections for field applied finish work at entrance/exit gate locations.
4. Division 26 and 27 Sections for electrical/electronic work as required.
5. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
6. Section 285115 “Security Management System Enterprise (SMSe).”
7. Section 323118 “Decorative Metal Fences and Gates” for coordination with style of other compound fencing work.

1.2 SUBMITTALS

A. General:

1. Use same names for gates in submittals as used for labels on control system; see Part 2.8 on IDENTIFICATION.

2. Submittals should be accepted by the Project Director/COR prior to procurement of associated items by Contractor; premature procurement is at the risk of Contractor.
3. Refer to Division 01 Section on Submittals for general administrative requirements.

B. Product Data:

1. Product data for each element of work, whether purchased from other manufacturers or provided as gate fabricator's standard production. Include data substantiating that products comply with requirements of these specifications.
2. Product data for each primary material used in fabricating custom produced elements of the work; along with manufacturers' descriptive literature for standard or customized products, fabrications, assemblies, controls, buttons, monitor screens, indicator lights, devices, accessory items, and labeling used to produce work of this section. Include mechanical, electrical, and control data for operative and motorized units. Include performance charts and curves. Include complete list of equipment and materials. Identify applicable industry standards and how they apply to specific components.
3. Installation instructions.

C. Shop drawings for each type and size of customized fabrication or assembly, showing installation requirements for each element of the work of this section. Show plans, elevations, and sections at not less than 1:20 scale, and details at 1:5 scale.

1. Include dimensions of all important assemblies to confirm product will fit in the designated space with proper clearances (to include maintenance access) as applicable.
2. Include complete wiring and schematic diagrams and any other details necessary to demonstrate that the system has been coordinated and will properly function as a unit.
3. Show layout and anchorage of equipment and appurtenances, and equipment relationships to the other parts of the work (including foundation and clearances for maintenance and operation) and include sally port, barriers, and CACs as a minimum.
4. Indicate inclusion of all required accessories and features (as applicable).
5. For controls, identify project-specific information including type of controls, layout, buttons, panels, monitor screens, indicator lights and labeling. When applicable, show layouts for Primary and Secondary controls. When applicable, for screen controls on monitor screen, show graphic representation of controls and layout of each screen. For all controls, show sequence of operations to include functionality with safety devices and lock-out functionality.
6. Illustrate conformance to anti-climb design requirements identified in the Article on PERFORMANCE REQUIREMENTS.
7. Use of EU structural steel, provide a copy of the OBO approval per the ARTICLE ON MATERIALS, GENERAL REQUIREMENTS.

D. Installer Qualification Data: Submit resumes of all installers documenting that installers have installed same gate systems for a DOS project within last 5 years and the team leader has been trained by the gate manufacturer. Resume shall include at least three references (including contract information) that can provide verification that the installer has the expertise required to perform a successful installation. Installer's qualifications must be approved by the Project Director/COR with input from OBO/CFSM/SM physical security engineer.

E. **[Qualifications for Work in Corrosive Environment: Contractor shall submit evidence that confirms that gate system can operate in proposed environment and will perform consistently. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]**

F. Manufacturer's Qualification Data: Submit resumes of manufacturers documenting conformance with requirements of Article on QUALITY ASSURANCE.

G. Durability Submittals: Submit one of the following based on Contractor's selection, and in accordance with Durability requirements in Article on PERFORMANCE REQUIREMENTS.

1. **[Test Reports: Provide independent laboratory test reports using ISO/IEC 17025 (second edition) confirming the gate system meets the performance requirement for operating under specified number of cycles.]**
2. **[Warranty: See article on CLOSEOUT SUBMITTALS.]**

1.3 INFORMATIONAL SUBMITTALS

A. General:

1. Submit Informational submittals at least four weeks prior to installation.
2. Refer to Division 01 Section on submittals for general administrative requirements.

1.4 CLOSEOUT SUBMITTALS

A. Test Reports: Upon completion and testing of the installed system, a test report shall be submitted in booklet form showing all fields tests, including component adjustments and demonstration of compliance with the specified performance criteria. Each test report shall indicate the final position controls of the primary and secondary controls within the guard booth or other locations (i.e., as-built drawings showing on which rack the controls where installed and where within the rack that they were installed).

B.

C. Training Documentation: Immediately upon completion of Operator and Supervisor training by the gate manufacturer, documentation of training shall be delivered to Project Director/COR of installation. Training shall be completed before substantial completion. Training documentation shall include:

1. The date and time of the training.
2. A list of the names of the personnel trained.

D. All closeout manuals, such as operation and maintenance manuals, are required in both printed and printable electronic formats. Along with copies required as part of Division 01 "Construction Submittals, deliver two copies of these manuals, incorporating all revisions, with system at time of commissioning. These copies shall be sent via commercial courier service to the Department

of State project director or to the cognizant post facility manager or, if directed to the Bureau of Diplomatic Security at the address below:

U.S. Department of State
Bureau of Diplomatic Security
Attn: DS/FSE/FSB – Vehicle Barrier Program Manager
SA-24 Kingstown
5800 Barclay Drive
Springfield, Virginia 22315

1. Submit copyright release for all documentation to permit reproduction and use of this material on Department of State internal automated information system networks.

E. Operation and Maintenance Manuals: Submit Operation and Maintenance data in accordance with Division 01.

1. Operation Instructions: Outline step-by-step procedures required for system startup, operation, and shutdown. Include manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.
2. Maintenance Instructions: Include routine maintenance procedures, possible break-downs and repairs, and troubleshooting guide. Include piping layout, equipment layout and simplified wiring, and control diagrams of systems as installed.

F. Spare Parts Data: Submit spare parts data for each different item of materials and equipment used. Data shall include complete list of parts and supplies, with current unit prices and source of supply.

G. **[Maintenance Plan for Corrosive Environments: Manufacturer shall develop and submit site-specific routine maintenance plan tailored to local conditions and executable by local labor force. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS for extreme corrosive environments are applicable.**

1. **Plan shall be based on a 25-year life span and show schedule for full life span.**
2. **Include routine cleaning schedule and inspection for corrosion for site specific conditions.**
3. **Provide inspector qualifications and instructions for inspecting painted coatings and instruction for repair and repaint.]**

1.5 QUALITY ASSURANCE

A. Nameplates: The anti-climb gate systems shall have the manufacturer's name, contact for service, and catalog or serial number permanently affixed to a plate securely attached to the equipment in a suitable location.

B. Label: Each operator shall bear a label indicating that the operator mechanism has been tested for full power and pressure of all hydraulic components, full stress tests of all mechanical components and electrical tests of all overload devices.

C. Verification of Dimensions: The Contractor shall become familiar with all details of the work and verify dimensions in the field as required for coordination and provide to the gate manufacturer all the applicable information.

D. Manufacturer's Qualifications: Provide anti-climb gate systems which are produced by a manufacturer who has previously produced, within the last 2 years, units of similar size and function.

E. Installer Qualifications: Engage an experienced Installer who has completed in last five years an anti-climb gate system installation similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance Team leader shall have received manufacturer training.

F. Single Source: Provide complete gate systems (leaf, controls, operator, and accessories) from a single manufacturer, or provide integrated gate system designed, assembled, and tested by a single manufacturer.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver elements of the perimeter gate facilities to the project with assemblies prefabricated, prefinished, and equipped with devices and accessories to the greatest extent possible. Comply with Government's criteria for packaging, handling, protection, storage, and delivery. Use Manufacturer's export or General Contractor's Ocean Freight crating for shipment protection when available.

B. Store products upright in the original shipping containers, covered, ventilated and protected from all weather conditions.

1.7 WARRANTY

A. Durability: provide a 1-year comprehensive onsite material and labor warranty from Substantial Completion for any component necessary for continued operation of the gate system from substantial completion. See ARTICLE on DURABILITY requirements. Inhibiting the operation of the gate includes anything that relate to the opening/closing of gate and that this resistance requirements would generally relate to wheels, bearings, and motors.

B. Corrosion Resistance: All elements of the gate system shall be designed and constructed to resist these effects for a period of 5 years from Substantial Completion. Should corrosive damage inhibit or halt the operation of the gate system, replacement parts or new gate systems shall be shipped to the project site at no cost to the USG and installed by qualified installers provided by the manufacturer. The government at its sole discretion may opt to install the manufacturer provided replacement parts, however this will in no way void or alter the warranty.

1.8 EXTRA MATERIALS

A. Spare parts kit per manufacturer's recommended list, but as a minimum shall include:

1. PLC/controller
2. Touch screen
3. Guide rollers
4. Wheels
5. Any normal wear & tear parts.
6. Safety edge guards for gates that include edge guards.
7. Light curtain for gates that include light curtains.
8. All scheduled maintenance spare parts for up to the 200 000 cycle mark.
9. Manufacturer recommend spare part list specific to the site and gate.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Provide anti-climb gate systems in accordance with the OBO Zoning Code (International Zoning Code amended by OBO), ASTM F2200-20, UL325, and consistent with OBO “Physical Security Detail Handbook.” Provide all components of the gate system from a single manufacturer or provide an integrated gate system designed, assembled, and tested by a single manufacturer.

1. Provide anti-climb protection on attack side.

a. Anti-climb shall include but is not limited to hinges, light curtains, sensors, locking hasps, cross members, rails, drive rails, ornamental design, and signal lights.

B. Vehicle Control: Provide gate system capable in width of operation of obstructing vehicular traffic in 4 meter (13 ft) wide traffic lane.

C. Provide anti-climb gate system that meets all physical security requirements pertaining to fences components as described in Section 323118 “Decorative Metal Fences and Gates.”

D. Operational Speed: Provide gate and operator which travels at 300mm per second or faster.

E. Frequency of Operation: Anti-climb gate systems shall be capable of operating a minimum of 60 complete open/close cycles per hour.

F. Durability: Provide anti-climb gate systems capable of operating for 200,000 continuous cycles without failure of any component necessary for continued operation of gate. Cycle testing shall be performed in configuration where gate system itself is located in outdoor location that will expose unit to full sunlight and effects of climatic conditions at test facility (pollution, rain, snow, sleet, etc.). Anti-climb gate systems shall be capable of operating a minimum of 60 complete open/close cycles per hour.

G. Control Circuits: Design control system in such a way that when power fails, gate maintains "status quo" position. System shall fail neither secure nor safe, which prevents gate from being pushed open in event of failure.

H. Back-up and Manual Operation: Control system shall provide back-up and manual operating capability for use in event of power failure. Manual operation of gate shall be simple and without need of special tools, except for a hand crank, or knowledge and shall include a key for the cover and a manual hand-crank, which shall be located in the CAC. Gate shall be capable of being returned to secure position, in manual mode, in no more than 5 minutes.

2.2 APPROVED PRODUCTS

A. Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

1. TyMetal Inc. Trackless Security Speed Gate/Trackless Bi-Folding Speed Gate.
2. Bavak Beveiligingsgroep B.V. electrically powered Speed Bi-Folding Speed Gate.
3. Bavak Beveiligingsgroep B.V Trackless Bi-Folding Speed Gate.
4. Ross Security Systems LLC XT-4000 Sliding Anti-Climb Gate.
5. TyMetal Inc. Embassy Steel V-Groove Gate System (sliding gate).

B. Other Anti-Climb Gate Systems may be used subject to the requirements of this specification and additional warranty requirements stated in this specification.

2.3 MATERIALS, GENERAL

A. Corrosion Resistance Performance

1. Corrosion Risk: As indicated in the Project Contract (e.g., Statement of Work), the OBO Building Code Appendix W defined OBO Atmospheric Corrosivity Level for this site is **[Low][Moderate][Extreme]**. The atmospheric corrosion risk exposure risk type for a given component shall be as defined by OBO-ICS IBC Section W101.1.2 (i.e., direct exterior, indirect exposure to exterior, and interior exposure only).
2. Corrosion Resistance Standards: Provide materials and finishes for the components in accordance with the material specifications of this Specification Section and the general material type as indicated by this article for the project-specific corrosion risk identified above or elsewhere in the Contract Documents.
3. Material Standards for Anti-Climb Gates (e.g., tubes, plates, inserts, tie rods, hardware, anchors, clips and fasteners, etc.): As applicable for the OBO Atmospheric Corrosivity Level (ACL) of site and for both direct exterior exposure and indirect exposure to the exterior:

   a. Mild Steel: hot-dipped galvanized coating; low and moderate ACL.
   b. Stainless Steel: low, moderate, and extreme ACL.

4. Finish Standards for Components: as applicable for project site: See finish requirements of this section, contract documents, and 055005 “METAL FABRICATIONS.”

B. Materials, General Requirements for Mild Steel Anti-Climb Gates

1. Hot-Rolled Steel Sheets and Strips: ASTM A 569, commercial quality, pickled and oiled, except as otherwise indicated.
2. Cold-Rolled Steel Sheets: ASTM A 366, commercial quality except as otherwise indicated.
3. Galvanized (Zinc-Coated) Steel Sheets: ASTM A 653, minimum G90 zinc coating, mill phosphatized; commercial steel except as otherwise indicated. Zinc-iron alloy-coated (galvannealed) steel sheet products are not permitted.
4. Plates, Bars, Angles, and Channels: ASTM A36 or ASTM A572
5. Hollow Structural Sections (steel tubes): ASTM A500 or ASTM A1085.
6. Inserts, Bolts Fasteners: Standard units of strengths required to endure performances; hot-dip zinc coated.
7. Stainless Steel Bolts, Hex Headed Screws, Nuts, and Washers: AISI Type 316 (Alloy Group 2), complying with ASTM F593 and ASTM A594, or ASTM A193 and ASTM A194, or ASTM A320 and ASTM A194; provide compatible AISI Type 316 washers where appropriate.
8. Hot-Dip Galvanizing: All mild steel gate components must be hot-dip galvanized in accordance with ASTM A123/A123M.
9. Proposed product substitutions may be approved if they have been submitted, reviewed, and approved by OBO/PDCS/DE/CSE. Submittal shall include a copy of the pertinent material standard specifications.

C. Materials, General Requirements for Stainless Steel Anti-Climb Gates

1. Stainless Steel Plates, Sheets, and Strips: AISI Type 316, 316L, 2101 or 2205, complying with ASTM A240/A240M or ASTM A895/A895M, commercial quality.
2. Stainless Steel Bars and Shapes: AISI Type 316, 316L, 2101 or 2205, or AISI Type 316L where welding is to be performed, complying with ASTM A276/A276M or A582/A582M.
3. Stainless Steel Tubing: AISI Type 316, 316L, 2101 or 2205, complying with ASTM A1016/A1016M.
4. Stainless Steel Wire and Rod: AISI Type 316, 316L, complying with ASTM A555/A555M.
5. Stainless Steel Bolts, Hex Headed Screws, Nuts, and Washers, except where higher strengths or ductility is required, in which the Manufacturer shall submit product data for the fastener components and proposed corrosion prevention design for review and approval by OBO/PDCS/DE/CSE. See section above for stainless steel bolt requirements.
6. Stainless Steel Sheets where required for finish: AISI Type 316/316L, complying with ASTM A 240; commercial quality, **<bead blast, No. 4 directional polish or as otherwise indicated in the design documents>**.

D. Bolts and Fasteners: Where within reach of intruders working from attack-side of facilities, including working from inside sally ports, provide non-removable anti-tamper detention-style bolt/nut units (not removable by use of commonly available hand tools). Provide stainless steel washers.

E. Concrete Inserts: Furnish anchorage units to be placed in concrete substrates, of hot-dip galvanized cast-iron/malleable-iron body, design/type as indicated; ASTM A 153 zinc coating, ASTM A 47 casting. In addition to any restrictions or requirements indicated on the Construction Drawings, post-installed anchor systems proposed by the Contractor's delegated design shall each have ICC-ES Evaluation Report indicating conformance with current applicable ICC-ES

Acceptance Criteria including, but not limited to, for cracked concrete for concrete substrates, seismic applications, and for the use in the specific substrate type and characteristics intended. Shop drawings and field sketches shall clearly indicate critical embedment, spacing, and edge distance requirements and placement tolerances determined by the design.

F. Setting/Anchoring Cement: Provide non-shrinking, non-staining, hydraulic-controlled expansion-type cementitious compound; factory prepackaged for mixing with water at project for a pourable and trowel-able mix, recommended by manufacturer for exterior exposure (ASTM C 109).

G. <Aluminum Extrusions: ASTM B 221, Alloy 6005, Temper T5 or T6; sizes, shapes, and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated. Aluminum is acceptable for panels but is generally not acceptable for structural posts and rails; but in all cases the use of aluminum requires the approval of OBO/CFSM/SM/SCD/SEB.>

H. Fabricated steel: Provide galvanized coating including chemical cleaning complying with SSPC-SP1, followed by pickling treatment complying with SSPC-SP8, followed by hot-dip zinc coating complying with ASTM A 123. Provide prime coat recommended by finish coat manufacturer consisting of a hot-phosphate solution treatment, followed by a chrome-acid rinse, and followed by a dip-metal primer coating which is oven dried for 30 minutes at 149 degrees C (300 F). Provide special finish coating of polyester or acrylic enamel, electrostatically applied and baked on in accordance with coating manufacturer's instructions to dry film thickness of 1.5 mils (0.038 mm); or a two-coat powder coat finish if approved by OBO/PDCS/DE/AD, color as indicated or, if not otherwise indicated, as selected by COR from submission of available colors. Finish steel accessories with same or equivalent finish.

I. Provide touch-up paint with each painted gate.

J. Gate operators shall conform to UL325 and be listed by a testing laboratory.

K. Use high speed gate operators on UL 325, Class III and Class IV installations only.

2.4 GATE FABRICATION

A. General: Fabricate anti-climb gates at the factory to the greatest extent possible, including interfacing, supporting, and anchorage provisions as required for installation. Fabricate to comply with indicated performance requirements. Disassemble only to the extent required for handling, delivery, and installation. Provide anti-climb gate systems with all components designed and assembled by the gate manufacturer. The entire gate system shall be a complete kit warrantied by the gate manufacturer.

1. Factory Welding: To improve corrosion resistance, all welding should be factory welded prior to paint or other finishes. Field welding is prohibited, alternative assembly methods shall be used.
2. Surface Preparation at All Welds to Stainless Steel: Remove oxides, carbon precipitation, and weld splatter at or around welded joints and passivate surfaces in accordance with ASTM A380 and ASTM A967.

B. Fabricate gates as follow:

1. Use only electric, hydraulic, or pneumatic drive systems for anti-climb gate systems.
2. Provide 24 VDC, battery backed-up control circuitry.
3. Provide system which retains gate in current position when there is a power failure.
4. Provide a system for back-up system for the control systems for manual operation of gate when there is a power failure.
5. Hydraulic Lines: Where power and hydraulic lines are required and are below grade, protect lines with rigid electrical conduit. Where temperatures will exceed 38 degrees C (100 degrees F) for extended periods of time, provide a cooling unit for the hydraulic fluid as recommended by the manufacturer.
6. Provide mechanical disconnect switch in secure location.
7. Fabricate gate panels and supporting elements and appurtenances so that a 130 mm diameter sphere cannot pass through any portion of the gate panel or any location where the gate panel interfaces with the surrounding construction (on the attack side) including where the gate panel meets the ground.
8. Fabricate units with member sizes, shapes, and spacings as shown, and with overall dimensions of each unit as shown. Provide vehicle gates with anti-climb protection and UL325 and ASTM F2200 compliance.
9. Ease exposed edges of fabricated metal elements to approximately 0.8mm (1/32-inch) radius, prior to finishing.
10. Avoid the use of bolts and screws exposed and accessible from the exterior (attack side) of fabricated units. Where unavoidable, provide non-removable (with ordinary hand tools) type fasteners in the assembly.
11. Provide provision locking device for each (closed) gate, located on inside (secure side) of fence except where indicated as exterior.

    a. Design for Locking Device: Door assembly shall be capable of being secured by one of the following Government-Furnished Government-Installed lock types:
    b. Padlock with minimum 10 mm (3/8 inch) shackle diameter and shackle clearance of 45 mm or less.
    c. Lock accepting Medeco keyed six point interchangeable core.

12. Design load bearing gate to be easily serviceable and to withstand dead/live load with minimum safety factor of 2. For sliding gates, provide minimum of two, tandem (truck style) V-wheel assemblies per gate leaf, 150 mm diameter steel machined wheels with sealed roller bearings and pivoting brackets, 2200 kilogram minimum capacity.
13. Guide or support wheels should utilize nylon or synthetic roller and sealed maintenance free bearings and be capable of up and down movement, to compensate for uneven tracks, that provides constant engagement with the gate leaf as it travels.
14. V-track should be poured in place, level, plumb and straight and run the continuous length of both full open and full closed gate travel.
15. **[Ice Melting: Provide in-ground ice/snow melting capability in sallyport and sidewalks surrounding CACs when located in snow/ice environment.]**
16. Provide lane indicator lights, red and green, to indicate the direction of traffic when more than one lane of traffic exists in the sallyport.
17. Provide physical stop at both ends of the gate assembly.
18. Provide limit switches.

19. Provide “open gate annunciator”, voice annunciator that signals that the gate has been left open after 60 seconds in the open position. For perimeter gates the annunciator shall annunciate; “the perimeter gate is open.” For compound side sallyport gates, the annunciator shall annunciate: “the compound gate is open.”

2.5 GATE OPERATOR

A. General: Design sliding gate operator for continuous duty in high-cycle applications and require low maintenance. Operation shall be by means of a metal rail passing between a pair of solid metal wheels with polyurethane treads. Operator motors shall be hydraulic, geroller type, and system shall not include belts, pulleys, roller chains or sprockets to transfer power from operator to gate panel, or approved equal. The operator shall be capable of actuating gates up to 5 meters in overall length. Slide and bifold gate operators shall feature a ‘soft start’ and ‘soft stop’ to minimize shock loads to the gate and maximize hardware life.

1. The housing cover shall be able to accept a lock. All operator cover locks are to be keyed alike.
2. Chassis: 6mm (1/4") steel base plate and 2.66mm (12 Ga.) sides and back welded and ground smooth.
3. The housing and chassis shall be galvanized per ASTM 123M for Low/Moderate ACL environments and for Extreme ACL environments ASTM 316L.
4. Electrical enclosure: Oversized, metal, with hinged lid gasketed for protection from intrusion of foreign objects and providing ample space for the addition of accessories.
5. Hydraulic fluid: High performance type with viscosity index greater than 375 and temperature range -40 C to 75 C degrees (-40 F to 175 F).
6. All components shall have overload protection.
7. Control circuit: 24VDC.
8. Built-in “warn before operate” system.
9. User relay outputs options, “gate open 60 sec” alert and “gate operator tamper switch” for connection to user control panels.
10. Display for system configuration and reporting of control status.
11. Heating and Cooling System: Provide heating and cooling system per manufacturers' recommendations.
12. Manual Operation: Provide gate operating system with capability of disengaging the drive mechanism without the use of tools, so that the gate can be manually operated. The release mechanism must not be accessible from the threat side of the gate. The gate panel shall be securely locked in place any time the drive assembly is engaged.
13. Gate operation systems which feature any significant components housed below grade shall include a sump pump.
14. Provide gate operator with emergency close feature to override obstruction devices when in Emergency mode.
15. Provide power-off lock that mechanically restricts or interrupts the movement of the gate in the event of a power loss, resulting in the gate being inherently locked.

2.6 TOUCH SCREEN CONTROL SYSTEMS

A. If selected for use on the project, provide touch screen control systems capable of the operations identified in this Article.

B. Gate Control: Provide fabricated perimeter gates that are capable of being controlled remotely from the Primary (typically located in Post 1) and Secondary control panel (typically located within the CAC guard booth). Provide override capabilities from the Primary control panel (typically located within MSG post 1).

1. Provide units capable of being mounted in 480 mm (19”) racks or on desktop.

a. If selected for use on the project, provide rack mounted controls in accordance with Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks.
b. On dual or multiple lane sally ports or installations with more than two gates at a single CAC, provide a custom panel that consolidates controls (separate controls and EFOs required for each gate; however, open gate annunciator may be combined per sally port).

2. Provide systems that have programming systems that can be adapted with updated ladder logic programming from manufacturer. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).

C. Provide a Secondary control panel with the following:

1. Emergency Operation (EFO) button for each gate location (toggle switch with flip cover) (located above touchscreen and not part of the touchscreen). EFO switch may be located on the side with the approval of OBO/CSM/SM/SCD/SEB.
2. Open button
3. Close button
4. Stop button
5. Gate status indicator on the screen. (i.e., open, close)

a. Visual indication light when gate is in open position.
b. Visual indication light when gate is in closed position.
c. Audio and visual indication signal when gate is in open position for more than 60 seconds.

6. Audible annunciator, which is automatically activated when gate remains in the open position in excess of adjustable time period with adjustment capability up to 60 seconds.
7. The emergency switch or switches for the Secondary control must not be equipped with reset capability.
8. Provide either rack mounted (default standard) or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate design and selection with architectural and technical security systems design.

a. Gate controls are considered primary pieces of equipment and shall be placed so that the secondary operator can see the gate and the controls at the same time and for the primary operator, the CCTV and controls and located in his primary point of view.

D. Provide a Primary control panel with the following:

1. Emergency Operation (EFO) button for each gate location (toggle switch with flip cover) (located above touchscreen and not part of the touchscreen)
2. Open button
3. Close button
4. Stop button
5. Gate status indicator on the screen. (i.e., open, close).

   a. Visual indication light when gate is in open position.
   b. Visual indication light when gate is in closed position.
   c. Audio and visual (flashing or other) indication signal when gate is in open position for more than 60 seconds.

6. Audible annunciator, which is automatically activated when gate remains in the open position in excess of adjustable time period with adjustment capability up to 60 seconds.
7. EFO reset button
8. Gate interlock override button when used in a CAC sallyport location.

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of gates when in emergency modes. Provide EFO speed of at less than 8 seconds for 3.7-m wide opening.

F. Provide an “emergency stop” button at both control panels. Stop or emergency stop button must immediately stop the gate independently of the gate opening or closing.

G. Primary and Secondary panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections).

H. Interlocking functions: Provide control systems capable of locking out sallyport gate open operation when vehicle gate located on perimeter side of sallyport is in open position. Provide two stage button override control of interlocking override function at only the Primary control panel.

I. Monitor screens: Provide monitors with minimum 175 millimeter (7 inch) screen size. Monitor screens shall provide clear readable views of controls in bright sunlight and glare conditions. Monitors shall be Thin Film Transistor (TFT) Liquid Chrystal Display (LCD) type, high contrast color screens, 1280 x1024 pixels. Each monitor shall graphically depict each gate being controlled, at top of the screenso that gate operator can view the gate operation via screen. Directly below view of the gate, centered under this view, provide label of which gate is being controlled (e.g., “Main CAC Exterior Sallyport Gate”). Text of label shall be clear and easily readable with minimum 10mm, Times New Roman Bold. Directly to left of label, locate gate “CLOSED” button. CLOSED button shall be minimum of 25 mm in diameter and labeled below button “CLOSED” with clear and easily readable, minimum 15mm, Times New Roman Bold. Directly

to right of label locate gate "OPEN" button. OPEN button shall be minimum of 25 mm in diameter and labeled below button "OPEN" with clear and easily readable, minimum 15mm, Times New Roman Bold.

J. Provide an infrared vertical safety light curtain that provides continuous coverage not less than 1067mm (42 inches) high at each side of the gate (attack and secure). Mount 125mm (5 inches) above finish grade. Flush or surface mount so that equipment does not project more than 45mm (1.75 inches). Controls must be configured to stop gate when plane of light curtain is broken, except when EFO system is engaged.

K. Traffic lane indicator light controls (if applicable, multi lane sallyport only).

L. Controls must result in an installation which complies with the operational testing requirements identified in Article on FIELD TESTING.

M. System Processing Control Unit:

1. Self-diagnostic systems: Provide gate control systems capable of self diagnosis. Minimum features required are:

   a. Audit Trail: Provide audit trail of open, close, EFO, interlock and reset functions of gate that is easily user interpreted.
   b. Cycle counter: Provide cycle counter that records each cycle of gate. Provide gate cycle counter in gate and in control system. Cycle counter in gate unit shall be readily visible to maintenance staff monitoring gate.
   c. Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
   d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 "Security Management System Enterprise (SMSe). Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require user ID and Password for access to secure connection.
   e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer's gate systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
   f. Low oil level monitor: Provide monitor that warns gate operator when oil level in unit is low.

2. Standardized controllers: Provide controllers capable of operating up to two gates per controller unit.
3. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232, ethernet CAT 5/6 technologies, or fiber optic ethernet.
4. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting the unit or inadvertently triggering the system.

5. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.7 PUSH BUTTON CONTROL SYSTEMS

A. Touch screen controls are the default system and if push button control system is used, it requires OBO/CFSM/SM approval. If approved, provide push button control systems capable of the operations identified in this Article.

B. Gate Control: Provide fabricated anti-climb gates that are capable of being controlled remotely from the secondary control panel (typically located within the CAC guard booth). Provide override capabilities from the Primary control panel (typically located within MSG post 1).

1. Provide units capable of being mounted in 480mm (19”) racks or on desktop. If selected for use on the project, provide rack mounted controls per; Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. On dual or multiple lane sally ports or installations with more than two gates provide a custom panel that consolidates controls (separate controls and EFO’s required for each gate; however, open gate annunciator may be combined per sally port).
2. Provide systems that have programming systems that can be adapted by end user with updated ladder logic programming from manufacturer. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).

C. Provide a secondary control panel with the following:

1. Emergency Operation (EFO) button for each gate location (toggle switch with flip cover)
2. Panel power indicator light: on when panel is operational and controls operational; off when power or control is removed from primary panel
3. Open button (green) minimum 22mm diameter
4. Close button (red) minimum 22mm diameter
5. Stop button (black) minimum 22mm diameter
6. Gate status indicator light. (i.e., open, close)

    a. Visual indication light when gate is in open position.
    b. Visual indication light when gate is in closed position.
    c. Audio (recorded voice) and visual indication signal when gate is in open position for more than 60 seconds.

7. Audible annunciator, which is automatically activated when gate remains in the open position in excess of adjustable time period, with adjustment capability up to 60 seconds.
8. The emergency switch or switches for the secondary control must not be equipped with reset capability.
9. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate design and selection with architectural and technical security systems design.

D. Provide a Primary control panel with the following:

1. Emergency Operation (EFO) button for each gate location (toggle switch with flip cover)
2. Open button (green) minimum 22mm diameter
3. Close button (red) minimum 22mm diameter
4. Stop button (black) minimum 22mm diameter
5. Gate status indicator light. (i.e., open, close)

    a. Visual indication light when gate is in open position.
    b. Visual indication light when gate is in closed position.
    c. Audio and visual indication signal when gate is in open position for more than 60 seconds.

6. Audible annunciator, which is automatically activated when gate remains in the open position in excess of adjustable time period, with adjustment capability up to 60 seconds.
7. EFO reset button (black) minimum 22mm diameter.
8. When part of a sallyport configuration, provide Interlock tun switch (on/off): when on a gate cannot be opened unless the other gate is completely closed.
9. Capable of overriding and disabling the secondary panel with turn switch (on/off)
10. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate design and selection with architectural and technical security systems design.

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of gate when in emergency modes. Provide EFO speed in accordance with the Part 2 Article on PERFORMANCE REQUIREMENTS.

F. Primary and secondary control panels shall not require keys for operation.

G. Primary and secondary panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections).

H. System processing control unit:

1. Self-diagnostic systems: Provide gate control systems capable of self-diagnosis. Minimum features required are:

    a. Audit Trail: Provide audit trail of up, down, EFO, interlock and reset functions of gate that is easily user interpreted.
    b. Cycle counter: Provide cycle counter that records each cycle of gate. Provide gate cycle counter in gate and in control system. Cycle counter in gate unit shall be readily visible to maintenance staff monitoring gate.
    c. Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
    d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 “Security Management System Enterprise (SMSe).” Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require user ID and Password for access to secure connection.

e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer's gate systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
f. Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units.
g. Low oil level monitor: Provide monitor that warns gate operator when oil level in unit is low.

2. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232, ethernet CAT5/6 technologies, or fiber optic ethernet
3. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting unit or inadvertently triggering system.
4. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.8 IDENTIFICATION

A. Provide product identity by letter, name, or number (i.e. street name, MCAC, SCAC, etc.) and by location within the sallyport (i.e. compound side, street or plaza) by which controls may be uniformly labeled for local (CAC) and remote (Post 1). Coordinate with OBO construction management or the COR for final approval of names.

2.9 ACCESSORIES, AS APPLICABLE TO THE TYPE OF GATE:

A. Gate operator tamper switch.

B. Remote control panel with annunciator, override and reset.

C. Emergency Manual Operation: Provide hand crank to allow gate to be opened manually in event of prolonged power interruption.

D. Emergency fast operation.

E. Low fluid level switch.

F. Export packaging.

G. Electrical disconnect at the hydraulic unit.

H. Uninterrupted Power Supply (UPS) for Primary and Secondary control panels.

I. Lock for operator cover.

J. Safety light curtains.

K. **[Provide Power unit enclosure where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS. The steel enclosure shall be minimum of 2 mm thick steel and provided with DS approved padlock. Enclosure may be custom fabricated if not a standard accessory from power unit manufacturer.]**

L. **[Heating unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]**

M. **[Cooling unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]**

PART 3 - EXECUTION

3.1 EXAMINATION, COORDINATION, PREPARATION

A. General: Examine substrate work, being prepared as work of other sections, for the anchorage and support of perimeter gate facilities of this section. Deliver anchorage inserts, sleeves, and other elements to be cast in concrete work, prior to time scheduled for placement of concrete. Furnish instructions, setting diagrams, templates, and/or other information for elements to be installed as work of other sections. Set posts, frames and similar elements plumb, level and true to line and location; and support adequately during placement of concrete.

B. Examine prefabricated units, and preparations made and to be made as work of other Sections, and confirm that interfaces and support of work of this section will achieve performances and align within installation tolerances.

C. Coordinate installation of gate facilities with installation of related work to ensure optimum sequencing of interfaces.

3.2 INSTALLATION

A. Comply with manufacturer's instructions for the handling, protection, assembly, installation, anchorage, and other required interface connections of gate with other work. Set level and plumb, true to line and location. Anchor to develop full-strength resistances against attacks and forced-entry attempts.

B. Install exposed gate hardware, track, and devices with nonremovable or anti-tamper detention-style fasteners, where exposed to attack side. Assemble gate operating equipment and control system for smooth, secure gate movements, with ground-set items anchored in concrete supports. Comply with applicable installation provisions of ASTM F 1184, UL325 and ASTM F2200. For Bi-folding gates comply with UL325 and ASTM F2200.

C. Follow all UL-325 and ASTM F2200 safety standards and ensure that during installation and maintenance that a safety zone is established as well as fall protection and entrapment protection.

D. Installation of control panels:

1. When control panels are installed in racks, they shall be installed adjacent to anti-ram barrier controls when part of sallyport configuration.
2. Control panels shall be located high enough in rack that allows easy access without having to bend over. Secondary panels shall be installed so visual of gate can be maintained while using controls.
3. If touch screen is used, it must be located high enough in rack or on sloped section so that screen can be easily seen.
4. When Primary panel is located remotely, controls shall be installed so video monitor of gate can be seen while controlling gate.

3.3 TESTING AND ADJUSTING

A. Test gate operator through ten full cycles and adjust for operation without binding, scraping, or uneven motion. Test limit switches for proper 'at rest' gate position. Factory representative is required to be named and/or sign the Certificate of Compliance.

B. Test operate each gate facility operational unit through repeated cycles of operation; and demonstrate operation, controls, safety devices, signals, and other features to Project Director/COR. Provide adjustments as requested to comply with requirements and intended cycles of use and operation.

C. Instructions for testing anti-climb gate systems from Secondary Control Panel:

1. Test function of traffic lane indicator lights if applicable.
2. Cycle gates Open and Close and listen for binding or rubbing.
3. Check light curtain for function, reverse, or stop of gate while going closed.
4. Check open gate annunciator. Leave the gate in the open position. After a preset period (no more than one minute) an alarm will sound from the Secondary unit and from the Primary Control Panel. This annunciator can be set in gate operator panel.
5. Test the emergency close function. Be sure there is no vehicle or individual standing near the gate and have a safety person control the site. Check to make sure all safety functions are disabled while the gate is operating in the emergency mode.

    a. Activate the emergency close, from the open position - the gate should close quickly. Record the time (should be 8 seconds or less). The Secondary controller should now be inoperative and will have to be reset from the Primary controller in MSG Post I.

6. Test that the gate locks when the power is cut and the back-up system is depleted.
7. Test that the gates and controls will work under generator power from Secondary control station.
8. Cut all power to the hydraulic pump or electrical supply and test that the gate can be operated manually.

D. Instructions for testing anti-climb gate systems from Primary Control Panel

1. Test function of traffic lane indicator lights if applicable.
2. Cycle gates Open and Close while listening for binding or rubbing.
3. Check light curtain for function, reverse, or stop of gate while going close.

4. Check open gate annunciator. Leave gate in open position. After preset period (no more than one minute), an alarm shall sound from Secondary unit and from Primary control panels. This annunciator can be set in gate operator panel.
5. Test emergency close function; ensure that no vehicles or individuals are standing near gate, and have safety person control site. Ensure that all safety functions are disabled while gate is operating in emergency mode. Activate emergency close from open position; gate should close quickly. Record time; an acceptable closing time is 8 seconds or less. Secondary controller should now be inoperative and will have to be reset from Primary controller in MSG Post 1. Confirm that Secondary panel is completely disabled. Then confirm that 'reset' button in Primary Control Panel reactivates Secondary Control Panel buttons and switches.
6. Test that gate locks when power is cut and back-up system is depleted.
7. Test that gates and controls work under generator power from Primary Control station.

3.4 CLEANING AND FINISHING

A. Clean exposed surfaces of gate facilities, including primed surfaces and finished surfaces, exercising care to avoid damage to finishes; touch up minor blemishes in finished surfaces.

B. Refer to Division 09 Sections on painting and high-performance coatings for application of field-applied finish coatings over shop-applied primer coatings; not work of this section.

1. **[On a case-by-case basis, a two coat powder coat system may be approved as a substitution with approval of OBO/CSM/SM/SCD and OBO/PDCS/DE/AD.]**

3.5 MANUFACTURER'S SERVICE

A. Services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment supplied shall be available. The representative shall supervise the installation, adjustment, and testing of the equipment. A commissioning agent is not an approved substitution for the manufacturer's representative.

3.6 TRAINING

A. Operator Training: Manufacturers' representative shall provide initial Operator training to Local Guard Force (LGF) personnel. A commissioning agent or general gate technician is not an approved substitution for the manufacturer's representative. Training shall be delivered at post of installation within one business day following commissioning of new system. Initial Operator training shall include:

1. Overview of system.
2. Essential controls and displays.
3. Safety precautions.

B. Supervisor Training: Manufacturer's representative shall provide initial Supervisor training for Regional Security Officer (RSO) or designated representative, LGF supervisor, and others as

identified by RSO. This training shall be delivered at post of installation within one business day following commissioning of the new system. Initial Supervisor training shall include:

1. Overview of system.
2. Understanding of system's purpose and capabilities.
3. Essential controls and displays.
4. Safety precautions.

C. Maintenance Training: Manufacturer or representative shall provide Maintenance training, including MANUFACTURER'S CERTIFICATION TRAINING to level of "Factory Authorized Technician" status at manufacturer's facility for the following personnel:

1. Two instructional personnel from DS/SECD/TTB.
2. One instructional designer from DS/TPS/ISM.
3. One DS/C/ST subject matter expert (SME).
4. One person from OBO/CFSM/SM/SCD/TSB.

D. Manufacturer shall provide no less than two additional spaces per each Maintenance training class and/or training at their manufacturing facility for other DOS-designated personnel. This training shall encompass all aspects of operations, maintenance, safety, and repair.

E. Maintenance training shall enable personnel listed in this section to perform routine maintenance and inspection requirements in compliance with manufacturers' requirements.

F. Maintenance or repair that is not considered routine shall not be attempted without consultation with manufacturer and not by other than factory technicians or post personnel adequately trained for all safety and procedural precautions. Prepare and coordinate planned activities with post Security and Facility Maintenance management.

G. Manufacturer shall make available annual refresher or re-certification Maintenance training for personnel identified in Paragraph on "Maintenance Training" above.

H. System upgrades that require more than four hours for operator accommodation shall require operator and supervisor training as specified in of this specification as for new system.

END OF SECTION 324003

Certificate of Compliance

Anti-Climb Gate Systems

Gate Number_____
(Per Construction Documents)

Manufacturer Name and Model Number_____

Serial Number_____

The contractor shall complete the Certificates of Compliance in full prior to acceptance of the Anti-Climb Gates Systems by DOS. A Certificate of Compliance is required for each individual installed product. Each Certificate of Compliance shall be completed by the Installer Team Lead and the Contractor's Quality Control Manager.

		Installer Team Lead Initials / Date	Contractor QC Manager Initials/Date
1	Employees performing the installation meet the specified training and experience qualifications.		
2	Safety meeting was held prior to installation of gates to include fall over protection, protection when working in an entrapment zone and establishing safety zones.		
3	Identification tags have been provided and installed with accurate product and manufacture information		
4	Verify that that there any entrapment zones include an IR, photo eye or other safety sensor.		
5	When Recessed base is used, tracked base or bi-fold base must have unobstructed drainage piping and/or drainage sump pump connected and operational.		
6	Prior to Cycle Testing, all gate system components and controls are fully installed and integrated • Vehicle safety and traffic signal light devices integrated into the post or freestanding • Audible alarms • Secondary control panel (CAC Guard Booth) • Primary override control panel (Post 1 Guard Booth) • Main electrical power/ Backup electrical power		
	Cycle Testing (Minimum 3 Full Cycle Tests)		
7	**Testing procedure from Secondary Control Panel**: 1. Exercise open and close and listen for binding or rubbing. (Minimum open/closed speed 300 mm per second)		
8	2. Check stop & go lights.		

		Installer Team Lead Initials / Date	Contractor QC Manager Initials/Date
9	3. Check open alarm. Leave the gate in the open position. After a preset period (no more than 60 seconds) an alarm will sound from the Secondary unit and from the Primary.		
10	4. Test photo eye, IR, light curtain and all safety sensors, except the primary sensor on the motor that detects it has encountered an immovable object. Test motor sensor only if instructions are provided by the gate manufacturer. a. Open the gate and place a vehicle, or suitable object, so that it is in the path of the light curtain, IR or other safety sensor but not so that it will be struck by the gate. Attempt to close the gate- it should not close. If safety system is tied to an adjacent gate sharing light curtains, test light curtains for operability. Test edge sensors separately using an object but being careful not to get struck.		
11	5. Test the emergency close function. Be sure there is no vehicle or individual standing on or immediately next to the gate and have a safety person control the site. a. PART I: Activate the emergency close, from the open position - the gate should close. b. PART II: Now park a vehicle, or use a suitable object so that it engages the safety detection devices. Then follow PART I sequence - The emergency close function should now override the safety loop or light curtain – the gate should close.		
12	6. Cut all power to and test that the gates can be operated the required minimum number of cycles using the back-up system. Record the number of cycles.		
13	7. Test that the gate will work under generator power.		
14	8. Cut all power and test that the gate can be operated full cycle of the unit under manual function as prescribed within the specification.		
	Testing procedure from Primary Control Panel		

		Installer Team Lead Initials / Date	Contractor QC Manager Initials/Date
15	1. Check same Secondary Control Panel functions 7 thru 13 above from the Primary Control Panel.		
16	2. Check reset function from Primary Control Panel.		
17	Check that the gates interlocking is working and the override as well.

SECTION 324004 – ANTI-RAM GATE SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. The work of this section includes, but is not necessarily limited to, the following elements located in and around Compound Access Control (CAC) facilities at entrance/exit gate locations:

1. Anti-ram gates for passage of vehicles, in and out of the project site, on and off the post.

B. Related Sections include the following:

1. Section 033000 "Cast-in-Place Concrete" for requirements of concrete foundations and other elements of work in and around entrance/exit gates of the perimeter.
2. Section 055005 “Metal Fabrications” for structural steel and metal fabrications required at entrance/exit gate locations.
3. Division 09 Sections for field applied finish work at entrance/exit gate locations.
4. Division 26 Sections for electrical/electronic work as required.
5. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
6. Section 285115 “Security Management System Enterprise (SMSe).”
7. Section 323118 “Decorative Metal Fences and Gates” for coordination with style of other compound fencing work.

1.2 SUBMITTALS

A. General: All manuals, including operator, maintenance, and repair manuals are required in both printed and printable electronic formats. Along with copies required as part of Division 01 “Construction Submittals, deliver two copies of these manuals, incorporating all revisions, with system at time of commissioning. These copies shall be sent via commercial courier service to:

U.S. Department of State
Bureau of Diplomatic Security
Attn: DS/FSE/FSB – Vehicle Barrier Program Manager
SA-24 Kingstown
5800 Barclay Drive
Springfield, Virginia 22315

1. Submit copyright release for all documentation to permit reproduction and use of this material on Department of State internal automated information system networks.

B. Product data for each primary material used in fabricating custom produced elements of the work; along with manufacturers’ descriptive literature for standard or customized products, fabrications, assemblies, devices, and accessory items used to produce work of this section. Include mechanical, electrical, and control data for operative and motorized units, along with spare parts listing and maintenance manuals. Include performance charts and curves. Include complete list

of equipment and materials. Identify applicable industry standards and how they apply to specific components. Include installation instructions.

C. Shop drawings for each type and size of customized fabrication or assembly, showing installation requirements for each element of the work of this section. Show plans, elevations, and sections at not less than 1:20 scale, and details at 1:5 scale. Shop drawings shall contain complete wiring and schematic diagrams; and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationships to the other parts of the work including foundation and clearances for maintenance and operation. Shop drawings must also indicate all applicable accessories and features that are to be provided.

D. Manufacturer's Certification: Documentation that system is tested and certified by ASTM in accordance with Article on QUALITY ASSURANCE. Certified performance compliance documentation, to the extent elements are indicated with specific performance requirements; including actual crash test reports, equivalency certifications, design/analysis calculations, and similar data suitable for the demonstration of performance achievement.

E. Previous Successful Use: Information necessary to document a minimum 1-year successful field operation performance history for each type of vehicle gate installed.

F. Test Reports: Upon completion and testing of the installed system, a test report shall be submitted in booklet form showing all fields tests, including component adjustments and demonstration of compliance with the specified performance criteria. Each test report shall indicate the final position controls.

G. [Maintenance Plan for Corrosive Environments: The manufacturer shall develop and submit a site-specific routine maintenance plan tailored to local conditions and executable by the local labor force. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]

H. [Qualifications for Work in Corrosive Environment: The contractor shall submit evidence that confirms that the gate system can and will operate in the proposed environment and will perform consistently. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]

I. Operation and Maintenance Manuals: Submit Operation and Maintenance data in accordance with Division 01.

1. Operation instructions shall outline the step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacture's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.
2. Maintenance instructions shall include routine maintenance procedures, possible break-downs and repairs, and troubleshooting guide. The instructions shall include piping layout, equipment layout and simplified wiring, and control diagrams of the systems as installed.

J. Spare Parts Data: After approval of the shop drawings the Contractor shall submit spare parts data for each different item of materials and equipment used. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

K. Installer qualification data: Submit resumes of all installers documenting the installers have installed the same gate systems for a DOS project within the last 5 years. The resume must include at least 3 references (including contract information) that can provide verification that the installer has the expertise required to perform a successful installation. The installer's qualifications must be approved by the Project Director/COR with input from OBO/CFSM/SM physical security engineer.

L. Durability Submittals: Submit one of the following based on Contractor's selection, and in accordance with Durability requirements in Article on PERFORMANCE REQUIREMENTS.

1. [Test Reports: Provide independent laboratory test reports using ISO/IEC 17025 (second edition) confirming the gate system meets the performance requirement for operating under specified number of cycles.]
2. [Warranty: Provide warranty for operability.]

M. Training Documentation: Immediately upon completion of Operator and Supervisor training, documentation of training shall be delivered to Project Director/COR of installation. Training documentation shall include:

1. The date and time of the training.
2. A list of the names of the personnel trained.

1.3 QUALITY ASSURANCE

A. Nameplates: The anti-ram gate systems shall have the manufacturer's name, contact for service, and catalog or serial number permanently affixed to a plate securely attached to the equipment in a suitable location.

B. Verification of Dimensions: The Contractor shall become familiar with all details of the work, and verify dimensions in the field as required for coordination.

C. Performance Evaluation: The gate system shall comply with ASTM F 2656, Standard Test Method for Vehicle Crash Testing of Perimeter Barriers, latest revision. Conform to vehicle resistance standards identified in Article on PERFORMANCE REQUIREMENTS."

D. Installer Qualifications: Engage experienced Installer who has completed in last five years anti-ram gate system installation similar in material, design, and extent to that indicated for this Project and with record of successful in-service performance.

E. Label: Each operator shall bear a label indicating that the operator mechanism has been tested for full power and pressure of all hydraulic components, full stress tests of all mechanical components and electrical tests of all overload devices.

F. Source Limitations for Gate Systems: Provide complete gate system and all components (leaf, controls, operator, and accessories) of gate system from single manufacturer or provide integrated gate system designed, assembled, and tested by single manufacturer.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver elements of the perimeter gate facilities to the project with assemblies prefabricated, prefinished, and equipped with devices and accessories to the greatest extent possible. Comply with Government's criteria for packaging, handling, protection, storage, and delivery. Use Manufacturer's export or Ocean Freight crating for shipment protection when available.

B. Store products upright in the original shipping containers, covered, ventilated, and protected from all weather conditions.

1.5 [WARRANTY

A. Special Project Warranty:

1. [Durability: In lieu of testing of the gate system the manufacturer may provide a 5-year comprehensive on-site material and labor warranty from Substantial Completion for any component necessary for continued operation of the gate system.]

2. [Corrosion Resistance: All elements of the gate system shall be designed and constructed to resist these effects for a period of 5 years from Substantial Completion. Should corrosive damage inhibit or halt the operation of the gate system replacement parts or new gate systems shall be shipped to the project site (at no cost to the USG) and installed by qualified installers provided by the manufacturer. The government at its sole discretion may opt to install the manufacturer provided replacement parts, however this will in no way void or alter the warranty.]

1.6 EXTRA MATERIALS

A. Spare parts kit per manufacturer's recommended list.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Provide anti-ram rolling or cantilever gate systems in accordance with ASTM F2656 and the OBO Zoning Code (International Zoning Code as amended by OBO), UL325, and consistent with OBO "Physical Security Detail Handbook."

B. Vehicle Resistance: Provide anti-ram gate systems which are produced by manufacturers who have previously produced, within the last two years, units of similar security attack resistance of equivalent size and resistance ratings, and which have been certified by the Bureau of Diplomatic

Security (DS). Required performance is for a test rating of **[M50] [M40] [M30]** per project location design via speed approach calculations with maximum vehicle penetration of P1. Provide gate capable, in width of operation, of obstructing vehicular traffic in a 4 meter (13 ft) wide traffic lane.

C. Operational Speed: Provide gate and operator which travel at 300mm per second or faster.

D. Frequency of Operation: Anti-ram gate systems shall be capable of operating a minimum of 60 complete open/close cycles per hour.

E. [Corrosion Resistance: When the project site is identified by OBO as being in a moderate or extreme atmospheric corrosion risk location, the components necessary for continued operation of gate systems shall be fabricated to resist corrosion.]

F. Durability: Provide anti-ram gate systems capable of operating for 200,000 continuous cycles without failure of any component necessary for continued operation of gate. Cycle testing shall be performed in configuration where anti-ram gate itself is located in outdoor location that will expose unit to full sunlight and effects of climatic conditions at test facility (pollution, rain, snow, sleet, etc.). Anti-ram gate systems shall be capable of operating minimum of 60 complete open/close cycles per hour.

G. Control Circuits: Design control system in such a way that when power fails gate maintains "status quo" position. System shall fail neither secure nor safe. On hydraulic gate systems provide fail-safe lock system on hydraulic cylinder which prevents gate from being pushed open in event of hydraulic failure.

H. Back-up and Manual Operation: Control system shall provide back-up and manual operating capability for use in event of power failure. Manual operation of gate shall be simple and without need of special tools or knowledge. Gate shall be capable of being returned to secure position, in manual mode, in no more than 5 minutes.

I. Individual anti-ram gate systems cannot serve as sole vehicle barrier for compound and shall be mated with another Department of State approved vehicle barrier system which, in conjunction, is capable of providing EFO protection of 1.5 seconds or less.

2.2 MATERIALS, GENERAL

A. Steel Shapes, Plates, and Bars: ASTM A 36; except where otherwise indicated, and as follows:

1. Where indicated as "high-strength" steel, provide shapes, plates, and/or bars complying with ASTM A 588, Grade C, 34.9 kg/sq. mm (50 ksi) yield strength.
2. Where indicated as tubular "high-strength" steel, provide shapes, sizes, and wall thicknesses as indicated complying with ASTM A 618, Grade Ib; 34.9 kg/sq. mm (50 ksi) yield strength.

B. Steel Finishes: Hot-dip galvanize all steel components to comply with applicable standards of ASTM A 123/A 123 M for galvanizing steel products and ASTM A 153 A, 153 M for galvanizing steel hardware.

C. Welding Rods and Bare Electrodes: Provide type recommended by AWS specifications, for the metal and alloy being welded in each element of the fabrications.

D. Bolts and Fasteners: ASTM A 320, AISI Type 300-series stainless steel bolts and nuts. Where within reach of intruders working from attack-side of facilities, including working from inside sally ports, provide non-removable bolt/nut units (not removable by use of commonly available hand tools). Provide stainless steel washers.

E. Concrete Inserts: Furnish anchorage units to be placed in concrete substrates, of hot-dip galvanized cast-iron/malleable-iron body, design/type as indicated; ASTM A 153 zinc coating, ASTM A 47 casting.

F. Setting/Anchoring Cement: Provide non-shrinking, non-staining, hydraulic-controlled expansion-type cementitious compound; factory prepackaged for mixing with water at project for a pourable and trowellable mix, recommended by manufacturer for exterior exposure (ASTM C 109).

G. Aluminum Extrusions: ASTM B 221, Alloy 6005, Temper T5 or T6; sizes, shapes, and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

H. Stainless Steel Tubing: ASTM A 269, AISI Type 304; sizes and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

I. Coatings for Fabricated Steel: Provide galvanized coating including chemical cleaning complying with SSPC-SP1, followed by pickling treatment complying with SSPC-SP8, followed by hot-dip zinc coating complying with ASTM A 123. Provide prime coat recommended by finish coat manufacturer consisting of hot-phosphate solution treatment, followed by chrome-acid rinse, and followed by dip-metal primer coating which is oven dried for 30 minutes at 150 deg C (300 deg F). Provide special finish coating of polyester or acrylic enamel, electrostatically applied and baked on in accordance with coating manufacturer's instructions to dry film thickness of 1.5 mils (0.038 mm); color as indicated or, if not otherwise indicated, as selected by Project Director/COR from submission of available colors. Finish steel fasteners and accessories with same or equivalent finish.

1. Provide touch-up paint with each painted gate.

J. Gate panels and gate operators shall conform to UL325. Gate operators shall be listed by a testing laboratory.

K. Use high speed gate operators on UL 325, Class III and Class IV installations only.

2.3 GATE FABRICATION

A. General: Fabricate anti-ram gates at the factory to the greatest extent possible, including interfacing, supporting, and anchorage provisions as required for installation. Fabricate to comply with indicated performance requirements. Disassemble only to the extent required for handling, delivery, and installation. Provide anti-ram gate systems with all components designed and

assembled by the gate manufacturer. The entire gate system shall be a complete kit warrantied by the gate manufacturer.

B. Fabricate gates as follow:

1. Use only electric, hydraulic, or pneumatic drive systems for anti-ram gate systems.
2. Provide 24 VDC, battery backed-up control circuitry.
3. Provide system which retains gate in current position when there is a power failure.
4. Provide a system for back-up for the control systems, and for manual operation of gate when there is a power failure.
5. Provide lifting points for maintenance.
6. Hydraulic Lines: Where power and hydraulic lines are required and are below grade, protect lines with rigid electrical conduit. Where temperatures will exceed 38 degrees C (100 degrees F) for extended periods of time, provide a cooling unit for the hydraulic fluid as recommended by the manufacturer.
7. Provide disconnect switch in secure location.
8. Fabricate gate panels and supporting elements and appurtenances so that a 130mm diameter sphere cannot pass through any portion of the gate panel or any location where the gate panel interfaces with the surrounding construction (on the attack side), including where the gate panel meets the ground.
9. Fabricate units with member sizes, shapes, and spacings as shown, and with overall dimensions of each unit as shown. Provide vehicle gates with anti-climb protection, and which comply with UL325 and ASTM F2200.
10. Fabricate fencing component of gate to be coordinated with and to complement the style of fencing work that is part of perimeter barrier or used in other portions of the compound; see Section 323118 “Decorative Metal Fences and Gates.”
11. Ease exposed edges of fabricated metal elements to approximately 0.8mm (1/32-inch) radius, prior to finishing.
12. Avoid the use of bolts and screws exposed and accessible from the exterior (attack side) of fabricated units. Where unavoidable, provide non-removable (with ordinary hand tools) type fasteners in the assembly.
13. Provide matching padlock eyes for each (closed) gate, located on inside (secure side) of fence except where indicated as exterior.
14. Design load bearing gate to be easily serviceable and to withstand dead/live load with minimum safety factor of 2. Minimum two, tandem (truck style) V-wheel assemblies per gate leaf, 150 mm diameter steel machined wheels with sealed roller bearings and pivoting brackets, 2200 kilogram minimum capacity.
15. Guide or support wheels shall utilize nylon or synthetic roller and sealed maintenance free bearings and be capable of up and down movement to compensate for uneven tracks, providing constant engagement with the gate leaf as it travels.
16. V-track should be poured in place, level, plumb and straight and run the continuous length of both full open and full closed gate travel.
17. **[Ice Melting: Provide in-ground ice/snow melting capability in the sallyport and sidewalks surrounding the CACs when located in a heavy snow/ice environment.]**
18. Provide lane indicator lights, red and green, to indicate the direction of traffic when more than one lane of traffic exists in the sallyport.
19. Provide physical stop at both ends of the gate assembly.
20. Provide limit switches.

21. Provide “open gate annunciator”, voice annunciator that signals that the gate has been left open after 60 seconds in the open position. For perimeter gates the annunciator shall annunciate; “the perimeter gate is open.” For compound side sallyport gates, the annunciator shall annunciate: “the compound gate is open.”

2.4 GATE OPERATOR

A. General: Design operator for continuous duty in high-cycle applications and require low maintenance. Operation shall be by means of a metal rail passing between a pair of solid metal wheels with polyurethane treads. Operator motors shall be hydraulic, and system shall not include belts, pulleys, roller chains or sprockets to transfer power from operator to gate panel or approved equal. The operator shall be capable of actuating gates up to 5 meters in overall length. The gate operator shall feature a ‘soft start’ and ‘soft stop’ to minimize shock loads to the gate and maximize hardware life.

1. The housing cover shall be able to accept a lock. All operator cover locks are to be keyed alike.
2. Remote or separate hydraulic or battery enclosures shall feature a lockable enclosure.
3. Chassis: 6mm (0.25 inch) steel base plate and 2.66 mm (12 gauge) sides and back welded and ground smooth.
4. The housing and chassis shall be galvanized per ASTM 123M for corrosion resistance in all environments.
5. Electrical enclosure: Oversized, metal, with hinged lid gasketed for protection from intrusion of foreign objects and providing ample space for the addition of accessories.
6. Hydraulic fluid: High performance type with viscosity index greater than 375 and temperature range -40 C to 75 C degrees (-40 F to 175 F).
7. All components shall have overload protection.
8. Control circuit: 24VDC.
9. Built-in “warn before operate” system.
10. User relay outputs options, “gate open 60 sec” alert and “gate operator tamper switch” for connection to user control panels.
11. Display for system configuration and reporting of control status.
12. Heating and Cooling System: Provide heating and cooling system per manufacturers' recommendations.
13. Hydraulic systems featuring an accumulator to accomplish the required two complete cycles after primary power failure shall also include a hand pump to manually recharge the accumulator once depleted.
14. Hydraulic systems featuring an accumulator to accomplish the required two complete cycles after primary power failure shall feature a battery or UPS system to maintain electrical control function for automatic operation of the gate after primary power loss. Requiring manual actuation of hydraulic valves shall not be acceptable during accumulator or battery driven operations.
15. Fully battery-operated gate operators are considered equal to accumulator supported systems, but must meet same post power failure, cycle and control performance criteria.
16. Manual Operation: Provide gate operating system with capability of disengaging the drive mechanism without the use of tools, so that the gate can be manually operated. The release

mechanism must not be accessible from the threat side of the gate. The gate panel shall be securely locked in place any time the drive assembly is engaged.

17. Gate operation systems which feature any significant components housed below grade shall include a sump pump.

2.5 CONTROL SYSTEMS

A. Provide touch screen control systems capable of the operations identified in this Article.

B. Gate Control: Provide fabricated perimeter gates that are capable of being controlled remotely from the Secondary control panel within the CAC guard booth with override capabilities from the Primary control panel in MSG post 1. The emergency switch or switches for the Secondary control must not be equipped with reset capability.

C. Provide a Secondary control panel at guard booth location with open/close buttons, Emergency Fast Operation (EFO) button (two stage button) and an audible annunciator, which is automatically activated when gate remains in open position in excess of adjustable time period, with adjustment capability up to 60 seconds. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate selection with the architectural and technical security systems design.

D. Provide Primary control panel at Post 1 location with open/close buttons, Emergency Fast Operation (EFO) button and signal light, activated by operation of annunciator signal at CAC location. Provide reset, which can also be used to deactivate signal at CAC. Provide rack mounted controls only; see Section 280508 “Common Work Results for Technical Security Systems” for racks. On dual or multiple lane sally ports or installations with more than two gates provide a custom panel that consolidates controls (separate controls and EFOs required for each gate; however, open gate annunciator may be combined per sally port).

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of gates when in emergency modes. Provide EFO speed of 8 seconds.

F. Provide an “emergency stop” button at both control panels.

G. Primary power failure must not result in any uncommanded motion, activation, or disruption of the gate or controls.

H. Provide an infrared vertical safety light curtain that provides continuous coverage not less than 1067 mm (42 inches) high at each side of the gate (attack and secure). Mount 125 mm (5 inches) above finish grade. Flush or surface mount so that equipment does not project more than 45 mm (1.75 inches). Controls must be configured to stop gate when plane of light curtain is broken, except when EFO system is engaged.

I. Traffic lane indicator light controls (if applicable, multi lane sallyport only).

J. Controls must result in an installation which complies with the operational testing requirements identified in Article on FIELD TESTING.

K. Provide touch screen control systems capable of the following:

1. Provide systems that have programming systems that are editable by end user. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).
2. Provide units capable of being mounted in 480 mm (19”) racks or on a desktop.
3. Open/close control buttons.
4. Emergency Operate Button (EFO): EFO button shall be separate physical two stage button. Each barrier must have its own EFO button.
5. Status Lights: Provide gate status indicators that indicate:

    a. Visual indication light when the gate is in open position.
    b. Visual indication light when the gate is in closed position.
    c. Audio and visual indication signal when gate is in open position for more than 60 seconds.

6. Primary controller: Provide Primary control system in Post 1 or Security Control Center (SCC). Primary control panel shall be capable of overriding Secondary panels. Panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections); custom made control panel units are not permitted. Primary control panel shall not require keys for operation.
7. Secondary controller: Provide Secondary control system in vehicle control booths of CAC’s or other facilities. Secondary control systems shall be capable of being overridden by Post 1 or the SCC. Panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections); custom made control panel units are not permitted. Secondary control panel shall not require keys for operation.
8. Interlocking functions: Provide control systems capable of locking out the sallyport gate open operation when vehicle gate located on perimeter side of sallyport is in open position. Provide two stage button override control of interlocking feature at Post 1 or SCC.
9. Self-diagnostic systems: Provide gate control systems capable of self-diagnosis. Minimum features required are:

    a. Audit Trail: Provide audit trail of open, close, EFO, interlock and reset functions of gate that is easily user interpreted.
    b. Cycle counter: Provide cycle counter that records each cycle of gate. Provide gate cycle counter in gate and in control system. Cycle counter in gate unit shall be readily visible to maintenance staff monitoring gate.
    c. Lifecycle Function: Lifecycle function that alerts the maintenance staff of required or upcoming necessary maintenance.
    d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 “Security Management System Enterprise (SMSe). Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System must require a user ID and Password for access to secure connection.
    e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is

consistent for each of manufacturer's gate systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.

f. Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units. Provide low pressure alarm to warn when pressure has dropped below 4.14 MPa (600 PSI)) in unit.

g. Low oil level monitor: Provide monitor that warns gate operator when oil level in unit is low.

10. Monitor screens: Provide monitors with minimum 175 mm (7 inch) screen size. Monitor screens shall provide clear readable views of controls in bright sunlight and glare conditions. Monitors shall be Thin Film Transistor (TFT) Liquid Chrystal Display (LCD) type, high contrast color screens, 1280 x1024 pixels. Centered under control, provide label of which gate is being controlled (e.g., "Main Perimeter Side Gate "). Text of label shall be clear and easily readable with minimum font size of 24 point, Times New Roman Bold. Directly to left of label, locate gate "OPEN" button. Open button shall be minimum of 20 mm in diameter and labeled below button "OPEN" with clear and easily readable, minimum 32 point font, Times New Roman Bold. Directly to right of label locate gate closed "CLOSE" button. CLOSE button shall be minimum of 20 mm in diameter and labeled below button "CLOSE" with clear and easily readable, minimum 24 point font, Times New Roman Bold.
11. Standardized controllers: Provide controllers capable of operating up to two gates and two barriers per controller unit.
12. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232 and CAT 5 technologies.
13. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting unit or inadvertently triggering system.
14. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.6 ACCESSORIES

A. Gate operator tamper switch.

B. Remote control panel with annunciator, override and reset.

C. Emergency Manual Operation: A hand pump shall be furnished to allow gate to be opened manually in event of prolonged power interruption.

D. Emergency fast operation.

E. Low fluid level switch.

F. Export packaging.

G. Electrical disconnect at the hydraulic unit.

H. Uninterrupted Power Supply (UPS) for Primary and Secondary control panels.

I. Lock for operator cover.

J. Safety light curtain.

K. [Provide Power unit enclosure where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS. Steel enclosure shall be minimum of 2 mm thick steel and provided with DS approved padlock. Enclosure may be custom fabricated if not a standard accessory from power unit manufacturer.]

L. [Heating unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

M. [Cooling unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

PART 3 - EXECUTION

3.1 EXAMINATION, COORDINATION, PREPARATION

A. General: Examine substrate work, being prepared as work of other sections, for the anchorage and support of perimeter gate facilities of this section. Deliver anchorage inserts, sleeves, and other elements to be cast in concrete work, prior to time scheduled for placement of concrete. Furnish instructions, setting diagrams, templates, and/or other information for elements to be installed as work of other sections. Set posts, frames and similar elements plumb, level and true to line and location; and support adequately during placement of concrete.

B. Examine prefabricated units, and preparations made and to be made as work of other Sections, and confirm that interfaces and support of work of this section will achieve performances and align within installation tolerances.

C. Coordinate installation of gate facilities with installation of related work, to ensure optimum sequencing of interfaces.

3.2 INSTALLATION

A. Comply with fabricator's instructions for the handling, protection, assembly, installation, anchorage, and other required interface connections of gate with other work. Set level and plumb, true to line and location. Anchor to develop full-strength resistances against attacks and forced-entry attempts.

1. Install exposed gate hardware, track, and devices with non-removable fasteners, where exposed to attack side. Assemble gate operating equipment and control system for smooth, secure gate movements, with ground-set items anchored in concrete supports. Comply with applicable installation provisions of ASTM F 1184, UL325, and ASTM F2200.

3.3 TESTING AND ADJUSTING

A. Test gate operator through ten full cycles and adjust for operation without binding, scraping, or uneven motion. Test limit switches for proper 'at rest' gate position.

B. Test operate each gate facility operational unit through repeated cycles of operation; and demonstrate operation, controls, safety devices, signals, and other features to Project Director/COR. Provide adjustments as requested to comply with requirements and intended cycles of use and operation.

C. Instructions for testing anti-ram gate systems from Secondary Control Panel:

1. Open and Close and listen for binding or rubbing.
2. Check light curtain for function, reverse, or stop of gate while going closed.
3. Check open gate annunciator. Leave the gate in the open position. After a preset period (no more than one minute) an alarm will sound from the Secondary unit and from the Primary Control Panel. This timer can be set in gate operator panel.
4. Test the emergency close function. Be sure there is no vehicle or individual standing near the gate and have a safety person control the site. Check to make sure all safety functions are disabled while the gate is operating in the emergency mode.

   a. Activate the emergency close, from the open position - the gate should close quickly. Record the time (should be 8 seconds). The Secondary controller should now be inoperative and will have to be reset from the Primary controller in MSG Post I.

5. Test that the gate locks when the power is cut and the back-up system is depleted.
6. Test that the gates and controls will work under generator power from Secondary control station.
7. Test that with power cut to both hydraulic pump and controls that gate functions two full cycles with all AC power shut off.
8. Cut all power to the hydraulic pump or electrical supply and test that the gate can be operated manually.

D. Instructions for testing anti-ram gate systems from Primary Control Panel

1. Test function of traffic lane indicator lights if applicable.
2. Cycle gates Open and Closed while listening for binding or rubbing.
3. Check light curtain for function, reverse, or stop of gate while going close.
4. Check open gate annunciator. Leave gate in open position. After preset period (no more than one minute), an alarm shall sound from Secondary unit and from Primary control panels. This timer can be set in gate operator panel.
5. Test emergency close function; ensure that no vehicles or individuals are standing near gate, and have safety person control site. Ensure that all safety functions are disabled while gate is operating in emergency mode. Activate emergency close from open position; gate should close quickly. Record time; an acceptable closing time is 12 seconds or less. Secondary controller should now be inoperative and will have to be reset from Primary controller in MSG Post 1. Confirm that Secondary panel is completely disabled. Then

confirm that 'reset' button in Primary Control Panel reactivates Secondary Control Panel buttons and switches.

6. Test that gate locks when power is cut and back-up system is depleted.
7. Test that gates and controls work under generator power from Primary Control station.
8. Test that, with power cut to both hydraulic pump (where applicable) and controls, gate still functions two full cycles with all AC power shut off.

3.4 CLEANING AND FINISHING

A. Clean exposed surfaces of gate facilities, including primed surfaces and finished surfaces, exercising care to avoid damage to finishes; touch up minor blemishes in finished surfaces.

B. Refer to Division 09 Section on high-performance coatings for application of field-applied finish coatings over shop-applied primer coatings; not work of this section.

3.5 MANUFACTURER'S SERVICE

A. Services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment supplied shall be available. The representative shall supervise the installation, adjustment, and testing of the equipment.

3.6 TRAINING

A. Operator Training: Manufacturers' representative shall provide initial Operator training to Local Guard Force (LGF) personnel. Training shall be delivered at post of installation within one business day following commissioning of new system. Initial Operator training shall include:

1. Overview of system.
2. Essential controls and displays.
3. Safety precautions.

B. Supervisor Training: Manufacturer's representative shall provide initial Supervisor training for Regional Security Officer (RSO) or designated representative, LGF supervisor, and others as identified by the RSO. This training shall be delivered at post of installation within one business day following commissioning of new system. Initial Supervisor training shall include:

1. Overview of system.
2. Understanding of system's purpose and capabilities.
3. Essential controls and displays.
4. Safety precautions.

C. Maintenance Training: Manufacturer or representative shall provide Maintenance training, including MANUFACTURER'S CERTIFICATION TRAINING to level of "Factory Authorized Technician" status at manufacturer's facility for the following personnel:

1. Two instructional personnel from DS/SECD/TTB.

2. One instructional designer from Instructional Systems Management Branch (DS/TPS/ISM).
3. One DS/C/ST subject matter expert (SME).
4. One person from OBO/CFSM/SM/SCD/TSB.

D. Manufacturer shall provide no less than two additional spaces per each Maintenance training class and/or training at their manufacturing facility for other DOS-designated personnel. This training shall encompass all aspects of operations, maintenance, safety and repair.

E. Maintenance training shall enable personnel listed in this section to perform routine maintenance and inspection requirements, in compliance with manufacturers' requirements.

F. Manufacturer shall make available annual refresher or re-certification Maintenance training for personnel identified in paragraph on "Maintenance Training" above.

G. System upgrades that require more than four hours for operator accommodation shall require operator and supervisor training as specified in of this specification as for new system.

END OF SECTION 324004

SECTION 324007 - ACTIVE ROADWAY BARRIER SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. The work of this section includes, but is not necessarily limited to, the following elements as indicated on Drawings located in compound perimeter at entrance/exit gate locations to control passage of vehicles through compound perimeter:

1. Active anti-ram roadway barriers, for vehicle arrest at sally port configurations in perimeter protection system.

2. Controls:

a. Primary:

1) Interface: **[Physical button][Touchscreen]**.
2) Location Type: **[Rack mounted][Countertop unit]**.

b. Secondary:

1) Interface: **[Physical button][Touchscreen]**.
2) Location Type: **[Rack mounted][Countertop unit]**.

B. Related Sections include the following:

1. Section 033000 "Cast-In-Place Concrete" for requirements of concrete foundations, barriers, fences, slabs, and other elements of work in and around entrance/exit of the perimeter.
2. Section 055005 on “Metal Fabrications.”
3. Division 09 sections for field applied finish work at entrance/exit locations.
4. Division 26 and 27 sections for electrical/electronic work; including lighting, interlocks, communication systems.
5. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
6. Section 285115 “Security Management System Enterprise (SMSe).”

1.2 SUBMITTALS

A. General:

1. Submittals should be accepted by the Project Director/COR prior to procurement of associated items by Contractor; premature procurement is at the risk of Contractor.
2. Use same names for barriers in submittals as used for labels on control system; see Part 2 Article on IDENTIFICATION.
3. Refer to Division 01 Section on Submittals for general administrative requirements.

B. Product Data:

1. Product data for each element of work, whether purchased from other manufacturers or provided as barrier fabricator's standard production. Include data substantiating that products comply with requirements of these specifications.
2. Product data for each primary material used in fabricating custom produced elements of the work; along with manufacturer's descriptive literature for standard or customized products, fabrications, assemblies, devices, and accessory items used to produce work of this Section. Include mechanical, electrical, and control data for operative and motorized units, along with spare parts listing and maintenance manuals. Include performance charts and curves. Include complete list of equipment and materials. Identify applicable industry standards and how they apply to specific components. Provide a copy of the ladder logic or other programming data specific to project installation as part of the as-builts.

C. Shop drawings for each type and size of customized fabrication or assembly, showing installation requirements for each element of the work of this section. Show plans, elevations, and sections at not less than 1:20 scale, and details at 1:5 scale. Shop drawings shall contain complete wiring and schematic diagrams; and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and include the layout of barrier as they related to the sally port, compound access control building, gates to include the foundations interface of the barrier and any overlapping anti-ram fixed elements, and anchorage of equipment and appurtenances, and equipment relationships to the other parts of the work including foundation and clearances for maintenance and operation. Shop drawings must also indicate all applicable accessories and features that are to be provided.

1. Controls: Provide project specific information on controls including type of controls, layout, buttons, panels, monitor screens, indicator lights and labeling. When applicable, show layouts for Primary and Secondary controls. When applicable, for screen controls on monitor screen show graphic representation of controls and layout of each screen. For all controls, provide sequence of operations to include functionality with safety devices and lock-out functionality.

1.3 INFORMATIONAL SUBMITTALS

A. General:

1. Submit Informational submittals at least four weeks prior to installation.
2. Refer to Division 01 Section on submittals for general administrative requirements.

B. Installer Qualification Data: Submit resumes of all installers documenting the installers have installed similar barrier system within the last 5 years. The resume must include at least 3 references (including contract information) that can provide verification that the installer has the expertise required to perform a successful installation and shall include training by the manufacturer for the team leader, as a minimum. The installer's qualifications must be approved by the Project Director/COR with input from an OBO/CFSM/SM physical security engineer.

C. Previous Successful Use: Information necessary to document a minimum 1-year successful field operation performance history for each type of vehicle barrier installed.

D. Manufacturer's Certification: Documentation that system is tested and certified by ASTM in accordance with Article on QUALITY ASSURANCE. Certified performance compliance documentation, to the extent elements are indicated with specific performance requirements; including actual crash test reports, equivalency certifications, design/analysis calculations, and similar data suitable for the demonstration of performance achievement.

1. See also Article 2.1 CORROSION RESISTANCE PERFORMANCE.

a. For stainless steel barriers either provide a barrier that has been tested with the components made of stainless steel or provide a technical evaluation for a mild steel barrier that has been redesigned as a stainless-steel barrier for OBO/PDCS/DE/CSE and DS/PSD/RD review and approval.

1) Manufacturer submittal must include an evaluation of all critical elements, to include structural elements and welds by and licensed PE comparing the "as-tested" design with the stainless-steel design with regards to design crash load. Calculations/Evaluation shall be performed by an independent engineer and stamped.
2) Provide Quality Control Plan demonstrating that the manufacturer has the capability to fabricate stainless-steel and welders that are certified for the type of stainless steel to be used and the anticipated weld lengths per AWS.
3) Once stainless has been reviewed and approved, information noted above in the Article STAINLESS STEEL BARRIER technical evaluation will not be required to be submitted for individual jobs.

E. Anti-ram Test Report: Provide a copy of the complete testing report in booklet form showing all crash tests, rating, results to demonstrate compliance with specified performance criteria.

F. Durability Submittals: Submit one of the following based on Contractor's selection, and in accordance with Durability requirements in Article on PERFORMANCE REQUIREMENTS.

1. [Test Reports: Provide independent laboratory test reports using ISO/IEC 17025 (second edition) confirming the barrier system meets the performance requirement for operating under specified number of cycles.]
2. [Durability Warranty: Provide warranty for durability of operation.]

G. [Corrosion Resistance Warranty: Submit Special Project Warranty as specified. See ARTICLE SPECIAL WARRANTY.]

1.4 CLOSEOUT SUBMITTALS

A. Test Reports: Upon completion and testing of the installed system, a test report shall be submitted in booklet form showing all fields tests, including component adjustments and demonstration of compliance with the specified performance criteria. Each test report shall indicate the final position/location of the primary and secondary controls.

B. All closeout manuals, such as operation and maintenance manuals are required in both printed and printable electronic formats. Along with copies required as part of Division 01 "Construction Submittals, deliver two copies of these manuals, incorporating all revisions, with system at time of commissioning. These copies shall be sent via commercial courier service with one going to the Bureau of Diplomatic Security, address below, and the other to the Department of Sate Commissioning agent, cognizant post or as direct by the US Government contracting officer representative:

U.S. Department of State
Bureau of Diplomatic Security
Attn: DS/FSE/FSB – Vehicle Barrier Program Manager
SA-24 Kingstown
5800 Barclay Drive
Springfield, Virginia 22315

1. Submit copyright release for all documentation to permit reproduction and use of this material on Department of State internal automated information system networks.

C. Operation and Maintenance Manuals: Submit Operation and Maintenance data in accordance with Division 01.

1. Operation instructions shall outline the step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacture's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.
2. Maintenance instructions shall include routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The instructions shall include piping layout, equipment layout and simplified wiring, and control diagrams of the systems as installed.
3. Provide backup copies of all software needed to restore a system.
4. Grant internal distribution rights of all necessary manuals and technical documentation.

D. Spare Parts Data: After approval of the shop drawings the Contractor shall submit spare parts data for each different item of materials and equipment used. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

E. [Maintenance Plan for Corrosive Environments: The manufacturer shall develop and submit a site-specific routine maintenance plan tailored to local conditions and executable by the local labor force. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.

1. Plan shall be based on a 25-year life span and show schedule for full life span.
2. Include routine cleaning schedule and inspection for corrosion, to include arresting chains.
3. Provide instruction for how to repair minor rust of elements and how to determine if an arresting chain needs to be replaced.
4. Provide instruction for inspecting for painted coating and instruction for repair and repaint.]

F. Training Documentation: Immediately upon completion of Operator and Supervisor training, documentation of training shall be delivered to Project Director/COR of installation. Training documentation shall include:

1. The date and time of the training.
2. A list of the names of the personnel trained.

1.5 QUALITY ASSURANCE

A. Nameplates: The vehicle barrier shall have the manufacturer's name, contact for service, and catalog or serial number permanently affixed to a plate securely attached to the equipment in a suitable location.

B. Verification of Dimensions: The Contractor shall become familiar with all details of the work and verify dimensions in the field as required for coordination.

C. Performance Evaluation: The barrier system shall comply with ASTM F 2656, Standard Test Method for Vehicle Crash Testing of Perimeter Barriers, latest revision. Conform to vehicle resistance standards identified in Article on PERFORMANCE REQUIREMENTS.

D. Installer Qualifications: Engage an experienced Installer who has completed in last five years an active roadway barrier system installation similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver elements of the active roadway barrier systems to the project with assemblies prefabricated, prefinished, and equipped with devices and accessories to the greatest extent possible. Comply with Government's criteria for packaging, handling, protection, storage, and delivery.

1.7 [WARRANTY

A. Special Project Warranty:

1. Durability: In lieu of the of the cycles testing, the manufacturer may provide a 5-year comprehensive onsite material and labor warranty for any component necessary for continued operation of the barrier system.
2. Corrosion Resistance: All elements of the active roadway barrier system shall be designed and constructed to resist these effects for a period of 10 years from Substantial Completion. Should corrosive damage inhibit or halt the operation of the barrier system replacement parts or new barrier systems shall be shipped to the project site (at no cost to the USG) and installed by qualified installers provided by the manufacturer. The government at its sole discretion may opt to install the manufacturer provided replacement parts, however this will in no way void or alter the warranty.]

1.8 EXTRA MATERIALS

A. Spare parts kit per manufacturer's recommended list for 1 to 2 barriers to include:

1. Hydraulic Barrier System

a. Power Supply
b. Motor
c. Motor Starter
d. Pressure Switch
e. Starter Overload
f. Control Card/Circuit Board
g. Control Panel
h. Vehicle Loop Detector/Sensor
i. HPU Oil Heater
j. Sump Pump
k. Touch screen
l. Control Panel
m. Any parts required for scheduled maintenance for the first 200,000 cycles.

2. Electro-Mechanical Barrier System

a. Power Supply
b. Actuator
c. Surge Protector
d. Fuses
e. Input Module
f. Output Module
g. IR Sensor Pair (Transmitter and Receiver)
h. Loop Detector Sensor
i. Springs (Minimum 2)
j. Sump Pump
k. Touch screen
l. Control panel
m. Any parts required for scheduled maintenance for the first 200,000 cycles.

B. Spare parts kit per manufacturer's recommended list for 3 or more barriers:

1. Three to four barriers: multiply quantities in Part A by 2
2. Five to six barriers: multiply quantities in Part A by 3
3. **[Six or more barriers: Coordinate/specify quantities with the assistance of OBO/CFSM/SM]**

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Provide active roadway barrier systems in accordance with ASTM F2656 and the OBO Zoning Code.

B. Vehicle Resistance: Provide active roadway barrier systems which are produced by manufacturers who have previously produced, within the last two years, units of similar security attack resistance of equivalent size and resistance ratings, and which have been certified by the Bureau of Diplomatic Security (DS). Required performance is for a test rating of **[M50] [M40] [M30]** per project location design via speed approach calculations with maximum vehicle penetration of P1. Provide barrier capable, in width of operation, of obstructing vehicular traffic in a 4 meter (13 ft) wide traffic lane.

C. Corrosion Resistance Performance

1. Corrosion Risk: As indicated in the Project Contract (e.g., Statement of Work the OBO Building Code Appendix W defined OBO Atmospheric Corrosivity Level for this site is **[Low][Moderate][Extreme]**. The atmospheric corrosion risk exposure risk type for a given component shall be as defined by OBO Building Code R101.1.2 (i.e., direct exterior, indirect exposure to exterior, and interior exposure only).
2. Corrosion Resistance Standards: Provide materials and finishes for the components in accordance with the material specifications of this Specification Section and the general material type as indicated by this article for the project-specific corrosion risk identified above or elsewhere in the Contract Documents.
3. Material Standards for Barrier Components (e.g., inserts, tie rods, hardware, clips and fasteners, steel plates and shapes). As applicable for the OBO Atmospheric Corrosivity Level (ACL) of site and for both direct exterior exposure and indirect exposure to the exterior:

   a. Mild Steel: hot-dipped galvanized coating; low and moderate ACL.
   b. Stainless Steel: low, moderate, and extreme ACL.

4. Exterior Environmental Protection Covers: as applicable for the OBO Atmospheric Corrosivity Level (ACL) of site and for both direct exterior exposure and indirect exposure to the exterior:

   a. Stainless Steel: AISI Type 316/316L, 2101 or 2205; low risk, moderate risk, and extreme ACL.

5. Arresting Chains: hot-dipped galvanized coating; low, moderate, and extreme ACL.
6. For reinforcing steel and concrete: See Article DIVISION 3 CONCRETE.
7. Finish Standards for Components: as applicable for project site.

D. Durability: Provide active roadway barrier systems capable of operating for 200,000 continuous cycles without failure of any component necessary for continued operation of barrier. Cycle testing shall be performed in configuration where active barrier itself is located in outdoor location

that will expose unit to full sunlight and effects of climatic conditions at test facility (pollution, rain, snow, sleet, etc.). Active roadway barrier systems shall be capable of operating a minimum of 60 complete up/down cycles per hour.

E. Provide power-operated barrier activation equipment, which is capable of fully activating the barrier in 4 seconds under normal operating conditions, and which is capable of fully activating the barrier in 1.5 seconds under emergency conditions (EFO). Operation of the emergency activation of the barrier requires a reset of the control system in order to retract the barrier; and that is possible only at primary control panel.

F. Provide system components that accept a full range universal AC power (100 VAC – 240 VAC ± 10 percent, 50 Hz – 60 Hz ± 10 percent).

G. Status Indicators: Vehicle arrest system shall provide a clearly visible device, such as signal light or drop arm, to indicate barrier's status to approaching driver.

H. Provide barrier vehicle detector safety loop to prevent barrier from being accidentally raised under authorized vehicle. This should detect vehicle at any point vehicle is over the barrier.

I. Control Circuits: Design control system in such a way that when power fails barriers maintain "status quo" position. System shall fail neither secure nor safe. On hydraulic barrier systems, provide fail-safe lock system on hydraulic cylinder which prevents barrier from lowering in event of hydraulic failure.

J. Back-up and Manual Operation: Control system shall provide back-up and manual operating capability for use in event of power failure. Back-up operating system shall provide, as a minimum, three complete cycles (up and down) without use of manual system. Manual operation of barrier shall be simple and without need of special tools or knowledge. Barrier shall be capable of being returned to secure position, in manual mode, in no more than 5 minutes. Battery backup systems shall be 24 to 100 volt or less, systems.

K. Reliability: The barrier system must provide maximum dependability and ease of maintenance. The system must be designed to function consistently in all DOS locations throughout the world.

L. Hydraulic Lines: Where power and hydraulic lines are required and are below grade they must be protected with rigid electrical conduit. Where temperatures will exceed 38 degrees C (100 degrees F) for extended periods of time provide a cooling unit for the hydraulic fluid.

M. Installation: The barrier system shall require no more than 600mm (24 inches) to accommodate its foundation.

N. Serviceability: Panels and sealing features mounted on the barrier shall be removable to facilitate maintenance and repair without the use of specialized tools

O. Hydraulic System: The hydraulic system (if so equipped) shall consist of an electrically driven hydraulic pump which shall pressurize a high pressure manifold connected to a hydraulic accumulator. The hydraulic system shall include all necessary control and logic devices, lines and valves to override and lock out the normal speed control for emergence fast operation of the barrier.

P. The Secondary and Primary controls must have an emergency (fast operation) secure switches for each barrier. The emergency switch or switches for the Secondary control must not be equipped with reset capability.

Q. Environmental Protection of Power Units: Environmental conditions for power units shall not exceed 30 degrees C (86 degrees F) or drop below -5 degrees C (24 degrees F). If units are placed in a building space, the conditions may be achieved either by using HVAC equipment for the space, or by using an enclosure accessory for power unit with heating and cooling unit accessories as needed to maintain the environmental conditions within the enclosed container. If power unit is place outdoors, provide an enclosure as an accessory where necessary to maintain required environmental conditions, and provide heating and cooling units as accessories as needed to maintain the conditions. In addition, in locations subject to exposure to severe weather or to intensive exposure to dirt, sand, and other harmful elements, provide protection through placement in a protected building space with designed features to limit harmful elements, or by placing power unit in an enclosure. Enclosure must be constructed of minimum 3 mm (0.125 inch) thick plate steel, must be capable of being padlocked with a DS approved padlock.

2.2 APPROVED PRODUCTS

A. Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

1. Robotic Security Systems Incorporated (RSSI) RSS-2000 electromechanical vehicle barrier.
2. Delta Scientific Corporation HD300 Phalanx electromechanical vehicle barrier.
3. Delta Scientific Corporation DSC2000 hydraulic vehicle barrier.
4. Delta Scientific Corporation DSC501 hydraulic vehicle barrier.
5. Delta Scientific Corporation DSC207s hydraulic vehicle barrier; this barrier does not comply with the maximum foundation depth requirements of this Section, and therefore its use is subject to written permission from OBO.
6. Ross Security Systems LLC XT-2000 hydraulic vehicle barrier (also known as Heald Viper HD-1).
7. Ross Security Systems LLC XT-1000W5 hydraulic vehicle barrier.

B. Other Active Roadway Barrier Systems approved by the Bureau of Diplomatic Security may be used subject to the requirements of this specification and additional warranty requirements stated in this specification.

2.3 MATERIALS, GENERAL

A. Steel Shapes, Plates, and Bars: ASTM A 36 or ASTM A572; except where otherwise indicated, and as follows:

1. Where indicated as "high-strength" steel, provide shapes, plates, and/or bars complying with ASTM A 588, Grade C, 34.9 kg/sq. mm (50 ksi) yield strength.

2. Where indicated as tubular "high-strength" steel, provide shapes, sizes, and wall thicknesses as indicated complying with ASTM A 618, Grade Ib; 34.9 kg/sq. mm (50 ksi) yield strength.

B. Steel Finishes: Hot-dip galvanize all steel components to comply with applicable standards of ASTM A 123/A 123 M for galvanizing steel products and ASTM A 153/A 153 M for galvanizing steel hardware. This is applicable for all active barriers.

C. Welding Rods and Bare Electrodes: Provide type recommended by AWS specifications, for the metal and alloy being welded in each element of the fabrications.

D. Bolts and Fasteners: ASTM A 320, AISI Type 300-series stainless steel bolts and nuts **[or other corrosive resistant bolts and fasteners where galvanic action is a concern and submit selection for OBO/PDCS/DE/CSE approval]**. Where within reach of intruders working from attack-side of facilities, including working from inside sally ports, provide non-removable bolt/nut units (not removable by use of commonly available hand tools). Provide stainless steel washers.

E. Concrete Inserts: Furnish anchorage units to be placed in concrete substrates, of hot-dip galvanized cast-iron/malleable-iron body, design/type as indicated; ASTM A 153 zinc coating, ASTM A 47 casting.

F. Setting/Anchoring Cement: Provide non-shrinking, non-staining, hydraulic-controlled expansion-type cementitious compound; factory prepackaged for mixing with water at project for a pourable and trowelable mix, recommended by manufacturer for exterior exposure (ASTM C 109).

G. Aluminum Extrusions: ASTM B 221, Alloy 6005, Temper T5 or T6; sizes, shapes, and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

H. Stainless Steel Tubing: ASTM A 269, AISI Type 304; sizes and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

I. Shop Primer Paint: Fabricator's baked-on, lead-free, modified alkyd-base, ferrous-metal primer; which is compatible with finish system specified in Division 09 Sections on painting or high-performance coatings, and which will provide long-term resistance to corrosion from external exposure, and form a firm undercoat for field-applied topcoats after prolonged construction-period exposures. Comply with performance requirements of FS TT-P-645 and with paint manufacturer's instructions for baked-on primer coat material and application.

J. Shop Primer Paint: Organic, zinc-rich coating, with zinc-dust content not less than 80 percent by weight of non-volatile content; with vehicle base selected for compatibility with specified finish coating system. Comply with paint manufacturer's instructions for surface pretreatment materials and methods, and for primer application.

2.4 FABRICATION

A. General: Fabricate active roadway barrier systems at the factory to the greatest extent possible, including interfacing, supporting, and anchorage provisions as required for installation. Fabricate to comply with indicated performance requirements. Disassemble only to the extent required for handling, delivery, and installation.

1. Provide active roadway barrier system with all components designed and assembled by the barrier manufacturer. The entire barrier system shall be a complete kit fully warrantied by the barrier manufacturer.

B. Fabricate active roadway barriers for installation as shown, flush with road surface when retracted. Include the following:

1. Provide signal light to indicate barrier status (activated or retracted) to approaching vehicle driver.
2. Provide a secondary control panel (typically at guard booth location) with open/close buttons, Emergency Fast Operation (EFO) button (two stage button, see Article on ACCESSORIES) and an audible annunciator, which is automatically activated when barrier remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Provide either rack mounted or countertop-installed panels and coordinate selection with the architectural and technical security designs; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks.
3. Provide active roadway barrier system that disarms all safety components of active roadway barrier systems when in emergency mode.
4. Provide a primary control panel (typically at Post 1 location) with open/close buttons, Emergency Fast Operation (EFO) button and signal light, activated by operation of annunciator signal at CAC location; provide reset, which can also be used to deactivate signal at CAC. Provide rack mounted controls only; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. On dual or multiple lane sally ports or installations with more than two anti-ram barriers provide a custom panel that consolidates controls (separate controls and EFO’s required for each barrier; however, open barrier annunciator may be combined per sally port).
5. Provide “open barrier annunciator”, voice annunciator that signals that the barrier has been left down after 60 seconds in the down position. The annunciator shall annunciate; “the barrier is down.”
6. Provide barrier position indicator and power indicator pilot light at both control station locations.
7. Provide 24 V control circuitry of the required cycles per min. rating (depends upon available power source). Provide system which retains barrier in current position when there is a power failure. Provide a system for back-up, such as accumulators and UPS for the controls, and for manual operation of barrier when there is a power failure.
8. Equip control station at MSG guard booth location with audible annunciator, which is automatically activated when barrier remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Equip control station at MSG booth location with signal light, activated by operation of annunciator signal at vehicular compound entry location. Provide reset, which can also be used to deactivate signal at vehicular compound entry location.

9. Provide cooling unit for the hydraulic fluid of the barrier operating system if unit is hydraulic.
10. Provide disconnect switch.
11. Provide limit switch (up/down).
12. Provide safety cover that closes the gap between the barrier top and pit when barrier is in the up position.
13. Electric, hydraulic, or pneumatic drive systems may be used for barrier systems.
14. Provide vehicle barrier system (VBS) control system must have the capability to input normally open dry contacts for the following:

    a. Open command
    b. Close command
    c. EFO command
    d. EFO Reset command

15. Each VBS control system must receive inputs and provide outputs for the following:

    a. Up status indication
    b. Down status indication
    c. EFO Activated indication

16. All indoor components must function in a temperature range of 24 °F to 95 ˚F (-4 °C to 35 °C).
17. All outdoor components must function in a temperature range of -20 °F to 130 °F (-29 °C to 54 °C).
18. Each primary and secondary controller must provide a visual indicator/light for each system to show an over-current alarm, if applicable.
19. The primary operator station must provide a visual indication with audible warning annunciator for loss of the communications link between the control system and the barrier system. The indicator and annunciator must identify which unit and activate within two seconds of data communications loss.
20. The primary operator station must provide a visual indicator/light with audible warning annunciator alerting the user to debris/water that could potentially hamper barrier operation. Where applicable, the VBS controller system must discretely indicate to which power unit this alarm applies.
21. When temperature status is out of the normal operating range as recommended by the manufacturer, the primary operator station must provide a visual indication with audible warning annunciator. Where applicable, the VBS controller system must discretely indicate which power unit this alarm applies to.
22. Provide an alarm and indicate the alarm to the primary operator station to warn of necessary maintenance of any kind that the barrier is designed to schedule or detect.
23. Provide a record of all events/alarms (that it is capable of recording) of forensic analysis for troubleshooting purposes for the system and maintain in a memory storage accessible only to admin/maintenance personnel for at least 90 days preceding the present day. Where applicable, the VBS controller system must discretely indicate to which power unit this alarm applies.
24. Provide IP-addressable via an Ethernet connection using IPv4 or IPv6 transport protocols.

a. The VBS must use Network Time Protocol to allow the barrier system clock to synchronize with an external network-connected time source.
b. The VBS must use Simple Network Management Protocol (both SNMPv2 and SNMPv3) to monitor barrier system attributes, diagnostics, and status, and provide a Management Information Base file.
c. The VBS must provide access to audit trails, diagnostic information, and maintenance data through a touch-screen (if provided) and using a locally connected computer or network via an Ethernet port.
d. Provide a digital or computerized counter to record each up/down cycle of the active vehicle barrier.
e. Any included API/SDK must include alerts for maintenance, audit trails, diagnostics, etc.
f. The VBS must provide secure login for administrators and operators using unique usernames and passwords to configure or query for status and diagnostic information. Implementation of any fixed, non-changeable passwords is not allowed. See the following examples:
g. Level 1 – Normal operations
h. Level 2 – Secondary
i. Level 3 – Primary
j. Level 4 – Administrative
k. The VBS must provide auto login feature for operators/Level 1 users.
l. The VBS shall NOT use proprietary wire and/or wiring harnesses.

25. The following are optional requirements that may be required features in the future:

a. Provide a lifecycle function that alerts to required or upcoming maintenance.
b. Provide a RADIUS and Lightweight Directory Access Protocol to allow an external server to centrally control, authenticate, and authorize remote logins. Locally-stored usernames and passwords must be allowed in case the authenticating server is not available.
c. Provide a system log to send text-based audit, status, and diagnostic messages to an external receiving server.
d. Provide/use Telnet and Secure Shell (SSH), and the capability to disable, to provide a command line interface for administrators and operators.

26. The following are allowed but not required:

a. The VBS may use Hypertext Transfer Protocol (HTTP) and Secure Sockets Layer to authenticate and authorize administrators and operators. Vendor must provide capability to disable HTTP if using HTTPS.
b. The VBS may provide native Application Programming Interface (API) or Software Development Kit (SDK) for third party PSIM integration.

2.5 TOUCH SCREEN CONTROL SYSTEMS

A. If selected for use on the project, provide touch screen control systems capable of the operations identified in this Article.

B. Barrier Control: Provide fabricated anti-ram barriers that are capable of being controlled remotely from the secondary control panel (typically located within the CAC guard booth). Provide override capabilities from the Primary control panel (typically located within MSG post 1).

1. Provide units capable of being mounted in 480 mm (19") racks or on desktop. As required, provide rack mounted controls per Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. On dual or multiple lane sally ports or installations with more than two barriers, provide a custom panel that consolidates controls (separate controls and EFOs required for each barrier; however, open barrier annunciator may be combined per sally port).
2. Provide systems that have programming systems that can be adapted by end user with updated ladder logic programming from manufacturer. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).

C. Provide a secondary control panel with the following:

1. Emergency Operation (EFO) button for each barrier location (toggle switch with flip cover) (located above touchscreen and not part of the touchscreen)
2. Open button
3. Close button
4. Barrier status indicator on the screen. (i.e., open, close)

   a. Visual indication light when barrier is in open position.
   b. Visual indication light when barrier is in closed position.
   c. Audio and visual indication signal when barrier is in open position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barrier remains in the open position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. The emergency switch or switches for the secondary control must not be equipped with reset capability.
7. Provide either rack mounted or countertop-installed panels; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. Coordinate design and selection with architectural and technical security systems design.

D. Provide a Primary control panel with the following:

1. Emergency Operation (EFO) button for each barrier location (toggle switch with flip cover) (located above touchscreen and not part of the touchscreen)
2. Open button
3. Close button
4. Barrier status indicator on the screen. (i.e., open, close)

   a. Visual indication light when barrier is in open position.
   b. Visual indication light when barrier is in closed position.
   c. Audio and visual indication signal when barrier is in open position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barrier remains in the open position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. EFO reset button
7. Capable of overriding and disabling the secondary panel.
8. Provide either rack mounted or countertop-installed panels; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. Coordinate design and selection with architectural and technical security systems design.

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of barrier when in emergency modes. Provide EFO speed per performance section.

F. Primary and secondary control panels shall not require keys for operation.

G. Primary and secondary panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections).

H. Monitor screens: Provide monitors with minimum 175 millimeter minimum (7 inch) diagonal screen size. Monitor screens shall provide clear readable views of controls in bright sunlight and glare conditions. Monitors shall be Thin Film Transistor (TFT) Liquid Chrystal Display (LCD) type, high contrast color screens, 1280 x 1024 pixels. Each monitor shall depict barrier being controlled, at top of the screen, via video input so that barrier operator can view the barrier operation via screen. Directly below view of the barrier, centered under this view, provide label of which barrier is being controlled (e.g., "Main CAC Barrier"). Text of label shall be clear and easily readable with minimum 10mm, Times New Roman Bold. Directly to left of label, locate barrier "UP" button. UP button shall be minimum of 25 mm in diameter and labeled below button "UP" with clear and easily readable, minimum 15 mm, Times New Roman Bold. Directly to right of label locate barrier "DOWN" button. DOWN button shall be minimum of 25 mm in diameter and labeled below button "DOWN" with clear and easily readable, minimum 15 mm, Times New Roman Bold.

I. System processing control unit:

1. Self-diagnostic systems: Provide barrier control systems capable of self-diagnosis. Minimum features required are:

   a. Audit Trail: Provide audit trail of up, down, EFO, interlock, and reset functions of barrier that is easily user interpreted.
   b. Cycle counter: Provide cycle counter that records each cycle of barrier. Provide barrier cycle counter in barrier and in control system. Cycle counter in barrier unit shall be readily visible to maintenance staff monitoring barrier.
   c. Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
   d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 "Security Management System Enterprise (SMSe)." Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require user ID and Password for access to secure connection.

e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer's barrier systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
f. Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units. Provide low pressure alarm to warn when pressure has dropped below 4.14 MPa (600 PSI) in unit.
g. Low oil level monitor: Provide monitor that warns barrier operator when oil level in unit is low.

2. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232 and CAT 5 technologies.
3. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting unit or inadvertently triggering system.
4. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.6 PUSH BUTTON CONTROL SYSTEMS

A. If selected for use on the project, provide push button control systems capable of operations identified in this Article.

B. Barrier Control: Provide fabricated anti-ram barriers that are capable of being controlled remotely from the secondary control panel (typically located within the CAC guard booth). Provide override capabilities from the Primary control panel (typically located within MSG post 1).

1. Provide units capable of being mounted in 480 mm (19 inch) racks or on desktop. As required, provide rack mounted controls per; Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. On dual or multiple lane sally ports or installations with more than two barriers provide a custom panel that consolidates controls (separate controls and EFOs required for each barrier; however, open barrier annunciator may be combined per sally port).
2. Provide systems that have programming systems that can be adapted by end user with updated ladder logic programming from manufacturer. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).

C. Provide a secondary control panel with the following:

1. Emergency Operation (EFO) button for each barrier location (toggle switch with flip cover)
2. Open button (green) minimum 22 mm diameter
3. Close button (red) minimum 22 mm diameter
4. Barrier status indicator light. (i.e., open, close)

a. Visual indication light when barrier is in open position.
b. Visual indication light when barrier is in closed position.

c. Audio and visual indication signal when barrier is in open position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barrier remains in the open position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. The emergency switch or switches for the secondary control must not be equipped with reset capability.
7. Provide either rack mounted or countertop-installed panels; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. Coordinate design and selection with architectural and technical security systems design.

D. Provide a Primary control panel with the following:

1. Emergency Operation (EFO) button for each barrier location (toggle switch with flip cover)
2. Open button (green) minimum 22 mm diameter
3. Close button (red) minimum 22 mm diameter
4. Barrier status indicator light. (i.e., open, close)

a. Visual indication light when barrier is in open position.
b. Visual indication light when barrier is in closed position.
c. Audio and visual indication signal when barrier is in open position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barrier remains in the open position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. EFO reset button (black) minimum 22 mm diameter.
7. Capable of overriding and disabling the secondary panel with turn switch (on/off).
8. Provide either rack mounted or countertop-installed panels; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. Coordinate design and selection with architectural and technical security systems design.

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of barrier when in emergency modes. Provide EFO speed per performance section.

F. Primary and secondary control panels shall not require keys for operation.

G. Primary and secondary panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections).

H. System processing control unit:

1. Self-diagnostic systems: Provide barrier control systems capable of self-diagnosis. Minimum features required are:

a. Audit Trail: Provide audit trail of up, down, EFO, interlock and reset functions of barrier that is easily user interpreted.
b. Cycle counter: Provide cycle counter that records each cycle of barrier. Provide barrier cycle counter in barrier and in control system. Cycle counter in barrier unit shall be readily visible to maintenance staff monitoring barrier.

c. Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 "Security Management System Enterprise (SMSe)." Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require user ID and Password for access to secure connection.
e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer's barrier systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
f. Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units. Provide low pressure alarm to warn when pressure has dropped below 4.14 MPa (600 PSI) in unit.
g. Low oil level monitor: Provide monitor that warns barrier operator when oil level in unit is low.

2. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232 and CAT 5 technologies.
3. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting unit or inadvertently triggering system.
4. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.7 IDENTIFICATION

A. Identify name to be used for labels on control system.

2.8 ACCESSORIES

A. Remote control panel with annunciator, override and reset.

B. Emergency Manual Operation: A hand pump shall be furnished to allow the barrier to be raised manually in the event of a prolonged power interruption.

C. Emergency fast operation.

D. Low fluid level switch.

E. Sump Pump: Self priming sump pump to drain water collected in barrier foundation. Pump shall have capacity to remove maximum expected rainfall per minute a distance of 5 meters to discharge drain. Pump operating voltage shall be 240 volts, 1 Phase, 50 Hertz.

F. Export packaging.

G. Electrical disconnect at the hydraulic unit.

H. Uninterrupted Power Supply (UPS) for the Primary and Secondary control panels.

I. Safety Interlock Detector: Provide barrier vehicle detector safety loop to prevent barrier from being accidentally raised under authorized vehicle. Detector shall utilize digital logic and have fully automatic tuning for stable and accurate long-term reliability. Output of detector shall delay any barrier rise signal (except for Emergency Fast Operation command) when vehicle is over loop.

J. [Provide Power unit enclosure where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS. The steel enclosure shall be minimum of 2 mm thick steel and provided with DS approved padlock. Enclosure may be custom fabricated if not a standard accessory from power unit manufacturer.]

K. [Heating unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

L. **[Cooling unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]**

PART 3 - EXECUTION

3.1 EXAMINATION, COORDINATION, PREPARATION

A. General: Examine substrate work, being prepared as work of other sections, for the anchorage and support of active roadway barrier systems of this section. Deliver anchorage inserts, sleeves, and other elements to be cast in concrete work, prior to time scheduled for placement of concrete. Furnish instructions, setting diagrams, templates, and/or other information for elements to be installed as work of other sections. Set elements plumb, level and true to line and location; and support adequately during placement of concrete.

B. Examine prefabricated units, and preparations made and to be made as work of other Sections, and confirm that interfaces and support of work of this section will achieve performances and align within installation tolerances.

C. Coordinate installation of active roadway barrier systems with installation of related work to ensure optimum sequencing of interfaces.

3.2 INSTALLATION

A. Comply with fabricator's instructions for the handling, protection, assembly, installation, anchorage, and other required interface connections of active roadway barrier systems with other work. Set level and plumb, true to line and location. Anchor to develop full-strength resistances against attacks and forced-entry attempts.

B. Comply with manufacturer's instructions for the installation of roadway barrier units as shown; and for the mechanical/electrical interconnection of power and control elements. Install units flush with roadway surface, except as otherwise indicated.

3.3 TESTING AND ADJUSTING

A. Test operate each active roadway barrier system operational unit through repeated cycles of operation; and demonstrate operation, controls, safety devices, signals, and other features to Project Director. Provide adjustments as requested to comply with requirements and intended cycles of use and operation.

B. Instructions for testing active roadway barrier systems from Secondary Control Panel

1. Exercise Up and Down and listen for binding or rubbing.
2. Check stop & go lights.
3. Check open alarm. Leave the barrier in the open position. After a preset period (no more than one minute) an alarm will sound from the Secondary unit and from the Primary. This timer can be set in the electrical panel adjacent to the hydraulic pump.
4. Test safety loop or light curtain:

    a. Open the barrier and park a vehicle over the loop but not over the barrier. Attempt to close the barrier - it should not close. If safety system is tied to an adjacent gate sharing light curtains, test light curtains for operability.

5. Test the emergency close function. Be sure there is no vehicle or individual standing on or immediately next to the barrier and have a safety person control the site.

    a. PART I: Activate the emergency close, from the open position - the barrier should snap closed (1.5 sec). Record the time. The Secondary controller should now be inoperative and will have to be reset from the Primary controller in Post I.
    b. PART II: Now park a vehicle over the safety loop but BE SURE NO PART OF THE VEHICLE IS OVER THE BARRIER. Then follow Part I sequence - The emergency close function should now override the safety loop and the sequence should be the same as for Part I.

6. Cut all power to the hydraulic pump and test that the barrier can be operated the required number of cycles using the back-up system. Record the number of cycles.
7. Test that the barrier will work under generator power.
8. Cut all power to the hydraulic pump or electrical supply and test that the barrier can be operated full cycle of the unit under manual function.

C. Instructions for testing active roadway barrier systems from Primary Control Panel

1. Check functions 3 thru 7 above from the Primary.
2. Check reset function from Primary.

3.4 CLEANING AND FINISHING

A. Clean exposed surfaces of active roadway barrier system, including primed surfaces and finished surfaces, exercising care to avoid damage to finishes; touch up minor blemishes in finished surfaces.

B. Refer to Division 09 Sections on painting and on high-performance coatings for application of field-applied finish coatings over shop-applied primer coatings; not work of this section.

3.5 MANUFACTURER'S SERVICE

A. Services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment supplied shall be available. The representative shall supervise the installation, adjustment, and testing of the equipment.

3.6 TRAINING

A. Operator Training: Manufacturers' representative shall provide initial Operator training to Local Guard Force (LGF) personnel. Training shall be delivered at post of installation within one business day following commissioning of new system. Initial Operator training shall include:

1. Overview of system.
2. Essential controls and displays.
3. Safety precautions.

B. Supervisor Training: Manufacturer's representative shall provide initial Supervisor training for Regional Security Officer (RSO) or designated representative, the LGF supervisor, and others as identified by RSO. This training shall be delivered at post of installation within one business day following commissioning of new system. Initial Supervisor training shall include:

1. Overview of system.
2. Understanding of system's purpose and capabilities.
3. Essential controls and displays.
4. Safety precautions.

C. Maintenance Training: Manufacturer or representative shall provide Maintenance training, including MANUFACTURER'S CERTIFICATION TRAINING to level of "Factory Authorized Technician" status at manufacturer's facility for the following personnel:

1. Two instructional personnel from DS/SECD/TTB.
2. One instructional designer from DS/TPS/ISM.
3. One DS/C/ST subject matter expert (SME).
4. One person from OBO/CFSM/SM/SCD/TSB.

D. Manufacturer shall provide no less than two additional spaces per each Maintenance training class and/or training at their manufacturing facility for other DOS-designated personnel. This training shall encompass all aspects of operations, maintenance, safety and repair.

E. Maintenance training shall enable personnel listed in this section to perform routine maintenance and inspection requirements, in compliance with the manufacturers' requirements.

F. The manufacturer shall make available annual refresher or re-certification Maintenance training for personnel identified in Paragraph on "Maintenance Training" above.

G. System upgrades that require more than four hours for operator accommodation shall require operator and supervisor training as specified in this specification as for a new system.

END OF SECTION 324007

Certificate of Compliance

Active Roadway Barrier Systems

Barrier Number_____
(Per Construction Documents)

Manufacturer Name and Model Number_____

Serial Number_____

The contractor shall complete the Certificates of Compliance in full prior to acceptance of the Anti-Ram Vehicle Barrier products by DOS. A Certificate of Compliance is required for each individual installed product. Each Certificate of Compliance shall be completed by the Installer Team Lead and the Contractor's Quality Control Manager.

		Installer Team Lead Initials / Date	Contractor QC Manager Initials/Date
1	Employees performing the installation meet the specified training and experience qualifications.		
2	Identification tags have been provided and installed with accurate product and certification information		
3	Barrier has been installed level and in accordance with the approved shop drawings.		
4	Barrier is located and installed such that the barrier leading edge, when in deployed position, is within maximum allowable horizontal gap of 1200 mm to adjacent anti-ram construction.		
5	Barrier sub grade recessed base cannot accumulate water and has unobstructed drainage piping and/or drainage sump pump connected and operational.		
6	Prior to Cycle Testing, inspect all barrier system components and controls are fully installed and integrated • Barrier device • Vehicle safety and traffic signal light devices • Audible alarms • Secondary control panel (CAC Guard Booth) • Primary override control panel (Post 1 Guard Booth) • Main electrical power/ Backup electrical power • Hydraulic Pump Unit (HPU) • Electro-mechanical control unit • Check and inspect all finishes		
	Cycle Testing (Minimum 3 Full Cycle Tests)		
7	**Testing procedure from Secondary Control Panel**:		

		Installer Team Lead Initials / Date	Contractor QC Manager Initials/Date
	1. Exercise Up and Down and listen for binding or rubbing. (Maximum 3-4 seconds Up)		
8	2. Check stop & go lights.		
9	3. Check open alarm. Leave the barrier in the open position. After a preset period (no more than 60 seconds) an alarm will sound from the Secondary unit and from the Primary. This timer can be set in the electrical panel adjacent to the hydraulic pump.		
10	4. Test safety loop or light curtain: a. Open the barrier and park a vehicle over the loop but not over the barrier. Attempt to close the barrier - it should not close. If safety system is tied to an adjacent gate sharing light curtains, test light curtains for operability.		
11	5. Test the emergency close function. Be sure there is no vehicle or individual standing on or immediately next to the barrier and have a safety person control the site. a. PART I: Activate the emergency close, from the open position - the barrier should snap closed (1.5 sec). Record the time. The Secondary Controller should now be inoperative and will have to be reset from the Primary Controller in Post I. b. PART II: Now park a vehicle over the safety loop but BE SURE NO PART OF THE VEHICLE IS OVER THE BARRIER. Then follow PART I sequence - The emergency close function should now override the safety loop and the sequence should be the same as for PART I.		
12	6. Cut all power to the hydraulic pump or electrical supply and test that the barrier can be operated the required minimum number of cycles using the back-up system. Record the number of cycles.		
13	7. Test that the barrier will work under generator power.		
14	8. Cut all power to the hydraulic pump or electrical supply and test that the barrier can be operated full cycle of the unit under manual function.		
	Testing procedure from Primary Control Panel		
15	9. Check same Secondary Control Panel functions 3 thru 8 above from the Primary Control Panel.		

		Installer Team Lead Initials / Date	Contractor QC Manager Initials/Date
16	10. Check reset function from Primary Control Panel.

[2]Certificate of Compliance is required to be included in the close out submittal.

SECTION 324008 – RISING BOLLARD BARRICADE SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes hydraulic and electromechanical bollard barricade systems as indicated on Drawings.

B. Related Sections include the following:

1. Section 033000 "Cast-In-Place Concrete" for requirements of associated concrete work.
2. Division 09 sections for field applied finish work.
3. Division 26 and 27 sections for electrical/electronic work; including lighting, interlocks, communication systems.
4. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
5. Section 285115 “Security Management System Enterprise (SMSe).”

1.2 SUBMITTALS

A. General: All manuals, including operator, maintenance, and repair manuals are required in both printed and printable electronic formats. Along with copies required as part of Division 01 “Construction Submittals, deliver two copies of these manuals, incorporating all revisions, with system at time of commissioning. These copies shall be sent via commercial courier service to:

U.S. Department of State
Bureau of Diplomatic Security
Attn: DS/FSE/FSB – Vehicle Barrier Program Manager
SA-24 Kingstown
5800 Barclay Drive
Springfield, Virginia 22315

1. Submit copyright release for all documentation to permit reproduction and use of this material on Department of State internal automated information system networks.

B. Product data for each primary material used in fabricating custom produced elements of the work; along with manufacturer's descriptive literature for standard or customized products, fabrications, assemblies, devices, and accessory items used to produce work of this section. Include mechanical, electrical, and control data for operative and motorized units, along with spare parts listing and maintenance manuals. Include performance charts and curves. Include complete list of equipment and materials. Identify applicable industry standards and how they apply to specific components. Provide programming data, instructions and copy of software used for all PLCs.

C. Shop drawings for each type and size of customized fabrication or assembly, showing installation requirements for each element of the work of this section. Show plans, elevations, and sections at not less than 1:20 scale, and details at 1:5 scale. Shop drawings shall contain complete wiring

and schematic diagrams; and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationships to the other parts of the work including foundation and clearances for maintenance and operation. Shop drawings must also indicate all applicable accessories and features that are to be provided.

D. Manufacturer's Certification: Documentation that system is tested and certified by ASTM in accordance with Article on QUALITY ASSURANCE. Certified performance compliance documentation, to the extent elements are indicated with specific performance requirements; including actual crash test reports, equivalency certifications, design/analysis calculations, and similar data suitable for the demonstration of performance achievement.

E. Previous Successful Use: Information necessary to document a minimum 1-year successful field operation performance history for each type of vehicle barricade installed.

F. Test Reports: Upon completion and testing of the installed system, a test report shall be submitted in booklet form showing all fields tests, including component adjustments and demonstration of compliance with the specified performance criteria. Each test report shall indicate the final position controls.

G. [Maintenance Plan for Corrosive Environments: The manufacturer shall develop and submit a site specific routine maintenance plan tailored to local conditions and executable by the local labor force. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]

H. [Qualifications for Work in Corrosive Environments: The contractor shall submit evidence that confirms that the bollard barricade system can and will operate in the proposed environment and will perform consistently. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]

I. Operation and Maintenance Manuals: Submit Operation and Maintenance data in accordance with Division 01.

1. Operation instructions shall outline the step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacture's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.
2. Maintenance instructions shall include routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The instructions shall include piping layout, equipment layout and simplified wiring, and control diagrams of the systems as installed.

J. Spare Parts Data: After approval of the shop drawings the Contractor shall submit spare parts data for each different item of materials and equipment used. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

K. Product data for each fabricated component of the work, including product data for operating mechanism(s) and all accessory items, fasteners, and applied finishes. Include mechanical and

electrical information along with spare parts listing and maintenance manuals. Provide operating and maintenance Manuals.

L. Certificates for each type of rising bollard barricade system that individual units and assemblies have been certified by the Bureau of Diplomatic Security (DS) for use on DOS projects and achieve the required K/L rating.

M. Installation instructions shall cite all installation and connection criteria, as well as all anchorage components, including minimum embedment and minimum edge distance, and shall include alert to installers to avoid cutting of rebar during concrete anchor installation.

N. Samples for verification of factory-applied colored finish(es), other than black and white, as indicated on the Drawings.

O. Installer Qualification Data: Submit resumes of all installers documenting the installers have installed a similar barricade system within the last 5 years. The resume must include at least 3 references (including contract information) that can provide verification that the installer has the expertise required to perform a successful installation. The installer's qualifications must be approved by the Project Director/COR with input from OBO/CFSM/SM physical security engineer.

P. Durability Submittals: Submit one of the following based on Contractor's selection, and in accordance with Durability requirements in Article on PERFORMANCE REQUIREMENTS.

1. [Test Reports: Provide independent laboratory test reports using ISO/IEC 17025 (second edition) confirming the system meets the performance requirement for operating under specified number of cycles.]
2. [Warranty: Provide warranty for operability.]

Q. Training Documentation: Immediately upon completion of Operator and Supervisor training, documentation of training shall be delivered to Project Director/COR of installation. Training documentation shall include:

1. The date and time of the training.
2. A list of the names of the personnel trained.

1.3 QUALITY ASSURANCE

A. Nameplates: The vehicle barricade shall have the manufacturer's name, contact for service, and catalog or serial number permanently affixed to equipment in a suitable location.

B. Verification of Dimensions: The Contractor shall become familiar with all details of the work and verify dimensions in field as required for coordination.

C. Performance Evaluation: The barricade system shall comply with ASTM F 2656, Standard Test Method for Vehicle Crash Testing of Perimeter Barricades, latest revision. Conform to vehicle resistance standards identified in Article on PERFORMANCE REQUIREMENTS.

D. Installer Qualifications: Engage an experienced Installer who has completed in last five years a rising bollard barricade system installation similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

1.4 DELIVERY, STORAGE, AND HANDLING

A. To the greatest extent practicable, deliver rising bollard barricade system to project, prefabricated, assembled, equipped with accessory items, primed for painting, and ready to install. Comply with Government's criteria and manufacturer's recommendations for packaging, handling, storage, and delivery.

B. Store materials as recommended by manufacturer. Permit easy access for inspection and identification. Keep steel members off ground by using pallets, platforms, or other supports. Protect steel members and packaged materials from erosion and deterioration.

1. Store fasteners in a protected place. Clean and re-lubricate bolts and nuts that become dry or rusty before use.
2. Do not store materials on structure in a manner that might cause distortion or damage to members or supporting structures. Repair or replace damaged materials or structures as directed.

1.5 [WARRANTY

A. Special Project Warranty:]

1. [Durability: In lieu of testing of the bollard barricade system the manufacturer may provide a 5-year comprehensive onsite material and labor warranty from Substantial Completion for any component necessary for continued operation of bollard barricade system.]
2. [Corrosion Resistance: All elements of the bollard barricade system shall be designed and constructed to resist these effects for a period of 5 years from Substantial Completion. Should corrosive damage inhibit or halt the operation of the bollard barricade system replacement parts or new bollard barricade systems shall be shipped to the project site (at no cost to the USG) and installed by qualified installers provided by the manufacturer. The government at its sole discretion may opt to install the manufacturer provided replacement parts, however this will in no way void or alter the warranty.]

1.6 EXTRA MATERIALS

A. Spare parts kit per manufacturer's recommended list.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Rising bollard barricade systems shall conform to requirements in accordance with ASTM F2656 and the OBO Zoning Code (International Zoning Code as amended by OBO).

B. Vehicle Resistance: Provide rising bollard barricade systems which are produced by manufacturers who have previously produced, within the last two years, units of similar security attack resistance of equivalent size and resistance ratings, and which have been certified by the Bureau of Diplomatic Security (DS). Required performance is for a test rating of **[M50] [M40] [M30]** per project location design via speed approach calculations with maximum vehicle penetration of P1. Provide barricade capable, in width of operation, of obstructing vehicular traffic in a minimum 4 meter (13 ft) wide traffic lane.

C. [Corrosion Resistance: When the project site is identified by OBO as being in a moderate or extreme atmospheric corrosion risk location, the components necessary for continued operation of gate systems shall be fabricated to resist corrosion.]

D. Durability: Provide rising bollard barricade systems capable of operating for 200,000 continuous cycles without failure of any component necessary for continued operation of barricade. Cycle testing shall be performed in configuration where active barricade itself is located in outdoor location that will expose unit to full sunlight and effects of climatic conditions at test facility (pollution, rain, snow, sleet, etc.). Hydraulic bollard barricade systems shall be capable of operating a minimum of 60 complete up/down cycles per hour.

E. Control Circuits: Design control system in such a way that when power fails, rising bollard barricades maintain "status quo" position. System shall fail neither secure nor safe. On rising barricade systems, provide fail-safe lock system on hydraulic cylinder or electromechanical operating system which prevents barricade from lowering in event of hydraulic or electric failure.

F. Back-up and Manual Operation: Control system shall provide back-up and manual operating capability for use in event of power failure. Back-up operating system shall provide, as a minimum, three complete cycles (up and down) without use of manual system. Manual operation of barricade shall be simple and without need of special tools or knowledge. Barricade shall be capable of being returned to secure position in manual mode in no more than 5 minutes. Battery backup systems shall be 24 to 100 volt.

G. Barricade Height: In its fully deployed, protective mode, barricade shall be minimum of “as tested” height as measured from top of foundation to top of vehicle arresting element of barricade.

H. Barricade Spacing: Provide bollard spacing no greater than “as tested” condition and with space between bollards no greater than 1200mm. Installed in a bollard line, provide no less than number of bollards with respective foundation as the “as tested” condition.

I. Serviceability: Panels and sealing features mounted on barricade shall be removable to facilitate maintenance and repair without use of specialized tools

J. Hydraulic System (if used for system): Hydraulic system shall consist of electrically driven hydraulic pump which shall pressurize high pressure manifold connected to hydraulic accumulator. Hydraulic system shall include all necessary control and logic devices, lines and valves to override and lock out normal speed control for emergence fast operation of barricade.

K. Reliability: Barricade system shall provide maximum dependability and ease of maintenance. Design system to function consistently in all DOS locations throughout the world.

L. Hydraulic Lines (if hydraulic system used): Where power and hydraulic lines are required and are below grade they must be protected with rigid electrical conduit. Where temperatures will exceed 38 degrees C (100 degrees F) for extended periods of time provide a cooling unit for the hydraulic fluid.

M. Secondary and primary controls shall have an emergency (fast operation) secure switches for each barricade. Emergency switch or switches for secondary control shall not be equipped with reset capability.

N. Environmental Protection of Hydraulic and Electrical Power Units: Environmental conditions for power units shall not exceed 30 degrees C (86 degrees F) or drop below -5 degrees C (24 degrees F). If units are placed in building space, conditions may be achieved either by using HVAC equipment for space, or by using enclosure accessory for power unit with heating and cooling unit accessories as needed to maintain environmental conditions within enclosed container. If power unit is place outdoors, provide enclosure as accessory where necessary to maintain required environmental conditions, and provide heating and cooling units as accessories as needed to maintain conditions. In addition, in locations subject to exposure to severe weather or to intensive exposure to dirt, sand, and other harmful elements, provide protection through placement in protected building space with designed features to limit harmful elements, or by placing power unit in an enclosure. Enclosure must be constructed of minimum 3mm (0.125 inch) thick plate steel and must be capable of being padlocked with a DS approved padlock.

2.2 APPROVED PRODUCTS

A. Rising Bollard Barricade Systems approved by the Bureau of Diplomatic Security may be used subject to the requirements of this specification and additional warranty requirements stated in this specification.

2.3 MATERIALS, GENERAL

A. Steel Shapes, Plates, and Bars: ASTM A 36; except where otherwise indicated, and as follows:

1. Where indicated as "high-strength" steel, provide shapes, plates, and/or bars complying with ASTM A 588, Grade C, 34.9 kg/sq. mm (50 ksi) yield strength.
2. Where indicated as tubular "high-strength" steel, provide shapes, sizes, and wall thicknesses as indicated complying with ASTM A 618, Grade Ib; 34.9 kg/sq. mm (50 ksi) yield strength.

B. Steel Finishes: Hot-dip galvanize all steel components to comply with applicable standards of ASTM A 123/A 123 M for galvanizing steel products and ASTM A 153 A, 153 M for galvanizing steel hardware. This is applicable for all active barricades.

C. Welding Rods and Bare Electrodes: Provide type recommended by AWS specifications, for the metal and alloy being welded in each element of the fabrications.

D. Bolts and Fasteners: ASTM A 320, AISI Type 300-series stainless steel bolts and nuts. Where within reach of intruders working from attack-side of facilities, including working from inside sally ports, provide non-removable bolt/nut units (not removable by use of commonly available hand tools). Provide stainless steel washers.

E. Concrete Inserts: Furnish anchorage units to be placed in concrete substrates, of hot-dip galvanized cast-iron/malleable-iron body, design/type as indicated; ASTM A 153 zinc coating, ASTM A 47 casting.

F. Setting/Anchoring Cement: Provide non-shrinking, non-staining, hydraulic-controlled expansion-type cementitious compound; factory prepackaged for mixing with water at project for a pourable and trowelable mix, recommended by manufacturer for exterior exposure (ASTM C 109).

G. Aluminum Extrusions: ASTM B 221, Alloy 6005, Temper T5 or T6; sizes, shapes, and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

H. Stainless Steel Tubing: ASTM A 269, AISI Type 304; sizes and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

I. Shop Primer Paint: Fabricator's baked-on, lead-free, modified alkyd-base, ferrous-metal primer; which is compatible with finish system specified in Division 09 painting sections, and which will provide long-term resistance to corrosion from external exposure, and form firm undercoat for field-applied topcoats after prolonged construction-period exposures. Comply with performance requirements of FS TT-P-645 and with paint manufacturer's instructions for baked-on primer coat material and application.

J. Shop Primer Paint: Organic, zinc-rich coating, with zinc-dust content not less than 80 percent by weight of non-volatile content; with vehicle base selected for compatibility with specified finish coating system. Comply with paint manufacturer's instructions for surface pretreatment materials and methods, and for primer application.

2.4 FABRICATION

A. General: Fabricate rising bollard barricade systems at the factory to greatest extent possible, including interfacing, supporting, and anchorage provisions as required for installation. Fabricate to comply with indicated performance requirements. Disassemble only to extent required for handling, delivery, and installation.

B. Provide rising bollard barricade systems that disarm all safety components of rising bollard barricade systems when in emergency mode.

C. Provide rising bollard barricade systems with all components designed and assembled by the barrier manufacturer. The entire barrier system shall be a complete kit fully warrantied by the barrier manufacturer.

D. Fabricate rising bollard barricade systems for installation as shown, flush with road surface when retracted. Include the following:

1. Provide signal light to indicate barricade status (activated or retracted) to approaching vehicle driver.
2. Provide power-operated barricade activation equipment, which is capable of fully activating the barricade in 5 seconds under normal operating conditions, and which is capable of fully activating the barricade in 1.5 seconds (for hydraulic systems) or 2 seconds (for electromechanical systems) under emergency conditions. Provide primary activation push button control station located in guard booth at barricade (secondary control unit), and overriding activation control station located at Post 1 (primary control unit) in Embassy Office Building. Operation of emergency activation at barricade requires reset of control system to retract barricade; that is possible only at Post 1.
3. Provide secondary control panel at guard booth location with open/close buttons, Emergency Fast Operation (EFO) button, and audible annunciator, which is automatically activated when barricade remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Provide either rack mounted or countertop-installed panels and coordinate selection with architectural and technical security designs; see Section 280508 “Common Work Results for Technical Security Systems (TSS).”
4. Provide primary control panel at Post 1 location with open/close buttons, Emergency Fast Operation (EFO) button and signal light, activated by operation of annunciator signal at CAC location; provide reset, which can also be used to deactivate signal at CAC. Provide rack mounted controls only; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. On dual or multiple lane sally ports or installations with more than two anti-ram barricade systems, provide custom panel that consolidates controls (separate controls and EFO’s required for each barricade; however, open barricade annunciator may be combined per sally port).
5. Provide barricade position indicator and power indicator pilot light at both control station locations.
6. Provide 24 V control circuitry of required cycles per min. rating (depends upon available power source). Provide system which retains barricade in current position when there is power failure. Provide system for back-up, such as accumulators and UPS for the controls, and for manual operation of barricade when there is power failure.
7. Equip control station at guard booth location with audible annunciator, which is automatically activated when barricade remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Equip control station at MSG booth location with signal light, activated by operation of annunciator signal at vehicular compound entry location. Provide reset, which can also be used to deactivate signal at vehicular compound entry location.
8. Provide cooling unit for hydraulic fluid of barricade operating system if unit is hydraulic.
9. Provide disconnect switch.

10. Provide limit switch (up/down).
11. Provide safety cover that closes the gap between the barricade top and pit when barricade is in the up position.
12. Electric, hydraulic, or pneumatic drive systems may be used for barricade systems.

2.5 TOUCH SCREEN CONTROL SYSTEMS

A. If selected for use on the project, provide touch screen control systems capable of the operations identified in this Article.

B. Barricade Control: Provide fabricated anti-ram rising bollard barricades that are capable of being controlled remotely from the secondary control panel (typically located within the CAC guard booth). Provide override capabilities from the Primary control panel (typically located within MSG post 1).

1. Provide units capable of being mounted in 480 mm (19”) racks or on desktop. As required, provide rack mounted controls per Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. On dual or multiple lane sally ports or installations with more than two barricades, provide a custom panel that consolidates controls (separate controls and EFOs required for each barricade; however, open (down) barricade annunciator may be combined per sally port).
2. Provide systems that have programming systems that can be adapted by end user with updated ladder logic programming from manufacturer. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).

C. Provide a secondary control panel with the following:

1. Emergency Operation (EFO) button for each barricade location (toggle switch with flip cover) (located above touchscreen and not part of the touchscreen)
2. Open (down) button
3. Close button
4. Barricade status indicator on the screen. (i.e., open, close)

    a. Visual indication light when barricade is in open (down) position.
    b. Visual indication light when barricade is in closed (up) position.
    c. Audio and visual indication signal when barricade is in open (down) position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barricade remains in the open (down) position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. The emergency switch or switches for the secondary control must not be equipped with reset capability.
7. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate design and selection with architectural and technical security systems design.

D. Provide a Primary control panel with the following:

1. Emergency Operation (EFO) button for each barricade location (toggle switch with flip cover) (located above touchscreen and not part of the touchscreen)
2. Open (down) button
3. Close button
4. Barricade status indicator on the screen. (i.e., open, close)

    a. Visual indication light when barricade is in open (down) position.
    b. Visual indication light when barricade is in closed (up) position.
    c. Audio and visual indication signal when barricade is in open (down) position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barricade remains in the open (down) position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. EFO reset button.
7. Capable of overriding and disabling the secondary panel.
8. Provide either rack mounted or countertop-installed panels; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. Coordinate design and selection with architectural and technical security systems design.

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of barricade when in emergency modes. Provide EFO speed per performance section.

F. Primary and secondary control panels shall not require keys for operation.

G. Primary and secondary panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections).

H. Monitor screens: Provide monitors with minimum 175 millimeter minimum (7 inch) diagonal screen size. Monitor screens shall provide clear readable views of controls in bright sunlight and glare conditions. Monitors shall be Thin Film Transistor (TFT) Liquid Chrystal Display (LCD) type, high contrast color screens, 1280 x 1024 pixels. Each monitor shall depict barricade being controlled, at top of the screen, via video input so that barricade operator can view the barricade operation via screen. Directly below view of the barricade, centered under this view, provide label of which barricade is being controlled (e.g., "Main CAC Barricade"). Text of label shall be clear and easily readable with minimum 10mm, Times New Roman Bold. Directly to left of label, locate barricade "UP" button. UP button shall be minimum of 25 mm in diameter and labeled below button "UP" with clear and easily readable, minimum 15 mm, Times New Roman Bold. Directly to right of label locate barricade "DOWN" button. DOWN button shall be minimum of 25 mm in diameter and labeled below button "DOWN" with clear and easily readable, minimum 15 mm, Times New Roman Bold.

I. System processing control unit:

1. Self-diagnostic systems: Provide barricade control systems capable of self-diagnosis. Minimum features required are:

a. Audit Trail: Provide audit trail of up, down, EFO, interlock, and reset functions of barricade that is easily user interpreted.
b. Cycle counter: Provide cycle counter that records each cycle of barricade. Provide barricade cycle counter in barricade and in control system. Cycle counter in barricade unit shall be readily visible to maintenance staff monitoring barricade.
c. Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 "Security Management System Enterprise (SMSe)." Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require user ID and Password for access to secure connection.
e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer's barricade systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
f. Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units. Provide low pressure alarm to warn when pressure has dropped below 4.14 MPa (600 PSI) in unit.
g. Low oil level monitor: Provide monitor that warns barricade operator when oil level in unit is low.

2. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232 and CAT 5 technologies.
3. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting unit or inadvertently triggering system.
4. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.6 PUSH BUTTON CONTROL SYSTEMS

A. If selected for use on the project, provide push button control systems capable of operations identified in this Article.

B. Barricade Control: Provide fabricated anti-ram rising bollard barricades that are capable of being controlled remotely from the secondary control panel (typically located within the CAC guard booth). Provide override capabilities from the Primary control panel (typically located within MSG post 1).

1. Provide units capable of being mounted in 480 mm (19 inch) racks or on desktop. As required, provide rack mounted controls per; Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. On dual or multiple lane sally ports or installations with more than two barricades provide a custom panel that consolidates controls (separate controls and EFOs required for each barricade; however, open (down) barricade annunciator may be combined per sally port).

2. Provide systems that have programming systems that can be adapted by end user with updated ladder logic programming from manufacturer. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).

C. Provide a secondary control panel with the following:

1. Emergency Operation (EFO) button for each barricade location (toggle switch with flip cover)
2. Open (down) button (green) minimum 22 mm diameter
3. Close button (red) minimum 22 mm diameter
4. Barricade status indicator light. (i.e., open, close)

   a. Visual indication light when barricade is in open (down) position.
   b. Visual indication light when barricade is in closed (up) position.
   c. Audio and visual indication signal when barricade is in open (down) position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barricade remains in the open (down) position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. The emergency switch or switches for the secondary control must not be equipped with reset capability.
7. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate design and selection with architectural and technical security systems design.

D. Provide a Primary control panel with the following:

1. Emergency Operation (EFO) button for each barricade location (toggle switch with flip cover)
2. Open (down) button (green) minimum 22 mm diameter
3. Close button (red) minimum 22 mm diameter
4. Barricade status indicator light. (i.e., open, close)

   a. Visual indication light when barricade is in open (down) position.
   b. Visual indication light when barricade is in closed (up) position.
   c. Audio and visual indication signal when barricade is in open (down) position for more than 60 seconds.

5. Audible annunciator, which is automatically activated when barricade remains in the open (down) position in excess of adjustable time period, with adjustment capability up to 60 seconds.
6. EFO reset button (black) minimum 22 mm diameter.
7. Capable of overriding and disabling the secondary panel with turn switch (on/off).
8. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate design and selection with architectural and technical security systems design.

E. Provide Emergency Fast Operation (EFO) control system that overrides all safety and obstruction components of barricade when in emergency modes. Provide EFO speed per performance section.

F. Primary and secondary control panels shall not require keys for operation.

G. Primary and secondary panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections).

H. System processing control unit:

1. Self-diagnostic systems: Provide barricade control systems capable of self-diagnosis. Minimum features required are:

   a. Audit Trail: Provide audit trail of up, down, EFO, interlock and reset functions of barricade that is easily user interpreted.
   b. Cycle counter: Provide cycle counter that records each cycle of barricade. Provide barricade cycle counter in barricade and in control system. Cycle counter in barricade unit shall be readily visible to maintenance staff monitoring barricade.
   c. Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
   d. Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 “Security Management System Enterprise (SMSe).” Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require user ID and Password for access to secure connection.
   e. Troubleshooting: Provide systems that have troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer’s barricade systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
   f. Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units. Provide low pressure alarm to warn when pressure has dropped below 4.14 MPa (600 PSI) in unit.
   g. Low oil level monitor: Provide monitor that warns barricade operator when oil level in unit is low.

2. Equipment and components: Provide only programmable logic controllers (PLCs) and other components that are compatible with RS232 and CAT 5 technologies.
3. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting unit or inadvertently triggering system.
4. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.7 ACCESSORIES

A. Remote control panel with annunciator, override and reset.

B. Emergency Manual Operation: Provide hand pump to allow barricade to be raised manually in event of prolonged power interruption.

C. Emergency fast operation.

D. Low fluid level switch.

E. Sump Pump: Provide self-priming sump pump to drain water collected in barricade foundation. Pump shall have capacity to remove maximum expected rainfall per minute a distance of 5 meters to discharge drain. Pump operating voltage shall be 240 volts, 1 Phase, 50 Hertz.

F. Export packaging.

G. Electrical disconnect at the hydraulic unit.

H. Uninterrupted Power Supply (UPS) for the primary and secondary control panels.

I. Safety Interlock Detector: A bollard vehicle detector safety loop shall be supplied to prevent the bollard from being accidentally raised under an authorized vehicle. The detector shall utilize digital logic and have fully automatic tuning for stable and accurate long-term reliability. The output of the detector shall delay any bollard rise signal (except for Emergency Fast Operation command) when a vehicle is over the loop.

J. [Power unit enclosure where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS. The steel enclosure shall be minimum of 2 mm thick steel and provided with DS approved padlock. Enclosure may be custom fabricated if not a standard accessory from power unit manufacturer.]

K. [Heating unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

L. [Cooling unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

2.8 FABRICATION

A. General: Fabricate rising bollard barricade systems at the factory to the greatest extent possible, including interfacing, supporting, and anchorage provisions as required for installation. Fabricate to comply with indicated performance requirements. Disassemble only to the extent required for handling, delivery, and installation.

1. Provide rising bollard barricade system that disarms all safety components of active barricade systems when in emergency mode.
2. Provide rising bollard barricade system with all components designed and assembled by the barrier manufacturer. The entire barrier system shall be a complete kit fully warrantied by the barrier manufacturer.

B. Fabricate rising bollard barricade systems for installation as shown, flush with road surface when retracted. Include the following:

1. Provide power-operated barricade activation equipment, which is capable of fully activating barricade in 5 seconds under normal operating conditions, and which is capable of fully activating barricade in 1.5 seconds under emergency conditions. Provide primary activation push button control station located in guard booth at barricade (secondary control unit), and overriding activation control station located at Post 1 (primary control unit) in Embassy Office Building. Operation of emergency activation at barricade requires reset of control system in order to retract barricade; that is possible only at Post 1.
2. Provide secondary control panel at guard booth location with open/close buttons, Emergency Fast Operation (EFO) button (two stage button, see paragraph on "Emergency Fast Operation Button (EFO)" and audible annunciator, which is automatically activated when barricade remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Provide either rack mounted or countertop installed panels and coordinate selection with the architectural and technical security designs; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks.
3. Provide primary control panel at Post 1 location with open/close buttons, Emergency Fast Operation (EFO) button and signal light, activated by operation of annunciator signal at CAC location; provide reset, which can also be used to deactivate signal at CAC. Provide rack mounted controls only; see Section 280508 "Common Work Results for Technical Security Systems (TSS)" for racks. On dual or multiple lane sally ports or installations with more than two anti-ram barricades provide a custom panel that consolidates controls (separate controls and EFO's required for each barricade; however, open barricade annunciator may be combined per sally port).
4. Provide barricade position indicator and power indicator pilot light at both control station locations.
5. Provide 24 V control circuitry of required cycles per min. rating (depends upon available power source). Provide system which retains barricade in current position when there is power failure. Provide system for back-up, such as accumulators and UPS for the controls, and for manual operation of barricade when there is power failure.
6. Equip control station at MSG guard booth location with audible annunciator, which is automatically activated when barricade remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Equip control station at MSG booth location with signal light, activated by operation of annunciator signal at vehicular compound entry location. Provide reset, which can also be used to deactivate signal at vehicular compound entry location.
7. Provide cooling unit for hydraulic fluid of barricade operating system if unit is hydraulic.
8. Provide disconnect switch.
9. Provide limit switch (up/down).
10. Provide safety cover that closes the gap between the barricade top and pit when barricade is in the up position.
11. Electric, hydraulic, or pneumatic drive systems may be used for barricade systems.

PART 3 - EXECUTION

3.1 EXAMINATION, COORDINATION, PREPARATION

A. General: Examine substrate work, being prepared as work of other sections, for the anchorage and support of rising bollard barricade system of this section. Deliver anchorage inserts, sleeves, and other elements to be cast in concrete work, prior to time scheduled for placement of concrete. Furnish instructions, setting diagrams, templates, and/or other information for elements to be installed as work of other sections. Set posts, frames and similar elements plumb, level and true to line and location, and support adequately during placement of concrete.

B. Examine prefabricated units, and preparations made and to be made as work of other Sections and confirm that interfaces and support of work of this section will achieve performances and align within installation tolerances.

C. Coordinate installation of rising bollard barricade system with installation of related work, to ensure optimum sequencing of interfaces.

3.2 INSTALLATION

A. Comply with fabricator's instructions for the handling, protection, assembly, installation, anchorage, and other required interface connections of rising bollard barricade system with other work. Set level and plumb, true to line and location. Anchor to develop full-strength resistances against attacks.

3.3 TESTING AND ADJUSTING

A. Test operate each set of bollards through repeated cycles of operation, and test operation, controls, safety devices, signals, and other features to Project Director/COR. Provide adjustments as requested to comply with requirements and intended cycles of use and operation.

B. Instructions for testing bollard barricade system from Secondary Control Panel

1. Exercise Up and Down and listen for binding or rubbing.
2. Check open alarm. Leave barricade in the down position. After preset period (no more than one minute) an alarm will sound from secondary unit and from primary. This timer can be set in electrical panel adjacent to hydraulic pump.
3. Test safety loop or light curtain:

   a. Lower barricade and park vehicle over loop but not over barricade. Attempt to raise barricade - it should not rise. If safety system is tied to an adjacent gate sharing light curtains, test light curtains for operability.

4. Test emergency up function. Be sure there is no vehicle or individual standing on or immediately next to barricade and have safety person control site.

a. PART I: Activate emergency up, from down position - barricade should snap up (1.5sec); record time. Secondary controller should now be inoperative and will have to be reset from primary controller in Post I.
b. PART II: Now park vehicle over safety loop but BE SURE NO PART OF VEHICLE IS OVER BARRICADE. Then follow Part I sequence - Emergency up function should now override safety loop and sequence should be same as for Part I.

5. Cut all power to hydraulic pump and test that barricade can be operated required number of cycles using back-up system. Record number of cycles.
6. Cut all power to hydraulic pump or electrical supply and that barricade can be operated full cycle of unit under manual function.
7. Have contractor demonstrate that barricades and controls will work under generator power.

C. Instructions for testing bollard barricade system from Primary Control Panel

1. Check functions 1 thru 5 and 8 above from primary.
2. Check reset function from primary.

3.4 CLEANING AND FINISHING

A. Clean exposed surfaces of rising bollard barricade system, including primed surfaces and finished surfaces, exercising care to avoid damage to finishes; touch up minor blemishes in finished surfaces.

B. Refer to Division 09 Section painting Sections for application of field-applied finish coatings over shop-applied primer coatings; not work of this section.

3.5 MANUFACTURER'S SERVICE

A. Services of a manufacturer's representative who is experienced in installation, adjustment, and operation of equipment supplied shall be available. The representative shall supervise installation, adjustment, and testing of equipment.

3.6 TRAINING

A. Operator Training: Manufacturers' representative shall provide initial Operator training to Local Guard Force (LGF) personnel. Training shall be delivered at post of installation within one business day following commissioning of the new system. Initial Operator training shall include:

1. Overview of system.
2. Essential controls and displays.
3. Safety precautions.

B. Supervisor Training: Manufacturer's representative shall provide initial Supervisor training for Regional Security Officer (RSO) or designated representative, LGF supervisor, and others as

identified by RSO. This training shall be delivered at post of installation within one business day following commissioning of new system. Initial Supervisor training shall include:

1. Overview of system.
2. Understanding of system's purpose and capabilities.
3. Essential controls and displays.
4. Safety precautions.

C. Maintenance Training: Manufacturer or representative shall provide Maintenance training, including MANUFACTURER'S CERTIFICATION TRAINING to level of "Factory Authorized Technician" status at manufacturer's facility for following personnel:

1. Two instructional personnel from DS/SECD/TTB.
2. One instructional designer from DS/TPS/ISM.
3. One DS/C/ST subject matter expert (SME).
4. One person from OBO/CFSM/SM/SCD/TSB.

D. Manufacturer shall provide no less than two additional spaces per each Maintenance training class and/or training at their manufacturing facility for other DOS-designated personnel. This training shall encompass all aspects of operations, maintenance, safety and repair.

E. Maintenance training shall enable personnel listed in this section to perform routine maintenance and inspection requirements, in compliance with manufacturers' requirements.

F. Manufacturer shall make available annual refresher or re-certification Maintenance training for personnel identified in Paragraph on "Maintenance Training."

G. System upgrades that require more than four hours for operator accommodation shall require operator and supervisor training as specified in this specification as for new system.

END OF SECTION 324008

SECTION 324009 - CRASH-RATED DROP ARM SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. The work of this section includes, but is not necessarily limited to, the following elements as indicated on Drawings in and around the gatehouse at entrance/exit gate locations:

1. Crash-rated drop arm barriers for passage of vehicles, in and out of the project site, on and off the post.
2. Use of these systems is limited to seldom utilized secondary compound egress points with prior approval of the Project Director/COR with input from OBO/CFSM/SM physical security engineer.

B. Related Sections include the following:

1. Section 033000 "Cast-In-Place Concrete" for requirements of concrete foundations for drop arms.
2. Section 055005 “Metal Fabrications” for structural steel and metal fabrications required at entrance/exit locations.
3. Division 09 sections for field applied finish work at entrance/exit gate locations.
4. Division 26 and 27 sections for electrical/electronic work; including lighting, interlocks, communication systems.
5. Section 280508 “Common Work Results for Technical Security Systems (TSS).”
6. Section 285115 “Security Management System Enterprise (SMSe)” related to monitoring interface.

1.2 SUBMITTALS

A. General: All manuals, including operator, maintenance, and repair manuals are required in both printed and printable electronic formats. Along with copies required as part of Division 01 “Construction Submittals,” deliver two copies of these manuals, incorporating all revisions, with system at time of commissioning. These copies shall be sent via commercial courier service to:

U.S. Department of State
Bureau of Diplomatic Security
Attn: DS/FSE/FSB – Vehicle Barrier Program Manager
SA-24 Kingstown
5800 Barclay Drive
Springfield, Virginia 22315

1. Submit copyright release for all documentation to permit reproduction and use of this material on Department of State internal automated information system networks.

B. Product data for each primary material used in fabricating custom produced elements of the work; along with manufacturer's descriptive literature for standard or customized products, fabrications, assemblies, devices, and accessory items used to produce work of this section. Include mechanical, electrical, and control data for operative and motorized units, along with spare parts listing and maintenance manuals. Include performance charts and curves. Include complete list of equipment and materials. Identify applicable industry standards and how they apply to specific components. Include installation instructions.

C. Shop drawings for each type and size of customized fabrication or assembly, showing installation requirements for each element of the work of this section. Show plans, elevations, and sections at not less than 1:20 scale, and details at 1:5 scale. Shop drawings shall contain complete wiring and schematic diagrams; and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationships to the other parts of the work including foundation and clearances for maintenance and operation. Shop drawings must also indicate all applicable accessories and features that are to be provided.

D. Manufacturer’s Certification: Documentation that system is tested and certified by ASTM in accordance with article on QUALITY ASSURANCE. Certified performance compliance documentation, to the extent elements are indicated with specific performance requirements; including actual crash test reports, equivalency certifications, design/analysis calculations, and similar data suitable for the demonstration of performance achievement.

E. Previous Successful Use: Information necessary to document a minimum 1-year successful field operation performance history for each type of vehicle barrier installed.

F. Test Reports: Upon completion and testing of the installed system, a test report shall be submitted in booklet form showing all fields tests, including component adjustments and demonstration of compliance with the specified performance criteria. Each test report shall indicate the final position controls.

G. [Maintenance Plan for Corrosive Environments: The manufacturer shall develop and submit a site specific routine maintenance plan tailored to local conditions and executable by the local labor force. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]

H. [Qualifications for Work in Corrosive Environments: The contractor shall submit evidence that confirms that the drop arm system can and will operate in the proposed environment and will perform consistently. Submit when requirements for Corrosion Resistance in Article on PERFORMANCE REQUIREMENTS are applicable.]

I. Operation and Maintenance Manuals: Submit Operation and Maintenance data in accordance with Division 01.

1. Operation instructions shall outline the step-by-step procedures required for system startup, operation, and shutdown. The instructions shall include the manufacture’s name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.

2. Maintenance instructions shall include routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide. The instructions shall include piping layout, equipment layout and simplified wiring, and control diagrams of the systems as installed.

J. Spare Parts Data: After approval of the shop drawings the Contractor shall submit spare parts data for each different item of materials and equipment used. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

K. Installer Qualification Data: Submit resumes of all installers documenting the installers have installed the same crash-rated drop arm systems for a DOS project with the last 5 years. The resume must include at least 3 references (including contract information) that can provide verification that the installer has the expertise required to perform a successful installation. The installer's qualifications must be approved by Project Director/COR with input from OBO/CFSM/SM physical security engineer.

L. Durability Submittals: Submit one of the following based on Contractor's selection, and in accordance with Durability requirements in Article on PERFORMANCE REQUIREMENTS.

1. [Test Reports: Provide independent laboratory test reports using ISO/IEC 17025 (second edition) confirming the gate system meets the performance requirement for operating under specified number of cycles.]
2. [Warranty: Provide warranty for operability.]

M. Training Documentation: Immediately upon completion of Operator and Supervisor training, documentation of training shall be delivered to Project Director/COR of installation. Training documentation shall include:

1. The date and time of the training.
2. A list of the names of the personnel trained.

1.3 QUALITY ASSURANCE

A. Nameplates: The crash-rated drop arm systems shall have the manufacturer's name, contact for service, and catalog or serial number permanently affixed to a plate securely attached to the equipment in a suitable location.

B. Verification of Dimensions: The Contractor shall become familiar with all details of the work, and verify dimensions in the field as required for coordination.

C. Performance Evaluation: Drop arm system shall comply with ASTM F 2656, Standard Test Method for Vehicle Crash Testing of Perimeter Barriers, latest revision. Conform to vehicle resistance standards identified in Article on PERFORMANCE REQUIREMENTS.

D. Installer Qualifications: Engage experienced Installer who has completed in last five years a crash-rated drop arm system installation similar in material, design, and extent to that indicated for this Project and with record of successful in-service performance.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver elements of the perimeter gate facilities to the project with assemblies prefabricated, prefinished, and equipped with devices and accessories to the greatest extent possible. Comply with Government's criteria for packaging, handling, protection, storage, and delivery.

1.5 [WARRANTY

A. Special Project Warranty:]

1. [Durability: In lieu of testing of the drop arm system the manufacturer may provide a 5-year comprehensive on site material and labor warranty from Substantial Completion for any component necessary for continued operation of the gate system.]

2. [Corrosion Resistance: All elements of the drop arm system shall be designed and constructed to resist these effects for a period of 5 years from Substantial Completion. Should corrosive damage inhibit or halt the operation of the drop arm system replacement parts or new gate systems shall be shipped to the project site (at no cost to the USG) and installed by qualified installers provided by the manufacturer. The government at its sole discretion may opt to install the manufacturer provided replacement parts, however this will in no way void or alter the warranty.]

1.6 EXTRA MATERIALS

A. Spare parts kit per manufacturer's recommended list.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Provide crash-rated drop arm systems in accordance with ASTM F2656 and the OBO Zoning Code (International Zoning Code as amended by OBO).

B. Vehicle Resistance: Provide Crash-rated drop arm systems which are produced by manufacturers who have previously produced, within the last two years, units of similar security attack resistance of equivalent size and resistance ratings, and which are certified by the Bureau of Diplomatic Security (DS). Required performance is for a test rating of **[M50] [M40] [M30]** per project location design via speed approach calculations with maximum vehicle penetration of P1. Provide drop arm capable, in width of operation, of obstructing vehicular traffic in a 4 meter (13 ft) wide traffic lane.

C. [Corrosion Resistance: When the project site is identified by OBO as being in a moderate or extreme atmospheric corrosion risk location, the components necessary for continued operation of crash-rated drop arm systems shall be fabricated to resist corrosion.]

D. Durability: Provide crash-rated drop arm systems capable of operating for 200,000 continuous cycles without failure of any component necessary for continued operation of systems. Cycle testing shall be performed in a configuration where active barrier itself is located in outdoor location that will expose the unit to full sunlight and effects of climatic conditions at test facility (pollution, rain, snow, sleet, etc.). Crash-rated drop arm systems shall be capable of operating a minimum of 60 complete up/down cycles per hour.

E. Status Indicators: Drop arm system shall provide clearly visible device, such as signal light or drop arm, to indicate barrier's status to approaching driver.

F. Control Circuits: Design control system in such a way that when power fails barriers maintain "status quo" position. System shall fail neither secure nor safe. On hydraulic barrier systems, provide fail-safe lock system on hydraulic cylinder which prevents barrier from lowering in event of hydraulic failure.

G. Back-up and Manual Operation: Control system shall provide back-up and manual operating capability for use in event of power failure. Back-up operating system shall provide, as a minimum, three complete cycles (open and shut) without the use of manual system. Manual operation of barrier shall be simple and without need of special tools or knowledge. Barrier shall be capable of being returned to secure position, in manual mode, in no more than 5 minutes. Battery backup systems shall be 24 to 100 volt or less, systems.

H. Reliability: Barrier system shall provide maximum dependability and ease of maintenance. System shall be designed to function consistently in all DOS locations throughout world.

I. Hydraulic Lines: Where power and hydraulic lines are required and are below grade, they shall be protected with rigid electrical conduit. Where temperatures will exceed 38 degrees C (100 degrees F) for extended periods of time, provide cooling unit for hydraulic fluid.

J. Secondary and primary controls shall have emergency (fast operation) secure switches for each barrier. Emergency switch or switches for secondary control shall not be equipped with reset capability.

K. Environmental Protection of Power Units: Environmental conditions for power units shall not exceed 30 degrees C (86 degrees F) or drop below -5 degrees C (24 degrees F). If units are placed in building space, conditions may be achieved either by using HVAC equipment for space, or by using an enclosure accessory for power unit with heating and cooling unit accessories as needed to maintain the environmental conditions within enclosed container. If power unit is place outdoors, provide enclosure as accessory where necessary to maintain required environmental conditions, and provide heating and cooling units as accessories as needed to maintain conditions. In addition, in locations subject to exposure to severe weather or to intensive exposure to dirt, sand, and other harmful elements, provide protection through placement in protected building space with designed features to limit harmful elements, or by placing power unit in enclosure. Enclosure must be constructed of minimum 3 mm (0.125 inch) thick plate steel and must be capable of being padlocked with a DS approved padlock.

2.2 MATERIALS, GENERAL

A. Steel Shapes, Plates, and Bars: ASTM A 36; except where otherwise indicated, and as follows:

1. Where indicated as "high-strength" steel, provide shapes, plates, and/or bars complying with ASTM A 588, Grade C, 34.9 kg/sq. mm (50 ksi) yield strength.
2. Where indicated as tubular "high-strength" steel, provide shapes, sizes, and wall thicknesses as indicated complying with ASTM A 618, Grade Ib; 34.9 kg/sq. mm (50 ksi) yield strength.

B. Steel Finishes: Hot-dip galvanize all steel components to comply with applicable standards of ASTM A 123/A 123 M for galvanizing steel products and ASTM A 153 A, 153 M for galvanizing steel hardware. This is applicable for all active barriers.

C. Welding Rods and Bare Electrodes: Provide type recommended by AWS specifications, for metal and alloy being welded in each element of fabrications.

D. Bolts and Fasteners: ASTM A 320, AISI Type 300-series stainless steel bolts and nuts. Where within reach of intruders working from attack-side of facilities, including working from inside sally ports, provide non-removable bolt/nut units (not removable by use of commonly available hand tools). Provide stainless steel washers.

E. Concrete Inserts: Furnish anchorage units to be placed in concrete substrates, of hot-dip galvanized cast-iron/malleable-iron body, design/type as indicated; ASTM A 153 zinc coating, ASTM A 47 casting.

F. Setting/Anchoring Cement: Provide non-shrinking, non-staining, hydraulic-controlled expansion-type cementitious compound; factory prepackaged for mixing with water at project for a pourable and trowelable mix, recommended by manufacturer for exterior exposure (ASTM C 109).

G. Aluminum Extrusions: ASTM B 221, Alloy 6005, Temper T5 or T6; sizes, shapes, and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

H. Stainless Steel Tubing: ASTM A 269, AISI Type 304; sizes and wall thicknesses as indicated or, where not otherwise indicated, as required to achieve performances indicated.

I. Shop Primer Paint: Fabricator's baked-on, lead-free, modified alkyd-base, ferrous-metal primer; which is compatible with finish system specified in Division 09 Sections on painting and coatings, and which will provide long-term resistance to corrosion from external exposure, and form a firm undercoat for field-applied topcoats after prolonged construction-period exposures. Comply with performance requirements of FS TT-P-645 and with paint manufacturer's instructions for baked-on primer coat material and application.

J. Shop Primer Paint: Organic, zinc-rich coating, with zinc-dust content not less than 80% by weight of non-volatile content; with vehicle base selected for compatibility with specified finish coating system. Comply with paint manufacturer's instructions for surface pretreatment materials and methods, and for primer application.

2.3 FABRICATION

A. General: Fabricate crash-rated drop arm systems at factory to greatest extent possible, including interfacing, supporting, and anchorage provisions as required for installation. Fabricate to comply with indicated performance requirements. Disassemble only to extent required for handling, delivery, and installation.

1. Provide crash-rated drop arm systems that disarm all safety components of crash-rated drop arm system when in emergency mode.

B. Fabricate crash-rated drop arm systems for installation as shown, flush with road surface when retracted. Include the following:

1. Provide signal light to indicate barrier status (activated or retracted) to approaching vehicle driver.
2. Provide power-operated barrier activation equipment, which is capable of fully activating the barrier in 5 seconds under normal operating conditions, and which is capable of fully activating the barrier in 1.5 seconds under emergency conditions.
3. Provide primary activation push button control station located in guard booth at drop arm (secondary control unit),and overriding activation control station located at Post 1 (primary control unit) in the Embassy Office Building. Operation of the emergency activation at the drop arm requires a reset of the control system in order to retract the barrier; and that is possible only at Post 1.
4. Provide a secondary control panel at guard booth location with open/close buttons, Emergency Fast Operation (EFO) button and an audible annunciator, which is automatically activated when barrier remains in up position in excess of adjustable time period, with adjustment capability up to 60 seconds. Provide either rack mounted or countertop-installed panels; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. Coordinate selection with the architectural and technical security designs.
5. Provide a primary control panel at Post 1 location with open/close buttons, Emergency Fast Operation (EFO) button and signal light, activated by operation of annunciator signal at CAC location; provide reset, which can also be used to deactivate signal at CAC. Provide rack mounted controls only; see Section 280508 “Common Work Results for Technical Security Systems (TSS)” for racks. On dual or multiple lane sally ports or installations with more than two anti-ram barriers provide a custom panel that consolidates controls (separate controls and EFO’s required for each barrier; however, open barrier annunciator may be combined per sally port).
6. Provide barrier position indicator and power indicator pilot light at both control station locations.
7. Provide 24 V control circuitry of the required cycles per min. rating (depends upon available power source). Provide system which retains barrier in current position when there is a power failure. Provide a system for back-up, such as accumulators and UPS for the controls, and for manual operation of barrier when there is a power failure.
8. Equip control station at MSG guard booth location with audible annunciator, which is automatically activated when drop arm remains in retracted position in excess of adjustable time period, with adjustment capability up to 60 seconds. Equip control station at MSG

booth location with signal light, activated by operation of annunciator signal at gatehouse location. Provide reset, which can also be used to deactivate signal at gatehouse location.

9. Provide cooling unit for the hydraulic fluid of the drop arm operating system if unit is hydraulic. Provide disconnect switch.
10. Provide limit switch (up/down).
11. Provide safety cover that closes the gap between the barrier top and pit when barrier is in the up position.
12. Electric, hydraulic, or pneumatic drive systems may be used for drop arm systems.

2.4 CONTROL SYSTEMS

A. Provide touch screen control systems capable of the following:

1. Provide systems that have programming systems that are editable by end user. Systems shall be capable of being rebooted in no more than 60 seconds. Systems shall provide protection from Solar Maximum events and provide shielding from electromagnetic interference (EMI).
2. Provide units capable of being mounted in 480mm (19 inch) racks or on desktop.
3. Up/down control buttons.
4. Emergency Fast Operate Button (EFO): EFO button shall be separate physical two stage button. Each barrier shall have its own EFO button.
5. Status Lights: Provide barrier status indicators that indicate:

    1) Visual indication light when barrier is in up position.
    2) Visual indication light when barrier is in down position.
    3) Audio and visual indication signal when barrier is in up position for more than 60 seconds.

6. Primary controller: Provide primary control system in Post 1 or the Security Control Center (SCC). Primary control panel shall be capable of overriding secondary panels. Panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections); custom made control panel units are not permitted. Primary control panel shall not require keys for operation.
7. Secondary controller: Provide secondary control system in vehicle control booths of CAC's or other facilities. Secondary control systems shall be capable of being overridden by Post 1 or the SCC. Panels shall be of standard design and easily interchangeable (quick connect/reconnect non-solder type connections); custom made control panel units are not permitted. Secondary control panel shall not require keys for operation.
8. Interlocking functions: Provide control systems capable of locking out barrier down operation when vehicle gates located on the protected side of sallyport are in open position. Provide two stage button override control of interlocking feature at Post 1 or SCC.
9. Self-diagnostic systems: Provide barrier control systems capable of self-diagnosis. Minimum features required are:

    1) Audit Trail: Provide audit trail of up, down, EFO, interlock and reset functions of barrier that is easily user interpreted.

2) Cycle counter: Provide cycle counter that records each cycle of barrier. Provide barrier cycle counter in barrier and in control system. Cycle counter in barrier unit shall be readily visible to maintenance staff monitoring barrier.
3) Lifecycle Function: Lifecycle function that alerts maintenance staff of required or upcoming necessary maintenance.
4) Diagnostic Systems: Provide diagnostic systems capable of reporting through DOS SMSe monitoring network system; see Section 285115 "Security Management Systems Enterprise (SMSe)" regarding that system. Provide systems capable of providing secure (HTTPS) remote access connections with SMSe network. System shall require a user ID and Password for access to secure connection.
5) Troubleshooting: Provide systems that have a troubleshooting function. Troubleshooting function shall contain standardized code system or language that is consistent for each of manufacturer's barrier systems. Troubleshooting systems shall not have remote manufacturer maintenance and diagnostic capabilities.
6) Pressure monitoring meter: Provide pressure monitoring meter on hydraulic and pneumatic units. Provide low pressure alarm to warn when pressure has dropped below 4.14 MPa (600 PSI)) in unit.
7) Low oil level monitor: Provide monitor that warns barrier operator when oil level in unit is low.

10. Monitor screens: Provide monitors with minimum 175 mm (7 inch) minimum screen size. Monitor screens shall provide clear readable views of controls in bright sunlight and glare conditions. Monitors shall be Thin Film Transistor (TFT) Liquid Chrystal Display (LCD) type, high contrast color screens, 1280 x 1024 pixels. Each monitor shall depict barrier being controlled, at top of the screen, via video input so that barrier operator can view barrier operation via screen. Directly below view of barrier, centered under this view, provide label of which barrier is being controlled (e.g., "Main Gate Barrier"). Text of label shall be clear and easily readable with a minimum font size of 24 point, Times New Roman Bold. Directly to left of label, locate barrier "UP" button. UP button shall be minimum of 20 mm in diameter and labeled below button "UP" with clear and easily readable, minimum 32 point font, Times New Roman Bold. Directly to right of label, locate barrier "DOWN" button. DOWN button shall be minimum of 20 mm in diameter and labeled below button "DOWN" with clear and easily readable, minimum 24 point font, Times New Roman Bold.
11. Standardized controllers: Provide controllers capable of operating up to two barriers and two gates per controller unit.
12. Equipment and components: Provide only programmable logic controllers (PLC's) and other components that are compatible with RS232 and CAT 5 technologies.
13. Control systems frame: Provide control systems housings (frames) fabricated such that interior components can be removed without short circuiting the unit or inadvertently triggering system.
14. Spare modules: Provide one spare module for each type of module used in each controller provided.

2.5 ACCESSORIES

A. Remote control panel with annunciator, override and reset.

B. Emergency Manual Operation: Provide hand pump to allow barrier to be raised and lowered manually in event of prolonged power interruption.

C. Emergency fast operation.

D. Low fluid level switch.

E. Power off operation.

F. Sump pump (in ground units)

G. Export packaging.

H. Electrical disconnect at the hydraulic unit.

I. Uninterrupted Power Supply (UPS) for the primary and secondary control panels.

J. Safety Interlock Detector: Provide drop arm detector safety loop to prevent drop arm from being accidentally lowered onto an authorized vehicle. Detector shall utilize digital logic and have fully automatic tuning for stable and accurate long-term reliability. Output of detector shall delay any barrier rise signal (except for Emergency Fast Operation command) when vehicle is over loop.

K. [Power unit enclosure where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS. The steel enclosure shall be minimum of 2 mm thick steel and provided with DS approved padlock. Enclosure may be custom fabricated if not a standard accessory from power unit manufacturer.]

L. [Heating unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

M. [Cooling unit for power supply where required for environmental protection of power supply; see Article on PERFORMANCE REQUIREMENTS.]

PART 3 - EXECUTION

3.1 EXAMINATION, COORDINATION, PREPARATION

A. General: Examine substrate work, being prepared as work of other sections, for the anchorage and support of crash-rated drop arm systems of this section. Deliver anchorage inserts, sleeves, and other elements to be cast in concrete work, prior to time scheduled for placement of concrete. Furnish instructions, setting diagrams, templates, and/or other information for elements to be

installed as work of other sections. Set frames and similar elements plumb, level and true to line and location; and support adequately during placement of concrete.

B. Examine prefabricated units, and preparations made and to be made as work of other Sections and confirm that interfaces and support of work of this section will achieve performances and align within installation tolerances.

C. Coordinate installation of crash-rated drop arm systems with installation of related work, to ensure optimum sequencing of interfaces.

3.2 INSTALLATION

A. Comply with fabricator's instructions for the handling, protection, assembly, installation, anchorage, and other required interface connections of crash-rated drop arm with other work. Set level and plumb, true to line and location. Anchor to develop full-strength resistances against attacks and forced-entry attempts.

1. Comply with manufacturer's instructions for the installation of crash-rated drop arm systems as shown; and for the mechanical/electrical interconnection of power and control elements.

3.3 TESTING AND ADJUSTING

A. Test operate each active crash-rated drop arm system operational unit through repeated cycles of operation; and demonstrate operation, controls, safety devices, signals, and other features to Project Director/COR. Provide adjustments as requested to comply with requirements and intended cycles of use and operation.

B. Instructions for testing crash-rated drop arm systems from Secondary Control Panel.

1. Exercise Up and Down while listening for binding or rubbing.
2. Check stop & go lights.
3. Check open alarm. Leave the barrier in open position. After preset period (no more than one minute), an alarm will sound from secondary unit and from primary. This timer can be set in electrical panel adjacent to hydraulic pump.
4. Test safety loop:

   a. Open barrier and park a vehicle over loop but not under barrier. Attempt to close barrier - it should not close. If safety system is tied to an adjacent gate sharing light curtains, test light curtains for operability.

5. Test emergency close function. Ensure there is no vehicle or individual standing on or immediately next to barrier and have safety person control site.

   a. PART I: Activate emergency close, from open position - barrier should snap closed (1.5 sec); record time. Secondary controller should now be inoperative and will have to be reset from primary controller in Post 1.

b. PART II: Now park a vehicle over safety loop but BE SURE NO PART OF VEHICLE IS UNDER BARRIER. Then follow Part I sequence - Emergency close function should now override safety loop, and sequence should be the same as for Part I.

6. Cut all power to hydraulic pump and test that barrier can be operated required number of cycles using the back-up system. Record number of cycles.
7. Test that barrier will work under generator power.
8. Cut all power to hydraulic pump or electrical supply and test that barrier can be operated full cycle of unit under manual function.

C. Instructions for testing crash-rated drop arm system from Primary Control Panel

1. Check functions 3 thru 7 above from the primary.
2. Check reset function from primary.

3.4 CLEANING AND FINISHING

A. Clean exposed surfaces of crash-rated drop arm system, including primed surfaces and finished surfaces, exercising care to avoid damage to finishes; touch up minor blemishes in finished surfaces.

B. Refer to Division 09 Sections on painting and coatings for application of field-applied finish coatings over shop-applied primer coatings; not work of this section.

3.5 MANUFACTURER'S SERVICE

A. Services of a manufacturer's representative who is experienced in installation, adjustment, and operation of equipment supplied shall be available. The representative shall supervise installation, adjustment, and testing of the equipment.

3.6 TRAINING

A. Operator Training: Manufacturers' representative shall provide initial Operator training to Local Guard Force (LGF) personnel. Training shall be delivered at post of installation within one business day following commissioning of new system. Initial Operator training shall include:

1. Overview of system.
2. Essential controls and displays.
3. Safety precautions.

B. Supervisor Training: Manufacturer's representative shall provide initial Supervisor training for Regional Security Officer (RSO) or designated representative, LGF supervisor, and others as identified by RSO. This training shall be delivered at post of installation within one business day following commissioning of the new system. Initial Supervisor training shall include:

1. Overview of system.
2. Understanding of system's purpose and capabilities.
3. Essential controls and displays.
4. Safety precautions.

C. Maintenance Training: Manufacturer or representative shall provide Maintenance training, including MANUFACTURER'S CERTIFICATION TRAINING to level of "Factory Authorized Technician" status at manufacturer's facility for the following personnel:

1. Two instructional personnel from DS/SECD/TTB.
2. One instructional designer from DS/TPS/ISM.
3. One DS/C/ST subject matter expert (SME).
4. One person from OBO/CFSM/SM/SCD/TSB.

D. Manufacturer shall provide no less than two additional spaces per each Maintenance training class and/or training at their manufacturing facility for other DOS-designated personnel. This training must encompass all aspects of operations, maintenance, safety and repair.

E. Maintenance training shall enable personnel listed in this section to perform routine maintenance and inspection requirements, in compliance with the manufacturers' requirements.

F. Manufacturer shall make available annual refresher or re-certification Maintenance training for personnel identified in paragraph above on "Maintenance Training."

G. System upgrades that require more than four hours for operator accommodation shall require operator and supervisor training as specified in this specification as for new system.

END OF SECTION 324009

SECTION 329300 - PLANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Section 328400 Irrigation.

1.2 SUMMARY

A. Section Include:

1. Plants – trees, shrubs, groundcovers, ornamental grass, “tropicals,” xeriscaping, and desert plants (succulents and cacti), turf (lawn).
2. Tree stabilization.
3. Landscape edging.
4. Mulch.
5. Pesticide/Herbicide.
6. Maintenance.

1.3 DEFINITIONS, REFERENCES, AND APPLICABLE STANDARDS

A. General Definitions

1. Backfill: The earth used to replace or the act of replacing earth in an excavation.
2. Balled and Burlapped Stock: Plants dug with firm, natural balls of earth in which they were grown, with a ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required; wrapped with burlap, tied, rigidly supported, and drum laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1.
3. Balled and Potted Stock: Plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required.
4. Bare-Root Stock: Plants with a well-branched, fibrous-root system developed by transplanting or root pruning, with soil or growing medium removed, and with not less than the minimum root spread according to ANSI Z60.1 for type and size of plant required.
5. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.

6. Crown: The point where the stem or trunk of a plant meets the root system of any plants including turf.
7. Crownshaft (or Heart): The leaf bases of some pinnate leave palms (most notable being Roystonea regia but also including the genera Areca, Wodyetia, and Pinanga) form a sheath at the top of the trunk surrounding the bud where all the subsequent leaves are formed. The crownshaft takes the form of a column above the main trunk and beneath the main crown of leaves (frond).
8. Fabric Bag-Grown Stock: Healthy, vigorous, well-rooted plants established and grown in-ground in a porous fabric bag with well-established root system reaching sides of fabric bag but not protruding out from the sides. Fabric bag size is not less than diameter, depth, and volume required by ANSI Z60.1 for type and size of plant.
9. Finish Grade: Elevation of finished surface of planting soil, existing soil, or pavement, but not top of mulch.
10. Pesticide/Herbicide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. Pesticides include insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. They also include substances or mixtures intended for use as a plant regulator, defoliant, or desiccant. Some sources classify herbicides separately from pesticides.
11. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. Pests include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.
12. Planting Area: Areas to be planted.
13. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified with soil amendments and perhaps organic matter and/or fertilizers to produce a soil mixture best for plant growth. See Article PLANTING SOIL for requirements of planting soils.
14. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, palms, shrubs, vines, ground covers, “tropicals,” ornamental grasses, succulents and cacti, bulbs, corms, tubers, turfs, or herbaceous vegetation.
15. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.
16. Stem Girdling Roots: Roots that encircle the stems (trunks) of trees below the soil surface.
17. Subgrade: The surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed, or simply “below finish grade.”

B. Measurements:
1. Caliper: Measurement of width.
2. O.C: Measurement of distance, defined as On Center spacing.
3. SM (square meters): Measurement of area.
4. CM: Measurement of volume expressed as Cubic Meter.

C. References:
1. American National Standards Institute (ANSI).
2. American Society for Testing Materials (ASTM).
3. International Society of Arboriculture (ISA).
4. United States Department of Agriculture (USDA).

1.4 COORDINATION

A. Coordination with Turf Areas (Lawns): Plant trees, shrubs, and other plants after finish grades are established and before planting turf unless otherwise indicated.

1. When planting trees, shrubs, and other plants after planting turf, protect turf areas, and promptly repair damage caused by planting and other construction operations.

B. Coordination with Irrigation System: All plants shall be installed after the irrigation system for that planting area (or irrigation zone) is installed and tested for full function. See PART 3 EXECUTION below for plant installation steps. Also refer to Section 328400 Irrigation. Repair damage on irrigation system caused by planting and other construction operations immediately.

1.5 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site with Project Director/COR and/or OBO Landscape Architect to discuss and inspect:
1. Planting area preparation
2. Irrigation system installation
3. Plants quality and availability at nursery
4. Soil and mulch
5. Planting schedule

1.6 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Plant Materials: Include quantities, sizes, quality, and sources for plant materials.
2. Plant Photographs: Include color photographs in digital format of each required species and size of plant material as it will be furnished to Project. Take photographs from an angle depicting true size and condition of the typical plant to be furnished. Include a scale rod or other measuring device in each photograph. For species where more than 20 same species are required, include a minimum of 6 photographs showing the average plant, the best quality plant, and the worst quality plant to be furnished. Identify each photograph with the full scientific name of the plant, plant size, and name of the growing nursery.
3. Soil Test: Include soil test results and amendment recommendations for each type of soil, existing on site as well as imported planting soil and topsoil, required to achieve planting design intent as indicated in Article PLANTING SOIL.

B. Samples for Verification: For each of the following:

1. Trees: At minimum, two photographs of each tree, from two different sides showing the full canopy spread and complete trunk and rootball (when roots not in ground) stocked at proposed nursery for inspection by OBO Project Director/COR and/or OBO Landscape Architect. Trees shall be pre-tagged and numbered. Tag numbers shall be identified in submittal. Maintain approved tagged trees with tags at the nursery until installation. The nursery itself is subject to inspection and approval by OBO.

2. Shrubs, Grasses, & Perennials: Samples of each variety and size stocked at proposed nursery for inspection by OBO Project Director/COR and/or OBO Landscape Architect. Maintain approved Samples at the nursery until installation as a standard for comparison. Mark them clearly with a sign “Approved Sample” and do not remove the signs until final acceptance of planting work on site. The nursery itself is subject to inspection and approval by OBO.
3. Organic Mulch: 1 L (1 quart) volume of each organic mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the material to be furnished; provide an accurate representation of color, texture, and organic makeup.
4. Mineral Mulch: 2.5 kg (5 lb) of each mineral mulch required, in sealed strong plastic bags labeled with source of mulch. Samples shall be typical of the material to be delivered and installed on-site; provide an accurate indication of color, texture, sizes, and makeup of the material.
5. Weed Control Barrier: 300 by 300 mm (12 by 12 inches).
6. Slow-Release, Tree-Watering Device: One unit of each size required.
7. Edging Materials and Accessories: Manufacturer's standard size, to verify material and color selected.
8. Root Barrier: Width of panel by 300 mm (12 inches).

1.7 INFORMATIONAL SUBMITTALS

A. Qualification Data: For landscape Installer. Include a list of similar projects completed by Installer with photographs demonstrating Installer's capabilities and experience. Include qualification of foreman, project names, addresses, and year completed, and include names and addresses of owners' contact persons.

B. Product Certificates: For each type of manufactured product including but not limited to plants, soil amendment, organic matter, fertilizer, mulch, and edging, from manufacturer, and complying with the following:

1. Manufacturer's certified analysis of standard products.
2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
3. Certify in writing that selected plants will be available at time of installation in size, quantity, and species specified in contract documents.

C. Pesticides and Herbicides: Certificate that products meet specified requirements. Product label and manufacturer's application instructions specific to Project. Qualification and license of pesticide/herbicide applicator.

D. Warranty: For special warranty.

E. Time Restrictions and Planting Conditions: After selection of plants, submit schedule indicating anticipated planting dates that reflects appropriate timing for plant varieties in Project locale. Include schedule for planting area preparation, irrigation system installation and testing.

1.8 CLOSEOUT SUBMITTALS

A. Inspection Report: Submit report with photographs on the completion of planting work, a report on condition of planting, irrigation system, and planting beds, including recommendations and remedial actions to be taken prior to Substantial Completion and during the warranty period.

B. Maintenance Record Calendar: Submit record calendar for use by Post maintenance of planting and lawns showing recommended tasks and schedule. Provide data entry space for five years of maintenance.

C. Maintenance Manual: Submit maintenance guidelines for planting and lawn. Provide instructions for plant placement, pruning, watering, mowing, fertilization, weeding, disease and pest control, and plant replacement. Coordinate with Irrigation Operation and Maintenance Manual. See Section 328400 Irrigation for Irrigation Operation and Maintenance Manual and Irrigation Schedule submittals.

1. Include product data sheets in manual, along with maintenance instructions and parts lists for those products.
2. Include planting soil quality requirements for future planting needs.
3. Include information on manufacturers and local sources of all products such as replacement plants, plating soil, amendments, fertilizers, and pesticides.
4. Include maintenance record calendar and schedule of tasks.

D. Integrated Pest Management Plan (IPM): Submit IPM for specified plants including schedule of recommended pest control.

1.9 QUALITY ASSURANCE

A. Certificates of Inspection required by law for transportation shall accompany the invoice for each shipment of seeds or plants. Inspection by OBO at the place of growth or nursery does not preclude rejection of materials at the project site.

B. Installer Qualifications:

1. Professional Membership: Installer shall be a certified member in good standing of local professional association in related field for installing plants.
2. Experience: Minimum of five years' experience in landscape installation required.
3. Foreman: All work shall be under direction and general supervision of Foreman who possesses verifiable experience and technical competence in plant propagation and installation. Foreman shall be present at all times while work is performed. Foreman is responsible for controlling quality of work and inspecting completed work to ensure that

the contract requirements are met. Foreman shall be the primary contact for the work of this Section.

4. Workers: All workers, through related training and on-the-job experience, shall be familiar with technical and safety aspects of planting and equipment used in such operations.
5. Pesticide Applicator: Locally licensed as required, and familiar with EPA standards.

C. All plants are subject to inspection and approval by Project Director/COR and/or OBO Landscape Architect and/or Post Facility Manager at place(s) of growth, nurseries, and upon delivery to site for conformance to project requirements for genus, species, variety, cultivar, size, shape, and quality. Project Director/COR and/or OBO Landscape Architect and/or Post Facility Manager may also observe trees and shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and may reject unsatisfactory or defective material at any time during progress of work and during warranty period. Such approval does not limit the right of inspection and rejection during progress of work and warranty period. Submit written request for inspection of plant material at place of growth to Project Director/COR at least three weeks in advance of expected shipment date(s). Written requests shall state the place of growth and quantity to be inspected. Project Director/COR reserves the right to refuse inspection at that time if, in her/his judgment, sufficient quantity of plants is not available for inspection, or for any other reason. Replace rejected plants with new approved plants as soon as possible.

D. Plant Certification: Provide sod, seed, or original plant material that is certified by local certification agency, where such an agency is available. Certify that lawn material conforms to requirements identified for seeding, sodding, or sprigging.

E. Measurements: Measure according to ANSI Z60.1.

1. Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container-grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 150 mm (6 inches) above the root flare for trees up to 100-mm (4-inch) caliper size, and 300 mm (12 inches) above the root flare for larger sizes.
2. Palms: Take height measurements from or near the top of the root flare for field-grown stock and container-grown stock to the bottom of crownshaft, or the lowest frond if the plant does not have crownshaft.
3. Other Plants: Measure with stems, petioles, and foliage in their normal position.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Staging: Store and maintain propagated or procured plant materials until site is in acceptable condition for plant material installation to begin. It is the responsibility of the Contractor to procure plants well in advance, care for, and grow to make sure they meet the required sizes, quality, and quantity when they are delivered to the site for installation.

B. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and U.S. and local laws if applicable.

C. Bulk Materials:

1. Do not dump or store bulk materials near structures, utilities, walkways, and pavements, in or near existing tree protection areas, or on turf areas or plants.
2. Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent areas and properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk materials with appropriate certificates.
4. Coordinate schedule and location of bulk materials delivery with Project Director/COR at least seven days in advance.

D. Plants Preparation for Shipment: Protect and maintain plants until and during shipment to site for installation. Do not prune trees and shrubs before delivery. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, roots, and foliage to protect bark, branches, and roots from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape.

E. Shipping: Deliver bare-root stock plants within 24 hours of digging. Immediately after digging up bare-root stock, pack root system in wet straw, hay, or other suitable material to keep root system moist until planting. Transport in covered temperature-controlled vehicles, and keep plants cool and protected from sun, freeze, and wind at all times. Shipment shall occur in stages to prevent storage of plant material on site for more than 6 hours. Do not stack up many trees or containers of plants on top of each other to minimize the number of shipments. Place them neatly on shelves on trucks to deliver plants so that they are not damaged during delivery.

F. Storage: Store bulbs, corms, and tubers in a dry place at 16 to 18 deg C (60 to 65 deg F) until planting.

G. Protection: Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.

H. Handling: Do not drop plants. Do not pick up plants by stems for trunks. Handle trees and shrubs by root ball.

I. Seed: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with local requirements, as applicable.

J. Sod: Do not dig sod at the nursery or other approved source until ready to transport sod to Project site or approved storage location. Do not cut turf roots below crowns. Deliver sod with minimum of 15 mm (1/2 inch) of soil attached. Protect sod from breakage and drying.

K. Time Restrictions and Planting Conditions: Planting dates shall be appropriate for locale and plant variety, recognizing temperature, precipitation, and other conditions.

L. Delivery: Deliver plants after the irrigation system is in place, tested, and running, and preparations of planting bed have been completed. Install plants immediately after delivery to the site. If planting is delayed more than six hours after delivery, set plants and trees in their

appropriate aspect (sun, filtered sun, or shade), out of the way of other construction and facility operations, protect from weather and mechanical damage, and keep roots moist.

1. Heel-in bare-root stock. Soak roots that are in less than moist condition in water for two hours. Reject plants with dry roots.
2. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
3. Do not remove container-grown stock from containers before the time of planting.
4. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist but not overly wet condition.

1.11 ACCEPTANCE

A. Plants will not be accepted until inspected on arrival to site and prior to planting/installation and approved by Project Director/COR. Plants not meeting specifications for quality and size at the time of delivery are subject to rejection. All rejected stock shall be replaced with stock of designated variety, size, age, and other applicable attributes as identified in Construction Documents at no additional cost to Government.

B. Plants shall comply with the following minimum conditions in order to be accepted by Project Director/COR:

1. General Condition: Healthy, free of pests and disease, and in flourishing condition with full canopy and foliage. Trees with excessively pruned or imbalanced canopy, thin foliage, or missing leader or major branches will be rejected.
2. Branches: Free of dead, broken, and dying branches and branch tips.
3. Foliage: Plants shall bear foliage of normal density, size, and color.
4. Root Ball: Free of weeds, debris, and pests. Plants with unproportionate small root balls will be rejected.
5. Characteristics: Meet all requirements as noted in landscape report and plant legend.

C. Sod shall comply with the following minimum conditions to be accepted by Project Director/COR:

1. Refer to product requirements.
2. Absence of visible joints.
3. All areas shall show a uniform stand of specified grass in healthy condition.

1.12 FIELD CONDITIONS

A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of planting and construction contiguous with new planting by field measurements before proceeding with planting work.

B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply

products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.

C. Seasonal Limitations: Proceed with planting of each plant specified only during seasons appropriate for its installation. Refer to plant schedule in IFC (Issued for Construction) drawing set which includes installation calendar.

1.13 WARRANTY

A. Warranty: Installer agrees to provide maintenance of entire planting, repair or replace damaged plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.

1. Failures include, but are not limited to, the following:

   a. Death, decline, and unsatisfactory growth, except for defects resulting from abuse by the Government.
   b. Structural failures including plantings falling, leaning, or blowing over.
   c. Faulty performance of tree stabilization, edgings, tree grates, and other accessories.
   d. Deterioration of metals, metal finishes, and other materials beyond normal weathering.

2. Warranty Period: Two calendar years from the date of Substantial Completion.

3. Include the following remedial actions as a minimum:

   a. At end of warranty period, replace dead plants and plants not in vigorous, thriving condition, as determined by Project Director/COR or OBO Landscape Architect, or Post Facility Manager, without cost to the Government. Replacement shall occur as soon as weather conditions permit, and within the appropriate seasonal planting period.
   b. Replace plants that are more than 25 percent dead or in an unhealthy condition at the end of the warranty period.
   c. Replacements shall closely match adjacent specimens of the same species. Replacements are subject to all requirements of this Section.
   d. Make necessary repairs due to plant replacements at no cost to Government.
   e. Warranty of replacement plants shall extend for an additional one-year period from the date of their acceptance by the Government after replacement. In the event that replacement plants are not acceptable during or at end of extended guarantee period, the Government may elect one more replacement or credit for each item.

1.14 MAINTENANCE SERVICE

A. Initial Maintenance Period: Begin immediately after each plant is planted and continue until end of warranty/guarantee period.

1. Maintenance consists of keeping plants in healthy growing condition, and keeping beds and individual pits in neat appearance, and shall be performed by qualified and approved

individuals. Plants shall be protected from damage. Maintenance activities include, but are not limited to, the following:

a. Watering: As necessary to promote natural growth. Apply in amounts to prevent
b. excessive runoff. Water shall be suitable for irrigation, and free from ingredients
c. harmful to plant life.
d. Weeding and Cleaning: Keep planting areas free of weeds, grass, and trash.
e. Cultivating.
f. Pruning.
g. Fertilizing.
h. Re-mulching.
i. Tightening and repairing of guys: Remove stakes and guy wires at end of warranty
j. period.
k. Straightening of trees to a plumb position.
l. Removal of dead material.
m. Resetting plants to proper grades or upright position.
n. Restore planting saucers.
o. Protection from insects, pests, and disease.

2. Irrigate, fertilize, and mow new turf for entire warranty period. Provide supplementary irrigation during the new plant establishment period.
3. During maintenance period, any decline in condition of plantings requires Contractor to take immediate action to identify potential problems and to undertake corrective measures. If Contractor does not have sufficient expertise or if problems persist, engage professional arborists and/or horticulturalists at no cost to Government to inspect plant materials and to identify problems and recommend corrective procedures. Advise OBO Representative immediately of such actions.

B. Continuing Maintenance Proposal:
1. Furnish proposal from Installer to Government for continuing maintenance agreement for period of one year starting from end of Initial Maintenance Period. State services, obligations, conditions, and terms of agreement period.
2. Upon execution of the agreement with Government, commence maintenance service on date when initial maintenance services are concluded.

PART 2 - PRODUCTS

2.1 PLANT MATERIAL

A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant Schedule, indicated on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of weeds, disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

1. Trees with damaged, crooked, cut off, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark");

crossing trunks; cut-off limbs more than 19 mm (3/4 inch) in diameter; or with stem girdling roots are unacceptable.

2. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.

B. Plant Schedule: Provide plants of sizes, grades, and ball or container sizes complying with plant schedule and ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to OBO Landscape Architect and COR, with a proportionate increase in size of roots or balls.

C. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which begins at root flare according to ANSI Z60.1. Root flare shall be visible before planting.

D. Standards: All plant materials, including nomenclature, shall conform with the following, except where specifically indicated otherwise in the Contract Documents:

1. American Standard for Nursery Stock, ANSI Z60.1: American Nursery and Landscape Association.
2. Hortus III: J.H. Bailey, Cornell University.

E. Growing Practice: Plants shall be grown in accordance with climatic conditions similar to those of the project site for at least two years, unless specifically noted otherwise. Each plant shall be exceptionally heavy for its species and variety, and so trained or favored in development and appearance as to be superior in form, number of branches, and compactness. Size and grade of plant materials shall conform to ANSI Z60.1 unless otherwise specifically indicated in the Contract Documents.

F. Labeling: In each shipment, label at least 25 percent of each herbaceous plant species and variety, each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant.

G. Arrangements; If formal arrangements or consecutive orders of plants are indicated on Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.

H. Tree Size: Per plant schedule is contract requirement. Minimum sizes are noted below.

1. Shade Trees: Minimum size at installation shall be 75 mm (3 inches) caliper and 4 meters tall at time of planting.
2. Ornamental Flowering Trees: Minimum size at installation shall be 75 mm (3 inches) caliper and 2 meters tall at time of planting.
3. Palm Trees: Minimum size at installation shall be 3.5 meters tall to base of crownshaft at time of planting.
4. Multi-stem Palm Trees and Dwarf Palms: Minimum size at installation shall be 2.0 meters (6 ft and 6-3/4 inches) tall to base of crownshaft at time of planting.

I. Turfgrass Seed: Fresh, clean, dry, new-crop seed of suitable genetic identity, purity, and overall high quality to produce lawn free from noxious weeds as well as excessive quantities of other crops and weedy plants at time of harvest.

J. Turfgrass Sod: Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted. Use species with characteristics similar to those required for seed planting. Minimum 15 mm (1/2 inches) of soil attached at delivery.

K. Turfgrass Sprigs: Grower shall use only seed, cuttings, or other vegetative materials that have been harvested from a commercial operation. Provide sprigs from sod grown from certified, high-quality seed of know origin, or from plantings of certified grass seedlings or stolons.

L. Shrubs: Per Plant Schedule

M. Perennials: Per Plant Schedule

N. Grass and/or Forbe Seed Mix: Per Plant Schedule and:

1. Fresh, clean, dry, new-crop seed of suitable genetic identity, purity, and overall high quality to produce desired landscape design intent. Free from noxious weeds as well as excessive quantities of other crops and weedy plants at time of harvest.

2.2 PLANTING SOIL

A. General

Planting soil mix shall be naturally dark in color which indicates the existence of nutrients, adequate moisture, and organic matter in general. Leached white or off-white soil will be rejected. It shall contain no foreign matters like concrete, bricks, rocks, seeds, weeds, pests, or any debris of any size. It shall be well scarified and tilled when installed on site to create a soft permeable condition prior to planting. Compacted planting beds will be rejected.

B. Organic Matter

1. Sphagnum Moss.
2. Leaf Mold: Thoroughly shredded, composted leaf material.
3. Local Product: As approved by Project Director/COR.

C. Chemical Amendments

1. Dolomite Lime: Agricultural grade mineral soil conditioner containing **[35]** percent minimum magnesium carbonate and **[49]** percent calcium carbonate, 100 percent passing #65 sieve.
2. Iron Sulfate (Ferric or Ferrous): [**30-35**] percent iron, [**35-50**] percent sulphur. Shall be supplied by commercial fertilizer supplier.
3. Sulphate of Potash: Agricultural grade containing [**50 percent to 53 percent**] of water soluble potash.
4. Single Superphosphate: Commercial product containing [**18-20**] percent available phosphoric acid.
5. Calcium Nitrate: Agricultural grade containing [**15-1/2**] percent nitrogen.
6. Urea Formaldehyde: Commercial product containing [**38**] percent nitrogen.

7. Mineral Amendments:
   a. Grading Dry Weight Basis:

Percent Passing	Sieve Designation
100	10 mm (3/8 inch)
95-100	2.00 mm (#10)
20-80	0.41 mm (#40)
0-5	0.075 mm (#200)

8. Chemical Properties:
   a. Salinity: Saturation extract conductivity shall not exceed 3.0 milimhos/cm.
   b. Boron: Concentration in saturation extract shall not exceed 1.0 parts per million.
   c. Sodium Absorption Ratio (SAR), as calculated from analysis of saturation extract, shall not exceed 6.0.

D. Soil Mixes

1. General:

   a. Nutrient analysis and amendment: Unless specific amounts of chemical amendments are given in specification, the mix shall be tested for levels of pH, iron magnesium, potassium, phosphorous, salts, carbon, and nitrogen, and shall be adjusted to required fertility levels. The following are acceptable results for all soil types.

pH Range	5.0-7.0
Magnesium-Mg	100+ units
Phosphorous-P205	150+ units
Potassium-K20	120+ units
Carbon Nitrogen Ration-C/N	Max 30:1
Soluble Salts/Conductivity	Not to exceed 500 ppm/0.5 mmhos/cm (organics less than 5 percent), not to exceed 3000 ppm/2.5 mmhos/cm (organics greater than 5 percent)

2. Soil fractions shall be those defined by local Soil Conservation Service or similar entity. Soil fractions are by weight of mineral fraction without organics.
3. Organic content shall be tested by combustion test.
4. Unit weights shall be measured as wet density at 100 percent compaction and optimum moisture; reference ASTM D698.
5. Thoroughly combine all ingredients to create homogeneous mixtures prior to placement on subgrade.

E. Lawn Mix

1. Onsite or imported material naturally occurring or amended to meet the following:
   a. Loam, sandy loam, or clayey loam, reasonably free of subsoil, clay lumps, stones, or gravel of any dimensions, and debris. Free of excessive weeds, roots, and root mats, and any substance detrimental to plant growth. Imported topsoil shall be from an identifiable source.

b. Composition of mineral fraction:
   1) Sand: 20-60 percent.
   2) Silt: 12-50 percent.
   3) Clay: 7-40 percent.
c. Organic content: 3-5 percent.
d. General requirements as defined for general soil mixes.

F. Shrub and Tree Mix

1. Mix Ratio: Approximately 3:1 by volume mixture of loam or sandy loam and organic amendment meeting the following requirements:
   a. Composition of mineral fraction:
      1) Sand: 23-73 percent.
      2) Silt: 16-50 percent.
      3) Clay: 7-27 percent.
   b. Organic content: 4-8 percent.

G. Extensive Green Roof Soil Mix – per extensive green roof soil manufacturer specifications.

H. Intensive Green Roof Soil Mix – per intensive green roof soil manufacturer specifications.

2.3 FERTILIZERS

A. Planting Tablets: Tightly compressed chip-type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.

1. Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.

2.4 MULCHES

A. Organic Mulch: Free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:

1. Type: Locally available:
   a. ground or shredded bark
   b. bark chips
   c. pine straw or needles
   d. peanut, pecan, or cocoa bean shells
   e. Seed husks
   f. Shredded palm tree fronds.
   g. Or other organic mulch alternative to be approved by OBO Landscape Architect.

2. Organic Mulch shall be naturally dark brown in color indicating that it is already in composting process. Mulch that has negative effects on planting soil quality such as light color fresh organic mulch and artificially painted mulch are not permitted.
3. Size Range: 76 mm (3 inches) maximum, 10 mm (0.25 inch) minimum.

B. Compost Mulch: Well-composted, stable, and weed-free organic matter, pH of 5.5 - 8; moisture content 35 to 55 percent by weight; 100 percent passing through a 25-mm (1-inch) sieve; soluble-salt content of 2 to 5 dS/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

1. Organic Matter Content: 50 to 60 percent of dry weight.
2. **[Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste are not permitted.]**

3. **[Stone/Mineral Mulch for planting areas: XX]**

2.5 WEED-CONTROL BARRIERS

A. [Nonwoven Geotextile Filter Fabric: Polypropylene or polyester fabric, 101g/sq. m (3 oz./sq. yd.) minimum, composed of fibers formed into a stable network so that fibers retain their relative position. Fabric shall be inert to biological degradation and resist naturally encountered chemicals, alkalis, and acids.]

B. [Composite Fabric: Woven, needle-punched polypropylene substrate bonded to a nonwoven polypropylene fabric, 162 g/sq. m (4.8 oz./sq. yd).]

2.6 PESTICIDES

A. General: Pesticide registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

B. Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

C. Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

2.7 TREE-STABILIZATION MATERIALS

A. Trunk-Stabilization Materials:

1. Upright and Guy Stakes: Rough-sawn, sound, new [**hardwood**] [**softwood with specified wood pressure-preservative treatment**], free of knots, holes, cross grain, and other defects, 38-by-38-mm actual (2-by-2-inch nominal) by length indicated, pointed at one end.
2. Wood Deadmen: Timbers measuring 200 mm (8 inches) in diameter and 1200 mm (48 inches) long, treated with specified wood pressure-preservative treatment.

3. Flexible Ties: Wide rubber or elastic bands or straps of length required to reach stakes or [**turnbuckles**] [**compression springs**].
4. Guys and Tie Wires: ASTM A641/A641M, Class 1, galvanized-steel wire, two-strand, twisted, 2.7 mm (0.106 inch) in diameter.
5. Tree-Tie Webbing: UV-resistant polypropylene or nylon webbing with brass grommets.
6. Guy Cables: Five-strand, 4.8-mm- (3/16-inch-) diameter, galvanized-steel cable, with zinc-coated [**turnbuckles**] [**compression springs**], a minimum of 75 mm (3 inches) long, with two 10-mm (3/8-inch) galvanized eyebolts.
7. Flags: Standard surveyor's plastic flagging tape, white, 150 mm (6 inches) long.

B. Palm Bracing: Battens or blocks, struts, straps, and protective padding.

1. Battens or Blocks and Struts: Rough-sawn, sound, new hardwood or softwood, free of knots, holes, cross grain, and other defects, 38-by-89-mm actual (2-by-4-inch nominal) by lengths indicated.
2. Straps: Adjustable steel or plastic package banding.
3. Padding: Burlap.

2.8 LANDSCAPE EDGINGS

A. Lawn Edging: Provide steel edging, except provide precast concrete where corrosion is a risk.

1. Steel: 100 mm (4 inches) deep x 6 mm (1/4 inch) thick steel with stakes to hold edging in place.
2. Concrete: 150 mm (6 inches) wide by 150-200 mm (6-8 inches) deep precast curb.

B. Steel Edging: Standard commercial-steel edging, fabricated in sections of standard lengths, with loops stamped from or welded to face of sections to receive stakes.

1. Edging Size: 6.4 mm (1/4 inch) thick by 125 mm (5 inches) deep.
2. Stakes: Tapered steel, a minimum of 300 mm (12 inches) long.
3. Accessories: Standard tapered ends, corners, and splicers.
4. Finish: Manufacturer's standard finish.

2.9 TREE GRATES

A. Tree Grates: Manufacturer's standard tree grates and frames.

1. Grates: ASTM A48/A48M, Class 250 (Class 35) or better, gray-iron castings.
2. Frames: ASTM A48/A48M, Class 250 (Class 35) or better, gray-iron castings of shape, pattern, and size indicated.

B. Shape and Size: As indicated on Drawings.

C. Finish as indicated on drawings.

1. Color: as indicated on drawings.

2.10 TREE-WATERING DEVICES

A. Slow-Release Watering Device: Standard product manufactured for on grade irrigation of plants and emptying its water contents over **[two to nine hours]**; manufactured from UV-light-stabilized nylon-reinforced polyethylene sheet, PVC, or HDPE plastic.

1. Color: Manufacturer standard color and COR approved.

2.11 MISCELLANEOUS PRODUCTS

A. Root Barrier: Black, molded, modular panels 610 mm (24 inches) high (deep), 2.2 mm (85 mils) thick, and with vertical root deflecting ribs protruding 19 mm (3/4 inch) out from panel surface; manufactured with minimum 50 percent recycled polyethylene plastic with UV inhibitors.

B. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

C. Burlap: Non-synthetic, biodegradable.

D. Planter Drainage Gravel: Washed, sound crushed stone or gravel complying with ASTM D448 for Size No. 8.

E. Planter Filter Fabric: Nonwoven geotextile manufactured for separation applications and made of polypropylene, polyolefin, or polyester fibers or combination of them.

F. Jute mesh: as manufactured for erosion control.

G. Straw mats: as manufactured for temporary erosion control.

H. Geogrid: as manufactured for slope stabilization and erosion control.

PART 3 - EXECUTION

3.1 PLANTING AREA ESTABLISHMENT

A. Complete the following steps for planting area establishment before installing the irrigation system in the planting area. See Section 328400 Irrigation for irrigation system installation.

B. Within the entire area to be landscaped, the Contractor shall complete the following site topsoil preparation items to eradicate existing weeds and natural groundcover. Initiate site topsoil preparation as stated herein, and coordinate work with irrigation system and utility lines.

C. Prepare areas to be landscaped by clearing weeds and groundcover, stumps, stones larger than 25 mm (1 inch) in diameter, roots, and debris or materials that may hinder proper grading, tillage,

planting, or subsequent maintenance operations by approved means. Cleared material shall be totally removed from the Project site and properly disposed of the property.

3.2 EXAMINATION

A. Examine areas to receive plants, with Installer present, for compliance with requirements and conditions affecting installation and performance of the Work.

1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
2. Verify that plants and vehicles loaded with plants can travel to planting locations with adequate overhead clearance without damaging completed work.
3. Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
4. Verify subgrade to ensure that rough grading is correct, and that suitable subgrade materials exist before starting plant installation.
5. Verify service and utility location and irrigation components.
6. Verify that topsoil and subgrade are damp when topsoil is spread. Uniformly moisten excessively dry soil that is not workable and/or too dusty.

B. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove soil and contamination as directed by Project Director/COR, and replace with new planting soil.

C. Test Drainage: Test five plant beds and pits chosen by Project Director/COR by filling with water twice in succession. Note the time at which water is put into pit or bed for second filling. Notify Project Director/COR of the time it takes for pit or bed to drain completely. Do not proceed with planting operations until Project Director/COR has reviewed test drainage results and accepted soil drainage conditions.

D. Wrap shade trees with burlap fabric over trunks to first main branch to protect from wind and other damage during digging, handling, and transportation.

E. Make sure all irrigation systems are in place, completed, tested, and running before starting plant installation. Verify all locations of subgrade irrigation system installed are clearly marked with flags or other markers to avoid damaging completed irrigation installation. See Section 328400 Irrigation.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 PREPARATION

A. Protect structures, utilities, irrigation system, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

C. Check and make sure all subgrade irrigation system and pipe are installed and clearly flagged/marked.

D. Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Project Director's/COR's acceptance of layout before excavating or planting. Make minor adjustments as required.

3.4 EXCAVATION FOR TREES AND SHRUBS

A. Planting Pits and Trenches: Excavate circular planting pits.

1. Excavate planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are unacceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling with root flare 50 mm (2 inches) above adjacent finish grades. Scarify sides of planting pit smeared or smoothed during excavation unless it is on the root barrier side.
2. Excavate approximately three times as wide as root ball diameter for stock.
3. Excavate at least 300 mm (12 inches) wider than root spread and deep enough to accommodate vertical roots for bare-root stock.
4. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
5. If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
6. Maintain angles of repose of adjacent materials to ensure stability. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
7. Maintain supervision of excavations during working hours.
8. Subgrade of planting areas shall be loosened or scarified to a minimum of 75 mm (3 in.) depth prior to spreading planting soil. Subgrade shall be brought to true and uniform grade and shall be cleared of stone greater than 50 mm (2 in.), sticks, and other deleterious and extraneous materials.
9. If drain tile is indicated on Drawings or required under planting areas, excavate to top of porous backfill over tile.
10. Before planting, obtain Project Director's/COR's acceptance of finish grade; restore planting areas if eroded or otherwise disturbed after finish grading.
11. Keep excavations covered or otherwise protected after working hours and when unattended by Installer's personnel.

B. Backfill Soil: Subsoil and topsoil removed from excavations may be used as backfill soil or mixed into planting soil if its property meets above planting soil qualification and approved by OBO Landscape Architect in writing. Remove all debris and poor-quality parts of excavated soil before using for backfill.

C. Obstructions: Notify Project Director/COR if unexpected rock, obstructions, or hardpan layer detrimental to trees or shrubs are encountered in excavations.

D. Drainage: Notify Project Director/COR if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.

E. Fill excavations with water and allow to percolate away before positioning trees and shrubs.

3.5 TREE, SHRUB, AND VINE PLANTING

A. Inspection: At time of planting, verify that root flare is visible at top of root ball according to ANSI Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top-most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.

B. Roots: Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

C. Balled and Burlapped Stock: Set each plant plumb and in center of planting pit or trench with root flare 50 mm (2 inches) above adjacent finish grades.

1. Backfill: See Article PLANTING SOIL.
2. After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
3. Backfill pits with planting soil. Work soil carefully into voids and pockets, tamping lightly every 150 mm (6 in.). Finish backfilling and tamping, and form saucer around plant pits as indicated on Construction Drawings. When planting pit is approximately one-half filled, water thoroughly before placing the remainder of backfill. Repeat watering until no more water is absorbed. Fill saucer with water and leave water to soak in the soil. Then fill saucer with water again. Repeat this until the roots of the plants are well established.

D. Balled and Potted, and Container-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 50 mm (2 inches) above adjacent finish grades.

1. Backfill: See Article PLANTING SOIL.
2. Carefully remove root ball from container without damaging root ball or plant.
3. Backfill pits with planting soil. Work soil carefully into voids and pockets, tamping lightly every 150 mm (6 in.). Finish backfilling and tamping, and form saucer around plant pits as indicated on Construction Drawings. When planting pit is approximately one-half filled, water thoroughly before placing the remainder of backfill. Repeat watering until no more water is absorbed. Fill saucer with water and leave water to soak in the soil. Then fill saucer with water again. Repeat this until the roots of the plants are well established.

E. Fabric Bag-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 50 mm (2 inches) above adjacent finish grades.

1. Backfill: See Article PLANTING SOIL.
2. Carefully remove root ball from fabric bag without damaging root ball or plant. Do not use planting stock if root ball is cracked or broken before or during planting operation.
3. Backfill pits with planting soil. Work soil carefully into voids and pockets, tamping lightly every 150 mm (6 in.). Finish backfilling and tamping, and form saucer around plant pits as indicated on Construction Drawings. When planting pit is approximately one-half filled, water thoroughly before placing the remainder of backfill. Repeat watering until no more water is absorbed. Fill saucer with water and leave water to soak in the soil. Then fill saucer with water again. Repeat this until the roots of the plants are well established.

F. Bare-Root Stock: Set and support each plant in center of planting pit or trench with root flare 25 mm (1 inch) above adjacent finish grade.

1. Backfill: Soil mix per plant legend.
2. Spread roots without tangling or turning toward surface. Plumb before backfilling and maintain plumb while working.
3. Carefully work backfill in layers around roots by hand. Bring roots into close contact with the soil.
4. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
5. Place planting tablets equally distributed around each planting pit when pit is approximately one-half filled. Place tablets beside soil-covered roots about 25 mm (1 inch) from root tips; do not place tablets in bottom of the hole or touching the roots.

   a. Quantity: Two per plant.

G. Watering Pipe Watering System: See irrigation specifications.

H. Slopes: When planting on slopes, set the plant so the root flare on the uphill side flushes with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil but no more than 50 mm (2 inches). Apply enough soil to cover the downhill side of the root ball.

3.6 MECHANIZED TREE-SPADE PLANTING

A. Trees may be planted with an approved mechanized tree spade at the designated locations. Do not use tree spade to move trees larger than the maximum size allowed for a similar field-grown, balled-and-burlapped root-ball diameter according to ANSI Z60.1, or larger than manufacturer's maximum size recommendation for the tree spade being used, whichever is smaller.

B. Use the same tree spade to excavate the planting hole as will be used to extract and transport the tree.

C. When extracting the tree, center the trunk within the tree spade and move tree with a solid ball of earth.

D. Cut exposed roots cleanly during transplanting operations.

E. Where possible, orient the tree in the same direction as in its original location.

3.7 TREE, SHRUB, AND VINE PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural/arboricultural practices and as directed by OBO Landscape Architect. Unless otherwise indicated by Project Director/COR or OBO Landscape Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character. Do prune or cut trees for transportation to project site.

C. Do not apply pruning paint to wounds.

3.8 TREE STABILIZATION

A. Retain this article if tree stabilization is required; coordinate with details on Drawings. See Evaluations for discussion of advantages and disadvantages of stabilization methods.

B. Protect trunks of trees and palms. Do not nail any stabilization materials and equipment onto trunks. Wrap trunks with soft materials like rubber sheets to protect when attaching or tying wires, stakes, or any other support materials.

C. Trunk Stabilization by Upright Staking and Tying: Install trunk stabilization as follows unless otherwise indicated:

1. Upright Staking and Tying:

a. Stake trees of 25- through 125-mm (1- through 5-inch) caliper. Use a minimum of two stakes of length required to penetrate at least 450 mm (18 inches) below bottom of backfilled excavation and to extend at least 1830 mm (72 inches) above grade. Set vertical stakes and space to avoid penetrating root balls or root masses.

b. Stake trees with two stakes for trees up to 3.6 m (12 feet) high and 63 mm (2-1/2 inches) or less in caliper; three stakes for trees less than 4.2 m (14 feet) high and up to 100 mm (4 inches) in caliper. Space stakes equally around trees.

2. Support trees with bands of flexible ties at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.

D. Palm Bracing: Install bracing system at three or more places equally spaced around perimeter of trunk to secure each palm until established unless otherwise indicated.

1. Site-Fabricated Palm-Bracing Method:

a. Place battens over padding and secure battens in place around trunk perimeter with at least two straps, tightened to prevent displacement. Ensure that straps do not contact trunk.

b. Place diagonal braces and cut to length. Secure upper ends of diagonal braces with galvanized nails into battens or into nail-attached blocks on battens. Do not drive nails, screws, or other securing devices into palm trunk; do not penetrate palm trunk in any fashion. Secure lower ends of diagonal braces with stakes driven into ground to prevent outward slippage of braces.

3.9 INSTALLATION OF ROOT BARRIER

A. Install root barrier where trees are planted within 1200 mm (48 inches) of paving or other hardscape elements, such as walls, curbs, and walkways, unless otherwise indicated on Drawings.

B. Align root barrier with bottom edge angled at 20 degrees away from the paving or other hardscape element. Install root barrier linearly along and adjacent to the paving or other hardscape elements to be protected from invasive roots.

C. Install root barrier continuously for a distance of 1500 mm (60 inches) in each direction from the tree trunk, for a total distance of 3 m (10 feet) per tree. If trees are spaced closer, use a single continuous piece of root barrier.

1. Position top of root barrier according to manufacturer's written recommendations.
2. Overlap root barrier a minimum of 300 mm (12 inches) at joints.
3. Do not distort or bend root barrier during construction activities.
4. Do not install root barrier surrounding the root ball of tree.

3.10 PLACING SOIL IN PLANTERS

A. Place a layer of drainage gravel at least 100 mm (4 inches) thick in bottom of planter. Cover bottom with filter fabric and wrap filter fabric 150 mm (6 inches) up on all sides. Duct tape along the entire top edge of the filter fabric, to secure the filter fabric against the sides during the soil-filling process.

B. Fill planter with planting soil. Place soil in lightly compacted layers to an elevation of 38 mm (1-1/2 inches) below top of planter, allowing natural settlement.

3.11 GROUND COVER, ORNAMENTAL GRESS, AND “TROPICALS” PLANTING

A. Set out and space ground cover and plants other than trees, shrubs, and vines as indicated on Drawings in even rows with triangular spacing.

B. Use planting soil per Article PLANTING SOIL for backfill.

C. Dig holes large enough to allow spreading of roots in planting bed prepared per Article PLANTING AREA ESTABLISHMENT of this specification.

D. Protect and do not damage irrigation lines and drip tubes.

E. For rooted cutting plants supplied in flats, plant each in a manner that minimally disturbs the root system but to a depth not less than two nodes.

F. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

G. Water thoroughly after planting, taking care not to cover plant crowns with wet soil. Repeat watering daily to keep the planting bed moist all day unless it is not recommended in local practices.

H. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.12 XERISCAPING AND DESERT PLANTING

A. Set out and space xeriscaping and desert plants as indicated on Drawings.

B. Dig holes large enough to allow spreading of roots in planting bed prepared per Article PLANTING AREA ESTABLISHMENT of this specification.

C. Protect and do not damage irrigation lines and drip tubes.

D. For rooted cutting plants supplied in flats, plant each in a manner that minimally disturbs the root system but to a depth not less than two nodes.

E. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

F. Water thoroughly after planting, taking care not to cover plant crowns with wet soil. Repeat watering daily per recommended in local practices.

G. If provided, place and adjust point-source drip emitters per drawings. Ensure water from each emitter covers the root area of the plant completely.

H. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.13 PLANTING AREA MULCHING

A. Install weed-control barriers as required on plans before mulching according to manufacturer's written instructions. Completely cover area to be mulched, overlapping edges a minimum of 300mm (12 inches) and secure seams with galvanized pins.

B. Mulch backfilled surfaces of planting areas and other areas indicated.

1. Trees in Turf Areas: Apply organic mulch ring of 75-mm (3-inch) average thickness, with 900-mm (36-inch) radius around trunks or stems. Do not place mulch within 150 mm (6 inches) of trunks or stems.
2. Organic Mulch in Planting Areas: Apply 50-mm (2-inch) average thickness of organic mulch over whole surface of planting area, and finish level with adjacent finish grades.
3. Mineral Mulch in Planting Areas: Where indicated in drawings, apply 50-mm (2-inch) average thickness of mineral mulch over whole surface of planting area, and finish level with adjacent finish grades.
4. Do not step on or damage subgrade irrigation lines and drip tubes and plants during this operation.

3.14 NO PLANTING STRIP

A. Do not plant directly against perimeter fence/wall. Place landscaping mulch 800mm (24 inches) wide and 75mm (3 inches) deep over weed control barrier over compacted base. Separate planting and mulch areas from lawn and other planting with edging.

3.15 INSTALLATION OF EDGING

A. Steel Edging: Install steel edging where indicated according to manufacturer's written instructions. Anchor with steel stakes spaced approximately 760 mm (30 inches) apart, driven below top elevation of edging.

3.16 INSTALLATION OF TREE GRATES

A. Tree Grates: Install according to manufacturer's written instructions. Set grate segments flush with adjoining surfaces. Shim from supporting substrate with soil-resistant plastic. Maintain a 75-mm- (3-inch-) minimum growth radius around base of tree; break away portions of casting, if necessary, according to manufacturer's written instructions.

3.17 INSTALLATION OF TEMPORARY SLOW-RELEASE WATERING DEVICE

A. Provide one device for each tree for root establishment.

B. Place device on top of the mulch at base of tree stem and fill with water according to manufacturer's written instructions.

C. Remove them once the root is established or at the end of warranty period.

3.18 PLANT MAINTENANCE

A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing tree-stabilization devices, resetting to proper grades or

vertical position, and performing other operations as required to establish healthy, viable plantings.

B. Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices when possible to minimize use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

D. The Contractor is responsible for plant maintenance during construction, through plant establishment period, and until the end of warranty period.

3.19 PESTICIDE APPLICATION

A. Spray/apply insecticides, pesticides, and herbicides, to inhibit damage from insects, pests, and diseases, only with approval of Project Director/COR or Facility Manager (during warranty period). Spray products and application shall conform to the National Arborist Association Standards under the section titled “Standards for Pesticide Application Operations.” and as approved by Project Director/COR or Facility Manager. All insecticides, pesticides, and herbicides shall be EPA approved. Spraying shall be performed only by authorized and certified personnel.

B. Pre-Emergent Herbicides (Selective and Nonselective): Apply to tree, shrub, and ground-cover areas according to manufacturer's written recommendations. Do not apply to seeded areas.

C. Post-Emergent Herbicides (Selective and Nonselective): Apply only as necessary to treat already-germinated weeds and according to manufacturer's written recommendations.

3.20 REPAIR AND REPLACEMENT

A. General: Repair or replace existing or new trees and other plants that are damaged during construction operations, in a manner approved by Project Director/COR.

1. Submit details of proposed pruning and repairs.
2. Perform repairs of damaged trunks, branches, and roots within 24 hours, if approved.
3. Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by Project Director/COR or Facility Manager.

B. Remove and replace trees that are more than 25 percent dead or in an unhealthy condition before the end of the warranty period.

1. Provide replacement new trees of same size as those being replaced.
2. Species of Replacement Trees: Same species being replaced or species selected by Project Director/COR or Facility Manager with suggestions from OBO Landscape Architect.

3.21 CLEANING AND PROTECTION

A. During planting, keep adjacent paving and construction clean and work area in an orderly condition. Clean the site daily. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Project site.

C. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

D. After Substantial Completion, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and Project site.

3.22 DEMONSTRATION & TRAINING

A. Comply with Division 01, Section 017905 “Demonstration and Training” for general requirements of demonstration and training documentation.

B. The landscape Installer’s skilled representative shall provide ‘hands-on’ training sessions for the Government O&M personnel.
   1. Schedule as follows:
      a. Classroom Instruction: Two (2) hours.
      b. Field Demonstration: Six (6) hours.

C. Training shall cover the following topics:
   1. The classroom session shall review maintenance manuals, maintenance record schedules, and any lessons learned during the initial service period for all plantings and ground cover. Additionally, include procedures and activities required per the maintenance service contract section with this specification in coordination with complete irrigation/wastewater treatment system. Relevant health and safety issues shall be addressed in coordination with the Integrated Pest Management Plan. Inspection requirements and/or techniques with appropriate specialty tools.
   2. Provide a field demonstration for O&M/Gardening personnel on the landscape maintenance requirements within two months of concluding contractor’s initial maintenance service period.

END OF SECTION 329300

SECTION 331117 - WATER SUPPLY WELLS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. **[Cable-tool] [Rotary drilled] [Reverse-rotary drilled] [Driven]** water supply wells.

2. **[Line-shaft] [Submersible]** well pumps.

B. Related Section:

1. Section 223230 “Potable Water Treatment” for compound water treatment.
2. Various Division 22 sections for valves, fittings, and similar work.
3. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
4. Section 260525 "Grounding and Bonding for Electrical Systems."
5. Section 331414 “Fire Service Mains and Appurtenances.”
6. Section 331416 “Site Water Distribution Piping.”
7. Division 33 Section on site sanitary sewerage piping and structures.

1.2 PERFORMANCE REQUIREMENTS

A. Continuous Verified Yield of **<Insert Cubic Meters per Day (CMD)>**. Design complete well system with sufficient integration of well components, and of well with other systems, to ensure all components are matched and capable of delivering, conveying, and treating continuous yield.

B. Investigations and Analysis: Investigate and analysis geotechnical, geophysical, and ground water hydrology characteristics required to plan, locate, and construct complete well system which will provide required continuous yield.

1. General: EPA 570/9-75-001 and AWWA A100.
2. Development of Monitoring Well: ASTM D 5521.
3. Sieve Analysis: ASTM C 136.
4. Soil and Rock Sampling: ASTM D 1586, ASTM D 1587, and ASTM D 5079.
5. Soil and Rock Characteristics: ASTM D 2216, ASTM D 2487, ASTM D 2488, ASTM D 4318, and ASTM D 4750.
6. Water Analysis: AWWA EWW and EPA 600/4 – 79/020.
7. Contaminants: EPA 816-F-09-004 standards after passage through water treatment facility provided as part of this water supply well system.

C. General Well Standards:

1. Well Construction: EPA 570/9–75–001, and AWWA A100.
2. Examination and Treatment: AWWA B300, AWWA B301, AWWA C654, AWWA EWW, EPA 816-F-09-004.
3. EPA 600/4 – 79/020.

D. Protect wells against surface and subsurface contamination in accordance with EPA 570/9-75-001 and EPA 816-K-02-003.

E. Hazardous Materials: Where hazardous material is encountered, handle in accordance with 49 CFR 172, "Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, Training Requirements, and Security Plans."

THE REMAINDER OF THIS PAGE DELIBERATELY LEFT BLANK

F. Well Location: Locate water supply wells at distances identified in Table 1.2, "Minimum Well Location Distances:"

TABLE 1.2

MINIMUM WELL LOCATION DISTANCES

STRUCTURE OR TOPOGRAPHIC FEATURE	MIN. DISTANCE (M)
Building Foundation – Non-Treated	3
Building Foundation with Termite Treatment	15
[1]Residential Sewer Line	15
Wastewater Treatment Plant or Sewage Lift Station	30
Individual Septic Tanks	15
Septic Tank Drainfields	30
Underground Fuel Storage Tanks	30
Cemetery	30
Non-Potable Water Well	30
Property Line	15
Storm Water Detention Basin or Infiltration Beds	15

[1] If sewer line is located within 15 meters of potable water supply well, sewer line must be continuous and have permanent sealed joints. If sewer line is closer than 3 meters to potable water supply well, encase sewer line in conductor pipe that is nominally two sizes larger than sewer line throughout 3 meter distance from well. Seal casing to ends of sewer line with vent that extends above ground, and at least 3 meters down gradient from well.

G. Potable well water which is pumped from aquifer less than 15 meters from ground surface must be considered as surface water for **[potential future]** treatment for supply of potable well water.

1.3 SUBMITTALS

A. Product Data: Submit certified performance curves and rated capacities of selected well pumps and furnished specialties and accessories for each type and size of well pump indicated.

B. Well Installation Plan: Describe the following:

1. Well drilling methods and installation procedures including any temporary casing used, placement of filter pack and seal materials, drill cuttings and fluids disposal and soil/rock sample disposition.
2. Well construction materials including well screen, riser pipe, centralizers, air line and gauge, tailpiece, filter pack and filter pack gradation, bentonite, drilling mud, drilling fluid additives, drilling water, cement, and well protective measures.
3. Mechanical and electrical equipment to be installed both inside well casing but also inside of well head vault, and to first point of connection to site wide water, instrumentation, and electrical power distribution, and transmitting systems. Include catalogue and name plate information.
4. Quality control procedures to be used for vertical alignment checks and controls, and for placement of filter pack and boring seals, including depth measurements.
5. Procedures for contamination prevention, and for decontamination of well materials and equipment.
6. Cover protection scheme for well head protective surface, including frost heave or freeze protection provisions.
7. Well development methods.
8. List applicable publications and standards
9. Well decommissioning/abandonment procedures.
10. Well capacity testing techniques.
11. Geophysical techniques to be employed at site.
12. Permanent pump, including testing and commissioning procedures.
13. Include investigations and analysis identified in Article on PERFORMANCE REQUIREMENTS.
14. Forms to be used for written boring logs, installation diagram of wells, geophysical logs, well development records, well sampling data records, required well registration records, and well abandonment records.

C. Shop Drawings: Show layout and connections for well pumps.

1. Wiring Diagrams: Power, signal, and control wiring.
2. Show piping layouts and isometrics within the well head vault to the first point of connection at the contract limit line.
3. Setting Drawings: Include templates and directions for installing foundation bolts, anchor bolts, and other anchorages.

D. Qualification Data:

1. Well driller.
2. Testing Agency.

E. Field Documentation Report: Record the following data for each water supply well:

1. Casings: Material, diameter, thickness, weight per meter (foot) of length, and depth below grade.
2. Screen: Material, construction, diameter, and opening size.

3. Pumping Test: Static water level, maximum safe yield, and drawdown at maximum yield.
4. Log: Formation log indicating strata encountered.

F. Alignment Certification: Certify that well is aligned and plumb within specified tolerances.

G. Field quality-control reports, including the following:

1. [Pilot-hole and neighborhood well test data and analysis.]
2. Substrata formations.
3. Water-bearing formations.
4. Water levels.
5. Hydrostatic tests.
6. Laboratory water analysis.
7. Well-screen analysis.
8. Performance test data.

H. Operation and Maintenance Data: For each well pump, **[valves, motors, and well screen]** to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Well Driller Qualifications: An experienced water supply well driller licensed in the jurisdiction where Project is located that can provide documentary evidence of five years acceptable experience with ground water development projects of a similar nature.

B. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7.

C. Comply with the OBO-ICS NEC (NFPA 70, "National Electrical Code" as amended by OBO).

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE and marked for intended use.

D. Comply with standards referenced in section 1.2 of these specifications. If there is any conflict between any of the standards referenced the most rigorous requirement will be applied.

1.5 [PROJECT CONDITIONS

A. [Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:

1. Notify Project Director/COR no fewer than seven days in advance of proposed interruption of water service.
2. Do not proceed with interruption of water service without Project Director/COR's written permission.]

B. [Well Drilling Water: Provide temporary water and piping for drilling purposes.]

PART 2 - PRODUCTS

2.1 WELL CASINGS

A. [Steel Casing: AWWA C200, single ply, steel pipe with threaded ends and threaded couplings for threaded joints.]

B. [Acrylonitrile-butadiene-styrene (ABS) Casing: ASTM F 480, ABS, Schedule [40] [80] bell-and-spigot pipe and couplings for solvent-cemented joints.]

C. [Polyvinyl Chlorine (PVC) Casing: ASTM F 480[and NSF 14,] PVC, Schedule [40] [80] bell-and-spigot pipe and couplings for solvent-cemented joints. [Include NSF listing mark "NSF wc."]]

D. [Pitless Adapter: Fitting, of shape required to fit onto casing, with waterproof seals.]

E. [Pitless Unit: Factory-assembled equipment that includes pitless adapter.]

F. Well Seals: Casing cap, with holes for piping and cables, that fits into top of casing and is removable, waterproof, and vermin proof.

2.2 GENERAL PIPING

A. Underground Distribution Piping to Battery Limit: AWWA C200 or C604.

B. Steel Piping: AWWA C200, AWWA C206, AWWA C604, ASTM A 139/A 139M, ASTM A 312/A 312M

C. PVC Piping: ASTM D 1785.

2.3 [GROUT

A. Cement: ASTM C 150, Type II.

B. Aggregates: ASTM C 33, fine and coarse grades.

C. Water: Potable.]

2.4 WATER WELL SCREENS

A. Screen Material: Fabricated of ASTM A 666, Type 304 stainless steel **[, welded; with continuous-slot, V-shaped openings that widen inwardly] [tube; with slotted or perforated surface and designed for well-screen applications]**. Approval of final selection is required by Project Director/COR.

1. Screen Couplings: Butt-type, stainless-steel coupling rings.
2. Screen Fittings: Screen, with necessary fittings, closes bottom and makes tight seal between top of screen and well casing.
3. Maximum Entering Velocity: 0.03 m/s (0.1 fps).

2.5 [PACK MATERIALS

A. [Coarse, uniformly graded filter sand, maximum 3 mm (1/8 inch) in diameter.]

B. [Fine gravel, maximum 6 mm (1/4 inch) in diameter.]

2.6 [LINE-SHAFT WELL PUMPS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. American Turbine Pump Co.
2. Crane Pumps and Systems; Deming Pumps.
3. Flowserve Corporation; Flowserve Pump Division.
4. ITT Industries; Goulds Pumps.
5. Johnston Pump Company.
6. Pentair Pump Group; Fairbanks Morse Pump.
7. Pentair Pump Group; Layne/Verti-Line.
8. Sterling Fluid Systems (USA) Inc.; Peerless Pump.
9. WDM Pumps Inc.
10. <Insert manufacturer's name.>

B. Description: Line-shaft, [water] [oil]-lubricated, vertical-turbine well pump complying with HI 2.1-2.2 and HI 2.3; with the following features:

1. Impeller Material: [Stainless steel] [Carbon steel] [Bronze].
2. Motor: Full-voltage starting, vertical hollow- or solid-shaft, squirrel-cage induction type complying with ANSI C50.10.
3. Pump Base: Cast iron or fabricated steel.
4. Column Pipe: ASTM A 53/A 53M, Schedule 40, galvanized-steel pipe with threaded ends and cast-iron or steel threaded couplings.

C. Capacities and Characteristics:

1. **Capacity: <Insert L/s (gpm).>**
2. **Discharge Head: <Insert kPa (psig).>**
3. **Discharge Size: <Insert DN (NPS).>**
4. **Speed: <Insert rpm.>**
5. **Motor Horsepower: <Insert value.>**
6. **Lift: <Insert m (feet).>**
7. **Pressure Rating: <Insert kPa (psig).>**
8. **Volts: <Insert value.>**
9. **Phases: <Insert value.>**
10. **Hertz: <Insert value.>**
11. **Full-Load Amperes: <Insert value.>**
12. **Minimum Circuit Ampacity: <Insert value.>**
13. **Maximum Overcurrent Protection: <Insert amperage.>]**

2.7 SUBMERSIBLE WELL PUMPS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Aermotor Pumps, Inc.
2. American Turbine Pump Co.
3. Crane Pumps and Systems; Deming Pumps.
4. Grundfos.
5. ITT Industries; Goulds Pumps.
6. Jacuzzi, Inc.; Jacuzzi Brothers.
7. Johnston Pump Company.
8. McDonald, A. Y. Mfg. Co.
9. Pentair Pump Group; Layne/Verti-Line.
10. Pentair Pump Group; Myers, F. E.
11. Reda Productions Services; Schlumberger Limited.
12. Sta-Rite Industries, Inc.; Water Systems Group.
13. Sterling Fluid Systems (USA) Inc.; Peerless Pump.
14. USFilter/EMU Products.
15. Weber Industries, Inc.
16. <**Insert manufacturer's name.**>

B. Description: Submersible, vertical-turbine well pump complying with HI 2.1-2.2 and HI 2.3; with the following features:

1. Pumps: AWWA A102.
2. Impeller Material: [**Stainless steel**] [**Silicon bronze**].
3. Motor: Capable of continuous operation under water, with protected submersible power cable.
4. Column Pipe: ASTM A 53/A 53M, Schedule 40, galvanized-steel pipe with threaded ends and cast-iron or steel threaded couplings.

5. Discharge Piping: ASTM D 2239, SIDR Numbers 5.3, 7, or 9 polyethylene plastic (PE) pipe; made with PE compound number required to give pressure rating not less than [**1100 kPa (160 psig)**] [**1400 kPa (200 psig)**]. Include NSF listing mark "NSF pw."

   a. Insert Fittings for PE Pipe: ASTM D 2609, made of polyamide (nylon) plastic (PA), polypropylene plastic (PP), or PVC with serrated, male insert ends matching inside of pipe. Include bands or crimp rings.

C. Capacities and Characteristics:

1. Capacity: <**Insert L/s (gpm).**>
2. Discharge Head: <**Insert kPa (psig).**>
3. Discharge Size: <**Insert DN (NPS).**>
4. Speed: <**Insert rpm.**>
5. Motor Horsepower: <**Insert value.**>
6. Lift: <**Insert m (feet).**>
7. Pressure Rating: <**Insert kPa (psig).**>
8. Volts: <**Insert value.**>
9. Phases: <**Insert value.**>
10. Hertz: <**Insert value.**>
11. Full-Load Amperes: <**Insert value.**>
12. Minimum Circuit Ampacity: <**Insert value.**>
13. Maximum Overcurrent Protection: <**Insert amperage.**>

2.8 MOTORS

A. General requirements for motors are specified in **[Division 22 Section on common motor requirements for plumbing equipment]**.

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
2. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26 Sections.

PART 3 - EXECUTION

3.1 PREPARATION

A. [Pilot-Hole Data: Drill pilot hole in location anticipated for well. Analyze data to identify suitable well design.]

B. [Neighborhood Well Data: Review operating and test analyses.]

3.2 INSTALLATION

A. Construct well using method identified in SUMMARY Article.

B. Take samples of substrata formation at 3 meter (10-foot) intervals and at changes in formation throughout entire depth of each water supply well. Carefully preserve samples on-site in glass jars properly labeled for identification.

C. Excavate for mud pit or provide aboveground structure, acceptable to Project Director/COR, to allow settlement of cuttings and circulation of drill fluids back to well without discharging to on-site waterways.

D. [Enlarge pilot hole and install permanent casing, screen, and grout. Install first section of casing with hardened steel driving shoe of an OD slightly larger than casing couplings if threaded couplings are used.]

E. Set casing and liners round, plumb, and true to line. **[Extend casings to minimum of 15 meters below ground surface or rock formation to prevent ground water level contamination.]**

F. Join casing pipe as follows:

1. Ream ends of pipe and remove burrs.
2. Remove scale, slag, dirt, and debris from inside and outside casing before installation.

3. [Cut bevel in ends of casing pipe and make threaded joints.]

4. [Clean and make solvent-cemented joints.]

G. [Mix grout in proportions of 0.03 cu. m (1 cu. ft.) or a 42 kg (94-lb) sack of cement with 19 to 23 L (5 to 6 gal.) of water. Bentonite clay may be added in amounts of 1.4 to 2.3 kg/0.03 cu. m (3 to 5 lb/cu. ft.) for a 42 kg (94-lb) sack of cement. If bentonite clay is added, water may be increased to 25 L/0.03 cu. m (6.5 gal./cu. ft.) of cement.

H. Place grout continuously, from bottom to top surface, to ensure filling of annular space in one operation. Do not perform other operations in well within 72 hours after grouting of casing. When quick-setting cement is used, this period may be reduced to 24 hours.]

I. [Provide permanent casing with temporary well cap. Install with top of casing 900 mm (36 inches) above finished grade located at 5 meters from center of hole.]

J. After casing is set and concrete placed, complete drilling to estimated depth of usable groundwater. Once usable groundwater is located, testing agency must identify estimated safe yield for well prior to completing well. Develop wells to maximum yield per meter (foot) of drawdown.

1. Extract maximum practical quantity of sand, drill fluid, and other fine materials from water-bearing formation.
2. Avoid settlement and disturbance of strata above water-bearing formation.

3. Do not disturb sealing around well casings.
4. Continue developing wells until water contains no more than 2 ppm of sand by weight when pumped at maximum testing rate.

K. Install [**line-shaft**] [**submersible**] well pumps according to HI 2.1-2.4 and provide access for periodic maintenance.

1. Before lowering permanent pump into well, lower a dummy pump that is slightly longer and wider than permanent pump to determine that permanent pump can be installed. Correct alignment problems.
2. Before lowering permanent pump into well, start pump to verify correct rotation.
3. Securely tighten discharge piping joints.

4. [Locate line-shaft well pump near well bottom; locate motor above grade. Install driver plate to correctly align motor and pump.]

5. [Connect motor to submersible pump and locate near well bottom.

a. Connect power cable while connection points are dry and undamaged.
b. Do not damage power cable during installation; use cable clamps that do not have sharp edges.
c. Install water-sealed surface plate that will support pump and piping.]

L. Well Completion: After acceptance of field quality control testing by Projector/COR, perform well completion.

1. Surface Completion: Provide concrete surface protection extending at least one meter from well casing.
2. Top of well must extend above 100-year flood elevation.
3. Provide casing vent that extends above top of well casing, with pipe turned down and capped with mesh to prevent insect from entering well.
4. Seal space between well casing and concrete with silicone sealant.

3.3 CONNECTIONS

A. Piping installation requirements are specified in Section 331416 "Site Water Distribution Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

1. Connect piping between well pump and water piping.

2. **[Connect water distribution system in trench to well pipe at pitless** [**adapter**] [**unit**]**.]**

3. [Connect building water distribution to well pipe inside well house.]

B. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

C. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

3.4 WELL ABANDONMENT

A. [Comply with EPA 570/9-75-001 and ASTM D 5299 when abandoning water supply wells. Fill and seal holes and casings and restore ground surface to finished grade.]

B. [Follow well-abandonment procedures of authorities having jurisdiction. Restore ground surface to finished grade.]

3.5 FIELD QUALITY CONTROL

A. Test Preparation: Clean water supply wells of foreign substances. Swab casings using alkalis, if necessary, to remove foreign substances.

B. Perform tests and inspections and prepare test reports.

C. Tests and Inspections:

1. Plumbness and Alignment Testing: Comply with AWWA A100.
2. Furnish samples of water-bearing formation to testing laboratory and well-screen manufacturer for mechanical sieve analysis.
3. Prepare reports on static level of ground water, level of water for various pumping rates, and depth to water-bearing strata.
4. Performance Test Preparation: Start well pump and adjust controls and pressure setting. Replace damaged and malfunctioning controls and equipment.
5. Performance Testing: Conduct final pumping tests after wells have been constructed, cleaned, and tested for plumbness and alignment.

    a. Arrange to conduct tests, with seven days' advance notice, after test pump and auxiliary equipment have been installed. Note water-level elevations referred to for each assigned datum in wells.
    b. Provide discharge piping to conduct water to locations where disposal will not create a nuisance or endanger adjacent property. Comply with requirements of authorities having jurisdiction.
    c. Provide and maintain equipment of adequate size and type for measuring flow of water, such as weir box, orifice, or water meter.
    d. Measure elevation to water level in wells.
    e. Perform two bailer or air-ejection tests to determine expected yield. Test at depths with sufficient quantity of water to satisfy desired yields.
    f. Test Pump: Variable capacity test pump with capacity equal to maximum expected yields at pressure equal to drawdown in wells, plus losses in pump columns and discharge pipes.
    g. Start and adjust test pumps and equipment to required pumping rates.

h. Record readings of water levels in wells and pumping rates at [**30**] <**Insert number**>-minute maximum intervals throughout 24-hour minimum period.
i. Record maximum yields when drawdown is [**1500 mm (60 inches)**] <**Insert dimension**> above top of suction screens after designated times.
j. Operate pumping units continuously for [**eight**] <**Insert number**> hours after maximum drawdown is reached.
k. Record returning water levels in wells and plot curves of well recovery rates.
l. Remove sand, stones, and other foreign materials that may become deposited in wells after completing final tests.

D. Water Analysis Testing:

1. Engage a qualified testing agency to make bacteriological, physical, and chemical analyses of water from each finished well and report the results. Make analyses according to requirements of authorities having jurisdiction.

a. Bacteriological sample must include coliforms and total plate count (TPC).
b. Chemical sample must include ground water constituents and contaminants identified in EPA 570/9-75-001.

3.6 CLEANING

A. [Disinfect water supply wells according to AWWA A100 and AWWA C654 before testing well pumps.]

B. [Follow water supply well disinfection procedures required by authorities having jurisdiction before testing well pumps.]

3.7 PROTECTION

A. Water Quality Protection: Prevent well contamination, including undesirable physical and chemical characteristics.

B. [Ensure that mud pit will not leak or overflow into streams or wetlands. When well is accepted, remove mud and solids in mud pit from Project site and restore site to finished grade.]

C. Provide casings, seals, sterilizing agents, and other materials to eliminate contamination; shut off contaminated water.

D. Exercise care to prevent breakdown or collapse of strata overlaying that from which water is to be drawn.

E. Protect water supply wells to prevent tampering and introducing foreign matter. Retain temporary well cap until installation is complete.

END OF SECTION 331117

SECTION 331414 – FIRE SERVICE MAINS AND APPURTENANCES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes fire service mains for fire protection water service piping for dedicated building automatic sprinkler systems, and for fire service mains **[and the existing and re-purposed fire protection piping distribution]** for a dedicated fire hydrant system. **[This section also includes fire hydrants as appurtenances to the fire service mains.]** This Section only includes elements of the compound fire protection system outside of compound buildings.

B. Related Sections:

1. Section 033000 “Cast-in-Place Concrete.”
2. Section 211305 "Fire Sprinkler Systems" for wet-pipe fire-suppression sprinkler systems inside buildings.
3. Section 284626 “Addressable Fire Alarm Systems.”
4. Division 31 Section on earth moving.
5. Division 33 Section for common work results of piped utilities.
6. Section 331416 “Site Water Distribution Piping” for separate site water-service piping **[and combined water-service and fire-service piping]**.

1.2 STANDARDS

A. American Society of Mechanical Engineers (ASME):

1. ASME B1.20.1, Pipe Threads, General Purpose (Inch).
2. ASME B16.1, Gray Iron Pipe Flanges and Flanged Fittings, Classes 25, 125, and 250.
3. ASME B16.3, Malleable Iron Threaded Fittings, Classes 150 and 300.
4. ASME B16.4, Gray Iron Threaded Fittings, Classes 125 and 250.
5. ASME B16.5, Pipe Flanges and Flanged Fittings NPS 1/2 through 24.
6. ASME B16.9, Factory-Made Wrought Steel Butt weld Fittings.

B. American Society for Testing and Materials (ASTM):

1. ASTM A 234, Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated temperatures.
2. ASTM A 439, Specification for Schedule 80 CPVC Socket-Type Fittings.
3. ASTM D 2774, Standard Practice for Underground Installation of Thermoplastic Pressure Piping.
4. ASTM F 437, Chlorinated Polyvinyl Chloride (CPVC) Specification for Schedule 80 CPVC Threaded Fittings.
5. ASTM F 438, Specification for Schedule 40 CPVC Socket-Type Fittings.

6. IEEE/ASTM-SI-10, Standard for Use of the International System of Units (SI): The Modern Metric System.
7. ASTM F 1674, Standard Test Method for Joint Restraint Products for Use with PVC Pipe.

C. American Water Works Association (AWWA):

1. AWWA C104, Cement Mortar Lining for Ductile-Iron Pipe and Fittings.
2. AWWA C105, Polyethylene Encasement for Ductile-Iron Pipe Systems.
3. AWWA C110, Ductile Iron and Gray-Iron Fittings.
4. AWWA C111, Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
5. AWWA C115, Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges.
6. AWWA C116, Protective Fusion-Bonded Epoxy Coatings for the Interior and Exterior Surfaces of Ductile-Iron and Gray-Iron Fittings.
7. AWWA C150, Thickness Design of Ductile-Iron Pipe.
8. AWWA C151, Ductile Iron Pipe, Centrifugally Cast.
9. AWWA C153, Ductile-Iron Compact Fittings.
10. AWWA C600, Installation of Ductile-Iron Mains and Their Appurtenances.
11. AWWA C602, Cement-Mortar Lining of Water Pipelines in Place – 100 mm (4 inch) and Larger.
12. AWWA C900, Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 100 – 1500 mm (4 - 60 inch).

D. National Fire Protection Association (NFPA):

1. NFPA 3, Recommended Practice for Commissioning of Fire Protection and Life Safety Systems, 2024 edition.
2. NFPA 4, Standard for Integrated Fire Protection and Life Safety System Testing, 2024 edition.
3. NFPA 13, Installation of Sprinkler Systems, 2022 edition.
4. NFPA 24, Installation of Private Fire Service Mains and Their Appurtenances, 2022 edition.
5. NFPA 25, Standard for the Inspection, Testing and Maintenance of Water Based Fire Protection Systems, 2023 edtion.
6. NFPA 70, National Electric Code as amended by OBO in the OBO-ICS NEC.

E. Underwriters Laboratories (UL):

1. UL 246, Hydrants for Fire Protection Service.
2. UL 262, Gate Valves for Fire Protection Service.
3. UL 312, Check Valves for Fire Protection Service.
4. UL 789, Standard for Indicator Posts for Fire Protection Service.

F. Uni-Bell PVC Pipe Association (UBPPA):

1. UBPPA UNI-B-3, Recommended Practice for the Installation of Polyvinyl Chloride (PVC) Pressure Pipe (Nominal Diameters 4-36 Inch).

1.3 SUBMITTALS

A. Product Data: Provide a complete manufacturer's product data for all products specified. Submit manufacturer's standard drawings or catalog cuts, except submit both drawings and cuts for mechanically restrained and push-on and rubber-gasketed bell-and-spigot joints. Include information concerning gaskets with submittal for joints and couplings.

1. Piping materials
2. Water distribution main piping, fittings, joints, valves, and coupling.
3. Bituminous coating for clamps and rods
4. Water service line piping, fittings, joints, valves, and coupling.
5. Hydrants
6. Indicator posts
7. Valve boxes

B. Certificates: Certificates must attest that tests set forth in each applicable referenced publication have been performed, whether specified in that publication to be mandatory or otherwise and that production control tests have been performed at the intervals or frequency specified in the publication. Other tests must have been performed within three years of the date of submittal of certificates on the same type, class, grade, and size of material as is being provided for the project.

1. Water distribution main piping, fittings, joints, valves, and coupling.
2. Water service line piping, fittings, joints, valves, and coupling.
3. Shop-applied lining and coating.
4. Lining.
5. Fire hydrants.
6. Flushing of system.

C. Manufacturer's Instructions

1. Installation procedures for water piping.

D. Shop Drawings:

1. Pipe joint and pipe joining coupling construction and installation details.
2. Detail precast concrete vault assemblies and indicate dimensions, method of field assembly, and components.
3. Wiring Diagrams: For power, signal, and control wiring.

E. Field quality-control reports, including digital pictures and associated marked-up drawings.

1.4 QUALITY ASSURANCE

A. Acceptance of fire service mains and their appurtenances must be by OBO/OPS/FIRE in conjunction with Project Director/COR.

B. Manufacturer Qualifications: All components of the fire service main must be supplied by a U.S. manufacturer. There must be no deviations from this requirement except by written approval from OBO/OPS/FIRE/FPE through the project director/COR.

C. NFPA Compliance: Comply with NFPA 24 for materials, installations, tests, flushing, and valve and hydrant supervision for fire-suppression water-service piping.

D. Comply with requirements of the Post Facility Management Water Treatment Plant Operations Office supplying water, including tapping of water mains and backflow prevention.

E. Piping materials must bear label, stamp, or other markings of a nationally recognized testing laboratory (NRTL) or a specified testing agency. All materials must be UL listed, FM approved or AWWA recognized for Fire-Protection Service.

F. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO-ICS NEC by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

G. Comply with the "Approval Guide," published by FM Global, or UL's "Fire Protection Equipment Directory" for fire-service-main products.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Preparation for Transport: Prepare valves and all piping joining and fitting components, including fire hydrants, according to the following:

1. Ensure that valves and all piping joining and fitting components are dry and internally protected against rust and corrosion.
2. Protect valves against damage to threaded ends and flange faces.
3. Set valves in best position for handling. Set valves closed to prevent rattling.

B. During Storage: Use precautions for valves, including fire hydrants, according to the following:

1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.
2. Protect from weather. Store indoors and maintain temperature higher than ambient dew point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.

C. Handling: Use sling to handle valves and fire hydrants if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use hand wheels or stems as lifting or rigging points.

D. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

E. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.

F. Protect flanges, fittings, and specialties from moisture and dirt.

G. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.6 [PROJECT CONDITIONS

A. Interruption of Existing Fire-Suppression Water-Service Piping: Do not interrupt service to existing buildings and facilities on the Embassy Compound unless permitted under the following conditions, and then only after arranging to provide temporary water-distribution service according to requirements indicated:

1. Notify Project Director/COR no fewer than five days in advance of proposed interruption of service.
2. Do not proceed with interruption of service without written permission from Project Director/COR.]

1.7 [COORDINATION

A. Coordinate connection to existing water mains with Project Director/COR and Post Facilities Maintenance Water Treatment Plant Operations Office company.]

1.8 WARRANTY

A. Contractor's Warranty: Submit a written warranty agreeing to repair or replace any portion of the automatic sprinkler system that fails in materials or workmanship within a period of one year after the latter of substantial completion or final acceptance testing of the underground fire main installation, which is witnessed by OBO/OPS/FIRE.

B. Hydrants: Provide standard manufacturer's written warranty, without monetary limitation, signed by manufacturer agreeing to promptly repair or replace products that fail in materials or workmanship under normal and customary use and maintenance for the following period:

1. Warranty Period: 25 years from Substantial Completion.

PART 2 - PRODUCTS

2.1 DUCTILE-IRON PIPE AND FITTINGS

A. Grooved-Joint, Ductile-Iron Pipe: AWWA C151, with cut, rounded-grooved ends.

B. Mechanical-Joint, Ductile-Iron Pipe: AWWA C151, with mechanical-joint bell and plain spigot end.

C. Grooved-End, Ductile-Iron Pipe Appurtenances:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Anvil International, Inc.
b. Shurjoint Piping Products.
c. Star Pipe Products.
d. Victaulic Company.

2. Grooved-End, Ductile-Iron Fittings: ASTM A 47/A 47M, malleable-iron castings or ASTM A 536, ductile-iron castings with dimensions matching pipe.
3. Grooved-End, Ductile-Iron-Piping Couplings: AWWA C606, for ductile-iron-pipe dimensions. Include ferrous housing sections, gasket suitable for water, and bolts and nuts.

D. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

1. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.
2. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.
b. Anvil International, Inc.
c. Shurjoint Piping Products.
d. Star Pipe Products.

E. Push-on-Joint, Ductile-Iron Fittings: AWWA C153, ductile-iron compact pattern.

1. Gaskets: AWWA C111, rubber.
2. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.

b. Anvil International, Inc.
c. Shurjoint Piping Products.
d. Star Pipe Products.

F. Flanges: ASME B16.1, Class 125, cast iron.

2.2 PVC PIPE AND FITTINGS

A. PVC Pipe: AWWA C900 or UL 1285, Class 200, with bell end with gasket, and with spigot end.

B. PVC Pipe: AWWA C900 or UL 1285, Class 200, plain end pipe.

C. PVC Fittings: AWWA C900 or UL 1285, Class 200, with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell. All mechanical restraints must be supplied by a single supplier/manufacturer and must meet the test requirements of Uni-Bell Specification Uni-B-13, "Uni-Bell PVC Pipe Association.

D. Mechanical Joint Restraint for PVC Pipe:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.
b. ROMAC Industries Inc.
c. Star Pipe Products.

2. Description: Restraint devices for mechanical joint fittings and appurtenances conforming to ANSI/AWWA C153/A2153. Restraint devices for nominal pipe sizes 100 mm to 250 mm must consist of multiple gripping wedges incorporated into a follower gland meeting the applicable requirements of ANSI/AWWA C110/A21.10. Mechanical joint restraints must be UL listed and FM Global Approved and must meet or exceed the requirements of ASTM F1674. Restraint devices and associated components must employ an epoxy-based corrosion resistant coating system or approved equivalent.
3. Pressure Rating: 1725 kPa (250 psi) minimum.

E. Restrained Coupling for PVC Pipe:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.
b. ROMAC Industries Inc.
c. Star Pipe Products.

2. Description: Restrained coupling system for use in joining and restraining two plain end pipes of the same or dissimilar materials. The restraint mechanism must incorporate individually actuating gripping surfaces to maximize restraint capability and have torque limiting twist off nuts to insure proper actuating of restraint devices. The coupling sleeve internal surfaces must be lined with fusion bonded epoxy conforming to ANSI/AWWA C213 and sealing gaskets must be constructed of EPDM. The system must meet applicable requirements of ANSI/AWWA C116, ANSI/AWWA C111, ASTM A536 and ASTM D2000. Restraint devices and associated components must employ an epoxy-based corrosion resistant coating system or approved equivalent.
3. Pressure Rating: 1725 kPa (250 PSI) minimum.

2.3 SPECIAL PIPE FITTINGS

A. Ductile-Iron Flexible Expansion Joints:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. EBAA Iron, Inc.
   b. ROMAC Industries Inc.
   c. Star Pipe Products.

2. Description: Compound, ductile-iron fitting with combination of flanged and mechanical-joint ends complying with AWWA C110 or AWWA C153. Include two gasketed ball-joint sections and one or more gasketed sleeve sections. Assemble components for offset and expansion indicated. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.
3. Pressure Rating: 1725 kPa (250 psig) minimum.

B. Ductile-Iron Deflection Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. EBAA Iron, Inc.
   b. ROMAC Industries, Inc.
   c. Star Pipe Products

2. Description: Compound, ductile-iron coupling fitting with sleeve and one or two flexing sections for up to 15-degree deflection, gaskets, and restrained-joint ends complying with AWWA C110 or AWWA C153. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.
3. Pressure Rating: 1725 kPa (250 psig) minimum.

2.4 ENCASEMENT FOR PIPING

A. Standard: ASTM A 674 or AWWA C105.

B. Material: High-density, cross-laminated PE film of 0.10-mm (0.004-inch) minimum thickness.

C. Form: Sheet.

D. Color: Natural.

2.5 JOINING MATERIALS

A. Gaskets for Ferrous Piping and Copper-Alloy Tubing: ASME B16.21, asbestos free.

2.6 PIPING SPECIALTIES

A. Transition Fittings: Manufactured fitting or coupling same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

B. Tubular-Sleeve Pipe Couplings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Cascade Waterworks Manufacturing.
   b. Dresser, Inc.; Dresser Piping Specialties.
   c. Ford Meter Box Company, Inc. (The); Pipe Products Division.
   d. JCM Industries.
   e. ROMAC Industries Inc.
   f. Smith-Blair, Inc.; a Sensus company.
   g. Viking Johnson.

2. Description: Metal, bolted, sleeve-type, reducing or transition coupling, with center sleeve, gaskets, end rings, and bolt fasteners, and with ends of same sizes as piping to be joined.
3. Standard: AWWA C219.
4. Center-Sleeve Material: Ductile iron.
5. Gasket Material: Natural or synthetic rubber.
6. Pressure Rating: 1380 kPa (200 psig) minimum.
7. Metal Component Finish: Corrosion-resistant coating or material.

2.7 GATE VALVES

A. All underground gate valves must be epoxy coated.

B. AWWA Gate Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. American AVK Company; Valves & Fittings Division.
   b. American Cast Iron Pipe Company; American Flow Control Division.
   c. American Cast Iron Pipe Company; Waterous Company Subsidiary.
   d. Crane Co.; Crane Valve Group; Stockham Division.
   e. Kennedy Valve; a division of McWane, Inc.
   f. M&H Valve Company; a division of McWane, Inc.
   g. Mueller Co.; Water Products Division.
   h. U.S. Pipe.

2. 1380-kPa (200-psig), AWWA, Iron, OS&Y, Metal-Seated Gate Valves:

   a. Description: Cast- or ductile-iron body and bonnet; with cast-iron double disc, bronze disc and seat rings, and bronze stem.
   b. Standard: AWWA C500.
   c. Pressure Rating: 1380 kPa (200 psig).
   d. End Connections: Flanged or grooved.

3. 1380-kPa (200-psig), AWWA, Iron, OS&Y, Resilient-Seated Gate Valves:

   a. Description: Cast- or ductile-iron body and bonnet; with bronze, gray-iron, or ductile-iron gate; resilient seats; and bronze stem.
   b. Standard: AWWA C509.
   c. Pressure Rating: 1380 kPa (200 psig).
   d. End Connections: Flanged or grooved.

4. 1725-kPa (250-psig), AWWA, Iron, OS&Y, Resilient-Seated Gate Valves:

   a. Description: Cast- or ductile-iron body and bonnet; with bronze, gray-iron, or ductile-iron gate; resilient seats; and bronze stem.
   b. Standard: AWWA C509.
   c. Pressure Rating: 1380 kPa (200 psig).
   d. End Connections: Flanged or grooved.

C. UL-Listed or FM-Approved Gate Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. American AVK Company; Valve & Fittings Division.
   b. American Cast Iron Pipe Company; American Flow Control Division.
   c. American Cast Iron Pipe Company; Waterous Company Subsidiary.

d. Crane Co.; Crane Valve Group; Stockham Division.
e. Kennedy Valve; a division of McWane, Inc.
f. M&H Valve Company; a division of McWane, Inc.
g. Mueller Co.; Water Products Division.
h. Tyco Fire & Building Products LP.
i. United Brass Works, Inc.
j. U.S. Pipe.

2. 1200-kPa (175-psig), UL-Listed or FM-Approved, Iron, Nonrising-Stem Gate Valves:

a. Description: Iron body and bonnet, bronze seating material, and inside screw.
b. Standards: UL 262 and "Approval Guide," published by FM Global, listing.
c. Pressure Rating: 1200kPa (175 psig) minimum.
d. End Connections: Mechanical or push-on joint.
e. Indicator-Post Flange: Include on valves used with indicator posts.

3. 1725-kPa (250-psig), UL-Listed or FM-Approved, Iron, Nonrising-Stem Gate Valves:

a. Description: Iron body and bonnet, bronze seating material, and inside screw.
b. Standards: UL 262 and "Approval Guide," published by FM Global, listing.
c. Pressure Rating: 1725 kPa (250 psig) minimum.
d. End Connections: Mechanical or push-on joint.
e. Indicator-Post Flange: Include on valves used with indicator posts.

4. 1200-kPa (175-psig), UL-Listed or FM-Approved, Iron, OS&Y, Gate Valves:

a. Description: Iron body and bonnet and bronze seating material.
b. Standards: UL 262 and "Approval Guide," published by FM Global, listing.
c. Pressure Rating: 1200 kPa (175 psig) minimum.
d. End Connections: Flanged or grooved.

5. 1725-kPa (250-psig), UL-Listed or FM-Approved, Iron, OS&Y Gate Valves:

a. Description: Iron body and bonnet and bronze seating material.
b. Standards: UL 262 and "Approval Guide," published by FM Global, listing.
c. Pressure Rating: 1725 kPa (250 psig) minimum.
d. End Connections: Flanged or grooved.

6. UL-Listed or FM-Approved, OS&Y Bronze, Gate Valves:

a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Crane Co.; Crane Valve Group; Crane Valves.
2) Crane Co.; Crane Valve Group; Stockham Division.
3) Milwaukee Valve Company.
4) NIBCO INC.

5) United Brass Works, Inc.

b. Description: Bronze body and bonnet and bronze stem.
c. Standards: UL 262 and "Approval Guide," published by FM Global, listing.
d. Pressure Rating: 1200 kPa (175 psig) minimum.
e. End Connections: Threaded.

2.8 GATE VALVE ACCESSORIES AND SPECIALTIES

A. Tapping-Sleeve Assemblies:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
b. Kennedy Valve; a division of McWane, Inc.
c. M&H Valve Company; a division of McWane, Inc.
d. Mueller Co.; Water Products Division.
e. U.S. Pipe.

2. Description: Sleeve and valve compatible with drilling machine.
3. Standard: MSS SP-60.
4. Tapping Sleeve: Cast-iron, ductile-iron, or stainless-steel, two-piece bolted sleeve with flanged outlet for new branch connection. Sleeve must match size and type of pipe material being tapped and have recessed flange for branch valve.
5. Valve: AWWA, cast-iron, non-rising stem, metal-seated gate valve with one raised-face flange mating tapping-sleeve flange.

B. Indicator Posts:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American AVK Company; Valves & Fittings Division.
b. American Cast Iron Pipe Company; American Flow Control Division.
c. American Cast Iron Pipe Company; Waterous Company Subsidiary.
d. Crane Co.; Crane Valve Group; Stockham Division.
e. Kennedy Valve; a division of McWane, Inc.
f. Mueller Co.; Water Products Division.
g. NIBCO INC.
h. Tyco Fire & Building Products LP.

2. Description: Vertical-type, cast-iron body with operating wrench, extension rod, and adjustable cast-iron barrel of length required for depth of burial of valve.
3. Standards: UL 789 and "Approval Guide," published by FM Global, listing.

2.9 CHECK VALVES

A. All underground check valves must be epoxy coated.

B. AWWA Check Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. American AVK Company; Valves & Fittings Division.
   b. American Cast Iron Pipe Company; American Flow Control Division.
   c. APCO Willamette Valve and Primer Corporation.
   d. Crane Co.; Crane Valve Group; Stockham Division.
   e. Kennedy Valve; a division of McWane, Inc.
   f. M&H Valve Company; a division of McWane, Inc.
   g. Mueller Co.; Water Products Division.
   h. NIBCO INC.

2. Description: Swing-check type with resilient seat; with interior coating according to AWWA C550 and ends to match piping.
3. Standard: AWWA C508.
4. Pressure Rating: 1200 kPa (175 psig).

C. UL-Listed or FM-Approved Check Valves:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. American Cast Iron Pipe Company; Waterous Company Subsidiary.
   b. Crane Co.; Crane Valve Group; Stockham Division.
   c. Globe Fire Sprinkler Corporation.
   d. Kennedy Valve; a division of McWane, Inc.
   e. Mueller Co.; Water Products Division.
   f. NIBCO INC.
   g. Tyco Fire & Building Products LP.
   h. United Brass Works, Inc.
   i. Victaulic Company.
   j. Viking Corporation.

2. Description: Swing-check type with pressure rating, rubber-face checks unless otherwise indicated, and ends matching piping.
3. Standards: UL 312 and "Approval Guide," published by FM Global, listing.
4. Pressure Rating: 1725 kPa (250 psig).

2.10 DETECTOR CHECK VALVES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Ames Fire & Waterworks; a division of Watts Water Technologies, Inc.
2. Badger Meter, Inc.
3. FEBCO; SPX Valves & Controls.
4. Kennedy Valve; a division of McWane, Inc.
5. Mueller Co.; Hersey Meters Division.
6. Victaulic Company.
7. Viking Corporation.

B. Description: Galvanized cast-iron body, bolted cover with air-bleed device for access to internal parts, and flanged ends. Include one-piece bronze disc with bronze bushings, pivot, and replaceable seat. Include threaded bypass taps in inlet and outlet for bypass meter connection. Set valve to allow minimal water flow through bypass meter when major water flow is required.

C. Standards: UL 312 and "Approval Guide," published by FM Global, listing.

D. Pressure Rating: 1200 kPa (175 psig).

E. Water Meter: AWWA C700, disc type, at least one-fourth size of detector check valve. Include meter, bypass piping, gate valves, check valve, and connections to detector check valve.

2.11 PRESSURE-REDUCING VALVES

A. Water Control Valves:

1. Basis-of-Design Product: Subject to compliance with requirements, provide CLA-VAL Model 90A-21; or comparable product by one of the following:

   a. CLA-VAL Automatic Control Valves.
   b. Flowmatic Corporation.
   c. OCV Control Valves.
   d. Watts Regulator Company; Ames Fluid Control Systems.
   e. Watts Regulator Company; Watts ACV Division.

2. Description: Pilot-operation, diaphragm-type, single-seated main water control valve with UL listed, FM Global or AWWA C550 approved, interior epoxy coating. Include small pilot control valve, restrictor device, specialty fittings, and sensor piping.
3. Pressure Rating: Initial pressure of 1035 kPa (150 psig) minimum.
4. Main Valve Body: Cast or ductile iron with AWWA C550 or FDA-approved, interior epoxy coating; or stainless-steel body.

   a. Size: 250 mm.
   b. Pattern: Globe-valve design.
   c. Trim: Stainless steel.

5. Design Flow Rate: 11,350 LPM.
6. Design Inlet Pressure: 12 Bar.
7. Design Outlet Pressure Setting: 6.2 Bar.
8. End Connections: Threaded for DN 50 (NPS 2) and smaller; flanged for DN 65 (NPS 2-1/2) and larger.

2.12 BACKFLOW PREVENTERS

A. Double-Check, Backflow-Prevention Assemblies:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Ames Fire & Waterworks; a division of Watts Water Technologies, Inc.
   b. Conbraco Industries, Inc.; Apollo Valves.
   c. FEBCO; SPX Valves & Controls.
   d. Flowmatic Corporation.
   e. Watts Water Technologies, Inc.
   f. Zurn Plumbing Products Group; Wilkins Water Control Products Division.

2. Standard: UL 262.
3. Operation: Continuous-pressure applications unless otherwise indicated.
4. Pressure Loss: 35 kPa (5 psig) maximum, through middle one-third of flow range.
5. Size: 250 mm.
6. Selected Unit Flow Range Limits: 11350 LPM.
7. Pressure Loss at Design Flow Rate: 0.5 Bar for DN 65 (NPS 2-1/2) and larger.
8. Body Material: Bronze for DN 50 (NPS 2) and smaller; cast iron with interior lining complying with AWWA C550 for DN 65 (NPS 2-1/2) and larger.
9. End Connections: Flanged for DN 65 (NPS 2-1/2) and larger.
10. Configuration: Designed for horizontal, straight through flow.
11. Accessories: Ball valves with threaded ends on inlet and outlet of DN 50 (NPS 2) and smaller; OS&Y gate valves with flanged ends on inlet and outlet of DN 65 (NPS 2-1/2) and larger.

B. Backflow Preventer Test Kits:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Conbraco Industries, Inc.; Apollo Valves.
   b. FEBCO; SPX Valves & Controls.
   c. Flowmatic Corporation.
   d. Watts Water Technologies, Inc.
   e. Zurn Plumbing Products Group; Wilkins Water Control Products Division.

2. Description: Factory calibrated, with gages, fittings, hoses, and carrying case with test-procedure instructions.

2.13 CONCRETE VAULTS

A. Description: Precast, reinforced-concrete vault, designed for A-16 load designation according to ASTM C 857, and made according to ASTM C 858.

B. Ladder: ASTM A 36/A 36M, steel ladder; or PE-encased steel steps.

C. Manhole: ASTM A 48/A 48M, Class No. 35A minimum tensile strength, gray iron traffic frame and cover.

1. Dimension: 60-mm (24-inch) minimum diameter unless otherwise indicated.

D. Manhole: ASTM A 536, Grade 60-40-18, ductile-iron traffic frame and cover.

1. Dimension: 600-mm (24-inch) minimum diameter unless otherwise indicated.

E. Drain: ASME A112.6.3, cast-iron floor drain with outlet of size indicated. Include body anchor flange, light-duty cast-iron grate, bottom outlet, and integral or field-installed bronze ball or clapper-type backwater valve.

2.14 FIRE HYDRANTS

A. Basis-of-Design Product: Subject to compliance with requirements, provide AVK Series 2780; or comparable product by one of the following:

1. American Cast Iron Pipe Company; American Flow Control Division.
2. American Cast Iron Pipe Company; Waterous Company Subsidiary.
3. American Foundry Group, Inc.
4. Kennedy Valve; a division of McWane, Inc.
5. M&H Valve Company; a division of McWane, Inc.
6. Mueller Co.; Water Products Division.
7. U.S. Pipe.
8. Sigelock Systems LLC

B. Hydrant Materials and Coatings: Comply with NSF61 (Drinking Water Systems Components - Health Effects) and NSF372 (Drinking Water System Components - Lead Content) standards.

C. Performance Requirements: Hydrants must conform to ANSI/AWWA C502 Standard for Dry-Barrel Fire Hydrants.

D. Working Pressure Rating: Hydrants must be rated for 300 psig working pressure and must withstand hydrostatic tests for shell and seat leakage at pressures up to 600 psig.

E. Tested Design: Hydrants must have been tested for compliance with Underwriters Laboratories standards UL246 for operation, leakage, body strength, head loss, operating torque, nonmetallic materials aging.

F. Hydrant must impede unauthorized access to all nozzles and operating nut

G. Bolts and Nuts: Stainless steel.

H. Hydrant Finish: Factory-applied polyester powder coating.

I. General Description: Hydrant must have single-cast ductile iron body with three recessed nozzle outlets; one 115 mm (4-1/2 inch) pumper connection, and two 65 mm (2-1/2 inch) hand line hose connections. Hydrant must have integrated boltless head.

J. Hydrant must have a 130 mm (5-1/4 inch) main valve opening size. Hydrants must meet or exceed performance requirements of ANSI/AWWA C502 Standard for Dry-Barrel Fire Hydrants.

K. Shoe Connections: Coated in accordance with ANSI/AWWA C550 Protective Coatings for Valves and Hydrants.

L. Inlets: Conform to the requirements of Section 3.2.18 of ANSI/AWWA C502 Standard for Dry-Barrel Fire Hydrants.

M. Mechanical Joint Bell Dimensions: Conform to ANSI/AWWA C111/A21.11.

N. Hydrant wrench must fit all manufacturers' standard fire hydrant nozzle cap lugs and operating nuts when any additional security features are removed from any competitor's hydrant.

O. Operating Stem: 304 stainless steel.

P. Seat Ring and Valve Top Plate: 304 stainless steel.

Q. Barrel Interior: Powder coated finish.

R. Outlet Threads: Either thread must be compatible with local fire department hose threads, or an adapter attachment must be provided that is compatible with local fire service hose treads.

2.15 ALARM DEVICES

A. General: UL 753 and "Approval Guide," published by FM Global, listing, of types and sizes to mate and match piping and equipment.

B. Supervisory Switches: Single pole, double throw; designed to signal valve in other than fully open position.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Comply with excavating, trenching, and backfilling requirements in Division 31 Section on earth moving.

3.2 PIPING INSTALLATION

A. Comply with all requirements in Division 33 Section for common work results of piped utilities.

B. Water-Main Connection: Carefully remove materials so as to not damage material which is to remain. Replace existing work damaged by the Contractors' operations with new work of the same construction.

C. Water-Main System Installation: Equipment, materials, workmanship, fabrication, assembly, installation, examination, inspection and testing must be in accordance with NFPA 24, except as modified herein.

D. Underground Piping: Installation of underground piping and fittings must conform to NFPA 24. Joints must be anchored in accordance with NFPA 24. Concrete thrust block must be provided at elbow where pipe turns up toward the floor, and the pipe riser must be restrained with steel rods from the elbow to the flange above the floor. After installation, in accordance with NFPA 24, rods and nuts must be thoroughly cleaned and coated with bituminous material and wrapped, or other corrosion-resistant material identified in this Section and approved by Project Director/COR. Minimum depth of cover must be 900 mm (36 inches), and 305mm (12 inches) below frost line.

E. Comply with NFPA 24 for fire-service-main piping materials and installation.

F. Install ductile-iron, water-service piping according to AWWA C600 and AWWA M41.

G. Install exterior encasement to completely encase buried ductile iron pipelines with polyethylene sheet according to ASTM A 674 or AWWA C105.

H. Piping must be inspected, tested, photo documented, and approved before burying, covering or concealing.

I. Install PVC, AWWA pipe according to ASTM F 645 and AWWA M23. Install a continuous length of tracer wire for the full length of each run of non-metallic pipe. Attach wire to top of pipe in such manner that it will not be displaced during construction operations.

J. Bury piping with depth of cover in accordance with project drawings and maintain a minimum depth of at least 900 mm (36 inches), and 305mm (12 inches) below frost line as required by NFPA 24.

K. Install piping by tunneling or jacking, or combination of both, under streets and other obstructions that cannot be disturbed.

L. Extend fire-suppression water-service piping and connect to water-supply source and building fire-suppression water-service piping systems at locations and pipe sizes indicated in project drawings.

1. Terminate fire-suppression water-service piping at building floor slab. Terminate piping with caps, plugs, or flanges as required for piping material and to provide provisions for flushing. Make connections to building's fire-suppression water-service piping systems upon completion and acceptance of flushing and hydrostatic testing.

M. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.

N. Comply with requirements in Section 211305, "Fire Sprinkler Systems" for fire-suppression-water piping inside the building.

3.3 JOINT CONSTRUCTION

A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure rating same as or higher than systems pressure rating for aboveground applications unless otherwise indicated.

B. Install flanges, flange adaptors, or couplings for grooved-end piping on valves, apparatus, and equipment having DN 65 (NPS 2-1/2) and larger end connections.

C. Ream ends of tubes and remove burrs.

D. Remove scale, slag, dirt, and debris from outside and inside of pipes, tubes, and fittings before assembly.

E. Ductile-Iron Piping, Gasketed Joints for Fire-Service-Main Piping: UL 194.

F. Ductile-Iron Piping, Grooved Joints: Cut-groove pipe. Assemble joints with grooved-end, ductile-iron-piping couplings, gaskets, lubricant, and bolts.

G. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with bolts according to ASME B31.9.

H. PVC Piping Gasketed Joints: Use joining materials according to AWWA C900. Construct joints with elastomeric seals and lubricant according to ASTM D 2774 or ASTM D 3139.

I. Dissimilar Materials Piping Joints: Use adapters compatible with both piping materials, with OD, and with system working pressure.

J. Do not use flanges or unions for underground piping.

3.4 ANCHORAGE INSTALLATION

A. Anchorage, General: Install water-distribution piping with restrained joints. Anchorages and restrained-joint types that may be used include the following:

1. Concrete thrust blocks.
2. Locking mechanical joints.
3. Set-screw mechanical retainer glands.
4. Bolted flanged joints.

B. Install anchorages for tees, plugs, and caps, bends, crosses, valves, and hydrant branches in fire-suppression water-service piping according to NFPA 24 and the following:

1. Gasketed-Joint, Ductile-Iron, Water-Service Piping: According to AWWA C600.
2. Gasketed-Joint, PVC Water-Service Piping: According to AWWA M23.
3. Bonded-Joint Fiberglass, Water-Service Piping: According to AWWA M45.

C. Apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

3.5 VALVE INSTALLATION

A. AWWA Gate Valves: Comply with AWWA C600 and AWWA M44. Install each underground valve with stem pointing up and with valve box.

B. AWWA Valves Other Than Gate Valves: Comply with AWWA C600 and AWWA M44.

C. UL-Listed or FM-Approved Gate Valves: Comply with NFPA 24. Install each underground valve and valves in vaults with stem pointing up and with vertical cast-iron indicator post.

D. UL-Listed or FM-Approved Valves Other Than Gate Valves: Comply with NFPA 24.

E. MSS Valves: Install as component of connected piping system.

F. Pressure-Reducing Valves: Install in vault between shutoff valves. Install full-size valved bypass.

G. Support valves and piping, not direct buried, on concrete piers. Comply with requirements for concrete piers in Section 033000 on “Cast-in-Place Concrete.”

H. Sectional valve must be installed adjacent to a fitting that branches off to serve individual building.

3.6 BACKFLOW PREVENTER INSTALLATION

A. Install backflow preventers of type, size, and capacity indicated. Include valves and test cocks. Install according to requirements of plumbing and health department and authorities having jurisdiction.

B. Do not install backflow preventers that have relief drain in vault or in other spaces subject to flooding.

C. Do not install bypass piping around backflow preventers.

D. Support DN 65 (NPS 2-1/2) and larger backflow preventers and piping on concrete piers. Comply with requirements for concrete piers in Section 033000 "Cast-in-Place Concrete."

3.7 CONCRETE VAULT INSTALLATION

A. Install precast concrete vaults according to ASTM C 891.

3.8 PROTECTIVE ENCLOSURE INSTALLATION

A. Install concrete base level and with top approximately 50 mm (2 inches) above grade.

B. Install protective enclosure over valves and equipment.

C. Anchor protective enclosure to concrete base.

3.9 FIRE HYDRANT INSTALLATION

A. General: Install each fire hydrant with separate gate valve in supply pipe, anchor with restrained joints or thrust blocks, and support in upright position.

B. UL-Listed or FM-Approved Fire Hydrants: Comply with NFPA 24.

3.10 ALARM DEVICE INSTALLATION

A. General: Comply with NFPA 24 for devices and methods of valve supervision. Underground valves with valve box do not require supervision.

B. Supervisory Switches: Supervise valves in open position.

1. Valves: Grind away portion of exposed valve stem. Bolt switch, with plunger in stem depression, to OS&Y gate-valve yoke.
2. Indicator Posts: Drill and thread hole in upper-barrel section at target plate. Install switch, with toggle against target plate, on barrel of indicator post.
3. Tamper switch on valve tamper cover not permitted.

C. Locking and Sealing: Secure unsupervised valves as follows:

1. Valves: Install chain and padlock on open OS&Y gate valve.
2. Post Indicators: Install padlock on wrench on indicator post.

D. Connect alarm devices to building's fire-alarm system. Wiring and fire-alarm devices are specified in Section 284626 “Addressable Fire-Alarm Systems.”

3.11 CONNECTIONS

A. Connect fire-suppression water-service piping to existing water main. Use tapping sleeve and tapping valve.

B. Connect fire-suppression water-service piping to interior fire-suppression piping. The connection must not be made until all underground pipes have been flushed, tested, and certified by OBO/OPS/FIRE.

C. Connect waste piping from concrete vault drains to storm-drainage system. Comply with requirements in Division 33 Section on site storm utility drainage piping for connection to storm sewer.

3.12 FIELD QUALITY CONTROL

A. Use test procedure prescribed by authorities having jurisdiction or, if method is not prescribed by authorities having jurisdiction, use procedure described below.

B. Piping Tests:

1. Conduct piping tests before joints are covered and after concrete thrust blocks have hardened sufficiently.
2. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water.
3. Take digital pictures of each joint and each thrust blocks throughout each stage of installation. Number and label each picture keyed to a set of marked-up drawings. These marked-up drawing must be scanned and kept with digital images, and must submitted to OBO/OPS/FIR through the Project Director/COR.

C. Hydrostatic Tests: Test at not less than one-and-one-half times the working pressure for two hours.

1. Increase pressure in 350-kPa (50-psig) increments and inspect each joint between increments. Hold at test pressure for one hour; decrease to 0 kPa (0 psig). Slowly increase again to test pressure and hold for one more hour. Maximum allowable leakage is 1.89 L (2 quarts) per hour per 100 joints. Remake leaking joints with new materials and repeat test until leakage is within allowed limits.

D. Completely flush the system and certify in accordance with NFPA 24. and provide certification document to OBO/OPS/FIR through the Project Director/COR.

E. Prepare test and inspection reports.

3.13 IDENTIFICATION

A. Install continuous underground detectable warning tape during backfilling of trench for underground fire-suppression water-service piping. Locate below finished grade, directly over piping. Underground warning tapes are specified in Division 31 Section on earth moving.

B. Permanently attach equipment nameplate or marker indicating plastic fire-suppression water-service piping or fire-suppression water-service piping with electrically insulated fittings, on main electrical meter panel.

C. Post underground main drawing in picture type frame in fire pump room showing valve lineup external to building for use in an emergency.

D. Provide permanent tag/label for each valves and access cover identifying its purpose.

3.14 CLEANING

A. Clean and disinfect fire-suppression water-service piping as follows:

1. Purge new piping systems and parts of existing systems that have been altered, extended, or repaired before use.
2. Use purging and disinfecting procedure prescribed by Project Director/COR based upon input from OBO/OPS/FIRE and OBO/PDCS/DE/ME or, if method is not prescribed, use procedure described in NFPA 24 for flushing of piping. Flush piping system with clean, potable water until dirty water does not appear at points of outlet.
3. Use purging and disinfecting procedure prescribed by OBO/OPS/FIRE and OBO/PDCS/DE/ME through the Project Director/COR or, if method is not prescribed, use procedure described in AWWA C651 or do as follows:

    a. Fill system or part of system with water/chlorine solution containing at least 50 ppm of chlorine; isolate and allow to stand for 24 hours.
    b. Drain system or part of system of previous solution and refill with water/chlorine solution containing at least 200 ppm of chlorine; isolate and allow to stand for three hours.
    c. After standing time, flush system with clean, potable water until no chlorine remains in water coming from system.
    d. Submit water samples in sterile bottles to Project Director/COR, who will contact OBO/PDCS/DE/ME for input on handling samples and data. Repeat procedure if biological examination shows evidence of contamination.

B. Prepare reports of purging and disinfecting activities.

3.15 PIPING SCHEDULE

A. Underground Fire Service Water Piping: DN 100 (NPS 4). Must be one of the following:

1. Mechanical-joint, ductile-iron pipe; mechanical-joint, ductile-iron, standard-pattern or ductile-iron, compact-pattern fittings; glands, gaskets, and bolts; and gasketed joints.
2. PVC, Class 200 pipe listed for fire-protection service; mechanical-joint, ductile iron, compact-pattern fittings; glands, gaskets and bolts; and gasketed joints.

B. Underground fire-suppression water-service piping NPS 6 to NPS 10 (DN 150 to DN 250) must be one of the following:

1. Mechanical-joint, ductile-iron pipe; mechanical-joint, ductile- or gray-iron, standard-pattern or ductile-iron, compact-pattern fittings; glands, gaskets, and bolts; and gasketed joints.
2. PVC, Class 200 pipe listed for fire-protection service; mechanical-joint, ductile iron, compact-pattern fittings; glands, gaskets, and bolts; and gasketed joints.

C. Vault fire-suppression water-service piping NPS 6 to NPS 10 (DN 100 to DN 250) must be grooved-end, ductile-iron pipe; grooved-end, ductile-iron pipe appurtenances; and grooved joints.

D. Under slab fire-suppression water-service piping NPS 4 to NPS 10 (DN 100 to DN 250) must be one of the following:

1. Grooved-end, ductile-iron pipe; grooved-end, ductile-iron pipe appurtenances; and grooved joints.
2. Mechanical-joint, ductile-iron pipe; mechanical-joint, ductile- or gray-iron, standard-pattern or ductile-iron, compact-pattern fittings; glands, gaskets, and bolts; and restrained, gasketed joints.

3.16 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

B. Vault fire-suppression water-service shutoff valves DN 50 (NPS 2) and smaller must be UL-listed or FM-approved, OS&Y, bronze, gate valves.

C. Indicator-post underground fire-suppression water-service valves DN 100 (NPS 4) and larger must be 1200-kPa (175-psig), UL-listed or FM-approved, iron, non-rising-stem gate valves with indicator-post flange.

D. Standard-pressure, aboveground and vault fire-suppression water-service shutoff valves DN 100 (NPS 4) and larger must be one of the following:

1. 1200-kPa (175-psig), UL-listed or FM-approved, iron, OS&Y gate valves.

E. Fire-suppression water-service check valves DN 100 (NPS 4) and larger must be one of the following:

1. UL-listed or FM-approved detector check valves.

END OF SECTION 331414

SECTION 331416 – SITE WATER DISTRIBUTION PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes water-distribution piping and related components outside compound buildings for water service **[, and combined water service and fire-service mains]**. This following water-distribution piping is included in this Section:

1. **[Piping from municipal source, through or near compound Water Demarc Room, to compound raw water storage tanks.]**
2. **[Piping from on-compound wells to compound raw water storage tanks.]**
3. **[Piping of trucked water received at compound perimeter to compound raw water storage tanks.]**
4. Piping from the compound potable water storage tank to the domestic piping for each building.
5. Utility water meter at compound perimeter.

B. Related Sections include the following:

1. Division 22 Section on "Sleeves and Sleeve Seals for Plumbing Piping" for requirements also applicable to compound water-service piping.
2. Division 22 Section on "Domestic Water Piping" for water-distribution piping serving each individual compound building.
1. **[Division 22 Section "Domestic Water Piping" for post data metering at each individual compound building.]**
2. Section 223230 "Potable Water Treatment" for compound treatment of water stored in compound raw water tanks prior to distribution to each individual compound building.
3. Section 260518 "Low-Voltage Electrical Power Conductors and Cables" for connection of wiring.
4. Section 260525 "Grounding and Bonding for Electrical Systems" for equipment grounding.
5. Division 31 Section on "Earth Moving" for excavating, trenching, and backfilling.
6. **[Division 33 Section on "Common Work Results for Utilities" for piping-system requirements that are common for compound utility piping.]**
7. Section 331414 "Fire Service Mains and Appurtenances" for separate fire-service site distribution.

1.2 DEFINITIONS

A. BBL: Building battery limit. This identifies the transition location for engineering systems from the site utilities to building systems. The baseline for this transition point is 1.5 meters outside of the building wall for each building.

B. EPDM: Ethylene propylene diene terpolymer rubber.

C. LLDPE: Linear, low-density polyethylene plastic.

D. PA: Polyamide (nylon) plastic.

E. PE: Polyethylene plastic.

F. PP: Polypropylene plastic.

G. PVC: Polyvinyl chloride plastic.

H. RTRF: Reinforced thermosetting resin (fiberglass) fittings.

I. RTRP: Reinforced thermosetting resin (fiberglass) pipe.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Detail precast concrete vault assemblies and indicate dimensions, method of field assembly, and components.

1. Wiring Diagrams: Power, signal, and control wiring for alarms.

C. Coordination Drawings: For piping and specialties including relation to other services in same area, drawn to scale. Show piping and specialty sizes and valves, meter and specialty locations, and elevations.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For water valves and specialties to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Local Regulatory Requirements:

1. Comply with requirements of utility company supplying water. Include tapping of water mains and backflow prevention.
2. Comply with standards of the OBO-ICS IPC and local authorities having jurisdiction for potable-water-service piping, including materials, installation, testing, and disinfection.

B. Piping materials must bear label, stamp, or other markings of specified testing agency.

C. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chapter 1 of the OBO-ICS NEC by a testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE/EE and marked for intended use.

D. Comply with ASTM F645 for selection, design, and installation of thermoplastic water piping.

E. [Comply with FMG's "Approval Guide" or UL's "Fire Protection Equipment Directory" for fire-service-main products where applicable.]

F. [NFPA Compliance: For piping and components jointly used for site fire-suppression distribution, comply with NFPA 24 for materials, installations, tests, flushing, and valve and hydrant supervision for fire-service-main piping for fire suppression.

1. Potable-water piping and components must comply with NSF 14, NSF 61, and NSF 372. [Include marking "NSF-pw" on piping.].]

1.5 DELIVERY, STORAGE, AND HANDLING

A. Preparation for Transport: Prepare valves **[, including fire hydrants,]** according to the following:

1. Ensure that valves are dry and internally protected against rust and corrosion.
2. Protect valves against damage to threaded ends and flange faces.
3. Set valves in best position for handling. Set valves closed to prevent rattling.

B. During Storage: Use precautions for valves **[, including fire hydrants,]** according to the following:

1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.
2. Protect from weather. Store indoors and maintain temperature higher than ambient dew-point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.

C. Handling: Use sling to handle valves **[and fire hydrants]** if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

D. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

E. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.

F. Protect flanges, fittings, and specialties from moisture and dirt.

G. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.6 [PROJECT CONDITIONS

A. Interruption of Existing Water-Distribution Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only

after arranging to provide temporary water-distribution service according to requirements indicated:

1. Notify Project Director/COR no fewer than two days in advance of proposed interruption of service.
2. Do not proceed with interruption of water-distribution service without Project Director/COR's written permission.]

1.7 COORDINATION

A. Coordinate connection to water main with utility company.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in Article on PIPING APPLICATION for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.2 COPPER TUBE AND FITTINGS

A. Soft Copper Tube: [**ASTM B88M, Type A**] [**and**] [**ASTM B88M, Type B**], water tube, annealed temper.

1. Copper, Solder-Joint Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint pressure type. Furnish only wrought-copper fittings if indicated.

B. Hard Copper Tube: [**ASTM B88M, Type A**] [**and**] [**ASTM B88M, Type B**], water tube, drawn temper.

1. Copper, Solder-Joint Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper, solder-joint pressure type. Furnish only wrought-copper fittings if indicated.

C. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.

D. Copper Unions:

1. MSS SP-123.
2. Cast-copper-alloy, hexagonal-stock body.
3. Ball-and-socket, metal-to-metal seating surfaces.
4. Solder-joint or threaded ends.

E. Copper or Bronze, Pressure-Seal-Joint Fittings:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Viega; Plumbing & Heating Systems.

2. DN 50 (NPS 2) and Smaller: Wrought-copper with EPDM O-ring seal in each end.
3. DN 65 to DN 100 (NPS 2-1/2 to NPS 4): Bronze fitting with stainless steel grip ring and EPDM O-ring seal in each end.
4. Minimum 1400-kPa (200-psig) working-pressure rating at 120 deg C (250 deg F).

2.3 DUCTILE-IRON PIPE AND FITTINGS

A. Mechanical-Joint, Ductile-Iron Pipe: AWWA C151, with mechanical-joint bell and plain spigot end unless grooved or flanged ends are indicated.

1. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
2. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

B. Push-on-Joint, Ductile-Iron Pipe: AWWA C151, with push-on-joint bell and plain spigot end unless grooved or flanged ends are indicated.

1. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
2. Gaskets: AWWA C111, rubber.

C. Grooved-Joint, Ductile-Iron Pipe: AWWA C151, with cut, rounded-grooved ends.

1. Grooved-End, Ductile-Iron Pipe Appurtenances:

   a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

      1) Anvil International, Inc.
      2) Victaulic Company of America.

   b. Grooved-End, Ductile-Iron Fittings: ASTM A47/A47M, malleable-iron castings or ASTM A536, ductile-iron castings with dimensions matching pipe.
   c. Grooved-End, Ductile-Iron-Piping Couplings: AWWA C606, for ductile-iron-pipe dimensions. Include ferrous housing sections, gasket suitable for water, and bolts and nuts.

D. Flanges: ASME 16.1, Class 125, cast iron.

2.4 PE PIPE AND FITTINGS

A. PE, ASTM Pipe: ASTM D2239, SIDR No. 5.3, 7, or 9; with PE compound number required to give pressure rating not less than [**1100 kPa (160 psig)**] [**1400 kPa (200 psig)**].

1. Insert Fittings for PE Pipe: ASTM D2609, made of PA, PP, or PVC with serrated male insert ends matching inside of pipe. Include bands or crimp rings.
2. Molded PE Fittings: ASTM D3350, PE resin, socket- or butt-fusion type, made to match PE pipe dimensions and class.

B. PE, AWWA Pipe: AWWA C906, DR No. 7.3, 9, or 9.3; with PE compound number required to give pressure rating not less than [**1100 kPa (160 psig)**] [**1400 kPa (200 psig)**].

1. PE, AWWA Fittings: AWWA C906, socket- or butt-fusion type, with DR number matching pipe and PE compound number required to give pressure rating not less than [**1100 kPa (160 psig)**] [**1400 kPa (200 psig)**].

2.5 PVC PIPE AND FITTINGS

A. PVC, Schedule 40 Pipe: ASTM D1785.

1. PVC, Schedule 40 Socket Fittings: ASTM D2466.

B. PVC, Schedule 80 Pipe: ASTM D1785.

1. PVC, Schedule 80 Socket Fittings: ASTM D2467.
2. PVC, Schedule 80 Threaded Fittings: ASTM D2464.

C. PVC, AWWA Pipe: AWWA C900, [**Class 150**] [**and**] [**Class 200**], with bell end with gasket, and with spigot end.

1. [Comply with UL 1285 for fire-service mains if indicated.]
2. PVC Fabricated Fittings: AWWA C900, [**Class 150**] [**and**] [**Class 200**], with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell.
3. PVC Molded Fittings: AWWA C907, Class 150, with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell.
4. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

a. Gaskets: AWWA C111, rubber.

5. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

a. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

2.6 SPECIAL PIPE FITTINGS

A. Ductile-Iron Rigid Expansion Joints:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.
b. U.S. Pipe and Foundry Company.

2. Description: Three-piece, ductile-iron assembly consisting of telescoping sleeve with gaskets and restrained-type, ductile-iron, bell-and-spigot end sections complying with AWWA C110 or AWWA C153. Select and assemble components for expansion indicated. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.

a. Pressure Rating: 1700 kPa (250 psig) minimum.
b. Expansion Required: <**Insert mm (inches)**>.

B. Ductile-Iron Flexible Expansion Joints:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.
b. Hays Fluid Controls; a division of ROMAC Industries Inc.
c. Star Pipe Products.

2. Description: Compound, ductile-iron fitting with combination of flanged and mechanical-joint ends complying with AWWA C110 or AWWA C153. Include two gasketed ball-joint sections and one or more gasketed sleeve sections. Assemble components for offset and expansion indicated. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.

a. Pressure Rating: 1700 kPa (250 psig) minimum.
b. Offset: <**Insert mm (inches)**>.
c. Expansion Required: <**Insert mm (inches)**>.

C. Ductile-Iron Deflection Fittings:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. EBAA Iron, Inc.

2. Description: Compound, ductile-iron coupling fitting with sleeve and 1 or 2 flexing sections for up to 15-degree deflection, gaskets, and restrained-joint ends complying with

AWWA C110 or AWWA C153. Include AWWA C111, ductile-iron glands, rubber gaskets, and steel bolts.

a. Pressure Rating: 1700 kPa (250 psig) minimum.

2.7 JOINING MATERIALS

A. [Refer to Division 33 Section on "Common Work Results for Utilities" for commonly used joining materials.]

B. Brazing Filler Metals: AWS A5.8, BCuP Series.

C. Bonding Adhesive for Fiberglass Piping: As recommended by fiberglass piping manufacturer.

D. Plastic Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

2.8 PIPING SPECIALTIES

A. Transition Fittings: Manufactured fitting or coupling same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

B. Tubular-Sleeve Pipe Couplings:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Cascade Waterworks Manufacturing.
b. Dresser, Inc.; Dresser Piping Specialties.
c. Ford Meter Box Company, Inc. (The); Pipe Products Div.
d. Hays Fluid Controls; a division of ROMAC Industries Inc.
e. JCM Industries.
f. Smith-Blair, Inc.
g. Viking Johnson.

2. Description: Metal, bolted, sleeve-type, reducing or transition coupling, with center sleeve, gaskets, end rings, and bolt fasteners and with ends of same sizes as piping to be joined.

a. Standard: AWWA C219.
b. Center-Sleeve Material: [**Manufacturer's standard**] [**Carbon steel**] [**Stainless steel**] [**Ductile iron**] [**Malleable iron**].
c. Gasket Material: Natural or synthetic rubber.
d. Pressure Rating: [**1000 kPa (150 psig)**] [**1350 kPa (200 psig)**] <**Insert pressure**> minimum.
e. Metal Component Finish: Corrosion-resistant coating or material.

C. Split-Sleeve Pipe Couplings:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Victaulic Depend-O-Lok.

2. Description: Metal, bolted, split-sleeve-type, reducing or transition coupling with sealing pad and closure plates, O-ring gaskets, and bolt fasteners.

   a. Standard: AWWA C219.
   b. Sleeve Material: [**Manufacturer's standard**] [**Carbon steel**] [**Stainless steel**].
   c. Sleeve Dimensions: Of thickness and width required to provide pressure rating.
   d. Gasket Material: O-rings made of EPDM rubber, unless otherwise indicated.
   e. Pressure Rating: **[1000 kPa (150 psig)] [1350 kPa (200 psig)] <Insert pressure>** minimum.
   f. Metal Component Finish: Corrosion-resistant coating or material.

D. Flexible Connectors:

1. Nonferrous-Metal Piping: Bronze hose covered with bronze wire braid; with copper-tube, pressure-type, solder-joint ends or bronze flanged ends brazed to hose.
2. Ferrous-Metal Piping: Stainless-steel hose covered with stainless-steel wire braid; with ASME B1.20.1, threaded steel pipe nipples or ASME B16.5, steel pipe flanges welded to hose.

E. Dielectric Fittings:

1. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
2. Dielectric Unions:

   a. Description:

      1) Standard: ASSE 1079.
      2) Pressure Rating: 1700 kPa (250 psig) minimum working pressure at 80 deg C (180 deg F).
      3) Include insulating material that isolates dissimilar metals and ends with inside threads according to ASME B1.20.1.
      4) End Connections: Solder-joint copper alloy and threaded ferrous.

3. Dielectric Flanges:

   a. Description:

      1) Standard: ASSE 1079.
      2) Factory-fabricated, bolted, companion-flange assembly.

3) Working Pressure Rating: **[1000 kPa (150 psig)] [2000 kPa (300 psig)]** minimum to suit system pressures.
4) End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

4. Dielectric-Flange Insulating Kits:

a. Description:

1) Nonconducting materials for field assembly of companion flanges.
2) Pressure Rating: **[1000 kPa (150 psig)]** <**Insert pressure**>.
3) Gasket: Neoprene or phenolic.
4) Bolt Sleeves: Phenolic or polyethylene.
5) Washers: Phenolic with steel backing washers.

5. Dielectric Nipples:

a. Description:

1) Standard: IAPMO PS 66.
2) Electroplated steel nipple complying with ASTM F1545.
3) Pressure Rating: 2000 kPa (300 psig) at 105 deg C (225 deg F).
4) End Connections: Male threaded, plain, or grooved.
5) Lining: Inert and noncorrosive, propylene.

2.9 CORROSION-PROTECTION PIPING ENCASEMENT

A. Encasement for Underground Metal Piping:

1. Standards: ASTM A674 or AWWA C105.
2. Form: [**Sheet**] [**Sheet or tube**] [**Tube**].
3. Material: As identified in the Drawings, or otherwise one of the following:

a. LLDPE film of 0.20-mm (0.008-inch) minimum thickness.
b. LLDPE film of 0.20-mm (0.008-inch) minimum thickness, or high-density, cross-laminated PE film of 0.10-mm (0.004-inch) minimum thickness.
c. High-density, cross-laminated PE film of 0.10-mm (0.004-inch) minimum thickness.

4. Color: [**Black**] [**Natural**] <**Insert color**>.

2.10 GATE VALVES

A. AWWA, Cast-Iron Gate Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. American AVK Co.; Valves & Fittings Div.
    b. American Cast Iron Pipe Co.; American Flow Control Div.
    c. American Cast Iron Pipe Co.; Waterous Co. Subsidiary.
    d. Crane Co.; Crane Valve Group; Stockham Div.
    e. East Jordan Iron Works, Inc.
    f. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
    g. McWane, Inc.; Kennedy Valve Div.
    h. McWane, Inc.; M & H Valve Company Div.
    i. McWane, Inc.; Tyler Pipe Div.; Utilities Div.
    j. Mueller Co.; Water Products Div.
    k. NIBCO INC.
    l. U.S. Pipe and Foundry Company.

2. Non-rising-Stem, Metal-Seated Gate Valves:

    a. Description: Gray- or ductile-iron body and bonnet; with cast-iron or bronze double-disc gate, bronze gate rings, bronze stem, and stem nut.

        1) Standard: AWWA C500.
        2) Minimum Pressure Rating: 1400 kPa (200 psig).
        3) End Connections: Mechanical joint.
        4) Interior Coating: Complying with AWWA C550.

3. Non-rising-Stem, Resilient-Seated Gate Valves:

    a. Description: Gray- or ductile-iron body and bonnet; with bronze or gray- or ductile-iron gate, resilient seats, bronze stem, and stem nut.

        1) Standard: AWWA C509.
        2) Minimum Pressure Rating: 1400 kPa (200 psig).
        3) End Connections: Mechanical joint.
        4) Interior Coating: Complying with AWWA C550.

4. Non-rising-Stem, High-Pressure, Resilient-Seated Gate Valves:

    a. Description: Ductile-iron body and bonnet; with bronze or ductile-iron gate, resilient seats, bronze stem, and stem nut.

        1) Standard: AWWA C509.
        2) Minimum Pressure Rating: 1700 kPa (250 psig).
        3) End Connections: Push on or mechanical joint.
        4) Interior Coating: Complying with AWWA C550.

5. OS&Y, Rising-Stem, Metal-Seated Gate Valves:

a. Description: Cast- or ductile-iron body and bonnet, with cast-iron double disc, bronze disc and seat rings, and bronze stem.

1) Standard: AWWA C500.
2) Minimum Pressure Rating: 1400 kPa (200 psig).
3) End Connections: Flanged.

6. OS&Y, Rising-Stem, Resilient-Seated Gate Valves:

a. Description: Cast- or ductile-iron body and bonnet, with bronze or gray- or ductile-iron gate, resilient seats, and bronze stem.

1) Standard: AWWA C509.
2) Minimum Pressure Rating: 1400 kPa (200 psig).
3) End Connections: Flanged.

B. UL/FMG, Cast-Iron Gate Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American Cast Iron Pipe Co.; American Flow Control Div.
b. American Cast Iron Pipe Co.; Waterous Co. Subsidiary.
c. Crane Co.; Crane Valve Group; Stockham Div.
d. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
e. McWane, Inc.; Kennedy Valve Div.
f. McWane, Inc.; M & H Valve Company Div.
g. Mueller Co.; Water Products Div.
h. NIBCO INC.
i. U.S. Pipe and Foundry Company.

2. UL/FMG, Non-rising-Stem Gate Valves:

a. Description: Iron body and bonnet with flange for indicator post, bronze seating material, and inside screw.

1) Standards: UL 262 and FMG approved.
2) Minimum Pressure Rating: 1200 kPa (175 psig).
3) End Connections: Flanged.

3. [OS&Y, Rising-Stem Gate Valves:

a. Description: Iron body and bonnet and bronze seating material.

1) Standards: UL 262 and FMG approved.
2) Minimum Pressure Rating: 1200 kPa (175 psig).
3) End Connections: Flanged.]

C. Bronze Gate Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Jenkins Valves.
c. Crane Co.; Crane Valve Group; Stockham Div.
d. Hammond Valve.
e. Milwaukee Valve Company.
f. NIBCO INC.
g. Red-White Valve Corporation.

2. OS&Y, Rising-Stem Gate Valves:

a. Description: Bronze body and bonnet and bronze stem.

1) Standards: UL 262 and FMG approved.
2) Minimum Pressure Rating: 1200 kPa (175 psig).
3) End Connections: Threaded.

3. Non-rising-Stem Gate Valves:

a. Description: Class 125, Type 1, bronze with solid wedge, threaded ends, and malleable-iron handwheel.

1) Standard: MSS SP-80.

2.11 GATE VALVE ACCESSORIES AND SPECIALTIES

A. Tapping-Sleeve Assemblies:

1. Available Manufacturers:

a. American Cast Iron Pipe Co.; Waterous Co. Subsidiary.
b. East Jordan Iron Works, Inc.
c. Flowserve.
d. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
e. McWane, Inc.; Kennedy Valve Div.
f. McWane, Inc.; M & H Valve Company Div.
g. Mueller Co.; Water Products Div.
h. U.S. Pipe and Foundry Company

2. Description: Sleeve and valve compatible with drilling machine.

a. Standard: MSS SP-60.

b. Tapping Sleeve: Cast- or ductile-iron or stainless-steel, two-piece bolted sleeve with flanged outlet for new branch connection. Include sleeve matching size and type of pipe material being tapped and with recessed flange for branch valve.
c. Valve: AWWA, cast-iron, non-rising-stem, [**metal**] [**resilient**]-seated gate valve with one raised face flange mating tapping-sleeve flange.

B. Valve Boxes: Comply with AWWA M44 for cast-iron valve boxes. Include top section, adjustable extension of length required for depth of burial of valve, plug with lettering "WATER," and bottom section with base that fits over valve and with a barrel approximately 125 mm (5 inches) in diameter.

1. Operating Wrenches: Steel, tee-handle with one pointed end, stem of length to operate deepest buried valve, and socket matching valve operating nut.

C. Indicator Posts: UL 789, FMG-approved, vertical-type, cast-iron body with operating wrench, extension rod, and adjustable cast-iron barrel of length required for depth of burial of valve.

2.12 CHECK VALVES

A. AWWA Check Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American AVK Co.; Valves & Fittings Div.
b. American Cast Iron Pipe Co.; American Flow Control Div.
c. APCO Williamette; Valve and Primer Corporation.
d. Crane Co.; Crane Valve Group; Crane Valves.
e. Crane Co.; Crane Valve Group; Stockham Div.
f. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
g. McWane, Inc.; Kennedy Valve Div.
h. McWane, Inc.; M & H Valve Company Div.
i. Mueller Co.; Water Products Div.
j. NIBCO INC.
k. Watts Water Technologies, Inc.

2. Description: Swing-check type with resilient seat. Include interior coating according to AWWA C550 and ends to match piping.

a. Standard: AWWA C508.
b. Pressure Rating: 1200 kPa (175 psig).

B. UL/FMG, Check Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American Cast Iron Pipe Co.; Waterous Co. Subsidiary.
b. Crane Co.; Crane Valve Group; Stockham Div.
c. Globe Fire Sprinkler Corporation.
d. Kidde Fire Fighting.
e. MATCO-NORCA, Inc.
f. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
g. McWane, Inc.; Kennedy Valve Div.
h. Mueller Co.; Water Products Div.
i. NIBCO INC.
j. Reliable Automatic Sprinkler Co., Inc.
k. Tyco Fire & Building Products.
l. United Brass Works, Inc.
m. Victaulic Company of America.
n. Viking Corporation.
o. Watts Water Technologies, Inc.

2. Description: Swing-check type with pressure rating; rubber-face checks, unless otherwise indicated; and ends matching piping.

a. Standards: UL 312 and FMG approved.
b. Pressure Rating: [**1200 kPa (175 psig)**] [**1700 kPa (250 psig)**].

2.13 DETECTOR CHECK VALVES

A. Detector Check Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Ames Fire & Waterworks; a division of Watts Regulator Co.
b. Badger Meter, Inc.
c. FEBCO; SPX Valves & Controls.
d. Globe Fire Sprinkler Corporation.
e. McWane, Inc.; Kennedy Valve Div.
f. Mueller Co.; Hersey Meters.
g. Victaulic Company of America.
h. Viking Corporation.
i. Watts Water Technologies, Inc.

2. Description: Of type identified in Drawings, or otherwise as selected from the following:

a. Galvanized cast-iron body, bolted cover with air-bleed device for access to internal parts, and flanged ends. Include one-piece bronze disc with bronze bushings, pivot, and replaceable seat. Include threaded bypass taps in inlet and outlet for bypass meter connection. Set valve to allow minimal water flow through bypass meter when major water flow is required.

1) Standards: UL 312 and FMG approved.
2) Pressure Rating: 1200 kPa (175 psig).
3) Water Meter: AWWA C700, disc type, at least one-fourth size of detector check valve. Include meter, bypass piping, gate valves, check valve, and connections to detector check valve.

b. Iron body, corrosion-resistant clapper ring and seat ring material, flanged ends, with connections for bypass and installation of water meter.

1) Standards: UL 312 and FMG approved.
2) Pressure Rating: 1200 kPa (175 psig).

2.14 BALL VALVES

A. Bronze Ball Valves, Two-Piece:

1. Minimum Pressure Rating: 2750 kPa (400 psig).
2. Ends: Threaded.

2.15 BUTTERFLY VALVES

A. AWWA Butterfly Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. DeZURIK/Copes-Vulcan; a unit of SPX Corporation.
b. Milliken Valve Company.
c. Mosser Valve; a division of Olson Technologies, Inc.
d. Mueller Co.; Water Products Div.
e. Pratt, Henry Company.
f. Val-Matic Valve & Manufacturing Corp.

2. Description: Rubber seated.

a. Standard: AWWA C504.
b. Body: Cast or ductile iron.
c. Body Type: [**Wafer**] [**Wafer or flanged**] [**Flanged**].
d. Pressure Rating: 1000 kPa (150 psig).

B. UL Butterfly Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. McWane, Inc.; Kennedy Valve Div.
b. Milwaukee Valve Company.
c. Mueller Co.; Water Products Div.
d. NIBCO INC.
e. Pratt, Henry Company.

2. Description: Metal on resilient material seating.

a. Standards: UL 1091 and FMG approved.
b. Body: Cast or ductile iron.
c. Body Type: [**Wafer**] [**Wafer or flanged**] [**Flanged**].
d. Pressure Rating: 1200 kPa (175 psig).

2.16 PLUG VALVES

A. Plug Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. DeZURIK/Copes-Vulcan; a unit of SPX Corporation.
b. Homestead Valve; a division of Olson Technologies, Inc.
c. Milliken Valve Company.
d. McWane, Inc.; M & H Valve Company Div.
e. Pratt, Henry Company.
f. Val-Matic Valve & Manufacturing Corp.

2. Description: Resilient-seated eccentric.

a. Standard: MSS SP-108.
b. Body: Cast iron.
c. Pressure Rating: 1200-kPa (175-psig) minimum CWP.
d. Seat Material: Suitable for potable-water service.

2.17 [CORPORATION VALVES] [AND] [CURB VALVES]

A. Manufacturers:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Amcast Industrial Corporation; Lee Brass Co.
b. Ford Meter Box Company, Inc. (The); Pipe Products Div.
c. Jones, James Company.
d. Master Meter, Inc.

e. McDonald, A. Y. Mfg. Co.
f. Mueller Co.; Water Products Div.
g. Red Hed Manufacturing & Supply.

B. Service-Saddle Assemblies: Comply with AWWA C800. Include saddle and valve compatible with tapping machine.

1. Service Saddle: Copper alloy with seal and AWWA C800, threaded outlet for corporation valve.
2. Corporation Valve: Bronze body and ground-key plug, with AWWA C800, threaded inlet and outlet matching service piping material.

3. [Manifold: Copper fitting with two to four inlets as required, with ends matching corporation valves and outlet matching service piping material.]

C. Curb Valves: Comply with AWWA C800. Include bronze body, ground-key plug or ball, and wide tee head, with inlet and outlet matching service piping material.

D. Service Boxes for Curb Valves: Similar to AWWA M44 requirements for cast-iron valve boxes. Include cast-iron telescoping top section of length required for depth of burial of valve, plug with lettering "WATER," and bottom section with base that fits over curb valve and with a barrel approximately 75 mm (3 inches) in diameter.

1. Shutoff Rods: Steel, tee-handle with one pointed end, stem of length to operate deepest buried valve, and slotted end matching curb valve.

2.18 UTILITY WATER METERS

A. [Utility water meters will be furnished by utility company.]

B. [Provide Utility water meter.

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. AMCO Water Metering Systems.
b. Badger Meter, Inc.
c. Carlon Meter.
d. Hays Fluid Controls; a division of ROMAC Industries Inc.
e. McCrometer.
f. Mueller Co.; Hersey Meters.
g. Neptune Technology Group Inc.
h. Sensus Metering Systems.

C. Type: Provide water meter as required by Utility, as identified in Drawings, or otherwise as selected from one the of following:

1. Displacement-Type Water Meters:

a. Description: With bronze main case.

1) Standard: AWWA C700.
2) Registration: Flow in [liters (gallons)] [cubic meters (cubic feet)].

2. Turbine-Type Water Meters:

a. Description:

1) Standard: AWWA C701.
2) Registration: Flow in [liters (gallons)] [cubic meters (cubic feet)].

3. Compound-Type Water Meters:

a. Description:

1) Standard: AWWA C702.
2) Registration: Flow in [liters (gallons)] [cubic meters (cubic feet)].]]

4. Detector-Type Water Meters:

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Badger Meter, Inc.
2) Mueller Co.; Hersey Meters.
3) Neptune Technology Group Inc.
4) Sensus Metering System.

b. Description:

1) Main line, proportional meter with second meter on bypass. Register flow in [liters (gallons)] [cubic meters (cubic feet)].

a) Standards: AWWA C703, UL listed, and FMG approved.
b) Pressure Rating: 1000 kPa (150 psig).
c) Bypass Meter: [AWWA C701, turbine] [AWWA C702, compound]-type, bronze case.
d) Size: At least one-half nominal size of main-line meter.

2) Main line, turbine meter with strainer and second meter on bypass. Register flow in [liters (gallons)] [cubic meters (cubic feet)].

a) Standards: AWWA C703, UL listed, and FMG approved.
b) Pressure Rating: 1200 kPa (175 psig).
c) Bypass Meter: AWWA C701, turbine-type, bronze case.

d) Size: At least DN 50 (NPS 2).]

D. [Remote Registration System:

1. [Description: Utility company standard; direct-reading type. Include meter modified with signal-transmitting assembly, low-voltage connecting wiring, and remote register assembly.

a. Standard: AWWA C706.
b. Registration: Flow in [liters (gallons)] [cubic meters (cubic feet)].]

2. [Description: Utility company standard; encoder type. Include meter modified with signal-transmitting assembly, low-voltage connecting wiring, and remote register assembly.

a. Standard: AWWA C707.
b. Registration: Flow in [liters (gallons)] [cubic meters (cubic feet)].
c. Data-Acquisition Units: Comply with utility company requirements for type and quantity.
d. Visible Display Units: Comply with utility company requirements for type and quantity.]

2.19 PRESSURE-REDUCING VALVES

A. Water Regulators:

1. Available Manufacturers:

a. Cash Acme; a division of The Reliance Worldwide Corporation.
b. Conbraco Industries, Inc.
c. Honeywell Water Controls.
d. Watts Water Technologies, Inc.
e. Zurn Plumbing Products Group; Wilkins Water Control Products Div.

2. Standard: ASSE 1003.
3. Pressure Rating: Initial pressure of 1000 kPa (150 psig).
4. Size: <**Insert DN (NPS)**>.
5. Design Flow Rate: <**Insert L/s (gpm)**>.
6. Design Inlet Pressure: <**Insert kPa (psig)**>.
7. Design Outlet Pressure Setting: <**Insert kPa (psig)**>.
8. Body: Bronze [**with chrome-plated finish**] for DN 50 (NPS 2) and smaller; cast iron[**with interior lining complying with AWWA C550 or that is FDA approved**] for DN 65 and DN 80 (NPS 2-1/2 and NPS 3).
9. Valves for Booster Heater Water Supply: Include integral bypass.
10. End Connections: Threaded for DN 50 (NPS 2) and smaller; flanged for DN 65 and DN 80 (NPS 2-1/2 and NPS 3).

B. Water Control Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following.

   a. CLA-VAL Automatic Control Valves.
   b. Flomatic Corporation.
   c. OCV Control Valves.
   d. Watts Regulator Co.; Ames Fluid Control Systems.
   e. Watts Regulator Co.; Watts ACV Division.
   f. Zurn Plumbing Products Group; Wilkins Water Control Products Div.

2. Description: Pilot-operation, diaphragm-type, single-seated main water control valve with AWWA C550 or FDA-approved, interior epoxy coating. Include small pilot control valve, restrictor device, specialty fittings, and sensor piping.

   a. Pressure Rating: Initial pressure of 1000 kPa (150 psig) minimum.
   b. Main Valve Body: Cast- or ductile-iron body with AWWA C550 or FDA-approved, interior epoxy coating; or stainless-steel body.

      1) Size: <**Insert DN (NPS)**>.
      2) Pattern: [**Angle**] [**Globe**]-valve design.
      3) Trim: Stainless steel.

   c. Design Flow Rate: <**Insert L/s (gpm)**>.
   d. Design Inlet Pressure: <**Insert kPa (psig)**>.
   e. Design Outlet Pressure Setting: <**Insert kPa (psig)**>.
   f. End Connections: Threaded for DN 50 (NPS 2) and smaller; [**flanged**] <**Insert type**> for DN 65 (NPS 2-1/2) and larger.

2.20 RELIEF VALVES

A. Air-Release Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Crispin-Multiplex Manufacturing Co.
   b. GA Industries, Inc.
   c. Val-Matic Valve & Manufacturing Corp.

2. Description: Hydromechanical device to automatically release accumulated air.

   a. Standard: AWWA C512.
   b. Pressure Rating: [**2000 kPa (300 psig)**] <**Insert pressure**>.
   c. Body Material: [**Cast iron**] <**Insert material**>.
   d. Trim Material: Stainless steel [**, brass, or bronze**].
   e. Water Inlet Size: <**Insert DN (NPS)**>.

f. Air Outlet Size: <**Insert DN (NPS)** >.
g. Orifice Size: <**Insert mm (inch)** >.
h. Design Air-Release Capacity: <**Insert L/s (cfm)**> at <**Insert kPa (psig)**> pipeline pressure.

B. Air/Vacuum Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Crispin-Multiplex Manufacturing Co.
b. GA Industries, Inc.
c. Val-Matic Valve & Manufacturing Corp.

2. Description: Direct-acting, float-operated, hydromechanical device with large orifice to automatically release accumulated air or to admit air during filling of piping.

a. Standard: AWWA C512.
b. Pressure Rating: [**2000 kPa (300 psig)**] <**Insert pressure**>.
c. Body Material: [**Cast iron**] <**Insert material**>.
d. Trim Material: Stainless steel [**, brass, or bronze**].
e. Inlet and Outlet Size: <**Insert DN (NPS)**>.
f. Orifice Size: <**Insert mm (inch)**>.
g. Design Air Capacity: <**Insert L/s (cfm)**> at <**Insert kPa (psig)**> differential pressure.

C. Combination Air Valves:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Crispin-Multiplex Manufacturing Co.
b. GA Industries, Inc.
c. Val-Matic Valve & Manufacturing Corp

2. Description: Float-operated, hydromechanical device to automatically release accumulated air or to admit air.

a. Standard: AWWA C512.
b. Pressure Rating: [**2000 kPa (300 psig)**] <**Insert pressure**>.
c. Body Material: [**Cast iron**] <**Insert material**>.
d. Trim Material: Stainless steel [**, brass, or bronze**].
e. Inlet and Outlet Size: <**Insert DN (NPS)**>.
f. Orifice Size: <**Insert mm (inch)**>.
g. Design Air Capacity: <**Insert L/s (cfm)**> at <**Insert kPa (psig)**> differential pressure.

2.21 VACUUM BREAKERS

A. Pressure Vacuum Breaker Assembly:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Ames Fire & Waterworks; a division of Watts Regulator Co.
   b. Conbraco Industries, Inc.
   c. FEBCO; SPX Valves & Controls.
   d. Flomatic Corporation.
   e. Toro Co. (The); Irrigation Division.
   f. Watts Water Technologies, Inc.
   g. Zurn Plumbing Products Group; Wilkins Water Control Products Div.

2. Standard: ASSE 1020.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: [**35 kPa (5 psig)**] <**Insert pressure**> maximum, through middle 1/3 of flow range.
5. Size: <**Insert DN (NPS)**>.
6. Design Flow Rate: <**Insert L/s (gpm)**>.
7. Selected Unit Flow Range Limits: <**Insert L/s (gpm)**>.
8. Pressure Loss at Design Flow Rate: <**Insert kPa (psig)**>.
9. Accessories: Ball valves on inlet and outlet.

2.22 BACKFLOW PREVENTERS

A. Reduced-Pressure-Principle Backflow Preventers:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Ames Fire & Waterworks; a division of Watts Regulator Co.
   b. Conbraco Industries, Inc.
   c. FEBCO; SPX Valves & Controls.
   d. Flomatic Corporation.
   e. Watts Water Technologies, Inc.
   f. Zurn Plumbing Products Group; Wilkins Water Control Products Div

2. Standard: [**ASSE 1013**] [**or**] [**AWWA C511**].
3. Operation: Continuous-pressure applications.
4. Pressure Loss: [**80 kPa (12 psig)**] <**Insert pressure**> maximum, through middle 1/3 of flow range.
5. Size: <**Insert DN (NPS)** >.
6. Design Flow Rate: <**Insert L/s (gpm)**>.
7. Selected Unit Flow Range Limits: <**Insert L/s (gpm)**>.

8. Pressure Loss at Design Flow Rate: <**Insert kPa (psig)**> for DN 50 (NPS 2) and smaller; <**Insert kPa (psig)**> for DN 65 (NPS 2-1/2) and larger.
9. Body: Bronze for DN 50 (NPS 2) and smaller; [**cast iron with interior lining complying with AWWA C550 or that is FDA approved**] [**steel with interior lining complying with AWWA C550 or that is FDA approved**] [**stainless steel**] for DN 65 (NPS 2-1/2) and larger.
10. End Connections: Threaded for DN 50 (NPS 2) and smaller; [**flanged**] <**Insert type**> for DN 65 (NPS 2-1/2) and larger.
11. Configuration: Designed for [**horizontal, straight through**] [**vertical inlet, horizontal center section, and vertical outlet**] [**vertical**] <**Insert configuration**> flow.
12. Accessories:

    a. Valves: Ball type with threaded ends on inlet and outlet of DN 50 (NPS 2) and smaller; OS&Y gate type with flanged ends on inlet and outlet of DN 65 (NPS 2-1/2) and larger.
    b. Air-Gap Fitting: ASME A112.1.2, matching backflow preventer connection.

B. Double-Check, Backflow-Prevention Assemblies:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Ames Fire & Waterworks; a division of Watts Regulator Co.
    b. Conbraco Industries, Inc.
    c. FEBCO; SPX Valves & Controls.
    d. Flomatic Corporation.
    e. Watts Water Technologies, Inc.
    f. Zurn Plumbing Products Group; Wilkins Water Control Products Div.

2. Standard: [**ASSE 1015**] [**or**] [**AWWA C510**].
3. Operation: Continuous-pressure applications, unless otherwise indicated.
4. Pressure Loss: [**35 kPa (5 psig)**] <**Insert pressure**> maximum, through middle 1/3 of flow range.
5. Size: <**Insert DN (NPS)**>.
6. Design Flow Rate: <**Insert L/s (gpm)**>.
7. Selected Unit Flow Range Limits: <**Insert L/s (gpm)**>.
8. Pressure Loss at Design Flow Rate: <**Insert kPa (psig)**> for DN 50 (NPS 2) and smaller; <**Insert kPa (psig)**> for DN 65 (NPS 2-1/2) and larger.
9. Body: Bronze for DN 50 (NPS 2) and smaller; [**cast iron with interior lining complying with AWWA C550 or that is FDA approved**] [**steel with interior lining complying with AWWA C550 or that is FDA approved**] [**stainless steel**] for DN 65 (NPS 2-1/2) and larger.
10. End Connections: Threaded for DN 50 (NPS 2) and smaller; [**flanged**] <**Insert type**> for DN 65 (NPS 2-1/2) and larger.
11. Configuration: Designed for [**horizontal, straight through**] <**Insert configuration**> flow.

12. Accessories: Ball valves with threaded ends on inlet and outlet of DN 50 (NPS 2) and smaller; OS&Y gate valves with flanged ends on inlet and outlet of DN 65 (NPS 2-1/2) and larger.

C. Double-Check, Detector-Assembly Backflow Preventers:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Ames Fire & Waterworks; a division of Watts Regulator Co.
   b. Conbraco Industries, Inc.
   c. FEBCO; SPX Valves & Controls.
   d. Watts Water Technologies, Inc.
   e. Zurn Plumbing Products Group; Wilkins Water Control Products Div.

2. Standards: ASSE 1048 and UL listed or FMG approved.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: [**35 kPa (5 psig)**] <**Insert pressure**> maximum, through middle 1/3 of flow range.
5. Size: <**Insert DN (NPS)**>.
6. Design Flow Rate: <**Insert L/s (gpm)**>.
7. Selected Unit Flow Range Limits: <**Insert L/s (gpm)**>.
8. Pressure Loss at Design Flow Rate: <**Insert kPa (5 psig)**>.
9. Body: [**Cast iron with interior lining complying with AWWA C550 or that is FDA approved**] [**Steel with interior lining complying with AWWA C550 or that is FDA approved**] [**Stainless steel**].
10. End Connections: Flanged.
11. Configuration: Designed for [**horizontal, straight through**] [**vertical inlet, horizontal center section, and vertical outlet**] [**vertical**] <**Insert configuration**> flow.
12. Accessories:

    a. Valves: UL 262, FMG-approved, OS&Y gate type with flanged ends on inlet and outlet.
    b. Bypass: With displacement-type water meter, shutoff valves, and reduced-pressure backflow preventer.

D. Backflow Preventer Test Kits:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   a. Conbraco Industries, Inc.
   b. FEBCO; SPX Valves & Controls.
   c. Flomatic Corporation.
   d. Watts Water Technologies, Inc.
   e. Zurn Plumbing Products Group; Wilkins Water Control Products Div;

2. Description: Factory calibrated, with gages, fittings, hoses, and carrying case with test-procedure instructions.

2.23 WATER METER BOXES

A. Description: As indicated on drawings, or otherwise as selected from below as permitted by Local Authorities Having Jurisdiction.

1. Cast-iron body and cover for disc-type water meter, with lettering "WATER METER" in cover; and with slotted, open-bottom base section of length to fit over service piping.
2. Cast-iron body and double cover for disc-type water meter, with lettering "WATER METER" in top cover; and with separate inner cover; air space between covers; and slotted, open-bottom base section of length to fit over service piping.
3. Polymer-concrete body and cover for disc-type water meter, with lettering "WATER" in cover; and with slotted, open-bottom base section of length to fit over service piping. Include vertical and lateral design loadings of 7000 kg minimum over 250 by 250 mm (15,000 lb minimum over 10 by 10 inches) square. This type is not permitted for use in roadways, but is permitted in walks and unpaved areas away from traffic.

2.24 [CONCRETE VAULTS

A. Description: Precast, reinforced-concrete vault, designed for A-16 load designation according to ASTM C857 and made according to ASTM C858, and in accordance with the OBO Zoning Code and local Authorities Having Jurisdiction.

1. Ladder: Fiber-reinforced plastic (FRP) or cast; at 300 to 400 mm intervals.
2. Manhole:

a. [ASTM A48/A48M Class No. 35A minimum tensile strength, gray-iron traffic frame and cover.

1) Dimension: 900-mm (36-inch) minimum diameter, unless otherwise indicated.]

b. [ASTM A536, Grade 60-40-18, ductile-iron traffic frame and cover.

1) Dimension: 900-mm (36-inch) minimum diameter, unless otherwise indicated.]

3. Drain: ASME A112.6.3, cast-iron floor drain with outlet of size indicated. Include body anchor flange, light-duty cast-iron grate, bottom outlet, and integral or field-installed bronze ball or clapper-type backwater valve.]

2.25 PROTECTIVE ENCLOSURES

A. Freeze-Protection Enclosures:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Aqua Shield.
    b. BF Products, Inc.
    c. DekoRRa Products.
    d. Dunco Manufacturing, Inc.
    e. G&C Enclosures.
    f. Hot Box, Inc.
    g. HydroCowl, Inc.
    h. Watts Water Technologies, Inc.

2. Description: Insulated enclosure designed to protect aboveground water piping, equipment, or specialties from freezing and damage, with heat source to maintain minimum internal temperature of 4 deg C (40 deg F) when external temperatures reach as low as minus 36 deg C (minus 34 deg F).

    a. Standard: ASSE 1060.
    b. Class I: For equipment or devices other than pressure or atmospheric vacuum breakers.

        1) Housing: Reinforced[**-aluminum**] [**or**] [**-fiberglass**] <**Insert housing**> construction.

            a) Size: Of dimensions indicated, but not less than those required for access and service of protected unit.
            b) Drain opening for units with drain connection.
            c) Access doors with locking devices.
            d) Insulation inside housing.
            e) Anchoring devices for attaching housing to concrete base.

        2) Electric heating cable or heater with self-limiting temperature control.

B. Weather-Resistant Enclosures:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Aqua Shield.
    b. BF Products, Inc.
    c. DekoRRa Products.
    d. Dunco Manufacturing, Inc.
    e. G&C Enclosures.
    f. Hot Box, Inc.
    g. HydroCowl, Inc.
    h. Watts Water Technologies, Inc.

2. Description: Uninsulated enclosure designed to protect aboveground water piping, equipment, or specialties from weather and damage.

   a. Standard: ASSE 1060.
   b. Class III: For equipment or devices other than pressure or atmospheric vacuum breakers.

      1) Housing: Reinforced[**-aluminum**] [**or**] [**-fiberglass**] <**Insert housing**> construction.

         a) Size: Of dimensions indicated, but not less than those required for access and service of protected unit.
         b) Drain opening for units with drain connection.
         c) Access doors with locking devices.
         d) Anchoring devices for attaching housing to concrete base.

C. Expanded-Metal Enclosures:

1. Available Manufacturers:

   a. Backflow Prevention Device InnClosures, Inc.
   b. BF Products, Inc.
   c. Cross Brothers, Inc.
   d. Le Meur Welding & Manufacturing Co.

2. Description: Enclosure designed to protect aboveground water piping, equipment, or specialties from damage.

   a. Material: ASTM F1267, expanded metal side and top panels, of weight and with reinforcement of same metal at edges as required for rigidity.
   b. Type: Type[**I, expanded**] [**II, expanded and flattened**].
   c. Class: Class[**1, uncoated carbon steel**] [**2, hot-dip, zinc-coated carbon steel**] [**3, corrosion-resisting steel**].

   d. Finish: Manufacturer's enamel paint.
   e. Size: Of dimensions indicated, but not less than those required for access and service of protected unit.
   f. Locking device.
   g. Lugs or devices for securing enclosure to base.

D. Enclosure Bases:

1. Description: [**100-mm- (4-inch-)**] [**150-mm- (6-inch-)**] minimum thickness precast concrete, of dimensions required to extend at least 150 mm (6 inches) beyond edges of enclosure housings. Include openings for piping.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Refer to Division 31 Section on "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. General: Use pipe, fittings, and joining methods for piping systems according to the following applications.

B. Transition couplings and special fittings with pressure ratings at least equal to piping pressure rating may be used, unless otherwise indicated.

C. Do not use flanges or unions for underground piping.

D. Flanges, unions, grooved-end-pipe couplings, and special fittings may be used, instead of joints indicated, on aboveground piping and piping in vaults.

E. Underground water-service piping [**DN 20 to DN 80 (NPS 3/4 to NPS 3)**] <**Insert pipe size range**> must be any of the following:

1. Soft copper tube, [**ASTM B88M, Type A**] [**ASTM B88M, Type B**]; [**wrought-copper, solder-joint fittings; and brazed**] [**copper, pressure-seal fittings; and pressure-sealed**] joints.
2. PE, ASTM pipe; [**insert fittings for PE pipe; and clamped**] [**molded PE fittings; and heat-fusion**] joints.
3. PVC, Schedule [**40 pipe; PVC, Schedule 40**] [**80 pipe; PVC, Schedule 80**] socket fittings; and solvent-cemented joints. Solvent cemented joints must be limited to piping size 50 mm or smaller.

F. Underground water-service piping [**DN 100 to DN 200 (NPS 4 to NPS 8)**] <**Insert pipe size range**> must be any of the following:

1. Ductile-iron, [**push-on-joint pipe; ductile-iron, push-on-joint fittings; and gasketed**] [**mechanical-joint pipe; ductile-iron, mechanical-joint fittings; and mechanical**] [**grooved-end pipe; ductile-iron-pipe appurtenances; and grooved**] joints.
2. PE, AWWA pipe; PE, AWWA fittings; and heat-fusion joints.
3. PVC, Schedule [**40 pipe; PVC, Schedule 40**] [**80 pipe; PVC, Schedule 80**] socket fittings; and solvent-cemented joints.
4. DN 100 and DN 150 (NPS 4 and NPS 6): DN 150 (NPS 6) PVC, AWWA Class 150 pipe; PVC, AWWA Class 150 [**fabricated**] [**or**] [**molded**] fittings; and gasketed joints.
5. DN 200 (NPS 8): PVC, AWWA Class 200 pipe; [**PVC, AWWA Class 200 fabricated**] [**push-on-joint, ductile-iron**] [**mechanical-joint, ductile-iron**] fittings; and gasketed joints.

G. Water Meter Box Water-Service Piping [**DN 20 to DN 50 (NPS 3/4 to NPS 2)**] <**Insert pipe size range**> must be same as underground water-service piping.

H. [Underground Combined Water-Service and Fire-Service-Main Piping [NPS 6 to NPS 12 (DN 150 to DN 300)] <Insert pipe size range> must be of the following:

1. Ductile-iron, [push-on-joint pipe; ductile-iron, push-on-joint fittings; and gasketed] [mechanical-joint pipe; ductile-iron, mechanical-joint fittings; and mechanical] [grooved-end pipe; ductile-iron-pipe appurtenances; and grooved] joints.]

I. [Aboveground [and Vault] Combined Water Service and Fire-Service-Main Piping [DN 150 to DN 300 (NPS 6 to NPS 12)] <Insert pipe size range> must be ductile-iron, grooved-end pipe; ductile-iron-pipe appurtenances; and grooved joints.]

J. Underground Reclaimed Water Service Piping must be PVC, Purple Schedule **[40 pipe; PVC, Schedule 40] [80 pipe; PVC, Schedule 80]** socket fittings; and solvent-cemented joints. PVC pipe for recycled water system applications must be purple. Fittings and pipe appurtenances installed with PVC mains for recycled water must be identified with purple-colored coating, purple polyethylene sleeves, and identification labels,

3.3 VALVE APPLICATIONS

A. General Application: Use mechanical-joint-end valves for DN 80 (NPS 3) and larger underground installation. Use threaded- or flanged-end valves for installation in vaults. Use UL/FMG, non-rising-stem gate valves for installation with indicator posts. Use corporation valves and curb valves with ends compatible with piping, for DN 50 (NPS 2) and smaller installation.

B. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Valve Type:

   a. Ball valves must be used for water mains DN 50 (NPS 2) or smaller. Class 150, ferrous alloy.
   b. Gate valves must be used for water mains DN 65 (NPS 2-1/2) or larger. Class 150, ferrous alloy.
   c. Butterfly valves are permitted only for water mains DN 300 (NPS 12) or larger, with approval by Project Director/COR based upon input from OBO/PDCS/DE/CSE civil engineer. Flangeless, 100-kPa (15 psig) CWP rating, ferrous alloy, with EPFM liner.

2. Underground Valves, DN 100 (NPS 4) and Larger, for Indicator Posts: UL/FMG, cast-iron, non-rising-stem gate valves with indicator post.
3. Pressure-Reducing Valves: Use for water-service piping in vaults and aboveground to control water pressure.
4. Relief Valves: Use for water-service piping in vaults and aboveground.

a. Air-Release Valves: To release accumulated air.
b. Air/Vacuum Valves: To release or admit large volume of air during filling of piping.
c. Combination Air Valves: To release or admit air.

5. Detector Check Valves: Use for water-service piping in vaults and aboveground to detect unauthorized use of water.

3.4 [PIPING SYSTEMS - COMMON REQUIREMENTS

A. See Division 33 Section on "Common Work Results for Utilities" for piping-system common requirements.]

3.5 PIPING INSTALLATION

A. Water-Main Connection:

1. [Arrange with utility company for tap of size and in location indicated in water main.]

2. [Tap water main according to requirements of water utility company and of size and in location indicated.]

B. Make connections larger than DN 50 (NPS 2) with tapping machine according to the following:

1. Install tapping sleeve and tapping valve according to MSS SP-60.
2. Install tapping sleeve on pipe to be tapped. Position flanged outlet for gate valve.
3. Use tapping machine compatible with valve and tapping sleeve; cut hole in main. Remove tapping machine and connect water-service piping.
4. Install gate valve onto tapping sleeve. Comply with MSS SP-60. Install valve with stem pointing up and with valve box.

C. Make connections DN 50 (NPS 2) and smaller with drilling machine according to the following:

1. Install service-saddle assemblies and corporation valves in size, quantity, and arrangement required by utility company standards.
2. Install service-saddle assemblies on water-service pipe to be tapped. Position outlets for corporation valves.
3. Use drilling machine compatible with service-saddle assemblies and corporation valves. Drill hole in main. Remove drilling machine and connect water-service piping.
4. Install corporation valves into service-saddle assemblies.
5. Install manifold for multiple taps in water main.
6. Install curb valve in water-service piping with head pointing up and with service box.

D. Install ductile-iron, water-service piping according to AWWA C600 and AWWA M41.

1. Install PE corrosion-protection encasement according to ASTM A674 or AWWA C105.

E. Install PE pipe according to ASTM D2774 and ASTM F645.

F. Install PVC, AWWA pipe according to ASTM F645 and AWWA M23.

G. Bury piping with depth of cover over top at least [**1000 mm (36 inches)**] <**Insert dimension**>, with top at least [**300 mm (12 inches)**] <**Insert dimension**> below level of maximum frost penetration, and according to the following:

1. [Under Railroad Tracks: With at least [1200 mm (48 inches)] <Insert dimension> cover over top.]

H. Install piping by tunneling or jacking, or combination of both, under streets and other obstructions that cannot be disturbed.

I. Extend water-service piping and connect to water-supply source and building-water-piping systems at outside face of building wall in locations and pipe sizes indicated.

1. Terminate water-service piping at building wall until building-water-piping systems are installed. Terminate piping with caps, plugs, or flanges as required for piping material. Make connections to building-water-piping systems when those systems are installed.

J. Mechanical sleeve seals are specified in Division 22 Section on "Sleeves and Sleeve Seals for Plumbing Piping."

K. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.

L. See Division 22 Section on "Domestic Water Piping" for potable-water piping inside the building.

3.6 JOINT CONSTRUCTION

A. [See Division 33 Section on "Common Work Results for Utilities" for basic piping joint construction.]

B. Make pipe joints according to the following:

1. Copper-Tubing, Pressure-Sealed Joints: Join copper tube and pressure-seal fittings with tools and procedures recommended by pressure-seal-fitting manufacturer. Leave insertion marks on pipe after assembly.
2. Ductile-Iron Piping, Gasketed Joints for Water-Service Piping: AWWA C600 and AWWA M41.
3. Ductile-Iron Piping, Grooved Joints: Cut-groove pipe. Assemble joints with grooved-end, ductile-iron-piping couplings, gaskets, lubricant, and bolts according to coupling manufacturer's written instructions.
4. PE Piping Insert-Fitting Joints: Use plastic insert fittings and fasteners according to fitting manufacturer's written instructions.
5. PVC Piping Gasketed Joints: Use joining materials according to AWWA C900. Construct joints with elastomeric seals and lubricant according to ASTM D2774 or ASTM D3139 and pipe manufacturer's written instructions.
6. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

a. Dielectric Fittings for [**DN 50 (NPS 2)**] <**Insert pipe size**> and Smaller: Use dielectric [**nipples**] [**unions**].
b. Dielectric Fittings for [**DN 65 to DN 100 (NPS 2-1/2 to NPS 4)**] <**Insert pipe size range**>: Use dielectric [**flanges**] [**flange kits**] [**nipples**].
c. Dielectric Fittings for [**DN 125 (NPS 5)**] <**Insert pipe size**> and Larger: Use dielectric flange kits.

3.7 ANCHORAGE INSTALLATION

A. Anchorage, General: Install water-distribution piping with restrained joints. Anchorages and restrained-joint types that may be used include the following:

1. Concrete thrust blocks.
2. Locking mechanical joints.
3. Set-screw mechanical retainer glands.
4. Bolted flanged joints.
5. Heat-fused joints.
6. Pipe clamps and tie rods.
7. <**Insert devices**>.

B. Install anchorages for tees, plugs and caps, bends, crosses, valves, and hydrant branches. Include anchorages for the following piping systems:

1. Gasketed-Joint, Ductile-Iron, Water-Service Piping: According to AWWA C600.
2. Gasketed-Joint, PVC Water-Service Piping: According to AWWA M23.

C. Apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

3.8 VALVE INSTALLATION

A. AWWA Gate Valves: Comply with AWWA C600 and AWWA M44. Install each underground valve with stem pointing up and with valve box.

B. AWWA Valves Other Than Gate Valves: Comply with AWWA C600 and AWWA M44.

C. UL/FMG, Gate Valves: Comply with NFPA 24. Install each underground valve and valves in vaults with stem pointing up and with vertical cast-iron indicator post.

D. UL/FMG, Valves Other Than Gate Valves: Comply with NFPA 24.

E. MSS Valves: Install as component of connected piping system.

F. Corporation Valves and Curb Valves: Install each underground curb valve with head pointed up and with service box.

G. Pressure-Reducing Valves: Install in vault or aboveground between shutoff valves. [**Install full-size valved bypass.**]

H. Relief Valves: Comply with AWWA C512. Install aboveground with shutoff valve on inlet.

3.9 DETECTOR-CHECK VALVE INSTALLATION

A. Install in vault or aboveground.

B. Install for proper direction of flow. Install bypass with water meter, gate valves on each side of meter, and check valve downstream from meter.

C. Support detector check valves, meters, shutoff valves, and piping on brick or concrete piers.

3.10 UTILITY METER INSTALLATION

A. Install water meters, piping, and specialties **[according to utility company's written instructions] [as indicated on the Drawings]**.

B. Water Meters: Installation must be in relation to meter type: as indicated on the Drawings and

1. Install displacement or turbine-type water meters, DN 50 (NPS 2) and smaller, in meter boxes with shutoff valves on water meter inlets. Include valves on water meter outlets and valved bypass around meters unless prohibited by authorities having jurisdiction.
2. Install compound or turbine-type water meters, DN 80 (NPS 3) and larger, in meter vaults. Include shutoff valves on water meter inlets and outlets and valved bypass around meters. Support meters, valves, and piping on brick or concrete piers.
3. Install detector-type water meters in meter vault according to AWWA M6. Include shutoff valves on water meter inlets and outlets and full-size valved bypass around meters. Support meters, valves, and piping on brick or concrete piers.

3.11 ROUGHING-IN FOR UTILITY WATER METERS

A. Rough-in piping and specialties for water meter installation according to utility company's written instructions.

3.12 VACUUM BREAKER ASSEMBLY INSTALLATION

A. Install pressure vacuum breaker assemblies of type, size, and capacity indicated. Include valves and test cocks. Install according to requirements of plumbing and health department and authorities having jurisdiction.

B. Do not install pressure vacuum breaker assemblies in vault or other space subject to flooding.

3.13 BACKFLOW PREVENTER INSTALLATION

A. Install backflow preventers of type, size, and capacity indicated. Include valves and test cocks. Install according to requirements of plumbing and health department and authorities having jurisdiction.

B. Do not install backflow preventers that have relief drain in vault or in other spaces subject to flooding.

C. Do not install bypass piping around backflow preventers.

D. Support DN 65 (NPS 2-1/2) and larger backflow preventers, valves, and piping near floor and on brick or concrete piers.

3.14 UTILITY METER BOX INSTALLATION

A. Install water meter boxes as indicated on the Drawings, as specified below, and in accordance with Local Authorities Having Jurisdiction.

1. Install in paved areas flush with surface.
2. Install water meter boxes in grass or earth areas with top **[50 mm (2 inches)] <Insert dimension>** above surface.

3.15 [CONCRETE VAULT INSTALLATION

A. Install precast concrete vaults according to ASTM C891.]

3.16 PROTECTIVE ENCLOSURE INSTALLATION

A. Install concrete base level and with top approximately [**50 mm (2 inches)**] <**Insert measurement**> above grade.

B. Install protective enclosure over valves and equipment.

C. Anchor protective enclosure to concrete base.

3.17 CONNECTIONS

A. [See Division 33 Section on "Common Work Results for Utilities" for piping connections to valves and equipment.]

B. Connect water-distribution piping to **[utility water main] [existing water main] <Insert piping system>**. Use **[tapping sleeve and tapping valve] [service clamp and corporation valve] <Insert method>**.

C. Connect water-distribution piping to interior domestic water piping.

D. Connect waste piping from concrete vault drains to **[sanitary sewerage system. See Division 33 Section on "Site Sanitary Sewers" for connection to sanitary-sewer] [storm-drainage system. See Division 33 Section on "Site Storm Utility Drainage Piping" for connection to storm-sewer]** piping.

E. Ground equipment according to Section 260525 "Grounding and Bonding for Electrical Systems."

F. Connect wiring according to Section 260518 "Low-Voltage Electrical Power Conductors and Cables."

3.18 FIELD QUALITY CONTROL

A. Piping Tests: Conduct piping tests before joints are covered and after concrete thrust blocks have hardened sufficiently. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water.

B. Hydrostatic Tests: Test at not less than one-and-one-half times working pressure for two hours.

1. Increase pressure in 350-kPa (50-psig) increments and inspect each joint between increments. Hold at test pressure for 1 hour; decrease to 0 kPa (0 psig). Slowly increase again to test pressure and hold for 1 more hour. Maximum allowable leakage is 1.9 L (2 quarts) per hour per 100 joints. Remake leaking joints with new materials and repeat test until leakage is within allowed limits.

C. Prepare reports of testing activities.

3.19 IDENTIFICATION

A. Install continuous underground [**detectable**] warning tape during backfilling of trench for underground water-distribution piping. Locate below finished grade, directly over piping. Underground warning tapes are specified in Division 31 Section on "Earth Moving."

B. Permanently attach equipment nameplate or marker indicating plastic water-service piping, on main electrical meter panel. **[See Division 33 Section on "Common Work Results for Utilities" for identifying devices.]**

C. Pipe markings for PVC pipe for recycled water system must include designation “RECLAIMED WATER” in addition to standard labels required.

3.20 CLEANING

A. Clean and disinfect water-distribution piping as follows:

1. Purge new water-distribution piping systems and parts of existing systems that have been altered, extended, or repaired before use.
2. Use purging and disinfecting procedure prescribed by Project Director/COR based upon input from OBO/PDCS/DE/CSE, or, if method is not prescribed by authorities having jurisdiction, use procedure described in AWWA C651 or do as follows:

    a. Fill system or part of system with water/chlorine solution containing at least 50 ppm of chlorine; isolate and allow to stand for 24 hours.
    b. Drain system or part of system of previous solution and refill with water/chlorine solution containing at least 200 ppm of chlorine; isolate and allow to stand for 3 hours.
    c. After standing time, flush system with clean, potable water until no chlorine remains in water coming from system.
    d. Submit water samples in sterile bottles to Project Director/COR, and to local Authorities Having Jurisdiction if they require samples. Repeat procedure if biological examination shows evidence of contamination.

B. Prepare reports of purging and disinfecting activities.

END OF SECTION 331416

333700 – WASTEWATER TREATMENT PLANT

PART 1 - GENERAL

1.1 SUMMARY

A. This Specification Section is based on the following requirements:

1. Secondary Clarification System: Plant design must use the following system type:

a. [Gravity-based system.]
b. [Dissolved Air Floatation (DAF) system.]

1.2 SUBMITTALS

A. Qualifications: Furnish evidence for experience of manufacturer and manufacturer's field representative as required in Article on QUALITY ASSURANCE. Include project references and contact information.

B. Shop Drawings:

1. Site layout in consistent scale, showing size, spacing, and locations of all proposed process units, piping, wiring, and accessory equipment.
2. Layout drawings and sections showing profile views, maximum water surface elevations, and wall heights for process units. Include piping plan and profiles.
3. Detailed equipment drawings for fabricated items.
4. Schematic Diagrams: General diagram showing Process Flow Diagrams (PFDs). Detailed P&ID diagrams showing complete instrumentation, controls, and flow from and out of primary clarifiers **[to on-site reclaimed water storage tank]**. Show sludge digestion management, waste holding tank, and other auxiliary systems in diagram.
5. Control panel layout with graphic representation of P&ID showing status of all equipment with HOA switches, various instruments, and controls indicated in Construction Drawings.
6. Air supply and diffusion equipment layout, including air header layouts.

C. Product Data:

1. Technical literature; clearly identify applicable items including blowers, instruments, flowmeters, MBBR components, secondary clarification components, UV Disinfection, pumps, filtration, and chlorination equipment.
2. Manufacturer cut sheets with published ratings, capacity data, and specific models selected.

D. Design Calculations:

1. List utility requirements and projected monthly consumption rates at full plant capacity.

2. Structural and certified engineering calculations for tanks, structural members, foundations, and pads.
3. Table summarizing power requirements and breaker sizes.

E. Factory quality-control test reports; see Article on SOURCE QUALITY CONTROL.

F. Installation instructions and other pertinent installation data and procedures.

G. Start-up and testing plan in accordance with Article on PLANT START-UP.

H. Field quality-control and start-up reports; see Article on PLANT START-UP.

I. Operation and Maintenance Data, complete with easy-to-follow instructions to facilitate inexperienced personnel in obtaining and maintaining required levels of performance.

1. List of references and contact information for major elements of systems.

J. Warranties: Properly executed warranties from manufacturer as required by these Specifications.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Manufacturer must have minimum of ten years active experience in design, fabrication, installation, testing, start-up, training, and service of wastewater treatment plants of similar type and size. Firms must have achieved NSF/ANSI 40 certification for their small packaged units.

1. This manufacturer must be licensed by a State in USA, European Union, or equivalent, as approved by the owner.
2. Manufacturer's Field Representative: Minimum of ten years active experience in installation, testing, start-up, training, and service of wastewater treatment plants of similar type and size.

B. Manufacturer Certification: ISO 9001 quality standards.

C. Standards for fabrication and erection of tanks and basins:

1. "AISC Specification for Building"
2. "ACI 318 Building Code Requirements for Reinforced Concrete and Commentary"
3. "ACI 350 Environmental Engineering Concrete Structures"
4. "ASTM- A36 , low carbon plates for tank construction"
5. "ASTM-A48, Grey Iron Casting"

1.4 DELIVERY, STORAGE, AND HANDLING

A. Detach or support main electrical console panels and controls for secondary and tertiary systems prior to shipping.

B. Manufacturer must furnish lifting hooks and include graphic and descriptive procedures for unloading and picking up equipment, and installation, along with safety procedures.

C. Unload tanks and equipment in accordance with manufacturer's instructions.

D. [Deliver DAF system to jobsite complete with dissolved air system, saturators, recycle pumps, drive assembly, local wiring, valves, gauges, controls, anchor bolts and other appurtenances, including all piping and components necessary for complete operating installation.]

1.5 WARRANTY

A. Manufacturer's Warranty: Manufacturer's standard or customized form, without monetary limitation, in which manufacturer agrees to provide labor and technical assistance, and repair or replace components of system within specified warranty period.

B. Warranty Period:

1. Process Tanks: 15-year warranty, with no limits on pH, TDS or chemicals used in process
2. Warranty that all parts are free from defects in material and workmanship for minimum of two years after substantial completion.

1.6 EXTRA MATERIALS

A. Furnish spare parts, consumables, and sufficient parts and supplies for 12 months of operation and regularly scheduled maintenance.

1. Furnish 10 spare cartridges.
2. Chlorine supplies.

1.7 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date for a period of one calendar year provide system maintenance service based on manufacturer's recommended daily, weekly, monthly, quarterly, semi-annual, and annual maintenance activities. In addition to the initial year of maintenance service, provide a proposal for a renewable option year. The option year proposal must be submitted 60 days prior to the end of the initial maintenance contract period.

B. Maintenance service must be inclusive of controls set-up and programming, troubleshooting, and alarms based on manufacturer's recommendations and the operation and maintenance information, using factory-trained service personnel as required for proper system operation.

C. Maintenance service must include preventive maintenance, repair or replacement of worn or defective components, required supply of chemicals, and inspecting/adjusting as required for proper system operation, as well as other specific service identified under this specification section. Specific maintenance tasks must also align with the manufacturer's recommended

checklists as required in Division 01 Section 017825 "Systems Manual and O&M Data." Provide completed maintenance records inclusive of scheduling to the USG for inclusion in the CMMS.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Provide on-site Wastewater Treatment Plant (WWTP), complete and ready for operation, in accordance with Construction Drawings and these Specifications. Include components and installation necessary to conform to system performance requirements.

1. **[Odor Control: Sludge digester, sludge holding tank, primary settling basin, and equalization basin require venting and odor control.]**
2. Basic MBBR and secondary clarification systems must be factory assembled as package units, including piping and controls, with limited separate components.

2.2 SYSTEM PERFORMANCE

A. Wastewater treatment plants must conform to minimum Class A standards.

B. Provide wastewater treatment plant based upon on-site Moving Bed Bio-Reactor (MBBR) process-based design, wastewater treatment plant must be completed in general conformance with the following:

1. System Reference Standards: “Recommended Standards for Wastewater Facilities,” (referred to as “10-States Standards”) The Wastewater Committee of the Great Lakes – Upper Mississippi River. These Standards are the source for baseline size and design requirements major components of the system unless more stringent requirements are indicated in these specifications.
2. Plant must include backup of critical systems as necessary for continuous and efficient plant operation, monitoring, and control.
3. Treatment Process:

   a. Minimum elements include lift station, primary treatment; aerated equalization basin with equalization flow pumps; aerated MBBR reactors with blowers sized for BOD removal rates and suspension of the media; secondary clarifier; UV disinfection; chlorination as required to provide a minimum of 1 mg/L chlorine residual in reclaimed water; and batch aerated sludge digesters performing in accordance with “10-State Standards” and EPA 503 requirements for Class B sludge.
   b. Vented /aerated liquid waste sludge holding tank sized for minimum of seven days of storage between truck removals of waste sludge.

4. System must be capable of treating raw domestic sewage to effluent water quality conditions identified in Table 3.4, “Basis of Design” for EFFLUENT WATER QUALITY System design must allow for Infiltration & Inflow (I&I) flows based on the following criteria: three gallons per hour for inflow contribution into each manhole, and infiltration

rate of 100 gallons per day, per inch diameter, per mile of pipe if ground water is at or below midpoint of sewer pipes

5. Equalization Basin: Volume of no less than 35 percent of the average daily flow volume and meet the minimum conditions listed in Table 3.4, "Basis of Design" for EQUALIZATION BASIN.
6. Influent Water Quality: Generally compatible with Domestic wastewater; see Table 3.4, "Basis of Design Table" for INFLUENT WATER QUALITY.
7. Effluent Water Quality: Conform to criteria as identified in Table 3.4, "Basis of Design" EFFLUENT WATER QUALITY.
8. Secondary clarifier must conform to Table 3.4, "Basis of Design" for DAF or for GRAVITY, as applicable to WWTP system design.
9. Tertiary filtration systems must ensure that effluent conforms to Table 3.4, "Basis of Design" under EFFLUENT WATER QUALITY for required Total Suspended Solids (TSS) limits.

C. Corrosion Protection:

1. Corrosion protection must conform to OBO Electrical Code Chapter 1 and OBO Building Code Appendix W.
2. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.
3. All submerged metal piping must be stainless steel.

2.3 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, those listed below. Not all components may be available from one single manufacturer; coordinated mixing of components from multiple manufacturers is acceptable for providing complete packages, as long as the total plant is integrated under one company complying with the qualification requirements in the Article on QUALITY ASSURANCE.

1. Headworks International
2. World Water Works
3. WSI International
4. Pollution Control Systems, (PSI) Inc.
5. EEC Global Operations LLC- Veolia
6. Evoqua Water Technologies
7. Aeromix
8. JET (subject to approvals of concrete tanks)

2.4 TANKS

A. System manufacturers must identify actual dimensions on Shop Drawings consistent with system description and performance requirements of this Section.

B. Tanks must be designed for worst conditions, including the following:

1. Allow one process train to be dewatered while one train is full of liquid and operational.
2. All trains may be full of liquid and operational.
3. Any one basin by itself or combination may be empty or full while being operational.

C. Anodes: Provide sacrificial magnesium anodes for buried tanks.

D. Primary Clarifier Basin, Equalization Basin, and Aerobic Sludge Digester Tanks: Cast-in-place or precast concrete, designed for complete or partial burial. Internal tank surfaces must be epoxy coated with two-coat system; minimum dry thickness of 2 mm (80 mils).

E. MBBR, Secondary Clarifier, and Other Process Tanks: Components that are exposed to elements and in unprotected environment must meet one of the following:

1. Steel Tanks:

a. Fabricate tanks of minimum 6.35 mm structural grade steel plate conforming to ASTM A-36.
b. Join steel sections by arc welding with fillets of adequate section for joint involved. Connections must conform to American Welding Society (AWS) D1.1 and must develop full strength of member.
c. Walls must be continuous and watertight and must be supported by structural reinforcing members.
d. Fabrication and installation must conform to “AISC Specification for Buildings.”
e. Fabricate reinforcing members with 1.83 meter maximum spacing, and with H-frame reinforcing on end walls and partition walls.
f. Tank interior and exterior surfaces must be prepared and coated to obtain smooth, clean, dry, and corrosion resistant surface. Remove rust, dust, and mill scale, and other deleterious matter from interior surfaces by means of near white sandblast, SSPC-SP10. Sandblast external surfaces in accordance with SSPC-SP6. Paint interior and exterior vessel surfaces with coats of coal tar epoxy; Basis of Design is Tnemec series 46H-413, 0.4 mm (16 mils) minimum total dry film thickness.

2. Stainless Steel Tanks:

a. Fabricate with structural grade stainless steel plates, minimum 10 gauge.
b. Join stainless steel sections by arc welding with fillets of adequate section inside and out for joints involved. Connection must conform to AWS D1.1 and must develop full strength of member.
c. Walls must be continuous and watertight and must be supported by structural reinforcing members.
d. Fabrication and erection must include exterior/interior beams and bars for anticipated loads and must conform to applicable requirements of "AISC Specification for Building."

3. Non-Metallic Tanks:

a. Tank must be fabricated from high-impact stress-relieved UV-Stabilized Euro-Grey Copolymer Polypropylene, PVC, or equivalent material accepted by Project Director/COR based upon input from OBO/PDCS/DE/CSE civil engineer.
b. Tank shell must be minimum 25 millimeter thick.
c. Butt welds must have 100 percent penetration using automated butt fusion equipment. Structural welding must be flat clean smooth extrusion welds; use nitrogen to minimize oxidation.

4. [Reinforced Concrete Tank: See Section 033000 "Cast-in-Place Concrete" for general requirements for concrete.

a. Epoxy coat with two-coat system (minimum dry thickness of 2 mm (80 mils).]

2.5 INLET BAR SCREEN, PRIMARY CLARIFIER, AND EQUALIZATION TANK

A. Inlet Bar Screen: Provide screen at influent port to remove unusually large solids from incoming raw sewage.

1. Fabricate screen from 15DN bars spaced 25 mm apart and arrange as indicated on Drawings.
2. Slope bars 30 to 60 degrees to permit easy cleaning of accumulating debris.
3. Furnish drying deck for drying debris.
4. Locate bar screen at headworks in incoming manhole upstream of flow measuring v-notch weir plate.
5. Size bar screen in accordance with conditions identified in Table 3.4, "Basis of Design" for EFFLUENT WATER QUALITY.

B. Primary Clarifier Chamber: Provide chamber to work in conjunction with equalization chamber. Size clarifier chamber in accordance with the requirements for Primary Clarifier in Table 3.4, "Basis of Design" for PRIMARY CLARIFIER

C. Equalization Chamber: Provide chamber in accordance with conditions identified in Table 3.4, "Basis of Design" for EQUALIZATION BASIN and the following:

1. Fabricate flow equalization chamber to allow for constant flow through plant by equalizing flow surges that may be incurred during peak flow
2. Provide duplex set of equalization pumps within chamber. Provide emergency overflow from MBBR aeration chamber to equalization tank. Provide liquid level sensors to regulate pumps, and place controls in plant control panel. Provide dual rails using Type 304 L stainless steel. Fabricate to facilitate pump replacement and maintenance without entry into tank.

2.6 MOVING BED BIO-REACTOR (MMBR) FABRICATION

A. MBBR system must be two-stage (series) system. Fabricate complete system with media, aeration system, media retention screens, piping, and other appurtenances and accessories as identified Drawings, or otherwise necessary for properly operating MBBR installation.

B. Tanks for this system must be fabricated in accordance with Article on TANKS.

C. Provide aeration chamber in accordance with Table 3.4, "Basis of Design" on MBBR PROCESS **[This process must work in conjunction with DAF- Based clarification process as described in Table 3.4, "Basis of Design" for DAF.]** Aeration process must conform to the following:

1. Provide biofilm carrier elements of material, size and geometry that will enable system to reliably conform to conditions and requirements identified in Table 3.4, "Basis of Design" for EFFLUENT WATER QUALITY.
2. Aeration chamber must be of sufficient capacity to provide required hydraulic retention time (HRT) based on the equalized average daily flow. Shape vessel on each side to prevent sludge accumulation and to allow carrier elements to freely move within the reactor.
3. Entire aeration system must provide adequate/full floor coverage to produce uniform distribution of air to each lateral, and to allow for 50 percent of design airflow without loss of equal distribution of air to each lateral. Each aeration grid must be comprised of central manifold of 304L SS schedule 10 thickness equipped with diffuser laterals of 304L SS Schedule 5 thickness.
4. To ensure maximum retention and to eliminate short circuiting of raw sewage particles, fabricate aeration chamber with centralized air diffusers placed longitudinally along one side of chamber; this enhances spiral rotation of chamber contents (in conjunction with flow control baffles). Ensure sufficient velocity of rotation to scour bottom and prevent sludge filleting and prevent escape to surface of minuscule air diffusion bubbles; this should facilitate entrapment of bubbles to provide maximum oxygenation efficiency.
5. Install air distribution manifold longitudinally on one side of tank, with connection to diffuser drop assemblies.
6. Equip each diffuser drop assembly with air regulating and shutoff valve, disconnecting union, and diffuser bar with non-clog air diffuser nozzles. Ensure sufficient air velocity for self-cleaning. Ensure oxygen transfer capacity of each diffuser so that adequate supply of oxygen is maintained in aeration chamber to conform to treatment requirements in Table 3.4, "Basis of Design" under EFFLUENT WATER QUALITY.
7. Install retention screens to retain carrier elements within each reactor. Maximum allowable headloss through sieve assemblies is 50 mm at peak hydraulic flow conditions. System supplier must furnish and install the required sieve assemblies.
8. System supplier must furnish and install all necessary supports, fasteners, and anchor bolts for aeration manifold and sieve assemblies. Submerged supports and connection hardware must be fabricated of stainless steel, Type 304 L.
9. Air supply blowers must have Variable Frequency Drives (VFDs). Rate of air supply must be automatically adjusted based on the continuous online Dissolved Oxygen (DO) monitor.

2.7 AERATED SLUDGE DIGESTER

A. Fabricate aerated sludge digester as integral part of wastewater treatment system out of 6.35 mm steel or stainless steel plate. Chamber must have same protective coating and structural requirements as specified for treatment plant.

B. Chamber must be of aerated type. Supply diffused air by plant blower system supplying a minimum of 0.5 L/(m^3.sec) of tank volume (or 30 cfm per 1000 ft^3 of digester volume). Locate diffusers parallel to and near bottom of tank. Factory install all piping and valves within chamber.

C. Provide sludge withdrawal piping and valves.

D. Provide adjustable submersible decant pump to transfer supernatant from sludge digester to primary clarifier.

E. Dry Well Fabrication: Fabricate dry well with hatches, vents, and ladders for safe access in accordance with the OBO Zoning Code.

2.8 SECONDARY CLARIFIER SYSTEM

A. Tanks for these systems must be fabricated in accordance with Article on TANKS.

1. [Gravity-Based Clarifier: Refer to parameters in Table 3.4, "Basis of Design" for SECONDARY CLARIFIER: GRAVITY TYPE.]

2. [Dissolved Air Flotation (DAF):

a. Refer to parameters in Table 3.4, "Basis of Design" for SECONDARY CLARIFIER: DAF TYPE.

b. Manufacturer: All components for DAF process must be provided by single manufacturer with minimum five years experience fabricating equipment using this process.

c. DAF system must recirculate effluent and dissolve atmospheric air into water to provide micro-bubble size distribution as necessary for proper system functioning.

d. Separated top solids must be removed by chain-and-flight system fabricated of polymeric chain and fiberglass or polypropylene flights.

e. DAF process must utilize optimum flow path to optimize separation efficiencies.

f. Provide pressure relief valve on discharge side of regenerative pump to ensure pump is not dead-ended.]

2.9 AIR SUPPLY BLOWER UNITS

A. Provide minimum of two blowers for supplying air requirement of equalization tank; one must be fully redundant. Provide blowers for secondary MBBR systems as indicated on Drawings.

B. Blower must be driven by motor using close coupled drive assembly.

C. Provide each blower and motor with weatherproof enclosure. Design hood for easy access to service and provide latching handle.

D. Fabricate adjustable motor mount such that "V" belt drive connection between blower and motor can be easily adjusted.

E. Fit blowers with dry type wire mesh filter-silencer at air intake. Fit blower discharge with check valve and flexible rubber discharge coupling.

F. Mount blower motor enclosures on vibration dampeners to reduce vibration and noise. Noise levels must not exceed 79 dBA at one meter from equipment. Mount pressure relief valve and pressure gauge in air manifold for purposes of determining blower performance and diffuser condition.

2.10 PUMPS

A. Pump Assemblies: Cast iron, submersible, centrifugal, non-clogging type with stainless steel shafts and stainless steel rail.

1. Pumps must be capable of handling raw sewage and passing 35 mm solid.
2. Pumps must be capable of continuous operation submerged or in dry condition without adverse effects due to heat generation.

B. Motor Housing and Volute: Cast iron in accordance with ASTM A-48, with appropriate coatings to protect pump from corrosive properties of material being pumped.

C. Provide O-ring sealing between motor unit and volute to prevent external leakage.

D. Pump Motor Cable: Heavy-duty type suitable for submersible pump applications and sized in accordance with NEC and IEEE specifications for pump motors. Provide cable supports of wire braid sleeve type with Appendix tails for connection beneath access hatch frame.

E. Fabricate to automatically and firmly connect to discharge connection, guided by two stainless steel guide bars extending from top of tank to bottom. There must be no need for personnel to enter tank for pump removal.

2.11 CARTRIDGE FILTER

A. Provide 316 cartridge filters with Stainless Steel or non-metallic corrosion resistant housing.

B. Provide 1 micron melt blown filter cartridges.

C. Provide inlet and outlet pressure gauges and isolation valves on each filter housing.

2.12 UV DISINFECTION

A. System Type: Furnish and install a complete low pressure high output or medium pressure lamp UV disinfection system.

B. Referenced Standards: U.S. EPA “Ultraviolet Disinfection Guidance Manual for the Final Long Term 2 Enhanced Surface Water Treatment Rule” (November 2006).

C. System Capacity: UV system must be able to deliver minimum dose of 40 mi/cm^2.

D. Maximum allowable head loss across UV reactor at peak design flow must be 30 mm.

E. System Description: System must include, but not be limited to disinfection chamber, UV lamps, system power, and system control equipment.

1. System must consist, at a minimum, of two closed conduit UV vessels (one duty and one standby), each rated for design flow. Provide inlet/outlet isolation valves and reducers with each vessel if necessary.
2. Each closed conduit vessel reactor must have UV chamber of type 316L stainless steel.
3. Equip chamber with drain valve and manual air release valve.
4. UV system must control power output to lamps between 50 and 100 percent, with adjustments at 1 percent increments based upon flow.

F. Housing: House electronics and controls in panel enclosure in accordance with Article on ELECTRICAL AND CONTROL REQUIREMENTS. Mount on stand near UV units.

G. Interconnecting cables between UV reactor and control cabinets must be furnished as part of UV system.

2.13 CHLORINATION

A. Chlorination equipment must utilize liquid hypochlorite. Chlorinator must have capacity to provide minimum chlorine residual concentration of 1 mg/L.

1. Solid chlorine tablets may be used instead where regionally availability. For use of chlorine tablets, Contractor must submit documentation demonstrating acceptable availability to Project Director/COR for approval.

2.14 [ODOR CONTROL

A. When required, the odor control system must meet the following criteria:

1. Vessel Design and Airflow Configuration: Radial or up-flow design type.
2. Media: Activated Carbon, synthetic Biofilter, or combination of Activated Carbon and Activated Alumina. Media must be designed specifically for hydrogen sulfide removal.
3. Typical system design is single combined odor control system with vent pipes on suction of blower as indicated on Drawings. If project-specific system design shown on Construction Drawings places these tanks to be far away, then individual smaller odor control systems must be provided.
4. Odor control system materials, including associated hardware, must be selected for capability to resist attack from hydrogen sulfide or other compounds typically found in domestic wastewater.

5. **The fan must be a centrifugal industrial fiberglass reinforced plastic (FRP) fan. All parts of the fan that are exposed to the airstream must be encapsulated in FRP with graphite impregnation to ensure corrosion resistance and spark proof operation.**
6. **Fans: Equip with Flanged outlet / inlet, PVC coupling drain, Teflon shaft seals, Safety belt guard, and V-belt drive.]**

2.15 ELECTRICAL AND CONTROL REQUIREMENTS

A. Electrical Requirements:

1. Provide NEMA 4X weatherproof enclosure for all electrical/control panels. Mount as indicated on Drawings. Exterior mounting hardware must be stainless steel.
2. Wiring:

   a. Analog Signal Wiring: Minimum 16 gauge twisted pairs with foil shield and drain wire, with 300-volt, 90 degrees C insulation.
   b. Drain Wiring: Grounded at one end only.
   c. Other Control Wiring: Stranded copper. Control wiring must be 2.5 mm^2 (#14 AWG), 600 volt.

3. Fiber Optic Cable: 6-strand 62.5/125-micron multi-mode, gel-filled suitable for outdoor service regardless of location installation. Provide patch panel in each control panel for terminating fiber optic cable.
4. Electrical Controls: Magnetic starters, timers, and switches necessary to automatically control electrical devices, motors, and blowers. Protect electrical equipment and circuitry with properly sized circuit breakers or fuses. Design duplex or standby equipment so that they may be operated by devices within control system. Refer to Division 26 Sections for general electrical requirements.
5. Provide all wire and conduit required between control panel and electrical power service. All wiring and conduits associated with packaged systems must be fabricated by system manufacturer at factory.
6. Motors:

   a. Totally Enclosed Fan Cooled) (TEFC), heavy duty, premium efficiency with 1.15 service factor, and rated for Class 1 Division 2 locations.
   b. [Conform to requirements of Division 22 Section "Common Motor Requirements for Plumbing Equipment."]

B. Main Control Panels and Instrumentation:

1. Process controls and instruments indicated on Drawings are minimum required. Provide additional devices as required by system manufacturers for operation and control of such systems.
2. Instruments must be loop powered from Main Control Panel (MCP) unless local power is provided to instruments from local panels.
3. Ethernet Cables (ET): CAT-6 Ethernet/IP cables.

4. Mount indicators adjacent to instruments, making certain they are readable from walkways and platforms. If instrument is below grade, mount indicator on rails or adjacent walls so they are located between 1.0-1.5 meters above floor.
5. Provide analyzers and instruments suspended in tanks with perforated PVC pipe supported to tank as stilling well.
6. Instruments, analyzers, floats, flow meters, and level sensors must be corrosion resistant, and be compatible with domestic wastewater.

2.16 SERVICE WALKWAYS AND STAIRWAYS

A. Provide service walkways and stairways for top of tanks and tank openings to service plant equipment. Grating panels must have maximum yield strength of 250 MPa. Support each panel to have uniform load carrying capacity of 390 kg per square meters.

B. Provide hand-railing system at tank openings and perimeter of tanks. Railing must consist of two rails supported by posts on spans not to exceed 2.4 m on center, with top rail 1.07m from walkway surface and middle rail to be 0.45 m below top rail. Railing must be secured with four-bolt stanchion connection to tank surface at each post.

C. Grating, walkways and railing must be Anodized Aluminum, Fiberglass Reinforced Plastic or Epoxy coated steel.

D. Base toe-plates of the same material as the handrail must be provided to prevent objects from falling into process tanks.

2.17 LABORATORY TESTING EQUIPMENT

A. Furnish laboratory equipment identified in Table 2.1, as indicated in Drawings, and as otherwise identified in this Section.

B. Furnish portable laboratory test kit to facilitate gathering data for proper operation of wastewater treatment system for testing identified in "The Standard Methods for the Examination of Water and Wastewater," a joint publication from American Public Health Association, American Water Works Association, and Water Environment Federation."

1. Include equipment such as bottles, graduated cylinders, and Imhoff settling flask. Furnish renewable standard solutions in easy-to-use, distinctly marked containers in sufficient quantity for six months of normal operation.
2. Furnish benchtop testing equipment identified in Table 2.1:

TABLE 2.1
BENCHTOP TESTING EQUIPMENT

EQUIPMENT	PARAMETERS	RANGE/ FEATURES
Turbidimeter	Turbidity	0-1000 NTU

TABLE 2.1
BENCHTOP TESTING EQUIPMENT

EQUIPMENT	PARAMETERS	RANGE/ FEATURES
Colorimeter	Metals, COD, Color, Hardness, TKN, Chloride	Varies
Dissolved Oxygen Meter	DO	0-60 mg/L
Multi-Parameter	Ph, ORP, Conductivity, TDS, Temperature	Field Hand Held
Jar Tester	Jar Test	4 Paddle, Variable Speed
Suspended Solids	TSS, Turbidity, Sludge Level	0-100 mg/L Hand Held
Sludge Settleability Test	Rate of Sludge Settlement	mL/min
BOD Incubator	BOD	Control Humidity and Temp.

2.18 SOURCE QUALITY CONTROL

A. Factory test MBBR unit as complete assembly prior to delivery to site.

B. [Factory test DAF unit as complete assembly prior to delivery to site.]

C. Manufacturer must test wiring and conduits associated with packaged systems at factory prior to delivery to site.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Locate and install foundation pads as indicated on approved shop drawings.

1. Set chamber for aerated sludge digester on same concrete foundation pad as wastewater treatment plant, and at location indicated on Drawings.

B. Install tanks, basins, and accessories in accordance with manufacturer's recommendations, as indicated on approved shop drawings.

1. Ensure all tank walls are continuous and watertight.
2. Bury tank anodes, and securely connect to tank walls with heavy copper wire. Install minimum of one 8 Kg anode for every 3 meters of tank perimeter length.

C. Mount and align air blower supply unit on common base frame. Reinforce base structure support blower and motor unit.

D. Field route sludge withdrawal piping and valves to sludge disposal point as indicated on Drawings.

E. Install all interconnection piping, electrical and control conduits and wiring between equipment and to Main Control Panel.

F. Where Dry Well pumps are indicated on Drawings for aerated sludge digester, install dry well with fabricated safety features to ensure safe access in accordance with OBO Zoning Code for confined space entry.

3.2 PLANT START-UP

A. At time that wastewater treatment system is filled with water or sewage, all power connections have been completed, and all equipment is accepted by Project Director/COR for service, manufacturer's field representative must provide service for 7 calendar days minimum at project site. Manufacturer's representative must check installation and start-up system (including settings controls and performing operational tests). Service manual must have been submitted and available on-site before beginning of start-up.

1. Manufacturer's qualified Field Representative must field test MBBR, after installation, in presence of OBO Project Team engineer, as coordinated by Project Director/COR, to confirm structural and mechanical compliance with Contract Documents.
2. **[Field test DAF system.]**
3. Develop and implement field start-up and testing plan. Include adequate procedures to demonstrate that system meets all performance criteria.

B. Manufacturer's field representative must start-up and test system, adjust and set controls, and provide specified training for minimum period of 30 days on site. This period includes minimum time for demonstration and training identified below, which must not be shortened to address start-up and testing.

C. [Test disinfection processes and facilities prior to producing and using reclaimed water. Tests must include all processes, equipment, and reactors used in production of reclaimed water.]

D. Test water quality to ensure compliance with the Design requirements.

E. Adjust and maintain chlorine dosage based on final effluent online chlorine residual analyzer.

3.3 DEMONSTRATION AND TRAINING

A. Demonstration: After completion of plant start-up, there must be a period of minimum 14-day demonstration phase. Ensure all systems have been functioning properly and adjustments made.

1. Demonstration phase days must be extended, if there are major issues which cannot be resolved in one day in relation to applicable design parameters for the project.

B. Training: Provide training to plant operators at post for operation, laboratory testing, data collection/ management and compliance reporting.

1. 5 days minimum training.

3.4 BASIS OF DESIGN

A. Use of Basis of Design Information: Table 3.4 identifies baseline Basis of Design values. The application of values for listed parameters in the Table must be adjusted for project-specific design as indicated below. In addition, application of certain parameters require adjustment for project-specific design (e.g., type of secondary clarifier, project-specific design for reclaimed water).

1. Invariable: Where application of parameters is identified as "Capacity," values are unaffected by variations in capacity from baseline.
2. Capacity: Baseline Basis of Design assumes plant with Design Average Flow (ADF) of 50 cubic meters per day, including associated hydraulic capacity and waste. Where application of parameters is identified as "Capacity," values for the project-specific system and sizing of system components must be adjusted relative to variation from baseline values included in Table 3.4.
3. Other Factors: A few parameters of site specific application; no baseline values are shown in Table 3.4.

B. References in the Specification Section to Table 3.4 are to be understood in relation to the Paragraph on "Use of Basis of Design Information" above.

TABLE 3.4
BASIS OF DESIGN

PARAMETER	UNIT	VALUE	APPLI-CATION
A: General – Site Specific Conditions			
Site Elevation Above Sea Level (for derating equipment)	Meter above Sea Level	Variable	Other Factors

END OF SECTION 333700

SECTION 335005 - UNDERGROUND FUEL STORAGE TANKS AND DISTRIBUTION

PART 1 - GENERAL

1.1 SUMMARY

A. Provide double wall fiberglass fuel storage tanks, piping, and vehicular fuel dispensing equipment for compound or portion of facility.

B. Related Sections include the following:

1. Section 230905 "Instrumentation and Controls for HVAC" for building automation system (BAS).
2. Section 263214 “Engine Generators.”
3. Section 335217 “Motor Vehicle Fuel Dispensing.”

1.2 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) Specification D4021: Glass Fiber Reinforced Polyester Underground Petroleum Storage Tanks.

B. Underwriters Laboratories, Inc. (UL) 971: Outline of Proposed Investigation for Non-metallic Underground Piping for Flammable Liquids.

C. Underwriters Laboratories, Inc. (UL) 1316: Glass Fiber Reinforced Plastic Tanks for the Underground Storage of Petroleum Products, Alcohols and Alcohol-Gasoline Mixtures.

D. National Fire Protection Association (NFPA) 30: Flammable and Combustible Liquids Code and NFPA 31: Standard for the Installation of Oil Burning Equipment.

E. 40 Code of Federal Regulations (CFR), United States Environmental Protection Agency (EPA), Parts 280, Technical Standards and Corrective Actions for Owners and Operators of Underground Storage Tanks.

1.3 SYSTEM REQUIREMENTS

A. Fuel tanks must conform to Chapter 13 of the OBO Mechanical Code (International Mechanical Code as amended by OBO).

B. Loading Capacity:

1. External Loads: Provide tanks designed for pressures from external loads, including soils at side and top of tanks in underground installation configuration.
2. External Hydrostatic Pressure: Empty tanks must be able to be buried at maximum depth in ground such that there is distance of 2.1 meters of backfill between top of tanks and

ground surface leveled to surrounding ground elevation. Tanks must be able to withstand, with tank safety factory of 5:1, against general buckling after being placed in tank hole where there is total flooding.

3. Surface Loads: Install tanks in accordance with tank manufacturer's loading installation instructions, and in such a way that tanks are able to withstand H_2O level surface loads of 14,500 kilograms kg per axle. Isolate turbine enclosures from direct traffic loading.
4. Internal Load: Both primary and secondary tanks in double wall fiberglass storage tanks must be able to withstand a pressurization test of up to 35 kPa of air pressure prior to installation and, once installed, a hydrostatic test with safety factor of 5:1.
5. Design tanks to support accessory equipment mounted through DN 100 NPT couplings on manway cover or shell wall, with maximum downward load of 1090 kg and 136 kg respectively when installed in accordance with tank manufacturer's recommendations and limitations.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Storage tank, protective coatings, level and leak monitoring and alarm system, tank gauges, overfill protection system, containment manhole, shutoff valves, submersible fuel oil pump, and fuel fill panels.

B. Shop Drawings: Submit shop drawings for the following:

1. Tank System: Include critical dimensions and show locations of fittings and accessories that are part of the double wall fiberglass storage tank and associated storage tank system.

   a. For each tank, include couplings, manholes, turbine enclosures, manways, anchor hold down straps, double wall piping from remote fueling point in secure compartment with locked access to final fuel delivery point, liquid level indicator, all sensors in system and control panels.

2. Fuel Panels: Include fuel fill panel installation detail showing front closed, front open, and back and side views of fill panels. Show all piping and conduit, junction boxes, electrical connections, and alarm panel.
3. Level and Leak Monitoring and Alarm System: Include wiring diagrams for connection of various tank sensors to system panel.

C. Calibration Charts: Include Manufacturer’s latest calibration charts for each tank capacity and diameter specified in Liters. Include copy of this information also in Storage Tank Management Plan.

D. Qualification Data: For manufacturer and installer.

E. Factory Quality Control Checklists:

1. Manufacturer submit must provide leak detection test checklist used at factory, as identified in the Part 2 Article on FACTORY QUALITY CONTROL, to Project Director/COR upon delivery of tanks at final delivery site.
2. Checklists associated with re-tests must also be submitted to Project Director/COR at same time.

F. Field Report: For start-up service recording inspections and results of tests.

G. Installation Instructions and Checklists: Include Manufacturer's installation instructions for underground fuel tanks, fuel system piping, and level and leak monitoring and alarm system. Include copy of this information also in Storage Tank Management Plan.

1. System supplier must submit comprehensive checklist of quality and safety items critical to system and certify that installation has been done in accordance with contract requirements and local applicable fire and environmental codes.

H. Maintenance Data: For tanks, include list showing recommended maintenance frequency for system components.

1. Provide spare parts lists required for each element of fuel system.

I. Storage Tank Management Plan (STMP): Include the following content and organization in plan:

1. Introductory Material:

a. Title page with title "Storage Tank Management Plan (STMP)," Post name for which plan applies, and month and year of accepted plan.
b. Table of Contents and List of Appendices. Include major and minor headings used throughout STMP.
c. Executive Summary that is appropriate for material contained in STMP. Include statement of purpose of STMP and review frequencies for update that should be followed.

2. Section 1 – Introduction:

a. Explain particular details about Post where storage tank systems are located, list of equipment that depends on storage tanks for dependable supply of fuel, and specific details about storage tank systems at Post.

3. Section 2 – Regulations:

a. Summarize regulations that govern installation and operation of Storage Tank. Include appropriate references to CFR Part 280 and local standards.
b. Outline specific record keeping requirements for proper operations and maintenance of storage tank system and recommend procedure for maintaining these files.
c. Include descriptive paragraph for each storage tank subsystem, including identification of regulations applying to each of those subsystems.

4. Section 3 – Responsibilities:

a. List by staff position those responsible for various aspects of record-keeping and operations and maintenance of storage tank system.
b. Include Table with points of contact and associated contact information.

5. Section 4 – Underground Fuel Storage Tank Systems:

a. Identify specific conditions or requirements by local ordinances or permits for these tanks.
b. Maintain historical record of all closed tanks.
c. List all existing tanks with location, use, date of installation, capacity, and similar information.
d. Specify forms to be used for record keeping activities associated with operations and maintenance of tanks.
e. Specify standard operating procedures for various operations associated with tank systems.
f. Specify maintenance requirements of tank.

6. Section 5 – Spill Prevention, Control, and Countermeasure Plan (SPCC):

a. Identify oil discharge risks, spill prevention measures, and contingency plans. Model after guidance of 40 CFR 112.7, paragraphs (a) through (d), which sets out various prevention and control measures that Plan should address. Plan must be prepared and signed by professional engineer familiar with fuel system and associated regulatory standards.

7. Section 6 – Appendices:

a. Acronyms and abbreviations used in STMP.
b. Installation checklists and warranty information.
c. Tank chart for each tank.
d. Product literature associated with various components of system. Specific parts used must be highlighted or noted to readily identify installed parts.
e. Copies of all applicable permits. If there are no required permits, a page must be inserted that contains wording that indicates this condition.
f. List of qualified contractors who can repair various aspects of tank system. Identify which portion of system each contactor can perform, and appropriate contact information.
g. Certifications of Leak Detection Evaluations for various aspects of system, and test used to determine whether tank system is tight. Refer to www.epa.gov/oust/pubs/ldlist.htm.
h. List of monitoring wells associated with present and past tank systems and identifying their current status. Include unique labels for each well, and specific location identifier. This requirement only applies if monitoring wells have been used.
i. Copy of EPA's publication, "Operating and Maintaining Underground Storage Tank System," EPA 510-B-00-008.

1.5 QUALITY ASSURANCE

A. Basis of Design: This Section identifies "Basis of Design" for various equipment and components. Other products from the identified manufacturer or other manufacturers are acceptable which conform to requirements of this Section.

B. Comply with the OBO Electrical Code (NFPA 70, "National Electrical Code" as amended by OBO).

C. Listing and Labeling: Provide voltage regulators specified in this Section that are listed and labeled. Listed and Labeled in accordance with Chapter 1 of the OBO Electrical Code by testing agency acceptable to Project Director/COR based upon input from OBO/PDCS/DE engineer, and marked for intended use.

1. Fuel Storage Tanks:

a. Certification Plates: Affix UL Labels for petroleum products affixed to each tank.
b. All monitoring equipment, including reservoirs and electronic controls, must be UL Listed.
c. Provide tank manways with UL Listed gaskets, bolts, and cover.
d. Tank Laminate: UL Listed for compatibility with monitoring fluid.
e. Containment Collar Sensor: Electrical components must be U. L. listed or accepted.
f. Flexible Connectors: Provide UL Listed flexible connectors at equipment.

D. Manufacturer Qualifications: Manufacturers must have produced similar systems for at least the past ten years.

E. Installer Qualifications: Installers who have been trained and certified by manufacturer for installation of systems required for this project.

1.6 DELIVERY AND HANDLING

A. Conform to instructions of storage tank manufacturer's installation manual regarding movement and temporary placement of storage tanks from point of distribution to point of installation. Tanks must only be moved using all manufactured lug lifts with guidelines that are correctly angled with respect to tank surface in accordance with manufacturer's instructions. Do not lift or hoist underground storage tanks while under pressure. Do not move tanks with chains or cables around tank, and do not be roll or drop. Protect tanks from damage in transit.

1.7 WARRANTY

A. General: Manufacturer's standard form in which manufacturer agrees to repair or replace components which fail in materials or workmanship within specified warranty period.

B. Fuel Storage Tanks:

1. Provide written warranty executed by tank manufacturer.

2. Warrant tanks, secondary containment collar, and integrally mounted monitoring reservoirs against failure due to internal/external corrosion and against structural failure.

   a. Warranty Period: 30 years from Substantial Completion.

C. Fuel Piping and Related Equipment:

1. Provide written warranty executed by manufacturer of fuel piping and related equipment. Warrant piping and related equipment against failure, including cracking, break-up, collapse, and leakage.

   a. Warranty Period: 30 years from Substantial Completion.

1.8 MAINTENANCE SERVICE

A. Commencing at the contract's Substantial Completion date for a period of one calendar year with a renewable option for an additional year, provide proposal for system maintenance service based on manufacturer's recommended daily, weekly, quarterly, semi-annual, and annual maintenance activities. The proposal must be submitted to the COR/Project Director at least 120 days prior to Substantial Completion.

B. The proposal must be inclusive of filtration, underground storage tanks, submersible and recirculation pumps, transition pumps, and control panels using factory-trained personnel.

PART 2 - PRODUCTS

2.1 DOUBLE WALL FIBERGLASS STORAGE TANKS

A. Basis of Design: Containment Solutions, Inc.; Xerxes Corporation.

B. Provide UL 1316 labeled tanks, including openings for manual stick gauging, fill pipe leading to remote fill port, vapor return pipes, tank vent pipe, fuel oil/gasoline suction pipes, fuel oil return pipes, gasoline vapor return pipes, and applicable fuel oil/gasoline gauge tubing. Locate strike plates at bottom of tanks under each opening provided at top of tank.

C. Product Storage Requirements:

1. Vent all primary tanks. Design tanks for operation at atmospheric pressure only, except for use with vapor recovery systems, at pressure or vacuum of approximately 6.9 kPa.
2. Tanks must be capable of storing liquids with specific gravity up to 1.1.
3. Maximum temperature: Tanks must be capable of storing gasoline, alcohol blended gasoline (with up to 100 percent methanol or ethanol), oxygenated fuels (up to 20 percent MTBE), AV-gas, jet fuel, motor oil, kerosene, or diesel fuel at ambient underground temperatures not to exceed 65 deg C at the tank's interior surface.
4. Tanks must be chemically inert to all petroleum products.

D. Monitoring Capabilities:

1. Tanks must have space between primary and secondary shell walls to allow for free flow and containment of all leaked products from primary tank.
2. The following continuous monitoring condition must be compatible with cavity between inner and outer tanks:

   a. Vented to atmosphere.
   b. Vacuum: - 34.5 kPa.
   c. Positive air pressure: 34.5 kPa maximum.
   d. External Hydrostatic Pressure: 2.1 m maximum groundwater head pressure over tank top.

3. Provide tanks having 1.83 m and larger diameter with integrally mounted reservoir installed on tank for factory installed, continuous hydrostatic monitoring. Construct reservoir of fiberglass reinforced plastic (FRP) materials. Tanks having 1.22 m diameter must use 0.1016 m diameter riser pipe screwed into 0.1016 m annular space fitting as reservoir.
4. Design tanks with access to tank bottom between primary and secondary tank walls through DN100 NPT rib-mounted fitting, or through reservoir if reservoir is mounted at end of tank. All tanks, except for 1.22 m diameter tanks, must include one DN50 NPT fitting in secondary tank only for in-plant test purposes.
5. Double wall tank monitor must be capable of detecting breach in inner or outer tank wall under the following installed conditions:

   a. When inner tank is empty.
   b. When inner tank is partially, or completely full, and groundwater table is below tank bottom.
   c. When inner tank is partially or completely full and tank is partially or completely submerged in groundwater.

6. Leak detection features of monitoring system must be capable of detecting leaks in primary or secondary tank as small as 0.38 liters per hour with 99.9 percent probability of detection and with less than 1.3 percent probability of false alarm.

2.2 TANK ACCESSORIES

A. Flanged Manways:

1. Each manway must be 550 mm inner diameter. Provide manway with each tank. Locate manways in accordance with recommendations of tank manufacturer.

B. Sounding Rod: Provide wooden gauging rod with plastic tip, graduated at 0.25 cm intervals. Use this gauging rod in conjunction with manufacturer-supplied tank chart for calculating number of liters of petroleum product in tank.

C. Hydrostatic Monitor Accessories:

1. Brine Antifreeze Solution: Factory install, with the following characteristics:

   a. Brine Solution: BAS-30 designation
   b. Chemical Composition: 30 percent or more calcium chloride, 1 percent to 3 percent potassium chloride, and 1 to 2 percent sodium chloride. Balance of solution must be water.
   c. Visual appearance: Green in color, odorless fluid.
   d. Specific gravity: 1.272-1.317 at 15.6 deg C.
   e. Color: Color of brine solution must be in sharp contrast to tank color to facilitate easy visual checking for tank damage.

D. Turbine Enclosure:

1. Watertight turbine enclosure must consist of fiberglass reinforced plastic (FRP) enclosure body and FRP reducer with o-ring groove and o-ring gasket. Reducer opening must be large enough (minimum of 711 mm diameter) to allow for removal of a 559 mm diameter manway lid. Turbine enclosure must be minimum of DN1050, and maximum of DN1200, and must be capable of mounting to DN1050 secondary containment collar. Enclosure body must be capable of joining to 1067 mm or 1219 mm diameter secondary containment collar with leak-tight adhesive joint. Reducer must be capable of joining to enclosure body with external leak-tight adhesive joint to allow for field installation of adhesive without entering enclosure.
2. Turbine enclosures must be of variable length to correspond to required burial depth for tanks. Mark cut lines for field trimming on top 300 mm of turbine enclosure in 75 mm intervals.
3. Construct turbine enclosure lid of high-density polyethylene or other non-corrosive product, with top diameter to match turbine enclosure. Turbine enclosure lid outer diameter must be small enough to be removed through 914 mm diameter street box. With lid installed, assembly must provide watertight seal under standing water up to 305 mm over lid.
4. Turbine enclosure lid must include friction-fit lid constructed of high-density polyethylene or other non-corrosive product, with outside diameter of DN675. Lid must be able to support person standing on lid without damage to lid. One of lid handles must be offset to aid in removal of lid; the other must be centered on lid.
5. Manhole frame and cover over turbine enclosure lid must be composite, H-20 rated type, sized DN900 or larger. Rain tight lids must be provided with factory gasket and bolts or cams locks. Use stainless steel hex head bolts or cam locks to secure manhole cover for limited access. Provide two sets of tools to be used with lid or two wrenches for each type of cover to Project Director/COR. Top seal caps on all tank opening within manholes must be lockable.
6. Turbine Enclosure Adhesive Kit: Kit must be manufacturer's standard with quantities as recommended by manufacturer.

E. Flexible Entry Boots for Conduit:

1. Flexible entry boots must be UL listed for this application.
2. Fit containment chambers with conduit entry seals that are flexible and semi-absorbent to ground movement.

3. No metallic components must be exposed to ground.
4. Materials of flexible boot assembly must be chemically compatible with and resistant to materials and liquids encountered.

F. Secondary Containment Collar: Secondary containment collar must be fiberglass reinforced plastic. Collar must be DN1050 and factory installed. Collar must include sensor-mounting bracket.

G. Containment Collar Sensor: Pre-assemble containment collar sensor, ready to wire. This float switch sensor must be capable of detecting a 13 mm or more accumulation of liquid (water or product) in turbine enclosure. Construct float switch of Buna-N. House the float switch in plastic casing and include mounting clamp.

H. Ladders: Standard ladders supplied by tank manufacturer.

I. Overfill Protection System for Gravity Fill Systems:

1. Basis of Design: EBW Auto Limiter II series with EBW Remote Fill Kit.
2. Provide automatic shut off valve designed to be installed at tank. Assume that 150 L of fuel will be in line at any time and will need to be accounted for during remote shutoff procedure. Valve must reduce flow into tank by 90 percent at first stage which varies from approximately 85 percent (for tank size of 3,785 L) to 92 percent (for tank size of 37,850 L and larger) of tank capacity; reduction must be field adjustable. Second stage must vary from approximately 87 percent (for tank size of 3,785 L) to 94 percent (for tank size of 37,850 L and larger) of tank capacity. Once the second stage is reached, completely shut off the flow.
3. Construct valve body of cast aluminum, and internal guide rod of stainless steel.
4. Valve must allow manual stick gauging of storage tank after valve has reached complete shut off.
5. Provide remote fill kit for use with automatic shut off valve.

J. Overfill Protection System for Pumped Fill Systems:

1. Basis of Design: Morrison Bros. Co. 9095AA0300 AV
2. Aluminum body valve that closes when fuel level reaches a preset warning level, with built in bleed hole for pressure relief when valve closes and anti-siphon protection.
3. Aluminum drop tube compatible with valve

K. Tank Lifting Lugs: Provide lifting lugs on all tanks. Lugs must be capable of withstanding weight of tanks with a safety factor of 3.

L. Fittings Threaded – NPT:

1. Threaded fittings on UL Listed tanks for storage of petroleum products must be located in manway lid on tank, mounted within 300 mm of tank top centerline, and constructed consistent with requirements of the UL Listing. Provide fittings with threaded cast iron plugs.
2. Threaded fittings to primary tank cavity must be DN100 or DN150. Standard threaded fittings must be half couplings. Use reducers for smaller sizes.

3. Thread Standards: Threaded fittings must have machine tolerances in accordance with ANSI Standards for each fitting.
4. Strength: NPT fittings must withstand minimum of 204 Newton-meters of torque and
5. 1357 Newton-meters of bending, both with a 2:1 factor of safety.
6. Terminate rigid vertical piping 102 mm from bottom of primary tank.

M. Anchor Hold Down Straps:

1. Provide FRP anchor hold down straps and turnbuckle clamps for each tank. Number and location of straps must be as required by tank manufacturer. Each strap must be capable of withstanding buoyancy load for tank diameter as indicated on Drawings:

   a. 1.22 m diameter (1,905 kg).
   b. 1.83 m diameter (8,165 kg).
   c. 2.44 m diameter (11,340 kg).

2. Straps must be standard as supplied by tank manufacturer.
3. NOTE: Include the following for projects without remote filling.

N. [Containment Fill Manhole:

1. Manhole frame and cover lid must be composite, H-20 rated type, sized DN300 or larger. Rain tight lids must be provided with factory gasket and bolts or cams locks. Use stainless steel hex head bolts or cam locks to secure manhole cover for limited access. Provide two sets of tools to be used with lid or two wrenches for each type of cover to Project Director/COR. Interior of manhole must have one-piece HDPE bellows liner attaching to top and bottom of manhole. Manhole must have one piece fiberglass base with DN100 bottom connection for vapor recovery use or product fill use. Fill manholes must contain spring-pull drain assembly for emptying manhole basin of spilled fuel.
2. Basis of Design: Emco Wheaton A1003-001 with drain for fill lines and A1003-002 without drain for vapor return lines.]

O. Tank Monitoring Manholes:

1. Manhole frame and cover lid must be composite, H-20 rated type, sized DN300 or larger. Rain tight lids must be provided with factory gasket and bolts or cams locks. Use stainless steel hex head bolts or cam locks to secure manhole cover for limited access. Provide two sets of tools to be used with lid or two wrenches for each type of cover to Project Director/COR.

P. Fill Caps: Bottom opening must have self-aligning, toggle-action design for easy coupling fill caps. Caps must be lockable, cam-and-groove type caps made of aluminum or FRP material with Buna-N seals. Toggle pins and cams on caps must be stainless steel, and links must be plated steel. Vapor recovery line caps must have impregnated orange color for identification.

1. Basis of Design: Emco Wheaton A97 for tight fill product caps and A99 for vapor adapter caps.

2.3 PIPING

A. General: Underground fill pipe, tank vent pipe, vapor return pipe, fuel oil supply pipe, and fuel oil return pipe must be durable wall fiberglass piping or semi-rigid double-contained pipe.

1. Piping components must be UL 972 for use as underground containment piping for gasoline, alcohol blended gasoline (with up to 100 percent methanol or ethanol), oxygenated fuels (up to 20 percent MTBE), AV-gas, jet fuel, motor oil, kerosene, or diesel fuel products.
2. Piping must be rated by UL to pressure of 690 kPa at 66 deg C.
3. Fittings and accessories must be provided by manufacturer and rated to the greater of 344 kPa or 1.25 times the working pressure.

B. Double Wall Fiberglass Piping

1. Materials:

a. Basis of Design: FRP epoxy made by filament winding system by Smith Fiberglass Products, Inc.
b. Fittings must be FRP epoxy made by compression molding process. Fittings must be two-piece construction that will be bonded together at final assembly. Fasteners may be used to assemble fitting pieces until adhesive cures. Integrity of fiberglass system must not rely on metallic components once adhesive is cured.
c. Adhesive must be epoxy system that will develop adequate strength at 18 deg C to meet all strength requirements. Below 18 deg C, make available means of heat-assisted adhesive curing.
d. Provide containment fittings with 20 mm NPT outlets in bottom, rated for 68.9 kPa for pressure testing of containment system and draining secondary system.

C. Semi-Rigid, Double-Contained Pipe

1. Materials:

a. Basis of Design: UPP Pipe manufactured by PetroTechnik.
b. Coaxial semi-rigid high-density polyethylene with nylon permeation barrier.
c. Fittings must be manufacturer's secondary containment and entry fittings. Pipe connections and entry fittings must be fusion welded using manufacturer's electro fusion welder.
d. Provide fusion welded secondary containment fittings with test ports for pressure testing of containment system and drainage secondary system.

D. Schedule 40, Steel Piping:

1. Above ground fuel oil suction, return piping, vent piping and all piping in tanks must be Schedule 40 (USA) seamless black steel, with butt welded joints for piping DN40 and larger, and socket weld joints for piping DN32 or smaller. Fuel oil suction and return piping must not be smaller than DN20, but may be reduced to size of tapping in apparatus as close as possible to apparatus. Return piping must be same size as fuel oil suction piping unless otherwise required by manufacturer. Provide separate suction line from fuel oil

storage tank to generator day tank for each generator day tank with integral pump. For "prime power" single generator installations, provide dual suction lines connected together inside Equipment Room with separate gate valve and check valve in each suction line.

a. Provide piping entering building with dielectric unions to prevent transmission of field current to building piping.

E. Coupling Kits: Provide by fuel pipe manufacturer for joining piping.

F. Flexible Connectors at Equipment: Provide UL 536 and NFPA 30 and 30A approved 321A, stainless steel flexible connectors with 0.38 mm thick wall and carbon steel Schedule 80 male hex NPT or EZ Fit/Quick-Connect ends on fuel supply piping at connection to equipment. Pressure requirement is 344.5 kPa in accordance with UL. Seals must be MH25059 listed, specially engineered polymer to withstand aromatic petroleum products, alcohols, and alcohol-gasoline mixtures.

G. Sumps: Sumps must be watertight and accessible, constructed of polyethylene or fiberglass. Use grade level sumps for transition into and out of ground for piping. Provide sump top, lid, gasket-seal joints, and sump entry boots for pipe penetrations. All below grade entries must be made with fusion fittings or fiberglass entry fittings. Each sump must be provided with an inspection port that allows inspection of the leak sensor as well as water/fuel removal.

2.4 LIQUID LEVEL AND LEAK MONITORING

A. Basis of Design: The following components from Pneumercator Company:

1. Electronic Fuel System Control Panel: Model TMS4000.
2. Tank Level Sensor/Transmitter: Model MP450S.
3. Tank Leak Sensor: Model RSU 800.
4. Turbine Enclosure Leak Sensor: Model LS 600 LDBN or ES835-200F with sensor fault detection.
5. Remote Alarm Panel: Model RA200KRM or RA400 for diesel and RA 300KRM explosion proof for gasoline.

B. General:

1. Provide multi-tank liquid level and leak monitoring system, capable of monitoring tank levels, tank leaks, and sump leaks. System must consist of the following:

a. Electronic control panel.
b. Tank liquid level transmitter assembly for each tank.
c. Tank leak sensor for each tank capable of detecting break in inner and outer tank.
d. Turbine enclosure leak sensors for each tank turbine enclosure capable of detecting leak in enclosure.
e. Sump leak sensors capable of detecting fuel and water in sumps.

2. Principle of tank liquid level measurement must be by Direct Lift Magnetic Float with Manetores Resistance Transmitter.

3. Provide all wiring, including wiring from power source to control panel, and from control panel to probe assemblies and remote alarm console.
4. Provide remote alarm panel with locked access to inform truck operators when each tank approaches full level.

C. Electronic Fuel System Control Panel:

1. Provide controls and display for multiple tanks in single NEMA enclosure suitable for wall mounting. Use NEMA 12 for indoor applications and NEMA 4X for outdoor applications.
2. Provide front face of the panel with:

   a. Color Touchscreen display showing each tank's liquid level in liters.
   b. Normal/Alarm LEDs visible from at least 20 meters.
   c. Indicating lights for each tank's high, low and critical tank level alarms.
   d. Indicating lights for each leak sensor of each tank, tank turbine enclosure, and sumps.
   e. Horn and horn reset button.
   f. Touch keypads must facilitate selection of tank, and for each tank keypads must facilitate selection of testing, adjusting calibration, setting alarm limit, and operating in each mode.
   g. Provide offset adjustment for easy field correction of level sensor installation height error.
   h. Control panel must use a microprocessor-based controller and be user programmable to specific tank configurations encountered.
   i. Control resolution must be within 3 mm of liquid level in each tank.
   j. Provide Modbus protocol for remote interface to Building Automation System (BAS). Refer to Drawings for interface schematic.
   k. Leak and level transmitter installation must be intrinsically safe.

D. Tank Level Transmitter Assembly:

1. Each tank assembly must contain resistive sensor/transmitter element bonded to 10 percent glass-filled polycarbonate track, and hermetically sealed within stainless steel vertical tube suspended into tank through a DN100 opening. Provide magnetic float guided along tube that continuously senses liquid level position to 3 mm accuracy, unaffected by conductivity, temperature, pressure, specific gravity, or other liquid variables.
2. Provide float for water detection that rests at bottom of tube to detect water in range of 25 to 75 mm off tank bottom.
3. Wiring to electronic control panel must be 5 conductor and made through DN25 opening in explosion proof housing provided integral to top of tank assembly.

E. Tank Leak Sensor:

1. Sensor must consist of single float assembly capable of detecting breaks in inner or outer tank under all conditions. Single float and its stem must be of non-corroding PVC to withstand reservoir brine solution, and shielded by PVC outer cylinder which rests on reservoir.

2. Wiring to electronic control panel must be 2 conductor and terminated at leak sensor using watertight connections.
3. Leak sensor must actuate when brine solution in reservoir either falls below 50 mm, or rises above 280 mm.

F. Turbine Enclosure and Sump Leak Sensors:

1. Each leak sensor must be simple, mechanical float switch input to electronic control panel, consisting of magnetic, Buna-N float encased within stainless steel outer shroud, and terminated with 2 conductor wire.
2. Leak sensor must actuate above 13 mm of liquid along probe.

G. Remote Alarm Panel:

1. Alarm Panel must consist of solid-state electronic circuitry housed in wall mountable, weatherproof NEMA 4 enclosure for receiving signals from electronic control panel on overfill tank level and leak status.
2. Panel must include alarm horn, red alarm status lights, reset button to silence horn and test button to demonstrate working condition.

2.5 FUEL OIL SHUT-OFF VALVES

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Crane
2. Nibco
3. Jenkins

B. Provide hand-operated valves at fuel oil pump discharge and check valves at suction side so that fuel oil may be shut off and fuel oil pump removed. These valves are in addition to automatic valves.

C. Provide butterfly tank isolation valve in aboveground section of remote fill pipe just inside perimeter wall.

D. Where multiple supply tanks are providing fuel to single destination, provide automatic valve on each return line controlled by pump control panel, configured to be normally closed. Return valve on selected supply tank must open upon call for fuel from that tank, assuring that any return/overflow fuel returns to its originating tank.

2.6 SUBMERSIBLE FUEL PUMPS

A. Basis of Design: Red Jacket Standard Series; Franklin Fueling FE Petro.

B. General: Submersible pumps for handling low viscosity, volatile solvents from underground storage tanks which require explosion-proof pumping equipment.

C. Description:

1. Pump must be of submersible centrifugal type which installs through standard 100 or 150 mm threaded tank opening. Size must vary, depending upon required flow rates and head loss of given piping system. See equipment schedule on Drawings for additional characteristics.

D. Mechanical Features:

1. Pump:

a. Pump must be two, three or five stages, depending upon required flow rate, and must be self-lubricating and easily removed from storage tank without disconnecting discharge piping.
b. Pump and motor assembly must be readily separable from pump column pipe to allow for simple field replacement of pump and motor.

2. Impellers and Diffusers:

a. Impellers must be either splined or keyed to pump shaft to provide positive, non-slip rotation.
b. Diffusers must be tightly secured to lower motor bearing housing to prevent rotation.

3. Pump Intake Inlet:

a. Pump intake inlet must be horizontal to prevent drawing sediment from tank bottom into pump inlet.

4. Manifold Head Assembly:

a. Manifold assembly must be completely sealed against product leakage into ground and exterior water leakage into storage tank.
b. Discharge outlet must be standard DN50 on models that install through DN100 tank openings, and DN75 on models which install through DN150 openings.
c. Head must have built-in air eliminator, line check valve, pressure relief valve and must contain built-in siphon primer when required.

5. The Siphon System:

a. Capable of drawing 625 mm of mercury vacuum through venturi. Siphon must incorporate siphon check valve to maintain siphon action after pump has been turned off.

E. Electrical Features:

1. 100 mm size: Motor must be single phase, permanent split phase capacitance type, continuous duty, rated explosion-proof in Class 1, Group D, flammable solvents. Hermetically seal motor windings against leakage of product or moisture and provide

thermal overload device with automatic reset built into motor windings for motor cut-off when motor temperature reaches level which may cause damage to motor.

2. 150 mm size: Motors must be single or 3 phase. Single-phase motors must be capacitor run. All horsepower motors must be explosion-proof rated for use in Class 1, Group D, flammable solvents. Hermetically seal motor windings to protect against leakage of product or moisture into motor and provide thermal overload device with automatic reset built into motor for cut-off when motor temperature reached level that may cause motor damage. Single-phase models must be supplied with motor control box that provides proper capacitors, relays and overload protection.
3. Connections:

    a. Motor must have quick-disconnect type male/female connector, readily separable for servicing without cutting or splicing of conducting wires.
    b. Wiring connections to motor, including capacitor, must be disconnected by quick-disconnect. Reconnecting motor to column pipe must use alignment dowel pin for positive realignment of electrical male/female connector.

F. Construction:

1. Accessibility:

    a. Components must be designed and assembled to facilitate disassembly and servicing from above without disrupting discharge piping.

2. Assembly Order:

    a. Assemble pump with pump inlet and impellers at bottom for maximum liquid draw. Mount motor above pump inlet so that motor is both cooled and lubricated by liquid flow past motor.

3. Construction for Pumps with l00 mm Tank Opening:

    a. Packer/Manifold Head: Cast Iron.
    b. “O-Ring” Elastomers: Buna-N.
    c. Diaphragms: Viton.
    d. Check Valve Seat: Aluminum.
    e. Column Pipe: Steel Pipe.
    f. Conduit Pipe: Aluminum.
    g. Discharge Head: Cast Iron.
    h. Pump Motor:

        1) Outer Shell: Aluminum.
        2) Stator: Stainless Steel.
        3) Rotorshaft: Stainless Steel.
        4) Impellers and Diffusers: Celcon Acetal copolymer.
        5) Motor Bearings: Carbon.

4. Construction for Pumps with150 mm Tank Opening:

a. Packer Head: Cast Aluminum.
b. Manifold: Cast Iron.
c. "O-Ring" Elastomers: Buna-N or Viton.
d. Column Pipe: Steel.
e. Conduit Pipe: Steel.
f. Discharge Head: Cast Iron.
g. Pump Motor:

1) Outer Shell: Stainless Steel.
2) Impellers: Cast Aluminum
3) Diffusers: Celcon Acetal copolymer or cast iron.
4) Motor Bearings: Carbon.

G. Performance: Actual flow rates must be within 5 percent of published performance curves for each pump model.

H. Provide manufacturer's standard control box for model and pump size selected when pump is not powered by fuel controller.

2.7 SUBMERSIBLE PUMP DUPLEX CONTROLLERS

A. Basis of Design: Simplex, Inc.; Phillips.

B. General: Provide PLC-based duplex pump controllers. Controller must receive level signals via 4-20 mA signals for leak and level monitoring panel. Utilizing these signals, the controller (when receiving call for fuel from day tanks, dead-man switch for fire pump tank, or boilers) must:

1. Open inlet solenoid valve on device calling for fuel.
2. Open return line automatic valve on tank selected.
3. Activate lead submersible pump on main tank selected.

C. Control Panel Construction:

1. NEMA 1 or 3R rated wall-mounted box of 1.90 mm (14 gauge) steel with hinged access doors, and conduit entry areas as needed with terminal strips for connection to remote day tank level controllers.
2. Duplex pup controller for activation by level controller on remote day tank.
3. Fully labeled switches and indicator lamps or Touchscreen detailing system status and operating mode.
4. Provide dry alarm contacts and Modbus protocol for remote annunciation and building maintenance interface.
5. Pump motor starter, full voltage type, non-reversing, with overload relay and circuit breaker.
6. Power available indicator.
7. Pump running indicators.
8. Pump failure indicators.
9. Audible alarm horn with silence push-button.
10. Alarm reset push button.

11. Running time meter, each pump.
12. Control power transformer if voltage is other than 115 VAC, 1 phase, 60 Hz.
13. Power inlet to control cabinet must be interlocked to door-mounted main disconnect switch, which is mechanically interlocked such that power must be disconnected prior to opening enclosure.
14. Provide system with isolation-type control power transformer with fused primary. Subdivide control power circuits into discrete fused branches such that critical circuits are isolated among each other and from non-critical circuits.
15. Provide one flow switch on outlet of each submersible pump or each pair of duplex submersible pumps. Use switches to sense for proper pump operation by control system. Switches must be bronze construction, shuttle/reed switch type, 2756 kPa rated.

D. Function – General:

1. Pump controller must automatically select lead and lag pump on each underground storage tank based upon run-time log to allow equal run time for each pump. Upon requirement for fuel, "lead" pump must be energized. If "lead" pump failure occurs, failure alarm must be sent to Building Automation System (BAS) through level/leak detection controller and "lag" pump must be energized; see Section 230905 "Instrumentation and Control for HVAC" for BAS. If "lag" pump failure occurs, failure alarm must be sent to BAS through level/leak detection controller. When demand for fuel is satisfied, pump controller must de-energize operating pump. Status condition for each pump must be relayed to BAS through level/leak detection controller. Status categories must include Pump Auto (available for operation), Pump Running, and Pump Failure
2. If fuel level in underground fuel oil storage tank falls below low-low level (LLL), pump controller must terminate pumping and send alarm signal to BAS. When fuel level in fuel oil storage tank has risen above reserve level, system must switch back to "lead" storage tank.
3. If there are multiple supply tanks for main system, pump controller must control pumps on each, and equalize run time where feasible. If first main has low fuel level, pump controller must select next main tank with sufficient level.
4. Pump controller must receive leak and level signals from all main tanks and all day tanks.

E. Function for Dedicated Pumps for PCC Generator Day Tank:

1. PCC generator day tank must have dedicated stand-along pump controller that operates dedicated PCC fuel pumps. Mount at one of underground fuel storage tanks. This underground fuel oil tank must have low-low level indicator set at fuel reserve required for PCC for non-PCC fuel controllers.
2. Pump controller must operate in accordance with general function requirements above, except that this Pump Controller must not report to BAS.

2.8 [WALL-MOUNT REMOTE FUEL FILL PANELS

A. Basis of Design:

1. Fuel Fill Panels: Fairfield Industries, Model RFP-24 with one or two ports.

2. ISP Automation, Inc., Model WFB-SS1.

B. Pre-Fabricated Metal Panel:

1. Lockable access door.
2. Remote alarm panel signaling device.
3. Liquid tight conduit thru rear of panel.
4. 100-mm dry-break fill cap and adaptor. Provide one female adapter for each size of dry-break.
5. Fuel piping entry at rear of panel.
6. 15-mm steel pipe drain fitting at base of panel with rear outlet.
7. Maximum two piping ports per panel.]

2.9 [AT-GRADE REMOTE FUEL FILL BOX

A. Basis of Design: Fairfield Industries, Model RFTCN3/N4-WT with Padlock

1. 5-gallon spill bucket with 14GA secondary containment and termination chamber for piping secondary containment
2. Entries sized for piping.
3. 100-mm dry-break fill cap and adapter. Provide one female adapter for each size of dry-break.]

2.10 FACTORY QUALITY CONTROL

A. Precision Testing:

1. Test leak detection performance of monitoring system using UL test procedure at factory prior to shipping to detect leaks in primary or secondary tank. Test must be performed by qualified independent agency.
2. If tanks fail to pass either monitoring system test at factory, qualified personnel supplied by tank manufacturer must repair all leaks in primary and secondary tanks. Tanks must then be re-tested.
3. Hydrostatic Monitoring System must conform to Environmental Protection Agency (EPA) criteria associated with precision tank tests.

PART 3 - EXECUTION

3.1 GENERAL

A. Install tanks and piping, including appurtenances, manholes, and accessories as indicated on Drawings.

1. Verify location of equipment conforms to requirements of Chapter 13 of the OBO Mechanical Code.

2. Install wiring in conduit with long radius bends at all changes in direction. Comply with Division 26 requirements for conduit.

3.2 TANKS

A. Installation:

1. Install tanks in accordance with manufacturer's installation instructions. Complete installation checklist provided tanks, submit to Project Director/COR upon completion of installation.
2. Install fuel storage tanks below frost line, with tanks set upon bed having depth ranging from 300 mm to 600 mm. Anchor tanks to dead-man anchors, which must be sized and spaced in accordance with manufacturer's installation instructions, using manufacturer-provided anchor hold-down straps of quantity recommended in installation instructions.
3. Set storage tank must on concrete pad and anchor in accordance with NFPA 30.

    a. Consider tank weight, weight of earth above tank, weight of concrete and tank buoyancy in computation for sizing concrete hold down pad.
    b. Thickness and construction of reinforced concrete pad and concrete ballast pad under fuel storage tanks which must be used to keep empty tanks from floating must be determined by the structural engineer.

4. Attach turbine enclosure to tanks at containment collar, which must be connected using Turbine Enclosure Adhesive Kit.

3.3 FIBERGLASS/HDPE PIPING

A. See Division 31 Section on earth moving for trenching and backfilling of piping on the site. The following pipe installation specific requirements also apply:

1. Use shortest practical route, minimize bends, and run all pipe in single trench from remote fuel fill points to storage tanks, from storage tanks to final fuel destination, and from storage tanks to vent risers. Pipes must run parallel to tanks and dispensers. Avoid piping across tanks.
2. Typically, piping must slope at least 1 cm for every 96 cm toward tank. Pipe must be properly supported to prevent traps or sumps.
3. Piping must be separated by distance of at least 102 to 152 mm. Trench wall must be separated by at least six 152 mm. Follow manufacture specific instructions for distances between piping, walls, bottom of trench bed thickness, and backfill heights. In all cases, pipe must be completely surrounded with select backfill of either sand or 3 to 19 mm diameter pea gravel.
4. Compact backfill carefully over and around piping system. When using tamping equipment, take care to prevent vibration from driving small stones into pipe wall. Take care to remove frozen lumps from all backfill materials before backfilling.
5. Timing: Cover pipe as soon as possible after successful testing to eliminate chance of damage to pipe, floating of pipe due to flooding, or shifting of line due to cave-ins. If damage is suspected, retest lines.

6. Run piping outside buildings underground below frost line and carefully grade to drain toward fuel storage tanks.
7. Installation: Design containment fittings dimensionally such that they can be installed adjacent to each other and not require more distance between primary fittings than necessary in non-contained installations.
8. Preparation: Containment system must be plain end by plan end when installing two piece clam fittings for FRP systems or electro fusion joints for UPP systems. Light sand or scarf bonding surfaces. No tools must be required for installation to alter pipe diameter.
9. Pipe fittings must be free from all defects including delaminations, indentations, pinholes, foreign inclusions, bubbles and resin-starved areas which, due to their nature, degree or extent, detrimentally affect strength and serviceability of pipe or fittings. Pipe and fittings must be as uniform as commercially practicable in color, opacity, density and other physical properties.
10. Extend pipes up to grade from tanks for stick gauging and manual filling, and fit with watertight, lock-type, hinged cap. Provide pad lock and two keys through Project Director/COR to Post's Security Officer.
11. Run tank vent pipe up from grade for at least 3.7 m and 1.6 m from building openings, and terminate with return bend, bronze insect screen or vandal proof weather cap. Minimum size of vent piping must be DN50.
12. Underground piping must have secondary containment test ports at all low points in piping system and at transition sump when entering building.

3.4 STEEL PIPING

A. Fuel supply piping must extend inside tanks to within 102 mm of tank bottom. Install horizontal swing check valve on each fuel supply pipe at tanks in access manhole.

B. Install steel piping from fuel fill panel to transition sump, and within buildings from transition sump to equipment within buildings.

C. Fuel oil suction piping to equipment must not be smaller than DN20, but may be reduced to size of tapping in apparatus as close as possible to apparatus. Fuel return piping must be same size as fuel supply piping.

D. Install piping with ground joint unions near each piece of apparatus to facilitate disconnecting and similar activity. Run piping inside buildings as indicated on Drawings or as directed by Project Director/COR. All pipes must be free from vibration. Ream ends of pipes out before they are screwed into fittings. At screwed joints, apply suitable lubricant to male threads only.

3.5 FILL PANEL INSTALLATION

A. Coordinate construction of perimeter walls for locations of alarm conduit, fills supply pipe discharge, and drain line. Locate fill pipe connection maximum of 1 meter above exterior grade where fueling vehicle will be parked.

B. Mount remote alarm panel in remote fill-point secure compartment.

3.6 TRANSITION SUMPS

A. Install transition sumps on secure side of fill panels where steel piping enters ground and transitions to double wall piping and install at entrances to buildings where lowest floor of building is at grade. Use entry fittings where piping leaves transition sump underground.

3.7 INITIAL FUEL OIL SUPPLY

A. Contractor must initially fill each fuel storage tank with fuel to full capacity. Contractor must supply fuel required for testing and operating equipment as required until fuel system is accepted by the Government with issuance of substantial completion, at which time full tank of fuel must be present in storage tank.

3.8 FIELD QUALITY CONTROL

A. Hydraulically field-test all steel piping to 150 percent of maximum anticipated pressure of system, or pneumatically field-test to 110 percent of maximum of anticipated pressure of system, but not less than 35-kPa gage at highest point of system. Maintain test for at least 10 minutes, or for as long as necessary to visually inspect all joints and connections on piping.

B. Pressure test both primary and containment piping systems in accordance with Piping Manufacturer’s instructions. During testing, care must be taken to avoid sudden pressure surges or "water hammer" since pressures produced can exceed, many times over, rating of pipe and fittings.

1. Inspection: Prior to testing, containment piping system installation must be completely accessible for visual inspection of primary piping system. All primary fittings, joins and pipe lengths must be visible during testing. System installation must be inspected and approved by piping supplier or it's certified contractor.

C. After installation and prior to backfilling, pressure test tank to demonstrate tightness at 35-kPa pressure. Following test, tamp backfill material thoroughly in courses of 300 mm with care exercised to avoid damage to tank. Perform backfill in accordance with directions from manufacturer in installation manual. No foreign material (e.g., broken bricks, cinder blocks) are permitted in backfill. Screen native soil in excess of DN25 from backfill material to prevent damage to tanks during backfill. Backfill must not contain large quantities of ash and cinders.

1. Inspection: Prior to testing, storage tank system installation must be inspected and approved by storage tank system supplier or its certified contractor.

D. Containment system must be able to be tested, when installed and at later times, in accordance with local regulations and EPA requirements. No metallic components must be used to maintain the integrity of the system.

3.9 START-UP SERVICE

A. Engage manufacturer's factory certified technician to perform start-up service. Start-up service must be provided for Fuel Oil System (including liquid level controls, leak monitoring controls, and fuel pump controls). Notify Project Director/COR 14 days in advance of performing startup field testing.

1. Inspect field-assembled components, equipment installation, piping, and electrical connections for proper assemblies, installations, and connection.
2. Complete installation and perform start-up check according to manufacturer's written instructions.
3. Verify that installation complies with Construction Documents.

3.10 DEMONSTRATION

A. General:

1. Training must be performed at project site. Schedule training with Project Director/COR with at least fourteen days advance notice.
2. Train Government maintenance personnel on procedures and schedules for starting and stopping, operating, troubleshooting, servicing, and maintaining equipment and schedules.
3. Review data in manufacturer supplied maintenance manuals, and site-specific operations and maintenance plan,

B. Fuel Oil System:

1. Minimum of eight hours on-site training, provided by supplier of fuel oil system controls, for operators and managers of fuel storage system.

   a. Review system monitoring and controls.
   b. Review content of Storage Tank Management Plan.
   c. Review tank filling procedures, including spill prevention and control plan.

END OF SECTION 335005

SECTION 335217 - MOTOR VEHICLE FUEL DISPENSING

PART 1 - GENERAL

1.1 SUMMARY

A. Provide vehicular fuel dispensing equipment.

B. Related Sections include the following:

1. Section 335617 “Underground Fuel Storage Tanks and Distribution.”

1.2 REFERENCE STANDARDS

A. National Fire Protection Association (NFPA) 30: Flammable and Combustible Liquids Code and NFPA 31: Standard for the Installation of Oil Burning Equipment.

1.3 SYSTEM REQUIREMENTS

A. Fuel dispensing equipment must conform to Chapter 13 of the OBO-ICS IMC (International Mechanical Code as amended by OBO).

1.4 SUBMITTALS

A. Product Data: For the following:

1. Vehicular fuel dispensers and fuel management system.

B. Shop Drawings: Submit shop drawings for the following:

1. Dispensers: Include elevation view of dispenser and dispenser containment sump. Identify all component connections, including for piping, power, and monitoring.
2. Fuel Management System: Include details for fuel island terminal with pump control terminal, and wiring diagram for dispenser pump controls and monitoring system.

C. Qualification Data: For manufacturer and installer.

D. Field Report: For start-up service recording inspections and results of tests.

E. Installation Instructions and Checklists: Include Manufacturer’s installation instructions for fuel dispensers and fuel management system.

F. Maintenance Data: For vehicular fuel dispensing system, include list showing recommended maintenance frequency for system components.

1. Provide spare parts lists required for each element of fuel system.

1.5 QUALITY ASSURANCE

A. Basis of Design: This Section identifies “Basis of Design” for various equipment and components. Other products from the identified manufacturer or other manufacturers are acceptable which conform to requirements of this Section.

B. Comply with the OBO-ICS NEC (NFPA 70, “National Electrical Code” as amended by OBO).

C. Listing and Labeling: Provide voltage regulators specified in this Section that are listed and labeled. Terms "Listed" and "Labeled" must be as defined in Article 100 of NFPA 70. Listing and Labeling Agency Qualifications: "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

1. Vehicle Fuel Dispensers:

a. Dispenser Sump: UL Listed.
b. Electronic Fuel Management System: UL Listed, with manufacture conducted in prescribed manner within conditions controlled by ISO (9001) Certified Quality System.

D. Manufacturer Qualifications: Manufacturers must have produced similar systems for at least the past ten years.

E. Installer Qualifications: Installers who have been trained and certified by manufacturer for installation of systems required for this project.

1.6 WARRANTY

A. General: Manufacturer’s standard form in which manufacturer agrees to repair or replace components that fail in materials or workmanship within specified warranty period.

B. Electronic Fuel Management System for Vehicular Fuel Dispensing:

1. Warrant functionality of read/write keys. Provide technical support via telephone for diagnostics and assistance.

a. Warranty Period: Five years from Substantial Completion.

1.7 MAINTENANCE SERVICE

A. Commencing at the contract’s Substantial Completion date for a period of one calendar year with a renewable option for an additional year, provide proposal for system maintenance service based on manufacturer's recommended daily, weekly, quarterly, semi-annual, and annual maintenance

activities. The proposal must be submitted to the COR/Project Director at least 120 days prior to Substantial Completion.

B. The proposal must be inclusive of fuel dispensing equipment using factory-trained personnel.

PART 2 - PRODUCTS

2.1 VEHICULAR FUEL DISPENSERS

A. Basis of design: Basis is one of the following from Bennett Fleetmaster based upon product and hose indicated on Drawings:

1. Single Product, Single Hose: 3111SNR-68 UL listed remote dispenser.
2. Single Product, Dual Hoses: 3112SNS-21.
3. Dual Product, Dual Hoses: 3122SRR-27.

B. Description: Fuel dispenser for commercial and industrial applications, ready to operate with card and key-lock systems.

C. Features:

1. Electronic Totalizer; 7,571,000 liters.
2. Pumping Unit with Vortex Air Eliminator: 14 GPM nominal flow rate, 1/3 HP intermittent duty motor, 115/230V, 60/50 Hz.
3. Four-piston meter.
4. Electric and manual resets.
5. 25 mm (1 inch) diameter hose outlet with reducer, 19 mm (¾ inch) by 3.7 m (12 foot) long hose.
6. Sturdy hose hanger hook.
7. Field wiring terminal strip in ballast box.
8. Clear acrylic dial face inserts.
9. Brushed stainless steel top and sides.
10. White dial face covers.
11. Lighted dial face.
12. Stainless steel lower doors.
13. Internal 10:1 gallon pulser.
14. Satellite internal pipe connection.
15. Field installed hose retriever.
16. Diesel Fuel Nozzle: OPW 11A, or approved equal, 19 mm by 19 mm (¾ inch by ¾ inch) swivel.
17. Unleaded Fuel Vapor Recovery Type Nozzle:

    a. Basis of Design: Heally 800-02G3FS with 18 mm by 19 mm (3/4 inch by ¾ inch) swivel.

18. Hose Breakaway: OPW #66 with 230 mm (9 inch) whip hose, or approved equal.

19. Safety Valve: EBW 38 mm (1½ inch) double poppet or approved equal. Cast iron zinc-plated body and adapter; UL listed, conforms to NFPA 30A. Valve must automatically shut-off in event of a fire or impact.
20. Provide FRP dispenser sump with stabilizer bars, 762 to 1067 mm depth as required.

    a. Basis of Design: OPW-FCS dispenser sump.

21. Provide "emergency stop" button to facilitate immediate termination of fueling in case of emergency.

2.2 ELECTRONIC FUEL MANAGEMENT SYSTEM FOR VEHICULAR FUEL DISPENSING

A. Basis Of Design, subject to compliance with requirements of this Section:

1. Petro Vend System2, with Chipkey Option.
2. Syntech-Fuelmaster with key activation.

B. General:

1. Manufacture system using current microprocessor technology.
2. Design system to offer wide variety of operational modes and to provide maximum versatility without special programming or engineering changes. Provide ease and economy of expansion.
3. System must be capable of operating as stand-alone fuel management system. It must have capacity of interfacing with variety of data processing equipment. Data processing equipment may be located on-site or remotely. In remote mode, all commands and functions normally performed on-site through local data terminal must be executable remotely.
4. System must also comply with local standards where applicable, as well as applicable Federal Communications Commission (FCC) requirements.
5. System must provide self-test and diagnostic utilities for start-up and troubleshooting.

C. System Overview:

1. Purpose of system is to control dispensing equipment and provide accurate accounting of all fuel and related products being dispensed.
2. System must record data for each transaction in non-volatile memory and on journal printer.
3. System must have capability of user access by one of the following: Magnetic stripe card, hole-punched (optically coded) card, multi-programmable memory key, and manual entry of numbers via keyboard.

    a. References to cards or card users in this Section must be interpreted to include any of these listed access methods.

4. Access to products must be restricted to people holding valid cards and who perform predetermined series of data entry operations.
5. Internal electronic file must hold data for each card.

6. Authorized operator must be able to check and change system operating parameters, as well as card and account data.
7. All system commands must be menu-driven with on-screen "help" support for explanation of all functions. Single line command mode should also be available.

D. System Components:

1. Contain fuel island terminal (FIT) in weatherproof cabinet. Provide pedestal for mounting FIT. FIT must include the following features:

   a. Easy-to-read, back-lit, 2 line x 16 character, alphanumeric liquid crystal display (LCD).

      1) Display must be readable in bright sunlight.
      2) System must also be capable of being optionally equipped with 75 mm x 125 mm (3 inch x 5 inch) backlit graphic liquid crystal display (LCD).
      3) I line x 40 character display must also be available.

   b. 12-key metal keyboard with audible (tone) and tactile (keys move when pressed) feedback.
   c. "Emergency stop" button to facilitate immediate termination of fueling in case of emergency.
   d. Each Fuel Island Terminal (FIT) must be able to house up to 8 relays (1 per hose). Each FIT must be able to selectively access up to 32 hoses controlled by other FITS.
   e. Fuel Island Terminal (FIT) must have capability of being equipped with 2 different card/key reading devices to facilitate combination of cards and keys. Any combination of the following devices must be available:

      1) Push/pull magnetic card reader.
      2) Motorized magnetic card reader.
      3) Optical card (hole-punched) reader.
      4) Multi-programmable read/write key reader.

   f. Fuel Island Terminal (FIT) must be capable of being equipped with internal receipt printer. Receipt printer must use plain paper and have integral paper cutter.

2. Fuel Site Controller (FSC) must have capacity to connect up to 4 FIT units. Fully expanded system must be able to control 32 hoses simultaneously. Both mechanical and electronic pumps must be controllable by system.
3. Communication protocol between FSC and the FIT's must be RS485. Maximum wiring distance between the FSC and any FIT must be 5000 feet.
4. System must have two RS/232 ports for communication. One must be used to directly interface to an ASCII terminal, personal computer, or mainframe computer, which is capable of performing ASCII communication. One of these devices must be required to configure the system and generate reports.
5. System must have 5 x 9 pin dot-matrix bi-directional journal printer which must be located near FSC to make hard copies of transaction data and reports. Printer must be capable of operating at 180 cps (characters per second). Printer must use standard 216 mm x 280 mm

(8 1/2 inch x 11 inch) pin-feed paper and be capable of printing on 1, 2, or 3 part paper. System must be capable of operation with or without journal printer.

E. System Capabilities and Features:

1. Card/Key File Memory: System's memory must be flexible to maximize amount of card records and transaction records that can be stored, based on data stored for each card record. System must allow operator to determine what data is stored for each card record. There must be 3 incremental memory upgrades to increase amount of storage from standard configuration of 256 Kbytes to maximum of 2 Megabytes. Table 2.2 indicates typical ranges for card record and transaction record storage for each of memory configurations:

TABLE 2.2
CARD/KEY FILE MEMORY

MEMORY SIZE	NO. OF TRANSACTIONS	NO. OF CARDS MIN. DATA/CARD	NO. OF CARDS MAX. DATA/CARD
256 K	100	11,197	3,149
	1,000	6,397	1,799
512 K	100	25,761	7,245
	2,000	12,961	3,645
1 MB	100	54,888	15,437
	5,000	28,754	8,087
2 MB	100	113,142	31,821
	10,000	60,342	16,991

2. System must be capable of storing the following data for each card record:

a. Card/Key Number: 19 digits.
b. Card/Key Type: Single, Driver, Vehicle.
c. Status: Valid or Invalid.
d. Account Number: O - 9999.
e. Expiration Date: NW/DD/YY.
f. Monthly Allocation: $NNNNNN.NN.
g. Daily Allocation: $NNNNNN.NN.
h. Misc. Keyboard Entry: Off/On.
i. Personal Identification Number (PIN): O - 6 digits.
j. Current Odometer: 6 digits.
k. Odometer Reasonability Code: Up to 15 different levels.
l. Pump Restriction: Up to 15 different levels.
m. Quantity Restriction Level: Up to 15 different levels.
n. Driver Name: 9 characters.
o. Language Code: 1 digit.
p. Warning Odometer: 6 digits.

q. No Fuel Odometer: 6 digits.
r. Daily Limit: 1 digit.
s. Upper and Lower Range: 2 digits, 4 total.
t. Method: 1 digit.
u. Card Medium and ChipKey Modification Flags: 8 digits.

3. Account File Memory: System must have capacity to store 10,000 account records. Each record must contain:

a. Account Number: O - 9999.
b. Status: Valid or Invalid.
c. Account Discount: O - 99 percent.
d. Expiration Date: MMOD/YY.
e. Monthly Allocation: $NNNNNN.NN.
f. Daily Allocation: $NNNNNN.NN.
g. Quantity Restriction Level: Up to 15 different levels.
h. Pump Restriction: Up to 15 different levels.
i. Account Name: 9 characters.

4. Transaction Memory: System must have capacity to store transactions in non-volatile RAM. See Table 2.10, “Card/Key File Memory” for capacities. Each transaction must contain:

a. Sequential Transaction Number.
b. Transaction Termination Code (e.g., Normal, Quantity Restriction).
c. Account Name.
d. Driver Card Number.
e. Vehicle Card Number (omitted for single card transactions).
f. Date and Time.
g. Fuel Type.
h. Pump Number.
i. Quantity Dispensed.
j. Unit Price.
k. Total Transaction Extended Monetary Amount.
l. Odometer Entry.
m. Misc. Keyboard Number.
n. Consumption Factor: Miles per Gallon or Liters/100km.
o. Receipt Status: Issued/Not Issued.

5. Fuel Type (Product) Identification: Operator must be able to specify and store price and description of up to 16 products.
6. Miscellaneous Entry Field Capacity: System must be capable of recording a field of up to 10 digits entered at keyboard by user.
7. Clock/Calendar: System must keep accurate accounting time and date, even in event of power failure. Date and time formats must be user selectable (i.e., 12/24 hr, MMM/DD or DD/MMM). System must be able to automatically correct for daylight savings time.

8. Fuel Type Restriction: Operator must be able create table of up to 15 combinations, or levels, of authorized products. Operator must then be able to assign level number to each individual user or account group.
9. Quantity Restriction: Operator must be able to create a table of 15 quantity restriction levels. Operator must then be able to assign level number to each individual user or account group to limit amount of fuel dispensed for each transaction. Restriction must be by either quantity or monetary value.
10. Open/Close: System must have capability of being placed in either "Open" or "Closed" mode by authorized personnel. Fueling must not be allowed in "Closed" mode.
11. Single or Dual Card/Key Operation: Operator must be able to program system for cardless (manual entry via keyboard), single and/or dual card/key operation.
12. Personal Identification Numbers (PIN): System must have ability to recognize and verify up to 6-digit Personal Identification Number (PIN) when entered at Fuel Island Terminal. The system must be able to invalidate a card after 3 consecutive incorrect PIN entries. Operator must have choice of methods to select PIN's for each individual user:

    a. Individually program PIN number for each user.
    b. Automatically generate random PIN number.

13. Pump Configuration: Operator must be able to program and store up to 32 operating parameters for each hose position. These parameters must include:

    a. Pump Number: A pump number from 0 - 99 to be assigned to any available relay position.
    b. Fuel Type Number: Fuel Type number (1 - 16) and operator-selectable description of product being dispensed by pump.
    c. Tank Number: Tank number (1 - 8) to be used by inventory program.
    d. Quantity of Fuel per Transaction Limit.
    e. Total Transaction Time-Out: System must be able to monitor total transaction time, programmable for each hose between 1 - 999 seconds (entry of 'O' must allow unlimited time). System must turn off the pump if that time is exceeded.
    f. Pump Handle Time-Out: System must monitor time between authorization and activation of pump handle, which is programmable for each hose between I - 999 seconds (entry of 'O' must allow unlimited time). If device is selected but pump handle not activated by user before end of this period, transaction must be terminated.
    g. First Pulse Time-Out: System must monitor time between activation of pump handle and receipt of first pulse, which is programmable for each hose between I - 999 seconds (entry of 'O' must allow unlimited time). Transaction must be terminated if that time exceeds programmed parameter.
    h. Missing Pulse Detector (MPD) Time-Out: Missing Pulse Detector" (MPD) must be built into circuit controlling each pump so that all power must be removed from pump if pulses indicating fuel flow are not received at regular intervals. Length of acceptable interval between pulses must be 'programmable for each hose between 1 - 999 seconds (entry of 'O' must allow unlimited time).
    i. Pulser Divide Rate: Operator must be able to program system to assign 1 - 9999 pulses per unit of fuel measure.

j. Pump Deactivation Sentry: Operator must be able to program the system to automatically place pump "out of service" after 3 consecutive "zero quantity" fueling transactions occurring from that pump (zero quantity transactions may be indication of pump or pulser hardware failure). "Out of service", or other operator defined message, pump must be indicated on Fuel Island Terminal (FIT) display. System must have flexibility to disable this function for one or more particular pumps.
k. Messaging: System must have capability of displaying up to 100 different, operator-defined messages at Fuel Island Terminal (and printed on receipt) for specific Card/Key or Account numbers. System must have capability to automatically clear messages after operator-determined time period.

14. Card/Key Status: System must have capacity to allow driver and vehicle cards/keys to be declared valid or invalid by authorized personnel.
15. Site Name: System must have provision to program 12 character site name into memory. This is used when system is accessed by modem.
16. Pump and Product Totals: System must have capacity to accumulate individual pump and product totals as well as track each pump totalizer. Operator must be able to enter initial pump totalizer number into system for each pump. This number will be incremented by system when product is dispensed and can be checked against pump's totalizer to determine accuracy and working status of pulser.
17. Inventory Control: Operator must be able to program into system memory up to 8 tank inventory balances. Inventory balance for each product must be reduced automatically as each fueling transaction occurs. Operator must be able to change this number to accommodate fuel deliveries. System must be capable of 'displaying, on demand, current inventory amount for each individual tank.
18. Manual Operation: Operator must have ability to place pumps in "manual" mode, allowing manual operation of pumps (without entering rare ID). This must be done directly through programming terminal, or remotely by modem.
19. Display Prompts: Fuel Island Terminal display prompts must be programmable by operator. System must use set of standard default prompts at start-up.
20. Dual Language: System must have capability of storing 2 sets of Fuel Island Terminal (FIT) display messages in 2 different languages or 2 separate sets of display prompts (e.g., “Enter Odom” as opposed to “Enter Hubmeter”). When card/key is read, system must display all messages in correct language for that user.
21. Password: Operator must be able to program a 6-character, alphanumeric password that must be entered correctly to gain access to system either directly or via phone.
22. Pump Handle Monitor: System must monitor the pump handle to ensure that it was turned to "OFF" (reset) position before pump can be reactivated. Operator must be able to disable this feature.
23. Pass-through Communications Port: System must have capability of passing modem communications through to another RS/232 device.
24. Memory Key Report Features: Memory Key must:

    a. Be read/write device.
    b. Be made of highly durable plastic, able to withstand daily usage and handling.
    c. Be static-resistant.
    d. Have several methods of responding to incorrect odometer or hour readings.
    e. Have ability to be coded for minimum odometer or hour entry.

f. Have ability to be coded for maximum odometer or hour entry.
g. Have ability to be encoded a minimum of 10,000 times.
h. Contain last correct odometer entry and must have ability to download odometer entry to any key reader.
i. Have ability to be programmed with warning odometer for servicing purposes.
j. Have ability for "no fuel" odometer to prevent vehicle from not being serviced.

25. Memory Key with Multi-Site Odometer Reasonability: System must have capability of storing last odometer reading into memory key. Using stored reading, system must determine if current entry is "reasonable" (within specified range) before allowing access to fuel. Memory Key must also log number of unreasonable odometer entries and number of transactions per day. System must also have ability to prompt fuelers with service warnings and to prevent fueling when odometer entries meet or exceed programmed levels. System must check for lower and upper value for odometer reasonability range. System must allow for 5 different methods of odometer response to three sequential incorrect entries. If two or three bad odometer entries are same, current odometer entry must be printed in odometer field and odometer value in Memory Key must be updated. Bad entry counter must be automatically reset to zero after good odometer entry.

a. Method 0: Method 0 must be "bypass". All odometer entries are defined by system as reasonable. Fueling must always be allowed.
b. Method 1: This must be most restrictive method. After three bad odometer entries, Memory Key must be invalidated and fueling disallowed for user. System must not recognize invalidated Memory Key until it is reset (reprogrammed).
c. Method 2: Second method must log unreasonable odometer entries in same ways as Method 1. After third bad entry, Memory Key must be flagged on report and on transaction receipt by printing '< < <' in odometer field. Fueling must be allowed but only for entire current transaction.
d. Method 3: Method 3 must always allow fueling, and bad entries must be logged in two ways. If all three bad entries are different, transaction is flagged on transaction receipt and on report by printing '===' in odometer field. Odometer reading stored in Memory Key must not be updated, but bad entry log in Memory Key must be reset to zero. User must enter three more bad odometer readings for his transaction to be flagged again. If two or three of bad entries are same, '> > >' must be printed in odometer field and odometer value in Memory Key must be updated.
e. Method 4: Method 4 must log bad entries in two ways. Fueling must always be allowed. If all three bad entries are different, transaction must be flagged on transaction receipt and on report by printing '= = =' in odometer field. Odometer reading stored in Memory Key must not be updated, but bad entry log in Memory Key must be reset to zero. User must be required to enter three or more bad readings for his transaction to be flagged again.

26. Account Group Discount: System must have capability to assign discount, either in percent (O - 99 percent) or in cents per gallon/liter to each account. That discount must be reflected on price of each transaction.
27. Memory Key Encoding Method: FIT must be able to encode Memory Key in 2 methods.

a. Method 1: By authorized user placing FIT into manual encoding mode. This mode utilizes keyboard to program all or any of Memory Key fields.
b. Method 2: FIT must be able to automatically reprogram Memory Key (with on-site or remotely downloaded data) when key is inserted (e.g., new time for service or warning odometer message).

F. Vehicular Fuel Dispensing System Reporting:

1. System must have capability to generate reports. Operator must be able to access these reports on-demand via data terminal. System must be able to display or print report data at user's discretion.
2. System Information Reports:

a. System Status Report
b. Fuel Island Terminal (FIT) Status
c. Pump Configuration Data
d. Transaction Data Report
e. Card/Key Information Report
f. Account Information Report
g. Pump Totals and Totalizers Report
h. Inventory Report
i. Product Totals Report

PART 3 - EXECUTION

3.1 GENERAL

A. Install dispensing equipment, including accessories as indicated on Drawings.

1. Verify location of equipment conforms to requirements of Chapter 13 of the OBO-ICS IMC.
2. Install wiring in conduit with long radius bends at all changes in direction. Comply with Division 26 requirements for conduit.

3.2 VEHICULAR FUEL DISPENSERS INSTALLATION

A. A.Install Fuel dispensers with dispenser sumps according to manufacturer's written instructions.

3.3 ELECTRONIC FUEL MANAGEMENT SYSTEM INSTALLATION FOR VEHICULAR FUEL

A. Fuel Island Terminal: Install fuel island terminal system in accordance with manufacturer’s installation details.

B. Install Electronic fuel Management System in accordance with manufacturer's written instructions.

3.4 START-UP SERVICE

A. Engage manufacturer’s factory certified technician to perform start-up service. Start-up service must be provided for Electronic Fuel Management Systems (for vehicular fuel dispensing). Notify Project Director/COR 14 days in advance of performing startup field testing.

1. Inspect field-assembled components and electrical connections for proper assemblies, installations, and connection.
2. Complete installation and perform start-up check according to manufacturer’s written instructions.
3. Verify that installation complies with Construction Documents.

3.5 DEMONSTRATION

A. General:

1. Training must be performed at project site. Schedule training with Project Director/COR with at least fourteen days advance notice.
2. Train Government maintenance personnel on procedures and schedules for starting and stopping, operating, troubleshooting, servicing, and maintaining equipment and schedules.
3. Review data in manufacturer supplied maintenance manuals, and site-specific operations and maintenance plan,

B. Electronic Fuel Management System for Vehicular Fuel Dispensing:

1. Minimum of eight hours of on-site training, provided by fuel management system supplier, for operators and supervisors of fuel island management units and related software.

a. Review system controls.
b. Provide minimum of four additional hours training for users of software system, either on-site or online. Review use and maintenance of system software.

END OF SECTION 335217

SECTION 337105 - UNDERGROUND DUCTS AND RACEWAYS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Ducts in direct-buried duct banks.
2. Ducts in concrete-encased duct banks.
3. Handholes and handhole accessories.
4. Manholes and manhole accessories.
5. Locking devices for handholes, manholes and other devices provided to allow access to power and signal wiring for security devices (i.e., vehicle barriers, cameras, TSS equipment).

B. Related Sections include the following:

1. Section 033000 “Cast-in-Place Concrete,” including but not limited to provisions for field conditions, materials, and installation.
2. Section 260518 “Low-Voltage Electrical Power Conductors and Cables.”
3. Section 260525 "Grounding and Bonding for Electrical Systems" for grounding electrodes, counterpoise conductors, clamps and connectors for grounding metallic manhole and handhole accessories and testing of grounds.
4. Division 26 Section on “Raceways and Boxes.”
5. Section 270526 “Grounding and Bonding for Communications Systems.”
6. Division 27 Sections on communications.
7. Section 28 Sections on technical security systems and fire alarm systems.

1.2 SUBMITTALS

A. Product Data: For the following:

1. Manhole and handhole hardware.
2. Conduit and ducts, including elbows, bell ends, bends, fittings, and solvent cement.
3. Duct-bank materials, including spacers and miscellaneous components.
4. Warning tape.
5. Locking devices.

B. Shop Drawings: For cast-in-place and precast manholes and handles, submit shop drawings showing construction/fabrication and installation details for the items below. Precast elements must have shop drawings signed and sealed by qualified professional engineer.

1. For cast-in-place manholes and handholes:

a. Duct sizes and locations of duct entries.

b. Reinforcement details for cast-in-place structures.
c. Manhole cover design.
d. Step details.
e. Grounding details.
f. Dimensioned locations of cable rack inserts, pulling-in irons.
g. Locking devices.

C. Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures. Include plans and sections drawn to scale and show all bends and location of expansion fittings.

D. Splice Documentation: Document location and installation of splices for work in this Section. Documentation must be by trained splice technician that performed work.

E. Product Certificates: For concrete and steel used in underground precast manholes, according to ASTM C 858.

F. Product Test Reports: Indicate compliance of precast manholes with ASTM C 857 and ASTM C 858, based on factory inspection.

G. Thermal Imaging Report: Documentation of imaging; see the Article on FIELD QUALITY CONTROL.

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories (Including Ducts for Communications and Telephone Service) Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with ANSI C2.

C. Comply with the OBO-ICS NEC (OBO Electrical Code) and OBO-ICS IZC (OBO Zoning Code).

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver ducts to Project site with ends capped. Store nonmetallic ducts with supports to prevent bending, warping, and deforming.

B. Store precast concrete units at Project site as recommended by manufacturer to prevent physical damage. Arrange so identification markings are visible.

C. Lift and support precast concrete units only at designated lifting or supporting points.

1.5 COORDINATION

A. Coordinate layout and installation of ducts, manholes, and handholes with final arrangement of other utilities and site grading, as determined in the field.

B. Coordinate elevations of ducts and duct-bank entrances into manholes and handholes with final profiles of conduits as determined by coordination with other utilities and underground obstructions. Revise locations and elevations from those indicated as required to suit field conditions and to ensure duct runs drain to manholes and handholes, and as approved by Project Director/COR.

PART 2 - PRODUCTS

2.1 CONDUIT

A. Conduit and fittings are specified in Division 26 Section on "Raceways and Boxes."

2.2 DUCTS

A. Rigid Nonmetallic Conduit: NEMA TC 2, Type EPC-40-PVC, UL 651, with matching fittings by the same manufacturer as the conduit, complying with NEMA TC 3 and UL 514B.

2.3 HANDHOLES

A. Cast-in-Place or Precast: Fabricate according to requirements for cast-in-place handholes in the Article on UNDERGROUND ENCLOSURE APPLICATION.

2.4 MANHOLES

A. Cast-in-place or precast enclosures.

B. Precast Units:

1. ASTM 478, with interlocking mating sections, complete with accessories, hardware, and features as indicated. Include concrete knockout panels for conduit entrance and sleeve for ground rod.
2. Design and fabricate structure according to ASTM C 858.
3. Design structure according to details on Drawings.
4. Source Quality Control: Inspect structures according to ASTM C 1037.

C. Steps: Individual FRP or Steel Reinforced Polypropylene steps, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 300 mm- to 400-mm (12 Inch- to 16-inch) intervals. Omit steps if total depth from floor of manhole to finished grade is less than 1200mm (48 Inches).

2.5 ACCESSORIES

A. Duct Spacers: Rigid PVC interlocking spacers, selected to provide minimum duct spacings and cover depths indicated while supporting ducts during concreting and backfilling; produced by the same manufacturer as the ducts.

B. Manhole Frames and Covers: Comply with AASHTO loading specified for manhole.

1. Provide cast covers with cast-in legend as applicable:

a. "ELECTRIC-LV" for duct systems with power wires and cables for systems operating at 600 V and less.
b. "ELECTRIC-HV" for duct systems with medium-voltage cables.
c. "SIGNAL" for communications, data, and telephone duct systems.

2. Cast iron with cast-in legend "ELECTRIC" as indicated. Milled cover-to-frame bearing surfaces.
3. Manhole Frames and Covers: ASTM A 48; Class 30B gray iron, 762 mm size, machine-finished with flat bearing surfaces.
4. Special Covers: Recess on cover designed to accept finish material in paved areas.

C. Handhole Frames and Covers: Provide cast covers with cast-in legend:

a. "ELECTRIC."

D. Cover Lock Bolts: At office compounds, provide bolts for all manhole and handhole covers.

E. **Locking manhole covers:** Provide bolts with unique patterned heads designed for manholes. (typically for TSS equipment and wiring or fuel lines) Acceptable manufacturers are:
F. Van Lock
G. McGard
H. Other approved equal subsittutions must be submitted for DOS reivew and acceptance.

I. **Tamper resistant manhole covers:** Provide penta or 5-sided bolt heads designed for exterior manholes (typically for electrical and communication).

J. Sump Frame and Grate: ASTM A 48, Class 30B gray cast iron.

K. Pulling Eyes in Walls: Eyebolt with reinforcing-bar fastening insert 50 mm diameter eye and 25-by-100-mm bolt.

1. Working Load Embedded in 150 mm, 25 MPa Concrete: 60 kN minimum tension.

L. Pulling and Lifting Irons in Floor: 22 mm diameter, hot-dip-galvanized, bent steel rod; stress relieved after forming; and fastened to reinforced rod. Exposed triangular opening.

1. Ultimate Yield Strength: 180 kN shear and 270 kN tension.

M. Bolting Inserts for Cable Stanchions: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive thermoplastic material; 13 mm ID by 70 mm deep, flared to 30 mm minimum at base.

1. Tested Ultimate Pullout Strength: 53 kN minimum.

N. Expansion Anchors for Installation after Concrete Is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 12 mm bolt, 24 kN rated pullout strength, and minimum 30 kN rated shear strength.

O. Cable Stanchions: Heavy duty PVC; punched with 14 holes on 40 mm centers for cable-arm attachment.

P. Cable Arms: 5 mm thick, hot-rolled, hot-dip-galvanized, steel sheet pressed to channel shape; 300 mm wide by 350 mm long and arranged for secure mounting in horizontal position at any location on cable stanchions.

Q. Cable-Support Insulators: High-glaze, wet-process porcelain arranged for mounting on cable arms.

R. Grounding Materials: Comply with Section 260525 "Grounding and Bonding for Electrical Systems."

S. Ladder: Fiberglass specifically designed for electrical manhole use. Minimum length equal to distance from deepest manhole floor to grade plus 900 mm.

T. Duct-Sealing Compound: Nonhardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 2 deg C. Capable of withstanding temperature of 150 deg C without slump and of adhering to clean surfaces of plastic ducts, metallic conduits, conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.

U. Warning Tape: Underground-line warning tape specified in Division 26 Section on "Identification for Electrical Systems."

2.6 CONSTRUCTION MATERIALS

A. Waterproofing: Comply with Division 07 Sections.

B. Mortar: Comply with ASTM C 270, Type M, except for quantities less than 60 L where packaged mix complying with ASTM C 387, Type M, may be used.

C. Concrete: Use 25 MPa minimum, 28-day compressive strength and 10-mm maximum aggregate size. Concrete and reinforcement are specified in Section 033000 "Cast-in-Place Concrete."

PART 3 - EXECUTION

3.1 PREPARATION

A. Coordinate layout and installation of duct bank, manholes, and handholes with final arrangement of other utilities, site grading, and surface features in accordance with Drawings and as determined in the field. Notify Project Director/COR if there is a conflict between areas of excavation and existing structures identified to remain, vegetation identified to remain (e.g,, trees), or archaeological sites.

B. Coordinate elevations of duct-bank entrances into manholes, and handholes with final locations and profiles of duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct bank will drain to manholes and handholes, and as approved by Project Director/COR.

C. Clear and grub vegetation to be removed, protect vegetation to remain, and remove and stockpile topsoil for reapplication according to Drawings or other Specification Sections.

3.2 EARTHWORK

A. Excavation and Backfill: Comply with Division 31 Sections for earthwork and backfill but do not use heavy-duty, hydraulic-operated, compaction equipment.

B. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling is completed.

C. Restore all areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Division 32 Sections for landscaping.

D. Restore disturbed pavement. Refer to Division 01 Sections for cutting and patching for additional information for this Section.

3.3 CORROSION PROTECTION

A. Corrosion protection must conform to OBO-ICS NEC Chapter 1 and OBO-ICS IBC Appdx R.

B. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.

C. Use conductors with protective coatings where conditions would cause deterioration or corrosion of conductors.

3.4 UNDERGROUND DUCT APPLICATION

A. Underground Ducts for Electrical Cables Higher Than 600 V: Type EPC-80-PVC, concrete-encased duct bank.

B. Underground Ducts for Electrical Feeders 600 V and Less: Type EPC-40-PVC, concrete-encased duct bank.

C. Underground Ducts for Communications Utility Service: Type EPC-40-PVC, concrete encased duct bank, except use Type EPC-80-PVC when crossing roads.

D. Underground Ducts for Communication Circuits: Type EPC-40-PVC, concrete encased duct bank.

3.5 UNDERGROUND ENCLOSURE APPLICATION

A. Loading Design: Reference standard identified below identifies the Basis-of-Design utilizing precast concrete enclosures unless noted otherwise. Cast-in-place enclosures must be designed for equivalent loading.

1. Handholes and Boxes for 600 V and Less:

a. Units in Roadways and Other Deliberate Traffic Paths: H-20 structural load rating according to AASHTO HB 17.
b. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: H-20 structural load rating according to AASHTO HB17.
c. Units in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: H-10 structural load rating according to AASHTO HB17.
d. Units Subject to Light-Duty Pedestrian Traffic Only: Cast-in-place with structural loading to 20 MPa (3000 psi).
e. Cover design load must not exceed the design load of the handhole or box.

2. Manholes:

a. Units Located in Roadways and Other Deliberate Traffic Paths by Heavy or Medium Vehicles: H-20 structural load rating according to AASHTO HB 17.
b. Units Not Located in Deliberate Traffic Paths by Heavy or Medium Vehicles: H-10 load rating according to AASHTO HB17.

B. Cast-in-Place Manhole and Handhole Construction:

1. Reinforced concrete, monolithically poured walls and bottom, with steel frame and access door assembly as the top of handhole. Locate duct entrances and windows near corners to facilitate racking of cabling and conductors. Place built-in items must be installed before pouring concrete.

3.6 CONDUIT AND DUCT INSTALLATION

A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.

B. Curves and Bends: Use manufactured elbows for stub-ups at equipment and at building entrances. Use manufactured long sweep bends with a minimum radius as indicated on Drawings, with no less than 7.50 m radius, both horizontally and vertically, at other locations.

C. Use solvent-cement joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in the same plane.

D. Duct Entrances to Manholes and Handholes: Space end bells approximately 250 mm o.c. for 125-mm ducts and vary proportionately for other duct sizes. Change from regular spacing to end-bell spacing 3 m from the end bell without reducing duct line slope and without forming a trap in the line. Grout end bells into manhole walls from both sides to provide watertight entrances.

E. Building Entrances: Make a transition from underground duct to conduit at least 3 m outside the building wall. Use fittings manufactured for this purpose. Follow the appropriate installation instructions below:

1. Concrete-Encased Ducts: Install reinforcement in duct banks passing through disturbed earth near buildings and other excavations. Coordinate duct bank with structural design to support duct bank at wall without reducing structural or watertight integrity of building wall.
2. Waterproofed Wall and Floor Penetrations: Install a watertight entrance-sealing device with sealing gland assembly on the inside. Anchor device into masonry construction with one or more integral flanges. Secure membrane waterproofing to the device to make permanently watertight.

F. Concrete-Encased, Nonmetallic Ducts: Support ducts on duct spacers, spaced as recommended by manufacturer and coordinated with duct size, duct spacing, and outdoor temperature. Install as follows:

1. Separator Installation: Space separators close enough to prevent sagging and deforming of ducts and secure separators to earth and to ducts to prevent floating during concreting. Stagger spacers approximately 150 mm between tiers. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
2. Concreting: Spade concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Use a plank to direct concrete down sides of bank assembly to trench bottom. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-bank application. Pour each run of envelope between manholes or other terminations in one continuous operation. If more than one pour is necessary, terminate

each pour in a vertical plane and install 20 mm (#6) reinforcing rod dowels extending 450 mm into concrete on both sides of joint near corners of envelope.

3. Reinforcement: Reinforce duct banks where they cross disturbed earth and where indicated.
4. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
5. Depth: Install top of duct bank at least 600 mm below finished grade in nontraffic areas and at least 750 mm below finished grade in vehicular traffic areas, unless otherwise indicated, or where frost depth exceeds those dimensions.

G. Warning Tape: Bury warning tape approximately 300 mm above all concrete-encased duct banks. Align tape parallel to and within 75 mm of the centerline of duct bank.

H. Stub-ups: Use rigid steel conduit for stub-ups to equipment. For equipment mounted on outdoor concrete bases, extend steel conduit a minimum of 1.5 m from edge of base. Install insulated grounding bushings on terminations. Couple steel conduits to ducts with adapters designed for this purpose and encase coupling with 75 mm of concrete.

I. Sealing: Seal all penetrations into manholes, hand holes, and building penetrations. Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Seal around empty conduit. Use sealing compound and plugs to withstand at least 1.00 MPa (150 psi) hydrostatic pressure.

J. Identify spare ducts with stamped stainless steel tags where ducts terminate at other structures such as handholes, manholes, pullboxes, and buildings.

K. Pulling Cord: Install 450 N (100 lbf) test nylon cord in ducts, including spares.

L. Cable splices are not permitted in ductbanks or conduits; they are only permitted in manholes.

3.7 MANHOLE AND HANDHOLE INSTALLATION

A. Elevation: Install manholes with rooftop at least 375 mm below finished grade. Install handholes with depth as indicated. Where indicated, cast handhole cover frame directly into roof of handhole and set roof surface 25 mm above grade.

B. Incorporate clear vertical access area to allow insertion and removal of portable pump to drain manholes and vaults prior to start of work. Cables and supports must not be located within, or intrude upon, pump access area.

C. Drainage: Install drains in bottom of units where indicated. Coordinate with drainage provisions indicated.

D. Access: Install cast-iron frame and cover at top of access. Set frames in paved areas and trafficways flush with finished grade and set other frames 25 mm above finished grade. Install accessways in one of the following manner:

1. Install brick chimney to support frame and cover and to connect cover with roof opening. Provide moisture-tight masonry joints and waterproof grouting for cast-iron frame to chimney.
2. Install precast collars and rings to support frame and cover and to connect cover with roof opening. Provide moisture-tight masonry joints and waterproof grouting for cast-iron frame to chimney.

E. Racking: Rack cabling and conductors in manholes and utility trenches against walls of each. Cables and conductors are not permitted to be placed in center portion of manholes; they must be positioned to ensure safe personnel access at manhole.

F. Waterproofing: Apply waterproofing to exterior surfaces of units after concrete has cured at least three days. Apply according to Division 07 Sections for waterproofing sheet membrane, if applicable. After ducts have been connected and grouted, and before backfilling, waterproof joints and connections and touch up abrasions and scars. Waterproof exterior of manhole and handhole chimneys after brick mortar has cured at least three days.

G. Hardware: Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated.

H. Field-Installed Bolting Anchors: Do not drill deeper than 98 mm for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

I. Cable Splices: Limit splices for work in this Section. Splices must be UL listed for applications. Splice installation must be performed and documented by trained splice technician; see the Article on SUBMITTALS. Splices must have identification tags; these must be visible in manhole where splice occurs.

J. Grounding: Install ground rod through floor in each structure with top protruding 100 mm above floor. Seal floor opening against water penetration with waterproof non-shrink grout. Ground exposed metal components and hardware with bare-copper ground conductors. Train conductors neatly around corners. Use cable clamps secured with expansion anchors to attach ground conductors.

K. Cast-in-Place Manhole Installation: Comply with applicable requirements in Section 033000 "Cast-in-Place Concrete."

1. Finish interior surfaces with a smooth-troweled finish.
2. Windows for Future Duct Connections: Where indicated on Drawings or otherwise required, form and pour concrete knockout panels 38 to 50 mm thick, arranged as indicated.

L. Precast Concrete Manhole Installation: Unless otherwise indicated, comply with ASTM C 891.

1. Install units level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances.
2. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 25-mm sieve to 4.75-mm sieve and compacted to same density as adjacent undisturbed earth.

3.8 FIELD QUALITY CONTROL

A. Testing: Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.

B. Grounding: Test manhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 260525 "Grounding and Bonding for Electrical Systems."

C. Duct Integrity: Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out-of-round duct. Provide mandrel equal to 80 percent fill of the duct. If obstructions are indicated, remove obstructions and retest.

D. Thermal Imaging: Upon completion of installation and full energization of system, exam all racking with thermal imaging to ensure minimal heating from Electromagnetic Interference.

E. Correct installations if possible and retest to demonstrate compliance. Remove and replace defective products and retest.

3.9 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

B. Clean internal surfaces of manholes, including sump. Remove foreign material.

END OF SECTION 337105
