3	$	$	$	$	$
4	$	$	$	$	$
5	$	$	$	$	$
6	$	$	$	$	$
7	$	$	$	$	$
8	$	$	$	$	$
9	$	$	$	$	$

Cropland: Land that has been farmed to produce commodity crops at least once out of the last five years (including the associated non-infrastructure that is critical to farming drained hydric soils: ditches, buffers along ditches, pump stations, and irrigation pivots). Land currently in CRP qualifies as cropland.

Hayland: Land that has been farmed to produce hay at least three out of the last five years OR cropped at least once during the last ten years.

Pasture: Land that is primarily used to produce forage for livestock production (not cropped or used for hay production in the last five years).

Woodland: Land that is dominated (>50% cover) by woody species with a minimum height of fifteen feet at maturity.

Wetland: Land that contains hydric soils and currently has the hydrology to support a hydrophytic plant community. Land that has been idle for ten or more years and does not qualify as woodland.
