Tree Assessment

Please note: The following will be a numbered tree assessment to include the number of the tree to match up to the number on the corresponding tree picture. The location will be a description but most likely a number to a campsite to where the tree is found. The rating will be how hazardous the tree may be ranging from low, to moderate to high. Most of the trees in this assessment are low to moderate with only a few being high.

Most of the trees on this assessment are the softer wooded trees the cottonwoods and poplars, however there are many harder wooded trees at the employee housing area but most of the trees on the assessment are the softer wooded trees. These trees are great as they grow relatively fast and provide quick shade but they can be very unpredictable and extremely difficult to predict. It is wise to prevent these trees from getting extremely heavy to lessen the likelihood of them failing.

Most of these trees are Fremont Poplar Trees named after the explorer John C. Fremont. Many people refer to these trees, poplar trees as cottonwoods and poplars and cottonwoods are often interchanged. The poplars and

cottonwoods along with the aspen trees are all in the same family, “Populus.”

Green River Campground-					
No.	**location**	**Tree name**	**Notes**	**Rating**	**Action**
4	Site #66	Poplar	Numerous dead, dying and broken limbs	Moderate	Prune out dead limbs
